separated by centrifugal force. It follows from this that any rubber at once depreciates in value when it is allowed to coagulate with all its impurities as it is taken from the tree. This ball of rubber, for instance, which was taken from a tree a few days ago, is full of hurtful ingredients rendering the whole mass subject to the growth of fungoid disease and putrefaction, results which are greatly aggravated in a damp climate. The old American remedy to prevent disease was sun drying and smoking. But that is only partially effective and does not purify the rubber.

We now come to a brief review of *Castilloa elastica*, which has also attained the reproductive stage in the Lal Bagh. In its culturable requirements this important tree seems to be intermediate between the Pará and Ceará species, requiring neither the tropical humidity of the former nor the open and comparatively dry conditions of the latter. It is, in fact, a tree for the coffee zone, as, no doubt, some of you have already discovered.

Mr. C. O. Weber, an expert, who has recently visited *Castilloa*, a plantation on the Isthmus of Colombia, writes thus:—

"All the reliable evidence seems to show that the trees grow badly in dense forests, and produce a poor yield of rubber when grow on open ground. They appear to prosper best when growing up together with other trees, so that the trunk is always shaded, whilst the top of the tree, at least for a certain time during the day, receives the direct rays of the sun." These are the conditions which I have also found most favourable to the growth of *Castilloa* at Bangalore. Our trees, which are about nine years old, have only been tapped very slightly in one or two places to see if the latex would run freely. It appears to be a characteristic of at least two varieties of the species that the latex does not run freely, but collects in beads and tears under the punctures. Local trees are apparently of this class. Mr. Weber further writes that in Mexico and Ecuador the latex fluid runs freely. Three distinct varieties are described by this authority, e.g., *C. elastica alba*, the richest variety, producing a thick creamy milk *C. e. nigra*, yielding a thin fluid, and easily bled to death. *C. e. rubra*, affording good rubber but deficient in quantity. These names (which indicate the colours white, black and red) have reference to the colours of the bark in the different varieties, there being no botanical difference. The first named is apparently the best tree to get hold of. The seed of *Castilloa* ripens here in May. But as yet we have only a limited quantity—3,000 seeds were sent out to planters this season. It loses its vitality in a few weeks if not sown and I have not observed any self-sown seedlings under the trees, as happens in the case of Ceará. But there will be no difficulty about propagation as the species increase in age and number. I only hope we possess the most productive variety. What has been said previously about centrifugalisation applies with even greater force in the preparation of this valuable rubber, which readily lends itself to such treatment. There is a large percentage of albumen in the latex which if left for even a short period would cause fermentation in the solid product.

Although I do not say positively that *Castilloa* would fail on the *maidan* I certainly think it will have a better chance in comparatively open spaces throughout the coffee zone. Indeed it may become a good shade tree for coffee for all we know at present.

Now we come to the last of the three American trees, e.g. *Hevea brasiliensis*, or Pará rubber. When pure, the latter is worth Rs. 4 a lb. and is admitted to hold the market at present. But under improved methods of preparation it will soon be closely run in quality, and perhaps greatly exceeded in quantity, by the rubber which I have just reviewed. Anyhow, it is not likely to be of much practical use in the drier

parts of India: therefore, we are justified in turning our attention to more hopeful subjects. The Pará rubber tree is essentially tropical in its requirements, and needs a humid atmosphere such as is found in the Amazon Valley—its native habitat. Ceylon has started cultivation in a small way. But the only eastern country which is likely to compete on fairly equal terms with America is the Malay Peninsula and Archipelago. Along the West Coast of India, and in moist situations under the Ghauts there may be spots where the climatic conditions are tolerably favourable. But careful experiment should be conducted before a large investment is made. At Bangalore the tree languishes and dies during the long dry season. Irrigation gives only temporary relief, as there is too little moisture in the first four months of the year. *air during the*

The Assam rubber tree, (true india-rubber) *Ficus elastica*, I have all along said will grow well in the coffee districts, and the reason why it is not found there in quantity is possibly due to the difficulty of rapid propagation. But in any South Indian rubber plantation this useful tree should certainly find a place. It is said to be doing well in the Straits Settlements.

Much nonsense has been written lately concerning a new rubber plant—*Landolphia thalloni*—found on the French Congo. I have little doubt, too, but some of the writing was done to influence the rubber trade, for good or otherwise. The latex of this little shrub, which is only half a foot high, is chiefly stored in the root. But this is not an exceptional discovery, as I have shown in this paper that the roots of the Ceará rubber tree are full of milk sap. So are the roots of several species. Scientific experts who are in the best position to judge are not of opinion that this latest discovery will influence the rubber market greatly. They rather expect that many similar discoveries may be jumped upon us during the next few years. The African genus *Landolphia* promises to be a large one, and doubtless all the species contain latex. We have one or two species on trial which grow well. But as climbing plants they are not, in my opinion, very suitable for rubber farming in this country. Should we be driven to utilise climbers in preference to trees for our supply of rubber, which is improbable, the long established *Cryptostegia grandiflora*, a plant of Madagascar, offers a richer source of rubber, I believe, and it can be grown without trouble. It is known around Bangalore by the local name *Mate wuli umboo*. In concluding these details of my own experience with some rubber-yielding plants you will gather, gentlemen, that I favour the selection of Ceará for the plateau of Mysore and Castilloa for the moister region of the hills. Pará may succeed in parts of tropical West India; but of that I am uncertain.

#### FIBRES AND SERICULTURE.

The fibre industry is passing into the practical stage, and seems to hinge, at present, on capital outlay and a good market. Cultivation, as I told you on a former occasion, is assured in this country, where there are fibre-yielding plants suitable to almost every condition of soil and climate. The plants most suitable to the tea and coffee tracts are those producing Rheá, hemp, Mauritius hemp, and perhaps Manilla hemp; while at the highest elevations on the Western Ghauts, in somewhat sheltered positions, of course, an unlimited supply of New Zealand flax (*Phormium tenax*) and Ban Rheá (*Villebrunea integrifolia*) could be produced.

Sericulture is also well worthy of trial in the drier Districts. In connection with the latter industry the new Japanese reels recently imported by Mr. Tata promise to increase the value of local silk by at least 50 per cent. A consignment of silk thus reeled on Mr. Tata's farm, has been valued by the Home brokers at Rs.13 per lb., and is highly praised for its excellent quality. Silk prepared by the native method is only worth Rs.5 to Rs.6 per lb. What we really require for our

Indian industries is the best class of machinery that can be procured. Even the few products which I have named require three distinct machines or apparatus. These are, firstly, a powerful engine with decorticator, like Todd's (costing £600), to manipulate strong leathery leaves such as afford the so-called aloe fibres, bowstring hemp and New Zealand flax. Also Death and Ellwood's scraping wheels worked by Marshall's portable engines. The latter appear to be exclusively used in Yucatan, where a single wheel can clean leaves at the rate of 20 per minute. For further information on this point. I would refer you to an interesting article which appears in the last issue of *Planting Opinion*.

Secondly, a machine after the style of Faure's, priced, I believe, at £100, to deal with the more delicate fibre of Ramie, Rheá, and possibly Manilla hemp. Then we find that with proper reeling the value of silk is greatly enhanced. It is not, however, necessary that every grower of fibre should possess a machine. The one used by the South Indian Fibre Company is carried all over the country-side, just like a threshing machine at Home. It would be the same in dealing with silk, which is not a bulky article. One central depôt for reeling should suffice for a large area. Although essentially a poor man's industry, I see no reason, especially in times of planting depression like the present, why the planter should not have a mulberry patch and try his hand at sericulture.

In Assam, the Bengal Rheá Syndicate possesses a large area of cultivation, and it is highly probable that Ramie and Rheá may do for the north of India what the aloes and hems are expected to do for the south.

The common railway aloe, *Agave americana*, has risen to the expectations of the South Indian Fibre Company, whose best consignments have realised as much as £32 per ton of clean fibre. This only shows what a splendid opening there is in this country when Sisal and other first-class fibres shall be established in quantity, and supplies assured to the brokers at Home. Another healthy sign is the increasing local demand for plants of Sisal, and the Mauritius hemp. At the gardens we are booked for all that can be raised during the next two years—approximately a couple of lakhs. Fortunately our Sisal plants have commenced to pole, and propagation from that source already amounts to about 18,000 plants.

There are in Mysore alone, as you well know, immense tracts of poor, but still comparatively good, land under scrub. Many of these tracts, situated near the railway, I should like to see taken up for the cultivation of fibre and Ceará rubber, the success of which, if properly taken in hand, there can be no doubt whatever. At present the two redeeming products on these lands are grass for cattle and the tanner's shrub, *Cassia auriculata*, yielding *tangadi* bark, the staple tan of the Province. High prices are offered for the best tans, evidently because natural supplies are unequal to the requirements of the time. The pinch is being felt, for instance, at Cawnpore, where there are extensive leather and boot factories. The babul tree, which furnishes the bark in that locality, is becoming exhausted, and to carry bark in bulk from distant parts of the country is too expensive. For this reason, and for its richness in tannic acid, the comparatively light pods of the Divi Divi tree command a high price and are eagerly sought for. Plantations of this useful tree should certainly be raised at elevations ranging from 1,000 to 3,500 feet, with a rainfall of 30 to 70 inches. The Divi Divi is a very hardy and long-lived tree, which becomes more productive of pods (fruit) up to at least 60 years of age. It needs an open situation with good drainage. I am now in a position to supply a large quantity of seed, should it be bespoke some months before the ripening season at the close of the hot season.

After a cordial vote of thanks to Mr. Cameron had been passed, the Meeting adjourned for the day.

## FOURTH DAY, August 6.

The delegates met at 7 A.M. and sat with an interval for lunch till nearly 5 P.M., many important matters on the Agenda Paper being discussed.

## THE MADRAS PLANTERS' LABOUR LAW.

This matter which was thoroughly discussed in Committee on Monday came up again to-day for discussion and ratification of the Resolution in open Meeting. Mr. Romilly in opening the discussion said:—

MR. CHAIRMAN AND GENTLEMEN,—The motion that I rise to propose is that this Association tenders its most cordial thanks to the Government for their endeavours to meet the requirements of the planting industries as embodied in Act I. of 1903 and while regretting that it is made to apply to all forms of contract and all conditions of labour and that Act XIII. has not been allowed to run concurrently with it, accepts it as likely to prove of benefit to the several planting Districts of South India, and will endeavour to induce its members to give the Act a trial in their respective Districts.

By the wording of it you will see that I by no means express unqualified approval of Act I. of 1902. It would have been a miracle if an Act had been passed which at the outset commanded our unanimous and unqualified approval. But I maintain that this Act, with one very important exception, contains most of the provisions that we have been asking for for years; it gives us the enforcement of specific performance of our contracts, and it gives to the Native States the right of extradition. That these concessions should be safeguarded by careful and elaborate precautions for the welfare of the cooly is only what an intelligent employer of labour was bound to expect. I can see nothing in these precautions if they are fairly and honestly carried out by the minor Government officials that will entail any injury to the employer's interests or entail unnecessary expense. I am quite aware that this is not the general opinion, and that most of our Districts shudder as they contemplate a plunge into a new sea of labour difficulties, and many would like to remain shuddering on the brink while some poor Association is chucked in to try it. *Fiat experimentum in corpore wili.* But you will see that my Resolution does not enforce specific experimenting on the most timid. I merely want to have the grateful acceptance of this Act recorded by this our parent Association, as a proof to Government and to all who take an interest in the matter, that we have not been drifting for the last 10 years, and that we still adhere to the principles laid down here 10 years ago. I hope to see the Act put in force and tested in more Districts than one. We have been accused, I know, of inconsistency, of not knowing our own minds. I have heard it stated in planting circles and also by Government officials, that ever since the Report of the Committee of Enquiry came out, we must have known that Act XIII. of 1859 would be done away with and that we acquiesced in it. Now this is a complete misconception and misstatement of the case. There has been deplorable inconsistency I admit in some quarters, though I am glad to say that the action of the planters is not endorsed by their Associations or by their official representatives here, notably on the part of the rank and file in the Nilgiris, but I will refer to that case presently. For the present I will apply myself to vindicating the conduct of the leaders of our community. The main action which underlies the whole history of the agitation is that we wanted protection in the enforcement of our contracts for imported labour, and for imported labour only. In this we have been consistent throughout and are consistent now in raising objection to an Act which, by removing one class of disabilities, created as we believe, a perfectly new and unexpected one, so far from the Committee of Enquiry having recom-

mended the abolition of Act XIII. they say in paragraph 136 "that the question, etc. . . ." We discussed the Report at our Meeting in August, 1897, and our views were embodied in a letter which I, as your Chairman, addressed to Government on the 13th August, 1897. In it we said *vide* page 16, "It is considered, etc." We have persisted in this throughout. When Mr. Hodgson was our Member on the Legislative Council, I used to discuss the provisions of the proposed Bill with him. There was still no mention of doing away with Act XIII., nor yet of forcing the new Act on all alike. Certainly, for myself, I always understood that any legislation would be of a permissive character,—I mean by that, that if you were satisfied with your labour arrangements, no Act would be forced on your acceptance. I imagine every one was under the same delusion even as lately as at this Meeting last year, when I see that you discussed the new Bill with closed doors as usual, and apparently were all well satisfied.

Government published the Bill at the end of last year and we were suddenly confronted with a new clause,—a clause which in its initial form, would have upset all labour arrangements throughout the length and breadth of the planting Districts, and would have cost the community lakhs of rupees in unrecoverable advances. That Government was able to frame such a clause and to publish it as their serious idea of the wanted legislation shows how utterly they had failed to understand the position and labour arrangements of the people for whom they were going to legislate. I myself put down this want of knowledge to the absurd secrecy as it seems to me with which all our discussions of the proposed legislation and all our communications from and to Government are veiled.

In 1897, when the Report of the Committee of Enquiry was considered we were told to conduct our discussion with closed doors—the Report of it even was published not in our ordinary book of proceedings, but as a confidential supplement. Ever since, the same ridiculous course has been adopted, with the inevitable result that those who are unable to attend the Meetings never know what is the latest plan of Government may be and Government never knows the real feeling of the planters for whom they are going to legislate. During the late agitation before the Bill was passed, you will find in Mr. Acworth's Reports the passage:—"Don't let this go beyond your Association or don't let it appear in the papers"; the reason being that the Government of Madras are (I daresay very properly) not allowed to publish their attempts at legislation before they have received the sanction of the Government of India, until they have received sanction, publication is forbidden and consequently discussion on them is a hole and corner one. When sanction is given, discussion is too late.

The Member of Government in charge of the Bill had, I suppose, not had time during the last four years to master the true position of affairs and could never have read these secret discussions. At any rate the ignorance he displayed was sublime. I note in one of the circulars that went the round of our Associations that one Planting Member, in reply I think to the Shevaroy, in a rare moment of petulance said that if the Angel Gabriel came down to legislate for planters, there would be 10 per cent. of malcontents. Well it was not the angel, and there were 99 per cent., at least a considerable percentage I believe. The outcry was apparently so unanimous and persistent that the clause as originally framed had to go. The question suggests itself whether we should not then and there have refused the Bill outright. It was a distinct breach of all previous negotiations with us, and we should have been consistent and in a stronger position had we done so. As it was, Government amended the objectionable Section and we trusted that they would still further amend the Act, so as to

allow Act XIII. to run concurrently. I cannot help thinking that with more firmness on our part they might have done so. The Act first of all abolished Act XIII. altogether and with retrospective effect. Then when that was rectified, our Hon'ble Member assured us that Act XIII. was doomed for the future, and that the Government of India would have none of it. That threat again was withdrawn you will remember, and we are now assured that if on trial the new Act does not suit us that Act XIII. will be restored to us. The Hon'ble Member has told you that it was a matter of regret to him that he was not more conversant with the conditions of local labour, and I will agree with him because I think that had he had practical experience of them he would have engineered a Bill satisfactory to all. I will here pay a passing tribute to the services he did render, and I do it with all the more pleasure as I know it always evokes agreement.

So far I have vindicated the action of this our Central Association for its consistency in the past. It is now at the present moment and with regard to our future action where vacillation comes in. There is no doubt that we have accepted the Act through our representative on the Council, who seconded the reading of the Bill in its amended form and so passed it into law. If we did not now endorse his action by a formal recognition of it, we should not only be making a fool of him, but also of the Madras Government which has, you must all admit, notwithstanding the display of some ignorance, tried to meet our views and spent much time and trouble over this piece of legislation. We should in consequence, I maintain, accept it gratefully and, notwithstanding any fancied shortcoming, we should give it a trial. Our only ground of objection to it is that most of us still think that in its amended form even, it is inapplicable to the conditions of local labour. The Act has granted nearly everything that we have previously worked for, and every rational man must have known that in asking for Government interference and sanction to our contracts, we were also inviting such supervision as Government might think necessary on behalf of the labourer. None of these precautions in this new Bill on behalf of Government are more than we could naturally expect. They are fair to both sides, and on a previously well-managed estate should cause no extra expense or fear of consequences. And yet those Nilgiri planters are so alarmed at the prospect that they go back on all that they have said or that has been said on their behalf before. They now assert that so far as they are concerned no legislation was ever required.

The petition has been published in the public newspapers, or otherwise it might be as well to pass it over in silence, but it has been published and has been much discussed in planting circles, and I believe it has attracted the attention of Government, and when I saw it last, it had no less than 33 signatures attached. Now there is a Moorish proverb that a good bundle of faggots, well bound, will float a laden ass across a river, whilst cut the faggots apart and they will not bear a chicken to safety. It is a true proverb, but it takes no account of the possibility of the ass himself who is being ferried into safety ending through the rope that binds the faggots together. This unfortunately is what has really happened in our case. I take it for granted that you do not for one moment imagine that I am applying the word "ass" to any one of those 33 Nilgiri planters, no, not even in a Pickwickian sense. I am merely carrying out the Moorish metaphor, but yet I call them foolish politicians who having taken many of them an active, and the rest a passive part in the agitation of the last four years against Act XIII. and labour troubles in general, suddenly wake up with a start to the horror of having to realise that their efforts have actually been successful, and that they are on the brink of legislation that they have been too lazy to foresee. In a

sudden panic, without even being at the pains of securing a man with a good knowledge of their own vernacular or with a knowledge of the commonly accepted form of drawing up petitions, they sign a declamatory statement in which they assert that they live in a labour paradise from which their coolies occasionally are sent to the local hospital, and the same coolies return year by year to the same estate. The most extraordinary portion of the petition is the statement, that they have no difficulty in recovering advances when once given out. I have already called attention to this statement in the *Madras Mail* and asked the direct question if it was absolutely true—or a possible mistake; I think I suggested an exaggeration. I have no doubt that it is true in some individual cases, but I do not believe that the manager of any big concern can produce his books over a term of years and show no bad and irrecoverable advances. I see that the Vice-Chairman of this Association, Mr. E. G. Windle, signed the petition. Surely Mr. Windle must have given evidence before the Committee. Surely many of these 33 gentlemen must have done so, and if they gave their evidence to the same effect as their statement to Government now it would most assuredly have been mentioned in the Committee's Report. Even if their statement was true which, as I have said before, I can hardly believe, I consider it a most injudicious and impolitic document. The truth of the matter is that they prefer to rest content with the ills they have than fly to others that they know not of; but why they should go out of their way to assert that everything is for the best in this best of worlds of theirs I know not. I have only been a few months in this Elysium, as an Acting Manager of a very big concern, and my experience has been exactly what it has been elsewhere, that there are good maistries and bad maistries, good coolies and absconding coolies, maistries who always want more instead of pressing back their advances on you, and coolies who think nothing of leaving the estates and their advances unpaid to get others elsewhere. I have yet to learn that these advances are easily recoverable.

I would not have dwelt so long on this document but that I believe it has done us much harm, and would do still more if we did not repudiate it utterly. I must tell you, gentlemen, that when I was deputed by my Association to represent them at this Meeting, I was given definite instructions as to how to vote on certain subjects. In accepting the invitation I pointed out that I must reserve to myself the right to modify their laid down instruction in the light of the forthcoming debates. Otherwise it seemed to me that in a Meeting of this sort every vote might as well be a proxy. I very soon realised the absolute truth of this contention. I was instructed to vote for a petition to Government asking that this Act might run concurrently with Act XIII., and I admit that I was in complete accord with my instructions. Now I would ask other representatives of their Associations, who I know have also received distinct instructions, to listen to me patiently and carefully. I was in Ootacamund and asked leave to have an informal conversation with His Excellency the Governor. At that interview I told His Excellency what my instructions were, and he at once assured me that any such course on the part of this Association would be absolutely futile. His Excellency gave me leave to repeat to you the gist of his remark. It was to this effect:—"You planters laid your grievance before Government. It was listened to. A Committee of Enquiry reported on your grievances and a Bill was framed with your full concurrence to meet these grievances. Your representative on the Council after certain amendments accepts it on your behalf and it becomes law, and now without even giving it a trial you ask us to amend it. This is futile. You will not be listened to. Your fear of it may be unreasonable. Give it a trial, and then if in its working you do find that it operates harshly,

then come up to Government, not with vague surmise, but stating a concrete instance where hardship has occurred and we will listen to you." I quite but reluctantly admit that the logic of this advice is unanswerable. Do not think it weakness to change your views when convinced against your will. It is only common sense. I changed my views and wrote off at once to my Association to tell them that I had done so and that I could not being forward their Resolution. They have not met since and in consequence have not absolved me from the fulfilment of their injunction, but I have taken the responsibility on myself of acting as I think right.

When an authoritative statement comes like this from the head of the Government, and I can assure you that His Excellency was emphatic, it seems that not only should we be wasting time in going up with a petition to have the Act amended, but we should be putting ourselves in an absolutely false position. The only thing that is left us to do now is to give the Act a trial or to abandon the labour question for once and for all time, and to admit that we do not know our own minds, and that we have defeated our ends by gaining that which we asked for. Now, gentlemen, consider for one minute the lengthy and exhaustive debate that has taken place in Committee. Mr. Acworth, Mr. Hodgson, Mr. Norton and myself were for a long time alone. Many of you admitted that your views were modified by the arguments which had been brought forward. You were bound hand and foot to vote by mandate against your own feelings. I ask you to justify yourselves before your own constituents hereafter, but now to give a unanimous vote in favour of my Resolution and try effectually to get it carried into force. I am sure that it is the only logical course open to us, and I do not for one instant believe that the Act will entail the losses and sufferings on the employers of labour, which many of you foresee, and which as you will remember were equally predicted by some of the native members of Council and vernacular Press for the labourer.

Mr. H. P. HODGSON, in seconding Mr. Romilly's motion, said:—

Mr. CHAIRMAN AND GENTLEMEN,—I rise to second Mr. Romilly's Resolution. I am sure my doing so will be approved by the Associations I represent, as we are tendering to Government the thanks which is their due for the time and trouble they have given to the framing of Act I. of 1903.

At the Annual General Meeting of the Nilgiri Planters' Association held at Ootacamund on the 8th of June last, the following Resolution was put to the Meeting:—

"This Association sees no great reason why the Madras Planters' Labour Act of 1903 should not be beneficial to the planting interests in this District, and is both ready and willing for the said Act to be extended to the Nilgiris."

The votes for and against the above Resolution were exactly divided, being 14 each way, and considering the importance of the question at issue the Chairman's casting vote was not used, but it was decided to send a circular to all members of the Association so that each one might have the opportunity of recording his vote.

The result of this circular was a very large majority against the introduction of the Act into the Nilgiri District.

That this feeling extended beyond the members of the Association I am also bound to say, and it took the form of a circular letter which was published in the *Madras Mail* and in *Planting Opinion*. I think its untimely publication is to be regretted. This letter was signed by 34 planters, 22 of whom were members of the Nilgiri P. A., the other 12 not being members.

The reasons given in this letter for declining the Act are briefly—

(1) That there is no difficulty in obtaining labour or in recovering advances on the Nilgiris.

(2) The fear of expense under the rules to be framed providing for medical attendance, and accommodation for coolies.

(3) Objection to Government interference as likely to introduce "constant worry" by Government inspectors.

(4) Fears that too much will be left in the hands of local native Magistrates.

The letter concluded with a suggestion that "the Act will be given a trial elsewhere," and with a firm protest against its introduction "at present" to the Nilgiri District.

The above petition can hardly be considered as representative, as it only recorded the opinion of 34 planters, whereas in reply to the Honorary Secretary's circular sent out under instructions of the Meeting of the N. P. A. held on the 8th June, which was sent to members and non-members of the Association, 72 replies were received. Of these, 6 representing 3,800 acres were in favour of an immediate unconditional trial of the Act and 66 representing 16,000 acres were against it. Subsequent to this an amendment was circulated reading, "that this Association will be pleased to accept the Labour Act tentatively, if it be allowed to run concurrently with Act XIII., and on the understanding that the former will be withdrawn should the Association find it unsuitable after a trial, and that the delegate to Bangalore be instructed accordingly."

This amendment is supported by 34 for and 26 against, and is the final Resolution of the Nilgiri Planters' Association I have to lay before this Meeting. Of the 34 planters voting for this amendment 14 were signatories to the petition previously alluded to. I have gone thus fully into the various stages of the discussion of the Act, because, firstly the petition referred to was published in the public journals, and, secondly, to show that although the Nilgiri planters are doubtful of the suitability of the Act in its present form, they hesitate to decline it absolutely in view of the time and trouble expended in obtaining it.

The Anamallai Planters' Association on the 25th of July confirmed the Resolution passed at the General Meeting of the 11th of July which reads:—

"That the delegate be instructed that this Association has only been formed a short time, and under the prevailing conditions would never have asked for such an Act to be applied to this District."

I might mention that at present there is no long term contract imported labour in this District, the coolies going up and down from the low country at short intervals under fresh advances, and for such agreements the new Act is considered unsuitable by the Association.

So far, I have spoken on behalf of the two Associations I am representing and have endeavoured to put their opinions and Resolutions before you as clearly as circumstances admit, rendered the more necessary after the somewhat severe, though perhaps partly deserved comments, Mr. Romilly has made on their action.

I would now ask leave to make a few remarks on my own account, which I hope will not be considered out of place, seeing how closely I have been personally connected with first the enquiry and subsequently the early stages through which the Bill, which has finally come out as Act I. of 1903, has passed.

As Mr. Romilly has said, planters have been accused of being inconsistent and also unreasonable, in not at once accepting an Act for which they themselves asked. I cannot agree that this accusation of inconsistency is a fair one. What was asked for originally was an Act to control and deal with *imported labour*, for which the existing Act XIII. was unsuitable and

inefficient. It was never contemplated that on the introduction of such an Act, Act XIII. would be withdrawn from operation, specially as in Assam it runs concurrently with their labour laws, and the Committee of Enquiry in its Report considered such withdrawal as improbable and undesirable in paragraphs just quoted to you by Mr. Romilly. Act I. of 1903 may be said therefore, to give with one hand and take away with the other in this respect. Act XIII. of 1859 is, and always has been, much used for contracts with local labour, and for short term contracts and contracts for specified works, for which purposes it is very useful and convenient, and I can see nothing inconsistent in the objection of planters to its withdrawal.

The other principal objection to the new Act is raised through apprehension of the liabilities that may be imposed on the planter under Section 15, Chapter III of the Act. I would now emphasise my opinion that there is no desire on the part of the planter to evade the responsibility attaching to him, as an employer, to provide proper accommodation, and medical aid to his employees. Chapter V of the Enquiry Committee's Report deals fully with this subject, and in paragraph 33 you will find that "good lines are built and maintained for coolies;" "in case of illness ordinary medicines are administered on the estates;" "that in Malabar, Wynaad, Coorg and North-Mysore the planters subscribe to Medical funds," etc. In fact the whole of this paragraph shows that the Committee of Enquiry after extensive inspection and exhaustive enquiry was satisfied that everything possible was done for the health and comfort of the cooly.

But the Act as now offered to the planter has no finality as to what may be demanded of him in the future under Section 15, and it is this uncertainty which is evidently one of the chief cause of hesitation in accepting it. This is the fault of the system which allows the Government to take power to introduce unknown rules and regulations into an Act which has already become law. It is easy to see that in the nature of such rules much must depend. Rules of a harassing, stringent and inconvenient character might be imposed on the planter involving much expenditure and aggravating interference. Personally I do not fear that the local Government would impose any rules throwing large outlay or unnecessary trouble on the planter, but one cannot deny the argument that it is possible, and it is reasonable that the planter should at least be cautious in accepting unknown liabilities.

To remove this cause of apprehension, and possibly with it one of the chief objections to the Act, I would suggest that the proposed Rules to be made as laid down in Section 42, Chapter V, should be framed and published by local authorities as soon as possible, to enable planters to know definitely what is expected of them. With the conclusions arrived at by the Enquiry Committee and expressed in Chapter V of the Report, I cannot see why the planter must be put to any extra expenditure than that which in his own interest and the dictates of humanity he already cheerfully incurs.

It will be gathered from what I have said that I agree with the planters of my District so far as allowing that there are objections to the Act as it now stands. But I cannot agree that the best course to remove them is being followed.

It cannot be expected that an Act which has only just been made law, and has had no trial, can be amended in any way. The only possible means of obtaining amendment is by accepting the Act, giving it a fair trial, and then, if found necessary, applying for amendment. Act I. of 1903 fortunately allows us to give it a trial tentatively, in itself a great privilege, and what I most earnestly desire to see is planters giving it that trial, honestly and fairly, when I firmly believe that the Act in operation will be found to work with few if any of the disabilities attributed to it. If otherwise, however,

amendment can then be fairly sought or a return made to the old position.

Finally, I have sympathy with those who now say they never wanted or never asked for such an Act. Although they may find it convenient to forget, past history is recorded, and those who did not actually call for legislation tacitly acquiesced in it, by raising no dissentient voice. Turning to the Enquiry Committee's Report I find that 33 members of the U. P. A. gave evidence in favour of the proposed legislation and others replied accepting the answers furnished by the Honorary Secretary of their Association.

In the past eight years conditions no doubt have changed, and the coffee industry which was a prosperous and flourishing one when this legislation was started, has since fallen to the brink of ruin. In consequence competition has fallen off and with it some of the chief labour difficulties have disappeared for the time. For instance, I see that in 1896 N. Mysore had outstanding advances amounting to over Rs.5 lakhs of which over Rs.3 lakhs were considered to be unrecoverable. (See Appendix VII to Enquiry Committee Report.) Now I imagine that at that time the planters there would gladly have accepted this Act which they now say they do not want for the present. But, gentlemen, you may rest assured that competition for labour among ourselves will return with the first revival of prosperity for coffee, and in the meantime is increasing, and will increase, from other quarters. The scarcity of labour in Assam and in Ceylon is already acutely felt, and as the latter country draws its entire labour supply from South India, will push us harder as time goes on.

There is one warning note I wish to sound, *viz.*, the possibility of Act XIII. being repealed. We all know that the Government has long considered the Act as applied to contracts for labour as unsuitable and undesirable. With Act XIII. removed and Act I. of 1903 not in operation, you would have free labour, and advances recoverable only by Civil suit. How would planters and how would their maistries like that position? I think the possibility deserves your consideration.

I will conclude by expressing my earnest hope that each and every Association will, in the light of the discussion that has taken place at this Meeting, especially in Committee, carefully consider whether they cannot give the Act a trial and see how it works in operation, which is really the only practical way of testing its efficiency, and certainly the only possible way of arriving at any amendment of Sections which in operation may be found to be defective, and I therefore join with Mr. Romilly in asking you to make this Resolution unanimous if possible.

Mr. G. K. MARTIN supported the Resolution.

Mr. FLETCHER NORTON also supported the motion in the following speech:—

Mr. CHAIRMAN AND GENTLEMEN,—I am sure we are all pleased at the satisfactory nature of this Resolution which has received the almost unanimous support of the delegates here. I do not think we need to convince one another that this is a good Bill, but that we should try and bring round to our opinion our brother-planters who still hold a contrary view, and to that end I make these remarks. Had I been living in British India I should have welcomed this Bill (with some modifications which we hope to get introduced into it, always bearing in mind that the principle of the Bill must not be touched, and because the labour conditions in Mysore vary from those in other Districts, I am sure it can be made acceptable to us). Most of the criticism has been directed against Chapter III relating to Inspection of lines, etc. We are here in accord, but a very large body resent official interference, and have conjured up a bugbear from which they do not seem to be able to relieve themselves. I believe these clauses will work either smoothly or with friction just as each manager works them. The man

who is continually in Court seeking redress will most likely bring on himself those very evils which he fears. I know of no law where large bodies of labourers are employed, whose health and comfort are not specially provided for by legislation.

Instead of being an argument against the Bill I consider it the strongest argument in favour of it; for the planter has absolutely nothing to fear from the official inspection of his lines which would sink into a mere formality, and I am convinced that the great majority if not all planters are in the same happy position, for we may take it for granted that coolies would not return year after year to the same estates if they were not well looked after. I never realised until I came here, though I followed the course of this Bill closely, the enormous difficulties that the Planting Member had to contend with and the many conflicting interests he had to reconcile, and this Bill which I believe will bring us the relief we have so long desired will remain a lasting monument to his tact and ability. I have much pleasure in recording my vote in favour of the Resolution.

Mr. BROCK then explained, with reference to a remark made by Mr. Romilly, that Mr. E. G. Windle in signing the petition of the Nilgiri Planters against the Bill did so with the remark that he was supporting the principle and not the form of the petition.

Mr. R. GOMPERTZ supported the Resolution in the following explanatory speech:—

Mr. CHAIRMAN AND GENTLEMEN,—If I were to vote for this Resolution without explanation, it would probably be understood as a request, on behalf of my Association, that Act I. of 1903 might be introduced into the Salem District; and as my instructions to abstain from any such request are explicit and peremptory, I consider it my duty to place on record the reasons which dictated those instructions.

My Association yields to none in its appreciation of the assistance kindly accorded to planters by the Government of Madras, in their endeavours to get their wants understood and remedied by the Supreme Government; and of the Planting Member's laudable exertions in his hopeless endeavours to please everybody. But our conditions are exceptional as I will explain.

The estates of all the planters of my Association are situated on the Shevaroy Hills, in the Salem District, and none of our labour is imported from a distance. By far the greater part of it is purely local; by which I mean that the homes of the labourers are so close to their work that they live in their own villages, and not on the estates where they are employed. And so far as I am aware there is not a single coolie employed on the Shevaroy Hills who comes from another District, or whose home is so distant that he cannot reach it in a single day. We have to give advances, it is true. The system is so deeply rooted that we are compelled to give them even to coolies whose village is within a mile of their work. But they are very small compared with what planters, who recruit their labour from a distance, are obliged to offer. Our labourers—particularly the hill men—rarely work regularly; and, at ploughing time or harvest, absent themselves for weeks together to cultivate their fields. But, as a rule, they come back, when their private business is concluded and work out their advances. There are exceptions; but, when they do not, a summons under Act XIII of 1859 is generally sufficient to remind them of their duty. There are of course black sheep in every community; and it sometimes happens that when a coolie is ordered by the Magistrate to return to his work, he fails to do so, and is sent to prison for a fortnight or so when (under Act XIII.) the planter loses his advance. But with us, such cases are comparatively infrequent; and the loss is trivial compared to what we should suffer under the new Act, which limits contracts to one year, and under which a planter would

either have to take the whole of these men before a Magistrate (i.e. those who have worked on the estate for years and who have always honestly returned before, as well as the said black sheep) and have them punished and compelled to work for him, when it was of vital importance to them to attend to their own fields; or he would lose their service altogether for such portion of the year as they were absent, since he had not complained of it, as well as any balance of the advance that might be due, when the year expired. If he did the first, no local labourers would ever work for him again; if the second, he would have to suffer a loss which he can by no means afford.

Then in the case of coolies who do reside on the estate, their homes are so near that they are constantly visited by a host of relations and connections without the knowledge or consent of the planter; so that we should constantly be getting into trouble under Section 13 which obliges us to keep registers of our coolies "and of their dependents" and there are other reasons with which I need not trouble you. Suffice it to say that a few weeks ago the Collector enquired officially if we wished the new Act introduced, and we replied that as all our labour was local we did not desire a change. The Labour Enquiry Commissioners (in Chapter III of their Report, "The Labour Supply," page 10) frequently mentions that the Salem District is exceptional—a fact which is repeated no less than three times on the 1st page of the chapter. They couple Madura and Tinnevely with Salem, but the first two are not planting districts and are not represented on the U. P. A. S. I. And when the Bill was being discussed in the Legislative Council, the Planting Member specially mentioned the Shevaroyas as a District "in which labour conditions had always worked smoothly, and in which planters were therefore naturally nervous of any change." Whilst, therefore, I intend to vote for the Resolution before the Meeting, I consider it undesirable to disturb the Arcadian simplicity of the Shevaroy Hills by the introduction of Act I. of 1903, and that it is incumbent upon me to record my reason.

Mr. SCOT-SKIRVING also supported the Resolution and in explaining away the alteration that came over the views of the North Mysore Association with regard to the Act, he said that when North Mysore protested against Act XIII. of 1859, it was working very badly indeed. Since then the Act had been working very much better, and they are well satisfied with it. The advantage of the new Act was that it gave all that was asked for in Act XIII., namely, specific performance of contract and reciprocity in the issue of processes between British and Native States, and were it not for a latent fear that some of its provisions would bring expense and inconvenience to the planter, it would have been better received in Mysore than it had been. Though the N. M. P. A. considered some of the provisions of Act I of 1903 unsuitable to its District it was second to no other Association in its appreciation of the sympathy which the Government of Madras had shown to the planting industries of South India, and it rejoiced in the opportunity now afforded of recording that appreciation.

Mr. E. E. WILLIAMS, in supporting the Resolution, said:—My Association instructed me as their delegate to vote against the introduction of this Act into their District. There were several clauses in the Act which they took objection to. These have, I consider, in several instances been satisfactorily explained in Committee by Messrs. Acworth, Hodgson, and Romilly. I consider, however, that the Resolution now before the Meeting is such an open one that by supporting it I am only acting in the interests of my Association. I would suggest that the Committee proceedings on this question be printed separately as soon as possible, so as to allow of delegates putting the whole matter once more clearly before their various

Associations, thus enabling certain Districts to come to a speedy conclusion as to the question of a trial.

Mr. F. M. PARKER said that without unduly wishing to exalt the horn of the Central Travancore Association, he was glad of the opportunity of mentioning that his Association had applied to the Travancore Government for the Act, and would use it as soon as it was passed. He never had had a case brought against him, nor had he ever had to bring a case against his *Kanganis*, and he hoped that this happy state of things would continue. Why he welcomed the Act was because it would help *Kanganis* to recover advances from defaulting coolies. Under the present condition of things *Kanganis* lost heavily from this cause.

The Hon'ble Mr. G. L. ACWORTH briefly expressed his satisfaction at the turn the debate had taken.

The CHAIRMAN, in summing up the debate, said that the discussion had been so full that he would only make a few brief remarks. There had been so much adverse criticism of Act I. of 1903 in the Press and elsewhere, that he could not help feeling some anxiety as to the line that would be taken in the discussion, and must confess now a sense of great relief at the tone which had prevailed right through. It was necessary to member in the first place that the Bill had not the personal approval of the planting community; secondly, it was necessary to remember that the Planting Member had induced the Government to agree to several amendments which had been accepted, and finally, in order to reach a logical position, he had had a difficult course to steer, and that they had successfully done this, avoiding rocks and shoals, he thought was due to Mr. Romilly. It would have been a matter of great regret if any steps had been taken, which in any way repudiated the work of the past 10 years, on the one hand; or on the other, if they had failed to show their appreciation of the labours of Government on behalf of all concerned in the planting industry. He thought the Resolution put before the Meeting entirely met the situation. Personally he thought the new Bill, in the main, a satisfactory measure. It contained the two concessions which they had always demanded, specific performance of contract and reciprocity in the matter of issue of processes between Native States and British territory. Another very satisfactory point alluded to by Mr. Parker was that maistries and *Kanganis* would benefit even more largely under the Act than planters as it would protect them against the great losses which had hitherto fallen on them on account of absconding coolies. It was very evident that Government in drafting the Bill were entirely ignorant of local labour and entirely overlooked it, and it was only through the instrumentality of the Planting Member that the provisions under Section 4 were subsequently inserted. It was regrettable, too, that Government could not see their way to allow Act XIII. of 1859 to run concurrently with Act I. of 1903, as Mr. Romilly had shown. With greater determination it might have been possible to succeed on that point. But now as Government had pronounced finally on this point, he saw no good in kicking against the pricks. If, however, they had only been able to give the Planting Member full information regarding the conditions and difficulties of local labour, there was no doubt he would, with his usual ability, have persuaded the Government into inserting a clause which would have rendered the Bill a much more suitable one. He congratulated those Associations that were going to give the Act a trial as it would enable its working and alleged shortcomings to be viewed from the point practical experience. He reminded his hearers that the more numerous were the Associations who followed the example of Wynaad and Central Travancore and gave the Act a trial the more would be the opportunities for judging of its alleged shortcomings, and the

more evidence would there be of these if there were any. Finally he congratulated the delegates from the Shevaroyes, Coorg, North Mysore and the Cardamom Hills that they had been able to see their way to support the Resolution.

Mr. ROMILLY rose to correct any impression that Wynaad had pledged itself to give the Act a trial. He hoped he might persuade them to do so, but he had not pledged them to any action of that sort.

The CHAIRMAN then put the Resolution to the Meeting when it was carried unanimously and with acclamation.

#### DR. LEHMANN'S EXPERIMENTS.

Mr. HODGSON said that they had all listened to Dr. Lehmann's lecture yesterday as a subject of vital importance to coffee-planters. He thought it only right that they should show their interest in and appreciation of the work that Dr. Lehmann was doing. He therefore proposed the following Resolutions:—  
“(1) That this Association which so fully appreciates the benefits which accrue to the planting community though the labours of Dr. Lehmann, instruct the Secretary to respectfully approach the Mysore Durbar regarding the advisability of appointing an entomologist through whose instrumentality the work of the Agricultural Department would be rendered more complete.”  
“(2) That this Association respectfully urge the Mysore Durbar to allow Dr. Lehmann to devote sufficient time to the very important experiments he proposes to conduct in connection with the quality of coffee to enable him to complete them as early as may reasonably be expected, and also to continue his valuable investigations in connection with coffee fertilisers.”

The Resolutions were seconded by Mr. E. E. Williams and carried unanimously.

#### QUALITY AND CURING OF COFFEE.

Mr. FLECHER NORTON in opening the discussion on this subject said:—Under the head of deterioration of coffee a long and interesting debate took place at the Annual Meeting of the U. P. A. S. I. in 1899. In the discussion of 1899 the carefully conducted methods of preparation which are practiced on estates in Mysore were most fully explained, and special attention was drawn to all the subsequent processes through which our produce goes at the curing works on the Coast. I wish to clearly explain that it is our sincere desire to co-operate with our curing agents in the most friendly spirit possible, as we are already to acknowledge what a thankless and impossible task it must be for a Coast Agent to make our coffee attractive in appearance and general quality if the preparation has not been properly attended to on the estate. It will, however, be readily acknowledged that when exporters on the coast find no fault with the coffee that reaches their works and are frequently kind enough to pass most gratifying opinions on it, it is indeed extraordinary that such unsatisfactory reports of appearance, colour, quality and flavour should be received from London. In a letter from Mr. Rouse, the Chairman of the Coffee-brokers Committee to the Secretary of the London Chamber of Commerce, printed on page 149-50 of the proceedings of the Association for 1899, it is stated that “There are practically two markets supplied by London (a) the English home trade who owing to coffee being retailed roasted, buy consequently only on the roast; and (b) the export trade to the Continent where the coffee is sold raw who buy entirely on size and colour and have a good variation in price.” It is, therefore, self-evident that in order to secure good prices in London much must depend on the special requirements of the particular buyers; those that supply the Home demands insisting on having coffee that roasts well and yields a good flavour; while those who purchase for export are very particular about size and colour. These facts prove the truth of the conviction which exists among many producers that exceptional prices are frequently given for particular marks, which have

been favoured had purchased by certain buyers for many years past. I am quite prepared to acknowledge that certain estates, which are most favourably situated, have excellent soil and are carefully and liberally cultivated, produce coffee of an exceptionally fine character, but there are vagaries on the London market which experience has definitely proved are absolutely unexplainable. Leaving these vagaries out of the question, what we have to ascertain is what suggestions can we make in regard to improving the attractive appearance and conserving the good qualities of E. India coffee generally. Numerous experiments have been made and the members of my Association have conducted most careful investigations having for their object the elucidation of the most important points.

Samples of coffee hand-rubbed on the estate have been sent to London, and expert opinion has been obtained in regard to them. The difference in valuation between these samples and the consignments for which they were taken varies to the alarming extent of from £20 to £30 a ton. This is not all. Samples are now regarded in London as most unreliable by forward buyers, as the characteristics of the samples and the consignments are absolutely different in roast, colour and flavour; thus definitely proving that something prejudicially influences the coffee after it has left the estate. Even an hour's over-drying in the fierce heat of the low country sun will entirely change the colour of coffee for the worse, and if the delivery from the carts takes place in the open, even the exposure entailed in measuring large batches must have an injurious effect. In some reports received from the coast accurate accounts have been supplied of the number of hours drying to which the coffee was subjected and the weight per bushel before and after exposure. In some of the statements 1-2 lbs. loss of weight is recorded for the same number of hours drying, and this clearly proves what a delicate operation this must be, and what tremendous solar heat must be prevalent during the time of preparation. Again it is a well-known fact that some coffees are much more susceptible to damage by pressure or violent friction than others, high-grown coffee being harder and hornier than low-grown coffee. If an ordinary well dried coffee bean be subjected to pressure the diffusible pigment which constitutes "colour" will be either irregularly re-distributed giving a mottled appearance, or will be squeezed out leaving the bean quite pale. If a similarly well dried bean be held in the fingers and rubbed with a certain amount of rapidity on cloth or similar soft material, an oily bloom will be established on the surface; but if too great pressure or rapidity of action is used this oily bloom will be evanescent and the bean will have a faded shrivelled appearance. A very strong conviction exists among practical planters of experience that improvements in the peeling machinery are essentially necessary. Under any circumstances it is eminently desirable that elaborate experiments should be conducted with all the various machines at present in use. Samples of the same coffee should be prepared before and after secondary drying in each machine and should be promptly submitted for expert opinion in London. The varying stages of dryness at which coffee is peeled should be accurately recorded in another set of experiments, and similarly the varying effects of pressure and friction should be ascertained. In conclusion I have the honour to state that the following expert opinions have been obtained in London, and these I feel confident afford ample justification for the remarks which I have made on behalf of the members of the Association which I have the honour to represent. I can assure the preparing Agents that any suggestions as to improvements in the preparation on the estates will always command the promptest attention and I feel sure in the matter of technical and expert advice we may confidently rely on the valuable assistance of Dr. Lehmann who is ever ready to help us.

The Meeting then went into Committee to discuss the subject when the following Resolution was arrived at:—"Proposed

by Mr. Norton, seconded by Mr. Hodgson:—That in view of the extreme importance of quality in coffee with reference to its value in the London Market, the Coast Agents be again addressed by the Secretary asking them to give special attention to the effect produced upon the colour of coffee during the curing operations (1) by pressure on the bean in removing the various skins; (2) by exposure to the sun; (3) the possibility of drying by artificial means; (4) any other points which may suggest themselves to the curers.

The Resolution was carried unanimously.

#### THE DELEGATE TO BRAZIL.

Mr. ROMILLY said that he was instructed by his Association to support this Resolution very strongly. He had, however, prepared no notes in favour of the scheme, but with his usual perversity had prepared a few notes against it (laughter). But after his behaviour on the question of the Labour Act, he did not wish to go against his Association again, and he would mention, as a proof of his Association's interest in the scheme that it was prepared to subscribe Rs.107! He was very willing to admit that if they would get the information they wanted from Brazil that was absolutely reliable as to what the cost of production was to planters there, what profit they were making and what was the margin of loss, it would be of infinite value to them. Many planters were now going on working coffee in the hope that better times were in store. If as a result of their mission to Brazil they came to the conclusion that better times were impossible, then no doubt they would stop. In November last he was invited to Calicut to meet Sir Edward Law, and when he mentioned the matter of sending a delegate to Brazil, Sir Edward Law approved of it as an excellent idea. When the United Planters' Association and Sir Edward Law both formed an opinion on one side, he thought another humble individual should withdraw his ideas against them. He would, however, like to put forward the difficulties he had thought of before the scheme was put into practice. First of all he believed they were prepared to subscribe Rs.15,000, which it was thought would cover the whole cost of the expedition. One great difficulty would be to get a good man. They might have an able man, but for his Report to be of any value he ought to know Spanish or Portuguese. They wanted a man who would be able to talk to the farmers and pick up all the information necessary at first hand instead of being dependent on an interpreter. Besides a knowledge of the language they must get a man who could really get to the bottom of things, and get information by talking things over. Different people advocate different methods of work. Mr. Hodgson would tell them that his idea was to send a man to the principal ports and trading centres, with credentials from the Government, and thus get all the information he could as to the actual financial position in which the coffee-planters in Brazil were. On the other hand, his own Association (Wynaad) said that the delegate must go to each individual District. The knowledge thus gained would perhaps be worth the time and money spent, if it could be done. He thought, however, that after all that travelling and living in the various Districts had been done, there would be very little of that £1,000 left for the delegate himself. He did not think therefore that they would be able to find a man with ease.

Another question was what were the advantages to be gained from the mission. The main question underlying the whole scheme was this:—Was it worth while continuing cultivating coffee in India. After all the delegate's labours and troubles, they would probably hear something which they knew already, namely that Brazil could grow the commoner kinds of coffee cheaper than they could in the East Indies. What would seem more worth the trouble and expense to discover would be the question of quality, a matter they had already discussed.

All knew where they did grow coffee of good quantity the estates were paying well. He therefore moved "That in the opinion of this Association it would be desirable to send a delegate to Brazil to report on the coffee industry there."

Mr. H. P. HODGSON in seconding the Resolution, said that Mr. Romilly's was a strange method of moving a Resolution he was asked strongly to support. He could only explain the flippant manner in which Mr. Romilly had dealt with the subject as showing his relief at having got the Labour Bill off his chest. He did not agree with Mr. Romilly at all that the money spent would be money wasted. Personally he was of opinion that the expenditure they prepared to devote to their mission would be most remunerative. He regarded it as a matter of vital importance to find out the position in Brazil. If they could do so he did not think such grave difficulties surrounded the scheme as Mr. Romilly had suggested. Supposing in the first instance Brazil wanted to find out the position of the coffee industry in India, and a delegate from Brazil came over and going—properly accredited of course—to a Coast Agent asked what he could tell him about coffee in South India. He (the speaker) thought the Coast Agent could tell the delegate a good deal about coffee, its prosperity and the reverse in this country. In the same way their delegate could get much valuable information from the ports in Brazil as to the financial position of coffee there, and, no doubt, the delegate would also be told what Districts to visit where he would be able to gather detailed and valuable information. At the present time planters in South India were carrying on their estates with borrowed money in many cases in the hope that better times were in front of them; but if the delegate's report showed that even at present prices the Brazil planters were making a profit out of coffee, many in South India who were now hesitating would throw up the sponge and look in other directions for a livelihood. Mr. Romilly had referred to the difficulty of getting a suitable man. That, of course, was a difficulty, but it was another instance of putting the cart before the horse. They must first find out if they could get sufficient money and then look out for a suitable man.

Mr. FLETCHER NORTON and Mr. Scot-Skirving on behalf of the two Mysore Associations supported the scheme. Mr. G. Martin, on behalf of Coorg, opposed the proposition as a waste of their own money and the Government subscription which he would rather see transferred to the St. Louis Exhibition.

The CHAIRMAN said that it would be a good thing if they could get the information regarding the state of the industry in Brazil, as it would be a distinct advantage to planters to know whether the industry could be carried on at present prices or not. The question, however, to be considered was whether this information might not be ascertained in another way. He believed that Mr. Acworth's mysterious friend still contemplated visiting Brazil and was willing to place his services at their disposal in a private way, and he thought they ought to ascertain whether this source of information would be available or not before proceeding any further with the bigger scheme. Mr. Hodgson had suggested that most of the information could be ascertained from the Coast. If this was so, it could probably be obtained through the British Consuls without going to Brazil at all. Another point that had not been considered in the discussion at all was the financial aspect of the scheme, for, after all, the whole thing hinged on that very necessary consideration. They did not know to any very great extent what a District Association or individuals were prepared to subscribe, and until they knew that they could not proceed further with the matter. It had to be remembered that the U. P. A. S. I. could not subscribe towards the scheme and they must also remember that they were going to the various Governments now for money for the St. Louis Exhibition. They would have to

decide now if they were going to ask for assistance for two schemes or one. If one, which were they willing to support.

The Meeting then went into Committee to consider this point, when the following Resolutions were carried and adopted in open Meeting :—

"That the Secretary be instructed to communicate with the Government of India with a view to eliciting the good offices of the Secretary of State for Foreign Affairs towards obtaining the special services of H. M.'s Consuls in Brazil to conduct as exhaustive an enquiry as possible into the condition of the planting industry in that country."

(2) "That the Secretary be instructed to inform the Government of India that the U. P. A. S. I. have determined to exhibit their produce at the St. Louis Exhibition, for which purpose they have subscribed a sum of Rs.10,000, and as in the present depressed state of the industry it is impossible to contribute both towards the Exhibition and the sending of a mission to Brazil, the Government of India be requested to transfer the sum of Rs.5,000 referred to in their letter of the 27th February, 1903, to that of the St. Louis Exhibition." The original Resolution fell through when the first of the above Resolutions, which was an amendment, was carried.

### Tea Markets.

#### SALE IN INDIA AND GREEN TEA.

Mr. ACWORTH on this subject said that the tea cess had been established, and he went to Calcutta in June last to attend a Meeting to consult as to how the money was to be distributed. They were very well satisfied with the progress made in America by black tea: in fact they were well satisfied with the progress made by black tea throughout the world, and it now became a question of relieving the black tea market by making green tea. There was a large market in America and Canada for green tea and a smaller market in Italy and Brazil. The first thing to do was to make it worth while for the planter to manufacture it as it required special machinery. As usual Ceylon was first in the field, and with the Government cess were able to give a bonus to such estates as went in for green tea. The Indian Tea Association, while not going so far as the Ceylon Tea Association, had agreed to pay a bonus on four million pounds of green tea at 6 pies per lb. or a total sum of Rs.1½ lakhs. It had further agreed tentatively to give a sum of Rs. 2,000 a month for pushing the sale of South India tea in South India. That sum was given for six months, and if it was found satisfactory it would probably be continued for another period of six months. These sums together with the Rs.50,000 which it was proposed to give to the St. Louis Exhibition would absorb all the money given under the tea cess.

#### THE STANDARDISATION OF MANURES.

Mr. ACWORTH, as a means of following up Dr. Lehmann's proposals in this matter, brought forward two Resolutions for the choice of the Meeting. One was by himself, the other was the suggestion of Mr. Brock. The first Resolution ran as follows: "That this Association do from time to time publish in the *Madras Mail*, *Madras Times* and *Planting Opinion* the names of such firms as were willing to give guaranteed analyses of their fertilisers and that the Secretaries do urge members of their respective Associations as to the supreme importance of dealing with such firms." Mr. Brock's proposal was "That the Secretary of the U. P. A. S. I. be instructed to publish and circulate for the benefit of all Associations a list of the firms who have agreed to give guaranteed analyses of the fertilisers they supply, and that the firms who have not agreed to do so be requested to meet the wishes of the Association in this direction." Speaking personally, although he did not favour one Resolution more than another, he would try and gain the object they had by giving as much publicity to it as possible,

and from this point of view his own Resolution was perhaps preferable.

The matter was thoroughly threshed out in Committee when the following Resolution was adopted and afterwards confirmed in General Committee:—That the Secretary shall be instructed to again request all firms which have not yet agreed to give guaranteed analyses with all fertilisers they supply, to meet the wishes of this Association in this direction, and on their replies being received, that the Secretary shall communicate the result to the Chairman with a view to publishing and circulating for the information of the District Associations, the names of such firms as have agreed to supply guaranteed analysis, and that this Association would urge members to purchase their fertilisers as far as possible from such firms." The Resolution was proposed by Mr. Brock and was seconded by Mr. Parker.

#### MAIL COMMUNICATIONS.

Mr. ROMILLY gave a fairly satisfactory account of the roads in the Wynaad District, but under this head this year he desired to go further afield than their own local wants and touch upon a matter of Imperial interest. He therefore moved "that in the opinion of this Association the carriage of the Mails between Brindisi and Bombay should be so accelerated as to ensure delivery in Bombay on the thirteenth day after their despatch from London, and that a copy of this Resolution be sent to the Government of India in support of the letter from the Bengal Chamber of Commerce."

The motion was seconded by Mr. Hodgson and carried unanimously.

#### THE HARBOUR ON THE WEST COAST.

The Hon'ble Mr. ACWORTH explained the situation with regard to the investigations being carried on by the Madras Government regarding the proposed Harbour at Cochin. A recent Government Order on the subject said that the cost was so prohibitive that the Government had been compelled to reluctantly abandon the scheme.

#### REMISSION OF ASSESSMENT.

Mr. H. P. HODGSON opened the discussion of this subject in the following speech:

Mr. CHAIRMAN AND GENTLEMEN,—This is a subject that requires no explanation and but few words to recommend it. That coffee-planters need every support and assistance to enable them to survive the present crisis—is known to the Government, and the aid we propose to ask for is only what is constantly afforded in like cases of trouble and disaster, to which alas the cultivators of all agricultural products are more or less the victims. The cultivation of coffee lands is with very few exceptions being carried on at a loss, and yet owing to the capital sunk in it cannot be abandoned without ruin to the investor. The remission of the land-tax would be a practical form of relief greatly appreciated by the planter who finds it difficult to provide or raise the money to pay the coolies which the land, though worked at a loss, is obliged to support. Expenses have been cut down to the last anna compatible with keeping the coffee bushes alive—the planter has to deny himself the small luxuries and pleasures of life—and I fear in many instances even some of its necessities. More in this respect he cannot do. He moved that the Government of Fort St. George be addressed by this Association with a view to obtaining remission of assessment on all coffee plantations, as owing to the crisis in the coffee market the land is being worked at a loss and is unable to bear the taxation. The Association would urge that such a concession would be a great boon and assistance to the industry at a time of unprecedented difficulty.

The motion was seconded by Mr. Romilly and carried after some discussion.

#### WEIGHTS AND MEASURES.

The following Resolution on this subject was proposed by Mr. Norton and seconded by Mr. Martin:—"That this Association again emphasises the necessity for the establishment of a uniform standard of weights and measures throughout the Indian Empire."

#### LABOUR RECRUITING AND EMIGRATION.

On the complaint of the Cardamom Hills Association, the following Resolution was proposed by Mr. Williams and seconded by Mr. Brodrick:—"That this Association is prepared to investigate the matter of labour-recruiting for countries outside India, and on satisfying itself that there are abuses will lay the matter before the Planting Member who will bring it to the notice of the Government of Fort St. George."

The Meeting then adjourned for the day.

#### THE FINAL SITTING, August 7.

The delegates met for the last time at 11-30 A.M. to close the business of the Meeting which was for the most part formal and complimentary.

#### ELECTION OF OFFICE-BEARERS.

The following office-bearers were elected for the ensuing year:—

*Chairman.*—Mr. Geo. Romilly.

*Vice-Chairman.*—Mr. O. Scot-Skirving.

*Planting Member.*—Mr. H. P. Hodgson.

*Secretary.*—Mr. H. Ormerod.

*Auditor.*—Mr. A. Ronaldson.

The new Chairman, Vice-Chairman and Planting Member very briefly acknowledged the compliment that had been paid them by electing them to office.

#### VOTES OF THANKS.

Mr. H. P. HODGSON proposed a vote of thanks to the Hon'ble Mr. Acworth.

The Hon'ble Mr. ACWORTH, in acknowledging the vote of thanks, said,—Mr. CHAIRMAN AND GENTLEMEN:—I really hardly know how to thank Mr. Hodgson for what he has said. It is true enough that I have had the interests of this Association very much at heart and have devoted a certain amount of my time to it, but that time has been given perfectly willingly and with no after thought of the inconvenience and trouble it entailed. I am only sorry as I said before that I have not been able to satisfy everybody; but I am afraid that is an impossible thing to do in this world. I can only say that I thank Mr. Hodgson most heartily for the kindly and handsome expressions he has made use of and to you, gentlemen, for endorsing them in the same way. If I should leave the country for good next year—a contingency which is problematical—I can only say that I will carry away in my heart a feeling that this Association, and my connection with it, has been one of the brightest spots in my life in India. I have made friendships here—friendships which I hope will always endure. The time may be near at hand for me to part from this country, but I shall always remember the many friends that I have made here.

Mr. F. M. PARKER proposed a most cordial vote of thanks to Mr. Ormerod for the untiring energy and courtesy he had displayed in carrying on the onerous duties of Secretary of the Association.

Mr. ORMEROD replied briefly thanking the Meeting for the vote of thanks.

Mr. ROMILLY in proposing a vote of thanks to the Chairman said:—Mr. Harris, I am sorry to tell you that the duty has fallen on me of proposing a vote of thanks to you. I am sorry for your sake because, as you know, I have not the gift of speech. The few words I can utter, you may be sure, are sincere, and

is inspires me now, speaking on behalf of all here to assure you of our gratitude and respect. What struck me particularly was the excellent way in which you managed and the admirable manner in which you handled that excessively difficult and contentious matter, the Labour Act, in your opening speech. We were all aware that it was going to be a difficult discussion, but you handled it with a delicacy of touch and a firmness of expression which in my view must have influenced everybody and you put the climax to it all by the admirable manner in which you summed up the debate in Committee. I have never heard anything better done. I have only now to thank you for the courteous way you have ruled over us at this Meeting which is now drawing to a close. (Cheers.)

The CHAIRMAN in reply said:—

Mr. ROMILLY AND GENTLEMEN,—I can scarcely find words to thank you for the warm vote of thanks that you have offered to me. I can assure you that I have had the interest of the Association very much at heart and though I may not have done as well as I might have, I have at any rate done my best during my year of office. But in view of the fact that the Labour Act is about to be introduced by several Districts, I feel sure that you have made an excellent selection in your next chairman. He fully appreciates the difficulties of the Labour Act, and being so closely in touch with Government he will be able to afford you greater assistance than almost any one else could have done.

Among the many important subjects we have discussed at the Meeting there is none of wider interest than the Labour Bill, in future to be designated Act I. of 1903. It would have been well nigh incomprehensible, and, moreover, an incalculable misfortune if our labour of the past 10 years, the work of the Enquiry Committee, and of the Government of Fort St. George, had culminated in a Bill which failed in a great measure to meet the aspiration of the planting community. Fortunately, this has not been the case, and we have been able to show, in the course of our deliberations, and by the Resolutions we have passed, that though we regard the Bill as far from perfect, nevertheless the main principles we desired are embodied in it. It is a matter of great satisfaction that our Resolution was passed unanimously, and I trust that the experience of these Associations who intend to ask for the introduction of the Act will be such as will induce others to follow suit. Meanwhile, we shall await a Report on its practical working with eagerness, and I cannot too strongly urge that further criticism may be suspended until this is forthcoming.

We have passed a Resolution in support of Mr. Chamberlain's proposed enquiry into the fiscal policy of the Empire, and we have taken the important steps of not only subscribing to the St. Louis Exhibition scheme, but also of deciding to follow this up by measures to meet the demand that may subsequently arise. I am afraid disappointment will be felt at the withdrawal of the "coffee cess" and "the delegate to Brazil" from the list of projects, but I should like specially to emphasise that the failure of such schemes is in no measure due to the unpopularity of delegates at this Meeting—but to the lack of support that is afforded them in the different Districts. My last request as Chairman of this Association is that the proposals in connection with the St. Louis Exhibition may not be allowed to meet a similar fate; for there is the danger that if a continuance of indifference in such matters were discharged this Association might cease to concern itself about them. Dr. Lehmann could not have chosen a subject of deeper interest at the present time to coffee-planters than the question of quality, and it is to be hoped that he will be able to spare sufficient time to conduct the very important experiments he contemplates. If he, in conjunction with ourselves also investigate this matter, we may reasonably hope that some good, and possibly a great deal, will result.

I have great pleasure in welcoming the Anamalai Association as a member of this body, and trust it may grow and prosper until it shall become one of the largest subscribers.

I congratulate you gentlemen interested in tea on the brighter prospects that present themselves to you, and I wish you a long spell of prosperity, and I trust that the tea cess, now an accomplished fact, will prove the means of popularising your product still more widely. To you in coffee I say that though at present there is no sign of the cloud that is hanging over you dispersing, there is no telling when the sun may burst through, and bright times once more prevail. Meanwhile, your course is clear. By working economically as well as efficiently, I have no doubt you will be able to tide over this spell of depression and by sparing no effort to improve quality, and to push your produce into all corners of the earth, you will greatly mitigate your present difficulties. In conclusion, gentlemen, on behalf of this Association I thank the British Resident for the use of the room, and the Editor of the *Madras Mail* for the kindly support, assistance and advice which he continues to give us in the columns of his paper.

## GENERAL ARTICLES.

### STREET SCENES WHERE RIO SHIPS COFFEE.

A Special Correspondent of the *Tea and Coffee Trade Journal* says:—

RIO JANEIRO June 1, 1903.

Rio Janeiro is, next to Santos, the greatest coffee port of the world. Millions of bags are here shipped every year, and the chief business of Brazil's vast coffee crop is done here. Rio Janeiro lives upon coffee. The big coffee factories are interesting places. Some of them are as full of machinery as a Minneapolis flour mill. You walk under a network of moving belts through air mixed with coffee dust, and go through room after room filled with machines for dressing the berries to suit the different tastes of the world. Each market seems to have its particular desires. The Germans, for instance, demand that the husks be on the beans when they arrive in Hamburg. The Germans prefer to do the shelling themselves; the coffee is sold as washed coffee, and brings a much higher price.

Other countries want their coffee polished. It is shined up as you shine silver, being brushed by the most delicate machines, which do not injure the grain. The coffee which goes to the United States is sold just as it comes from the plantation. It is passed through the separators and graded, but so far as I know there is no demand in the United States for polished coffee or for any other than that natural in colour. A great deal of coffee for the United States is bought by the great roasting companies. It is shipped directly to the roasting mills in New York and Chicago, and the average man does not see it until it is handed out to him by his grocer in fancy packages at so much a pound.

There is no busier place in the world than the exporting section of Rio Janeiro. There are great warehouses near the wharves, which are filled with coffee and into which coffee is brought by the thousands of bags. The streets of this section are narrow and dirty. They are filled with wagons and cars laden with coffee.

#### CLEANING STREETS OF COFFEE.

You can scarcely get through the streets. There are scores of half-naked men going from the cars to the warehouses with great bags on their heads and scores of negro women down on their knees sweeping the coffee up from the cobblestones where it has dropped. They may wash it and sell it. Each of these street cleaners has a sieve, in which she puts the coffee beans as she picks them up, shaking out the dirt as she works. I am told that many of the women make a good living by gathering these stray coffee beans.

Stop a moment and watch the men as they unload the coffee. Every bag is tested before it is taken into the warehouse. The tester has a little tin pipe as big around as a broomstick, with a sharp point at the end. He jabs this into a bag, and in it brings out a handful of coffee. A glance at the beans tells whether they

are according to samples, and, if not, the rest of the load is carefully watched.

Notice how the men carry the great bags on their heads. Each bag weighs 132 pounds, but they stand straight up under them and walk off as briskly as though they were carrying feathers.

#### BAGGING OF COFFEE.

But let us follow them into the warehouse. The carload which is now being handled is in all sorts of bags and it has to be repacked for shipping. We walk through long aisles with bags of coffee piled on each side from the floor to the ceiling and come into a hall where the floor is covered with great piles of green coffee beans.

At each pile are a dozen half-naked negroes in bare feet. They are scooping up the coffee in bowls much like a bread bowl and pouring it into the bags. We hear the scratch, scratch, scratch of the bowls as they touch the floor, varied by the sound of the laughter of the men at work. Now they burst out in a song, keeping time with their scoops as they sing. As soon as a bag is filled it is dragged off to a pair of scales to be weighed. It is next handed over to the sewers, who sew up its mouth, leaving enough vacant space at the top that it may pack well in the steamer.

In other factories the bagging is done by machinery, and in all the work goes on in a business-like way.

Each of the big American establishments of Rio handles vast amounts of coffee in a year. Its manager must have good business ability and be a sharp trader. He must be a good judge of coffee and must know how to take advantage of the rise and fall of the market. Each establishment has its coffee expert, who can tell by the eye and nose just what the coffee is worth. His judgment is usually passed without grinding or burning the berries. Samples of about a pint each are spread out on blue paper, and the coffee expert will put his price on each grade by looking at, handling and smelling the sample.

### COCOA IN TRINIDAD AND GRENADA.

In the *Bulletin of the Department of Agriculture, Jamaica*, we read that in 1884 Kamerun became a German Colony. For nine or ten years cocoa was planted only in a small way, but in 1896, a commencement was made of Cocoa plantations on a large scale. The soil and climate was all that could be wished, and the trees grew in a satisfactory manner, but the cured cocoa did not get as high a price as was hoped. Researches were carried out, but with no satisfactory results. The surest and the quickest way to arrive at a solution of the question was to go and examine on the spot the methods of culture and preparation in the West Indies and Central and South America, where it had been longest cultivated and with the best results, to study their different species of Cocoa and their conditions of development, and to import into the German Colonies those species which are the most profitable and the most suitable. With this aim Dr. Preuss was commissioned to travel in Surinam, Trinidad, Grenada, Venezuela, Ecuador, Nicaragua, Guatemala, and Mexico. The account of his travels and the results of his mission are presented in his Report entitled, "Expedition nach Central und Sud-Amerika," published in Berlin by the "Colonial Wirtschaftliches Komitee;" the second half of which has been translated into French, and published by the "Société d'études coloniales de Belgique" under the title "Le Cacao, sa culture and sa préparation." The following is taken from this valuable treatise:—

#### METHODS OF CULTIVATION.

*Shade.*—The distance of the plants is generally 14 feet for the cocoa trees and 28 feet for the shade trees. In many plantations the distances are 10 to 12 feet, but these are gradually being given up, and planters are adopting 14 by 16, or 16 by 16 feet. The distance of the shade trees from one another varies with that of the cocoa trees, being in the proportion of one shade tree to two cocoa trees. Dr. Pruess had long discussions with the Trinidad planters on the subject of the shade being too dense, but they maintained that it was necessary. As proof, they told him that cocoa trees ceased to yield whenever their shade trees were blown down. Moreover, they informed him that formerly when less shade trees were planted, the cocoa trees dried up by the hundred in years of great drought. Dr. Pruess, in his journey through the best cocoa districts of Trinidad, saw evidence that the trees had suffered much from drought, and that a great number had died in spite of the thickness of the shade. What was said then about the ruin by drought of entire cocoa plantations that were insufficiently shaded, appeared to be quite

credible, and the distance of 28 feet between the shade trees did not seem too small. The explanation seems to lie in the amount of rainfall, the average at the Botanic Garden for 13 years being 68.19 inches. In other parts of Trinidad, for instance at the plantation "La Reunion," the rainfall was for 1896, 107 inches, for 1897, 101 inches, and for 1898, 93.5 inches.

The absence of shade trees in Grenada astonishes anyone who has seen the cocoa plantations in Trinidad so carefully shaded, and he asks with surprise how is it possible in the same latitude? The reason for this difference does not, however, lie in the fact that Grenada is extremely mountainous, and that it has deep depressions, so that the plantations are only exposed to the sun during a few hours of the day. This cannot be the cause, for in the first place the most extensive and the best plantations are not situated between steep hills, but on the contrary in the most level part of the island, where they are fully exposed to the sun. Besides the morning and evening sun is not of much importance, and there is no mountain in Grenada sufficiently lofty to be able to protect cocoa plantations against the sun after 9 o'clock in the morning.

The principal reason is rather in the very large rainfall, in the sky being much more overcast, and in the very great humidity of the air. The resistance of the variety which is planted there, also counts for something. A rainfall of less than 100 inches is a rarity in Grenada, while it is the rule in Trinidad. In Grenada the annual rainfall is about 220 inches. Thanks to this circumstance, the chief cause disappears which leads the planters of Trinidad to shade their plantations, namely, the fear of seeing them perish through drought.

The absence of shade which the Grenada planters partially supply by planting the trees very near one another, results in a different method of working the estates.

The cocoa trees yield a crop much sooner without shade, if the humidity is sufficient, than with shade. In Grenada a very fair crop is obtained in the fourth year from planting, and a full crop in the fifth year; while in Trinidad the trees only commence to yield a full crop after the tenth year.

It must be noted that trees not shaded become exhausted much more rapidly than the others, above all when they are planted close; a distance of 9 by 10 feet is not rare in Grenada. If it is desired to preserve as long as possible the fertility of the trees, it is necessary to manure and cultivate the soil, and this is done to the greatest extent in Grenada, where manuring and tillage play a very important part. This fact constitutes a great difference between the method of culture of Trinidad and Grenada.

The tilling is done by means of a four-pronged fork. No particular care is taken to avoid destroying sometimes a root that comes to the surface, but when this happens great trouble is taken to cut off the torn ends clean in order to prevent decay. The results obtained are considerable and far surpass those of the Trinidad plantations. In Grenada they cultivate very intensively, and the soil is completely exhausted at the end of a short time. The methods of culture in Trinidad is on the contrary more extensive, and they do not manure much. If manuring was given up in Grenada, the plantations would certainly have attained the maximum of their production at the end of 10 to 12 years, after which they would go down very rapidly. In Trinidad, on the contrary, the trees only attain at the end of 10 to 12 years that degree of development when full production commences, and they remain then for a great number of years at this maximum without manuring.

*Yield.*—The following figures are quoted as a maximum crop in Grenada. The Rev. Mr. Branch, of Good Hope, obtains in his plantation of 16 acres, the soil of which is of medium fertility, and the situation is in a hilly district, 4 to 5 lbs. of cocoa a tree per annum. The distance of the trees is 9 to 12 feet and less, the manuring is constant, pruning is not practised except to lop off the suckers. The manure consists of dung, leaves, and all sorts of vegetable matter, and care is taken to bury the manure. Mr. St. George of the Boulogne estate obtains on the best part of it, a valley of more than 10 acres, 27 cwt. per acre or more than 6 lbs. of cocoa per tree. He prunes the trees with much care and intelligence. The distance of the trees is greater than at Good Hope.

The following information relates to one of the best plantations in Trinidad, namely "La Tortuga":—

4,019 trees, 20 years of age, planted 12 by 12 feet, yielded 10,300 lbs. of cocoa—2.5 lbs. a tree.

1,250 trees, 17 years of age, planted 12 by 12 feet, yielded 4,450 lbs. of cocoa—3·5 lbs. a tree.  
 2,382 trees, 10 years of age, planted 10 by 10 feet, yielded 5,400 lbs. of cocoa—2·3 lbs. a tree.  
 1,080 trees, 25 years of age, planted 12 by 12 feet, yielded 3,600 lbs. of cocoa—3·3 lbs. a tree.  
 918 trees, 10 to 12 years of age, planted 12 by 12 feet, yielded 3,150 lbs. of cocoa—3·4 lbs. a tree.  
 2,770 trees, 20 years of age, planted 12 by 12 feet, yielded 7,100 lbs. of cocoa—2·5 lbs. a tree.  
 4,416 trees, 6 years of age, planted 12 by 14 feet, yielded 3,425 lbs. of cocoa—0·77 lbs. a tree.

The average yield of a cocoa tree in Trinidad is estimated in good plantations at 1·5 or 1·6 lb.; it is a little higher in Grenada. The price of cocoa from Trinidad is, on the contrary, a little higher than that of cocoa from Grenada. The explanation in Dr. Preuss's opinion is to be found in the variety cultivated. In Grenada the variety "Amelonado" is principally planted, whilst in Trinidad "Forastero" is more grown.

**Pruning.**—Great care is taken both in Trinidad and Grenada to give the trees a good shape. An essential principle for this effect is to cultivate them to maintain a low trunk, and the head in the form of a crown, but so that one can always pass under the trees without difficulty and without being obliged to bend too much, and so that all the labour of cropping and cultivating can be carried on. All lengthening of the trunk is prevented, as well as every attempt to form a second tier of branches.

In Trinidad the young cocoa trees are allowed to grow until they fork naturally. This happens when the trunk has attained a height of 2½ to 5 feet. The number of branches in the whole is 4 or 5. These are reduced to 3 or 4, and only rarely are 5 allowed to grow. In the varieties which have much wood developed and a thick mantle of leaves it is well to leave 4 or 5 branches for, if only 3 are left, the weight of each branch becomes too great, and the trunk is liable, during heavy winds to divide into three parts from above downwards. In varieties with feeble growth, only 3 branches are left in order to favour the development of solid branches. The pruning of the trees takes place oftenest a little after the crop in June and January. Dr. Preuss does not like the very heavy pruning practised in Trinidad. The ground is covered, after the pruning, with a thick layer of branches and leaves. Such treatment cannot be good for the trees. It results not in an increase, but in a diminution of the yield, for the trees have to devote a great part of their sap to form leaves again which are indispensable to them to nourish them properly. The planters say that the cutting off of a large number of leaves is of no importance since the trees recover themselves very quickly with new leaves, but this fact shows the evils of an exaggerated lopping since it has very little effect and the force and energy which the tree employs to cover itself again with leaves are lost to it, and the production of fruit is by so much lessened.

It cannot be overlooked that the leaves have the same claim as the roots to be considered organs of nutrition. The work people use a knife to prune the trees, and when they cannot reach high enough, they climb on the branches. They very rarely use a knife on the end of a pole. Cutting branches an inch thick, a constant practise in Trinidad, should be forbidden. Pruning should commence as soon as the tree forks, and should be continued as often as possible, but always to a slight extent only. The shoots ought naturally to be cut off, always. In large plantations it is difficult to spare a man to prune regularly and frequently. Pruning is done, therefore only once every 2 or 4 years, or the very outside once a year, and then heavily. Whilst a reasonable pruning favours fruit bearing, it is nevertheless a question whether, in place of pruning too severely it would not be preferable not to prune at all, and be content with taking away the dead wood. One of the two planters in Grenada who obtain the largest crops, prunes his trees very well, the other does not prune at all.

The trees attain sometimes in Trinidad, considerable dimensions. In the plantation of "La Vega," Dr. Preuss states that he saw a tree which had at 6 inches from the ground, a circumference of 59 inches; and at the height of 40 inches a circumference of 45 inches; it was 25 years of age. Very old trees which no longer bear fruit, and those which have been blown over, are renewed by allowing one of the shoots which arise near the ground to develop and become a trunk, while the old trunk is finally removed.

## PRODUCE AND PLANTING.

If we except the *Daily News* and the *Review of Reviews*, the book entitled "The Failure of Lord Curzon," published by Mr. Fisher Unwin, has not received much attention from the newspapers here at present. In the *Daily News*, however, two long articles have appeared, in which certain interrogatories suggested by the author's statements are put forth with sweet and insinuating simplicity. Amongst them we find the following: "Is it true that the revenue from liquor supplied to the tea gardens of Assam has increased 250 per cent. in the last ten years, that the liquor is made at a Government distillery, and that on analysis it has been found to contain seven times more fusel oil than the worst unrectified Scotch whisky? Has the Excise revenue risen from £1,755,000 in 1875 to £4,239,000 in 1901? We profoundly hope that these allegations are baseless. What is the real truth about the retirement of Sir Henry Cotton, formerly Chief Commissioner of Assam, who pointed out the dangerously low wages paid to indentured—i.e., enforced—workers in Assam tea gardens, and who was allowed by Lord Curzon to be driven by clamour from the Lieutenant-Governorship of Bengal? In 1900 the death-rate among these 'Act labourers'—who are recruited upcountry and bound over to serve for a certain number of years—amounted to 43·5 per 1,000. The death-rate among 'non-Act coolies' is 26·2 per 1,000. Again, we can only inquire," says the *Daily News*, "are these things so?"

According to the *Chemical Gazette* of America, quoted by the *Tea and Coffee Trade Journal* of New York, Mr. G. Wahgel has studied the cause of the fermentation of tea, which was presumed to be due to certain germs. To sterilised water he added as much tea powder to render the liquid about equal in strength to the natural juice of the tea leaves. This liquid was then kept for three days in an incubator at the same temperature used for the fermentation of tea—namely, from 27 to 30 degrees Celsius. At the expiration of this time fungus formed on the cloudy liquid. Mr. Wahgel examined a drop of this under the microscope. As often as he made the experiment with different sorts of black tea he found a certain species of yeast germs. The high-priced kinds contained only this certain species, while the cheaper ones contained less, but an immense amount of other bacteria. The strong and pleasant quality of the flavour seems to be dependent upon the quantity of the certain species of yeast germs. It is to be regretted, the *Chemical Gazette* states, that Mr. Wahgel did not continue his researches in order to ascertain whether the artificial addition of this peculiar yeast could not be used to increase the flavour of tea.

A number of tea merchants in Montreal have been interviewed by a representative of the *Canadian Grocer* as to the possibility of dealers in Canada imitating the action of certain tea merchants in London in discarding the shilling tea. The following are views of some of them:—Mr. E. D. Marceau says: "They have been selling too cheap over there, and ought to raise the price. The scheme here would not be practicable, as there are no concerns feeding some forty or fifty stores throughout the country as in England. If the retail stores could be controlled from one head, and every house have fifteen or twenty or thirty stores, it could perhaps be carried out. As its conditions are entirely different, and packers do not sell direct to the retailer or consumer." Mr. James A. Mathewson, junior, of J. A. Mathewson & Co., says: "It would be a good thing if we could get the people to use a better quality of tea, but it would not be possible to get rid of the 25c. article in that way." Mr. James Rutherford, of James Rutherford & Co., said: "What we need in this country is an Association such as has been formed in the United States, which would have something to say about the quality of tea allowed to come into Canada. At present this is the dumping ground for teas that are refused in other countries. What is not good enough for the United States, for instance, should not be good enough for Canada. But the standard here is low, and prices are kept down."

The New York correspondent of the *Grocer* says, referring to Indian and Ceylon tea, that these packet teas are being pushed, and the sales are increasing. He adds: "Besides the English and Canadian tea packers are the local jobbers, who are putting up

blends under proprietary labels, and competing for trade against the extensively advertised tea of London firms. In many stores demonstration booths are maintained, and good tea is served free." With regard to coffee the same authority states that the deliveries of coffee for the year ending June 30 in Europe and the United States will be fully 16,000,000 bags, indicating the greatest year's consumption on record. The grocers are pushing their coffee trade, and seem to be vying with each other as to which will furnish the most satisfactory blend for 1s. the pound. The result is seen in average monthly deliveries so far this trade here of 573,293 bags, against 526,138 bags in 1901-2, an increase of nearly 9 per cent. Coffee is retailed absolutely pure at prices ranging from 5d. to 2s. per pound, but very little is sold above 1s. 5d. per lb. The portable coffee mill, frequently run by electric motor, is made a prominent feature in the coffee section of the better class of stores. Buyers want to see the coffee ground before their eyes. The aroma which arises from the ground coffee pervades the store and invites customers busy elsewhere to find their way to the coffee counter.

The imports of tea into the United States during May were 1,933,737 lbs., and for eleven months ending May, 104,266,416 lbs.; and for eleven months ending May, 1901, they were 85,783,747 lbs. China furnished 53 per cent. of the total; Japan 33½ per cent. Imports of British-grown tea were 13,716,260 lbs., against 7,846,190 lbs. in 1902.—*H. & C. Muil.*

## RUBBER IN THE FEDERATED MALAY STATES AND THE STRAITS.

Mr. Donald Mackay writes to the *Ceylon Observer*:—

*July 24th.*—I am reminded of your enquiry about rubber in the Straits. I think you meant the "Federated Malay States" which do not like being classed as part of the Straits (any more than Scotland likes being classed as part of England). I am afraid my information is only enough to enable me to answer your question in a very rough fashion, but here it is for you.

The greatest progress in rubber has been made in Selangor which is, undoubtedly, the Premier State in agriculture, the same as Perak is in tin-mining. It is estimated that Selangor has rubber planted through close on 10,000 acres and has considerably over two million trees growing from no age, or under a year planted up to six. One half of the total quantity is under age or less than a year planted. Negri Sembilan comes next with something like 1,500 acres and over 310,000 trees from less than one up to six years growing. Unlike the neighbouring State it has little more than a tenth under age.

Perak comes last with broken and uncertain figures, but I am not inclined to put the total higher than 50,000 trees of all ages. Province Wellesley has a good many rubbers growing. I can, only in the absence of returns, hazard a guess of half-a-million trees growing. I think the whole Straits and States can be put at three millions. Out of the total there are not a hundred-thousand five and six years old, so that will give you an idea of the probable influence in the next few years on the market of the produce of the Straits and States. This, I take it, is what your correspondent has in view in asking for information about this part of H. M.'s tropical dominions, or he may be making an estimate to decide whether in view of the great areas, over wide-spread surfaces, now planted with rubbers, it is not advisable to call a halt.

We are a long way off the "end of our tether" in respect of what is considered suitable land which so far has been all on the flat. I am inclined to think, judging from the localities of the indigenous rubber trees in the forest clad slopes, that the Pará might do as well there if not better than on the alluvium and decomposed vegetable matter of the more or less swampy water-logged lands on which the greater part of the planting in Selangor has been done, and, indeed, in the other states as well. Probably lands so situated might not have been chosen, but for the failure of Liberian Coffee in respect of paying prices and the estates having been drained for the growth of that product. The planting in Province Wellesley is on lands drained for sugarcane and there is, figuratively speaking, any amount of such abandoned land. One estate alone last year put 50,000 cocoanuts in nurseries to utilise lands abandoned for cane-growing.

It may exercise your active brain why Selangor, a smaller state than Perak, took such a decided lead in planting Coffee. (It is natural enough having taken that lead that it should keep it up in Rubber.) I can only attribute it to the one man influence; there is no superiority in soil or difference in climate to account for it. The present Governor of the Straits was resident in Selangor 22 years or so ago. He started the railway from Klang to Kwala Lumpur and virtually started Coffee planting with it, but not on the swamp lands; it began and was continued on the higher lands until the accident of some coffee plants, growing luxuriantly in a Malay garden on the borders of the swampy low-land revealed the possibilities of that soil. (Of some of which William Forsythe and others had a dearly-bought experience in the Coffee-growing days when land at Klang was all the rage.) What Sir Frank Swettenham was to Selangor in influencing progress, Sir Hugh Low was at the same time to Perak in the introduction of new products, (he introduced the Pará seed from which grew the 250 trees which have been giving much of the seed which has planted up so much), establishing Experimental Gardens and generally enthusiastic with knowledge in all that concerned agricultural development. Our High Commissioner crowned his Federation labours by his excellent speech the other day at the opening of the Federal Conference in Kwala Lumpur.

## DISTRICT ASSOCIATIONS.

### UNITED PLANTERS' ASSOCIATION OF THE FEDERATED MALAY STATE.

At a Meeting of this Association held at Kwala Lumpur recently there were present.—Mr. W. W. Bailey (*Chairman*), Messrs C. Meikle, E. B. Skinner, E. B. Prior, and M. S. Parry (*Members of Committee*), also Messrs. H. F. Browell, F. M. Bell, E. V. Carey, H. M. Darby, W. R. Fraser, A. Irving, A. B. Lake, R. W. Mitchell, W. Meikle, H. M. Parkinson, and P. Stephenson.

The Honorary Secretary read correspondence from the Resident-General's Office re the expression of opinion on the decisions of the Singapore Labour Conference. The first letter stated—"that a copy of your letter will be submitted to the Colonial authorities for their consideration, but that the Resident-General understands that employers of Indian labour were fully represented at the Labour Conferences convened at Penang and Singapore."

The Honorary Secretary reported that no reply had yet been received from the colonial authorities to whom his letter of enquiry as to the price to be paid the Central Agency for recruiting free coolies, had been referred. He also read a letter from the Colonial Secretary, covering a letter from the Madura Company, asking whether the Members of the Association would be prepared to take "rejects," the fee to the recruiter being 4 Rupees. The approval of the Committee to the suggestion subject to a medical examination of physical fitness for light work was reported, and after some discussion, which brought out the fact that "rejects" had already been brought into the F. M. S. and were so far as equally fit for estate work as other coolies, it was proposed by Mr. E. V. Carey and seconded by Mr. C. Meikle, that the Honorary Secretary be instructed to write to the effect—"That this Association agrees to the general proposition of 'rejects' being sent over for estate work always provided that they are passed as physically fit for light work upon payment of the usual fee."

*Rubber Returns.*—The acreage as reported up to date under Pará Rubber amounts to 9,430 acres, containing approximately 1,352,547 trees. The Honorary Secretary reported the difficulty of making the returns tally owing to the different times at which the returns had been called for.

*Advertisement for Coolies to be circulated in India.*—Mr. Bailey reported that he had discussed with the Protector of Labour a proposed advertisement to be circulated in India, and that with the assistance of the Committee tentative paragraphs only dealing with Kangany recruited labour had been forwarded by him, but that until a reply had been received to the enquiry as to the powers of the new Central Agency no definite decision could be arrived at.

## INDIAN TEA ASSOCIATION.

## COMMITTEE MEETING.

The following is from an abstract of the proceedings of a Meeting of the General Committee held on the 21st ultimo:—

There were present:—Messrs. H. C. Begg (*Chairman*), T. McMorran (*Vice-Chairman*), A. C. Lawrie, Lockhart Smith, R. R. Toynbee, T. Traill, and W. Warrington.

Letters dated 26th June and 3rd July from the Secretary, Indian Tea Association, London, having been previously circulated, were brought up for disposal.

In a letter dated 24th June the Indian Tea Cess Executive Committee addressed the Committee with regard to the following Resolution which had been adopted by the Cess Committee on the 1st June, viz.:—

"That a sum of Rs.50,000 be allotted to the Exhibition of Indian Tea at St. Louis in 1904, provided that on enquiry it is found that further support can be obtained sufficient to make a satisfactory and adequate exhibition."

The Cess Committee, after carefully estimating the cost of an adequate representation, were, it was stated, convinced that a sum of £10,000 was the minimum without which it would be useless to proceed. The Hon. Palmer Bowen, an American Commissioner for the Exhibition, who had visited Calcutta, had explained that to make an effective representation a separate pavilion would be required, the cost of which, he estimated, would be about £4,000 to £5,000. Working expenses were estimated to require at least a further £5,000. Towards this, the Cess Committee were willing to contribute Rs.50,000. The Government of India would, it was believed, assist liberally, and the planters of Southern India would endeavour to raise about Rs.20,000 to Rs.25,000 if they were permitted to exhibit Coffee and Cardomoms in the same hall with tea, and if the United Planters' Association were allowed to have a special show-case of their own.

The Cess Committee enquired whether the Indian Tea Association would be prepared to contribute the remainder, a sum of Rs.25,000 to Rs.30,000, from the balance of the American and Foreign Market Fund. In the event of the whole amount being forthcoming, it was suggested that the Committee of the Indian Tea Association, London, could most efficiently organise the representation, as has been done on similar occasions in the past.

A copy of the letter had been forwarded to the Indian Tea Association, London, and as expression of their views requested, by telegraph.

A telegram had been received on the 15th July to the effect that if the £10,000 were guaranteed, the London Committee would make the necessary arrangements.

The papers were now brought up for further consideration, and, after considerable discussion, it was decided to telegraph to the London Committee proposing that the Association should contribute a sum of Rs.25,000, the Calcutta balance of the American and Foreign Market Fund, approximately Rs.21,000, being utilised for that purpose.

It was also decided to address the Government of Bengal and the Assam Administration on the subject, soliciting financial assistance in aid of the proposed exhibit. The Committee fully recognised that although a sum of £10,000 would admit of an exhibit being made, this was the minimum upon which it was possible to work. They considered it highly desirable, therefore, that a larger sum should, if possible, be provided, especially as the Ceylon planters were spending £15,000 in connection with the exhibition of their teas.

## MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated July 17th, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1903-1904 ...	110,298	160,440	12,516
1902-1903 ...	116,422	188,389	11,646
7,589 pkgs. INDIAN } Total 33,250 packages were offered in public auction			
4,077 " CEYLON } this week.			
1,584 " JAVA }			

Re-exports from this country when taken in conjunction with transshipments are encouraging, although there has been a falling off in the exports of Indian tea to North America from Great Britain. Of the large quantity of Indian tea transhipped from here to other places than North America, nearly the whole was sent to the Russian market, which is now becoming an important consumer of Indian and Ceylon tea.

Quantity of Indian and Ceylon Tea re-exported from U. K. from 1st January to 30th June.

INDIAN.—The small quantity brought forward was readily taken at rates current last week. Very little old season's tea was included in the auction. The official wire gives exports to U. K. for the first half of July as 9,530,000 lbs., against 8,020,000 lbs. for same period 1902, making the total exported to U. K. from 1st April to 15th July 19,472,000 lbs., against 20,590,000 lbs. last season.

SOUTHERN INDIA gradually increases in importance as a tea-growing locality, and now regularly exports large quantities to this market.

Revised Customs Imports of Indian and Ceylon Tea from 1st June to end of April:—

Bengal Presidency (including Calcutta and Chittagong) ...	143,617,038	1902-03. lbs. 150,931,695	1901-02. lbs. 155,681,371
Madras Presidency (including Travancore) ...	4,386,943	149,194,325	3,972,839
Bombay Presidency ..	1,190,344	776,837	
Ceylon Tea ..		83,073,266	84,021,488

Week's av. of New Season's tea sold on Garden Acct. 1903, 4,087 pkgs., av. 7.12d. 1902, 7,823 pkgs., av. 5.85d.

New Season's tea sold on Garden Acct. 1st June to date 1903, 17,211 pkgs., av. 7.23d. 1902, 21,834 pkgs., av. 6.14d.

CEYLON.—With a moderate sized auction there was a fair demand at last week's rates, although quotations appear to be somewhat lower on account of the continued falling off in quality. This is not unusual at this time of year, but we are now approaching the season when arrivals usually begin to show improved character. Private advices from Ceylon gives shipments to U. K. for first half of July as 5,500,000 lbs., against 4,500,000 lbs. last year.

Average for week 6.91d, against 5.99d in 1902.

Ceylon tea sold on Garden Acct. 1st January to date, 550,990 pkgs., av. 7.58d. 1902, 624,542 pkgs., av. 6.79d.

JAVA.—The auction was again light, comprising only six garden invoices, the remainder being tea brought over from Holland. Prices were generally steady at quotations fully up to last week's rates.

## QUININE.

Very firm and dearer. Sales of B. & S. and/or Brunswick have been made at 11d per oz. on the spot, while 10,000 oz. has been disposed of for December delivery at 11½d per oz.

## CINCHONA.

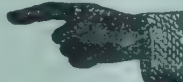

The auction to be held at Amsterdam on July 23 next will consist of 6,648 bales and 331 cases Java bark. The total weight of the bark is 611,393 kilos., containing 28,428 kilos. of sulphate of quinine. The February auctions at Amsterdam averaged 5.86 per cent. of quinine, April 5.57 per cent., May 5.42 per cent., and June sales 5.2 per cent. The average analyses of the ten Dutch auctions

during 1902 was 5.51 per cent. of quinine. This points to a steady decrease in the quinine-content, and the average analysis of the bark at the sale next week is the lowest percentage of alkaloid submitted at the Amsterdam auctions for many years. The shipments at Java during the first half of the month were 610,000 Amsterdam lbs. against 700,000 Amsterdam lbs. last year, and 691,000 Amsterdam lbs. in 1901.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, AUGUST 15, 1903.

[No. 32.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 21st instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*July 27th.—Weather*—This last week was a deluge of rain, never less than one inch on any day. Wind strong. *Works*—Planting and weeding. *Health*—Good. *Labour*—Abundant.

#### Munzerabad.

*August 3rd.—Weather*—Rainfall last week was in excess again, rain being from 2 inches upward; the total of rain is much in excess of the average. Weeding and planting progressing. Coffee bearing the heavy rain splendidly. *Health*—Fair. *Labour*—up to requirements.

#### Coorg.

*POLLI BETTA, 11th August.—Weather*—After a long spell of wet we are now enjoying a welcome break since Wednesday last. The coffee trees, which were beginning to look sick, have now turned round again. Paddy fields in some parts out east are in need of more water. *Crop* is full size now and is looking more full of promise than was supposed. *Plant diseases*—There is no sign of leaf-disease, and little or no borer is showing up. *Labour*—There are far more coolies than are required. *Health*—Coughs and colds and some fever are prevalent but, on the whole, health is fair.

### EMIGRATION OF LABOURERS.

To SOME of our readers it will seem that there are before coffee and tea planters in Southern India more interesting and more pressing problems than the question of emigration of labourers. We admit that this is the case, yet our present subject has been selected after mature deliberation. There are others that will fare no worse if left over for a time. The chief among them have been so recently discussed at the Annual Meeting of the U. P. A. S. I. that no harm will be done if planters are left for a little while to think matters over for themselves, without advice or comment from journalists. The Labour Question—as distinct from the Labour

Act—is one to which perhaps many of our readers devote little attention. So long as they get the labour they need, and get it at what appears to them reasonable terms, they are apt to neglect to follow the general trend of wages, or of the relations between labour supply and demand. In our present issue we give some interesting notes from Ceylon on a trip in what are known as the Cooly districts of India. There is a hint given in these notes that serfdom still prevails in those districts. There is truth in this; but the writer has failed to realise that this serfdom is of a dual character. Alluding particularly to the relations between Capital and Labour he remarks that the landholders complain that since Ceylon, the Straits Settlements, Natal and other importers of Indian labour have offered the cooly inducements to emigrate, wages have been steadily rising, until they are now double what they were a generation ago. He then states that he was told that Indian landholders look upon the coolies on their properties as assets or live-stock, much as they regard cattle and horses. "The property may change hands, but the cooly never leaves the soil and is practically as much a fixture as the buildings on it." Again, "the cooly is, in many cases, in debt to his master, but, as long as he remains on the estate, the amount is seldom worked off."

This is no doubt true; but most planters will realise that the same condition of affairs prevails on many of their estates as well as on the estates of native landholders in the Tanjore district. It may be regarded, in the case of the latter, as a survival, in that of the former, as an adaptation, of the old patriarchal system; and while something might be urged against it, much might also be advanced in its favour. If there is no oppression, no deliberate attempt or intent to reduce the labourer to the position of a slave, we see no reason why the prevailing system should be altered, except in this one respect, that, if the prosperity of the landowner increases, the wages of the cooly cannot remain stationary. There is, however, a different kind of serfdom upon which the Ceylon writer has not touched. We allude to the serfdom of the labourer in his relations, not with his master, but with petty local and village officials. There are instances, no doubt, where the landholder resorts to unfair measures in order to retain his labour supply. There are also instances in which quite as unfair measures are resorted to in order to take that labour supply away from him, and to induce the cooly to emigrate. We do not intend to amplify

these remarks as fully as we might do. We allude solely to *instances*, not to any general practice; and this for the simple reason that the time has not arrived for the complete exposure of systems that are but too common. One thing that we assert is that, in many cases, the recruiter of labour for "home" use suffers from the disadvantage of having no official support during his operations, while the recruiter for emigration would not meet with the success that attends his efforts were it not that he proceeds with what is, or appears to be, official sanction and official support to help him, and is aided by pressure put upon the poorer classes through the medium of village or district officials. This is a matter that calls for special investigation on the part of Government, and there is just a possibility that such an investigation will be demanded at no distant date.

As regards recruitment of labour for employment on estates in India, it was admitted by the South of India Planters' Enquiry Committee that a system of advances was a necessity. Planters, as a body, know this to be a fact. They are induced to think, perhaps, that the key to success or failure in recruiting lies in this system. This, however, is not a fact. It is not always large advances that tempt coolies away from India, that induce them to seek service abroad. To some extent they are likely to be deceived by recruiting agents, and probably they are in still greater measure open to the influence of officials who take the part of these agents, in the belief that by so doing they are acting according to the wishes of the Sirkar. The object of our present remarks is merely to touch upon this point in particular, with a view to urging upon the Government that Free Trade is desirable in the Labour Markets of India. We are no advocates of Protection in this matter. Our whole aim is to protest against anything that savours of a system of Bounties to exporters. There are instances, however few or however many they may be, of minor official pressure put upon labourers to induce them to take service abroad. Such pressure is the equivalent of the granting of a Bounty. We do not wish to keep wages where they are. An increase in the scale of wages is, *prima facie*, evidence of increased prosperity, and prosperity is what we desire to witness. But it is quite another matter when the "home" employer has to pay high wages mainly in order that the employer abroad may get labour on terms that practically include a subsidy towards which the "home" employer contributes. It is against indirect "Bounties" that we raise our voice, and we shall on a future occasion explain our meaning more fully, should the necessity for so doing arise.

### BRITISH BOARD OF TRADE RETURNS. JUNE 1903.

**Cocoa (raw).**—Very heavy quantities were landed in the United Kingdom last month, but as their effect was counteracted by equally large deliveries, the bonded stock remained in relatively the same position.

In the first six months.		1903.	1902.	1901.

## U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

## THE TEA INDUSTRY OF THE CAUCASUS.

A British consular report on this subject states :—

Before the year 1894 but little interest had been taken in tea-planting in the Caucasus, except by one or two private individuals who had been carrying out experiments as to whether the tea plant could be successfully grown near Batoum. Since that year, however, experiments on a very extensive scale have been made in the cultivation of the tea plant in the immediate neighbourhood of this town.

According to persons who are competent to pass an opinion on the matter, the results hitherto obtained are decisive, and it has been distinctly proved that the Trans-Caucasus is one of the countries in which tea can be profitably grown.

So far as it has been possible to ascertain, the portion of the Trans-Caucasus most favourable for tea-planting comprises a belt along the Black Sea, stretching from Soukhoum in the north to the Turkish frontier in the south, the general aspect being from southerly to westerly, but many causes, principally climatic, combine to prevent the zone from extending any distance inland, and attempts made to grow tea in the direction of Tiflis and other districts situated in the interior of the country have, I am given to understand, hopelessly failed. Although tea has been grown in and near Soukhoum it has never been undertaken on an extensive scale. It is, therefore, very doubtful whether its cultivation in that part of the Caucasus could be rendered a profitable commercial enterprise, and I am informed that success is more likely to be secured a few miles further south.

Land can be acquired by persons of Russian nationality, either by lease or purchase from private land-owners or from the Government. Foreigners of all nationalities, according to the existing laws, are excluded from acquiring lands along the coast, either by purchase or on lease, and the tea-growing zone, as stated above, is situated along the Black Sea littoral, therefore no foreigners can engage in the industry.

Roads, in the English sense of the word, are unknown in the country districts, but their construction (unmetalled) would be neither difficult nor expensive. The Trans-Caucasus Trunk Line from Batoum and Poti to Tiflis, and thence through Baladjari and Petrovsk, traverses the southern half of the tea-growing zone, and I think that in a couple of years its northern half will be also intersected by a railway coming from the north and joining the Trans-Caucasian main line at the station of Novo-Senaki; so that, in this respect, the tea district is already well served, and, at a later date, will be still better furnished with convenient outlets for its produce.

The most important factors in tea-planting, as in almost every other agricultural pursuit, are soil and climate.

The soil in the tea-growing district or zone spoken of above varies in different localities from a deep red clay to a light blackish earth, in many parts freely interspersed with stones, while the subsoil is clay with shelving rock of volcanic origin out-cropping on the hillsides. There are considerable stretches of alluvial land along the basins of the rivers, and these lands, from time immemorial, have been cultivated principally with maize, but the lower hills are almost entirely

covered with forests and brushwood, and have a surface soil of loam more or less rich in humus. Here and there patches of cleared land now covered with bracken occur, with few trees and occasionally the remains of buildings and orchards, thus proving former cultivation, abandoned however since the Russo-Turkish War. The slopes vary in different degrees, but the area of good land that could not be profitably brought under plantation by terracing is relatively small.

Every variety of weather occurs in the tea-growing district. At times severe drought, at others deluges of rain, whilst severe frosts and snow 3 feet at the coast line have been known to do enormous damage to the tea plantations. The weather otherwise is well adapted for tea-growing; the rainfall is heavy, averaging 96 inches per annum, and in some cases even in excess of these figures; it is, however, fairly evenly distributed throughout the year; but, if anything, the months of May and June are the driest months of the year, and are occasionally accompanied by more or less drought. The heat is never very excessive, ranging from 100 to 130 Fahr. in the sun; but, even during the hottest season of the year, the atmosphere is rarely very dry, averaging from 50 to 70 per cent. of moisture, except probably for one or two short periods during the year, when it is only 30 per cent. or so, but I do not think that I have ever noticed it to be drier than this.

I would imagine that the temperature and climate of the Batoum neighbourhood resemble, in a great measure, those of the Himalaya tea districts of India, the monsoons, which do not exist in the Caucasus, and somewhat more severe winters constituting the only differences, and the opinion that seems to prevail is that when the tea bushes are out of sight with snow in the winter a good first crop is ensured. The soft spring weather usually prevailing at the beginning of March enables transplanting to be carried out with perfect safety, and the spring rain frequently renders the watering of nurseries and seedlings unnecessary. As already stated, the heat during the summer months, although great, is never very excessive as the temperature on the hill slopes on which the tea is grown, having a southerly aspect, face the sea, and the heat is generally tempered during the day by a moisture like westerly sea breeze. Autumn varies little from the rest of the year, while November and December are usually bright and, as a rule, calm and warm months.

Next in importance is the question of labour supply, and in this respect the system in vogue some four years or five years ago was anything but satisfactory, as labourers were scarce and the gardens were worked by day-labourers, and the men coming and going at will, so that they could not be depended upon. A few Chinese and Japanese specialists, whose services had been engaged by contract in their countries, and who received monthly wages, formed an exception to the above, but their numbers were very few and have since dwindled down to only one Chinaman, who is now permanently employed on the tea estates belonging to the Imperial Domains. Things in this respect have, however, altered during the past two or three years, and I am given to understand that women and children are employed for picking the leaf. The method being that they are paid by piece-work, or by the basketful, and in this manner women earn about 35c. (9d.) per diem, the more industrious and expert being able to increase their daily earnings from the figures

just given up to 80c. (1s. 9d.) and children in the same proportions from 25 to 40c. (6d. to 10d.) per day. Men are no longer sent out to gather the crop but are employed in the factories at rates varying from 18r. (about £1 18s.) to 35r. (about £3 14s.) per month, according to the work on which they are employed. Labourers of the country, principally Georgians and Mingrelians, I am told, are not as good as Russians. The latter stay longer, the Georgians being averse to heavy work of any kind no matter how well it may be paid for; they are also said to be prone to scamp the tasks set them, unless very closely watched. As soon as they have earned a little money they must be off home to spend it, whether there be a press of work on hand or not. This would, of course, prove most detrimental in the event of the industry expanding and on occasions when a heavy crop has to be gathered. On the whole the labour question in the tea-growing districts of the Caucasus leaves much to be desired, and should the industry develop and assume very large proportions, considerable attention will have to be devoted to the study of the question of importing outside labour for the requirements of the industry.

On existing plantations the bulk of the plant is, I am told, pure China, the older portions exclusively so; but seed also has been imported from India, Ceylon, Java and Japan. They are all doing well, and the China plant appears to thrive in whatever situation it has been planted. Almost every system of planting has been resorted to from dibbling in the seeds to transplanting at from six months to three years old, with and without lumps of earth on the roots; the best results have apparently been obtained with young plants having earth attached to the roots, a process which, although expensive, gives an extremely small percentage of empty spaces. In previous years, owing to the want of knowledge in tea-planting, a considerable waste of land took place, as bushes were planted at ridiculous distances from each other in order to arrive at exactly a certain number of plants per dessiatine (2·7 acres) and in this way a dessiatine would only carry about 7,000 plants. Now, I believe, the number of plants on a dessiatine has been augmented to 10,000, the space between each row or bed of plants being about 4 feet with a space of 3 feet between each shrub. Terracing has, I am told, been done before and after planting. In some of the tea-growing localities, where the slopes of the hills are somewhat steep, a system of hedge planting has been adopted, the lining out being carefully done with this object in view. In these localities each hedge consists of a double row of plants, each plant being 3 feet from its neighbour in the same row, and 2 feet from the nearest plants in the parallel row, with 6 feet clear between each pair of rows.

In the remarks made in my agricultural report for the year 1902 (Annual Series No. 2916), I stated that the crop for that year had been far in excess of anything that had been expected, and on an average had yielded 20 poods, or as near as possible 7 cwts., per dessiatine of 2·7 acres, which crop had been sold at the all-round rate of 1 rouble per Russian lb., and therefore had brought in a revenue of nearly £30 per acre to the owners of the land. It will be admitted that this result is exceedingly good, and I am informed that the prospects for the present year are, if anything, still more brilliant.

The area of land under tea near Batoum is at the present time as near as possible to 1,134 acres.

Caucasian teas possess a very agreeable aroma and a flavour not unlike Ceylon and Indian teas, and some samples of tea furnished by the Imperial Domains have been valued by Russian experts as being worth from 4 to 5r. (8s. 4d. to 10s. 6d.) per lb. Tea samples from Batoum have been valued in London by experienced importers at 1s. to 1s. 2d. per lb.

According to Mr. Yachervsky, Phytologist of the Central Station of the Imperial Botanical Gardens at St. Petersburg, only two kinds of diseases, or blight on the leaf, have been noticed in the Caucasus. One of a fungus nature (*Pestalozzia guepini*) and the other a tick-like insect of the tetranychus species. Both made their appearance for the first time on the Chakva tea plantations of the Imperial Domains, and on the estate of Mr. K. Popoff near Batoum in 1897.

The first-mentioned parasite develops fast and spreads over the leaves with great rapidity; the only way to diminish its evil effects is to destroy the leaves attacked by it, otherwise, if a leaf attacked falls to the ground, whilst remaining there, it continues to spread the germ. Besides collecting and burning the leaves attacked it has been proved efficacious to sprinkle the bushes with a solution of 2 per cent. of Bordeaux fluid, exactly in the same way as is done when curing vines of mildew. This blight also spreads to a variety of other plants.

The second, although an insect of diminutive proportions, attacks the leaf in very large numbers, the latter becoming pitted with fawn-coloured spots, which, after a time, run into each other giving the leaf a bronze colour. They first appear on old leaves at the base of the shrub, but in the process of their development they gradually rise to the upper portions of the shrub and infect the whole plant. They do most damage in hot, dry weather, when they increase with wonderful rapidity. As soon as rainy, damp weather sets in the parasite disappears.

The remedy used on the Chakva estates against this pest is an emulsion of one part kerosene, two parts of green soap, and ten parts of water, also a solution of 1 per cent. of carbolic acid with 10 per cent. of green soap.

Two tea factories exist near Batoum. One of them, on the estates of Mr. K. Popoff, of Moscow, and the other on the tea plantations belonging to the Imperial Domains at Chakva. Both these factories are corrugated iron buildings, erected by a Belfast firm, and I understand are fitted with the most modern and up-to-date appliances for drying, rolling and in general otherwise manipulating the tea-leaf. The Popoff factory only manufactures tea grown on the plantations of its owner, whereas the tea factory belonging to the Imperial Domains undertakes to manufacture, at a small charge, tea grown on other estates, situated in the surrounding district, the quality of which is, however, up to the present, not great, although it is becoming an accepted thing that all landed proprietors and owners of small plots in the neighbourhood should, either more or less, take up the cultivation of tea. Thus it will be seen that the action of the Domains is to encourage tea-planting.

I learn that no more seed is being imported into the Caucasus from the Far East, and that seedlings and plants locally grown are being used now on the estates of the Imperial Domains and on the property of Mr. K. Popoff for extending the area under tea. The Imperial Domains also

furnish seeds and seedlings to any persons desirous of taking up the culture of tea.

Mr. Simonson, scientific agriculturist, who is manager of the Imperial Domains, has visited Ceylon, India, China, and other tea-growing countries. During his travels he also studied tea culture in all its phases, and has published a work in the Russian language which treats on the subject, and which is widely used as a practical guide by all persons in the Caucasus desirous of taking up tea-planting.

In conclusion, I may say that tea can be made to pay and pay well in the Batoum district, provided suitable land be selected and the gardens be judiciously and economically worked. The difficulty in this country is the lack of practical experienced men, and this difficulty is rendered still more acute in view of the restrictions in force in regard to foreigners owning and leasing lands. On the other hand, most of the private enterprises in the neighbourhood of Batoum are not sufficiently extensive or prosperous to admit of the heavy expenditure which the engagement of efficient tea-planters from abroad would entail; besides which the large majority of lands in the district do not possess the necessary means to enable them to engage in tea-planting on a large scale.

#### THE U. P. A. S. I. MEETING.

It is regrettable to have to call attention to more or less serious errors in some of the telegraphic reports of the U. P. A. S. I. Meeting that have found their way into the columns of the leading Calcutta and Bombay papers. For instance, before the resolution in respect to the new Labour Act had been passed, it was gravely announced that it had been carried with one dissentient. As a matter of fact, it was carried, at a later date, *unanimously*. Then it was stated that it had been resolved to spend Rs.25,000 to represent South India coffee, tea, cardamoms and pepper at the St. Louis Exhibition. Nothing of the kind was done. A grant of Rs.10,000 was voted from the Association's funds, and efforts are to be made to get this raised to Rs.25,000 by means of Government and private subscriptions. This money has nothing whatever to do with *Tea* exhibits. For these, the Indian Tea Association will provide out of its own funds, aided by Government contributions.

However, it is encouraging to receive praise for enterprise from enterprising Ceylon. The *Times of Ceylon* remarks:—"The necessity of following up the work done at an Exposition explains why the Ceylon Commissioner is not going to sell tea in packets—under a brand that would have to be dropped when the gates finally closed—at St. Louis. This must be left to private enterprise, and then it can be continued after. The other subject—Preferential Tariff—supplies an object-lesson. In Ceylon our public men either have no views on the subject, or shirk the duty of expressing them. We urged that something should be done by the P. A. and the Chamber of Commerce before Mr. Chamberlain opened his autumn campaign. Nothing has been done here in Ceylon. How different with the United Planters' Association of Southern India! The resolution passed at Bangalore on Tuesday last is to be published throughout Great Britain. Action that would be 'premature' in Ceylon is timely and effective across the Palk Straits."

#### COFFEE NOTES.

**Coffee in America.**—Messrs. Henry Nordlinger & Co., of New York, reviewing the coffee market under date of July 8, say:—

"During the past crop year the supplies which came into sight were slightly in excess of the extraordinarily large consumption encountered. The receipts during the past fiscal or crop year from all producing countries were about 16,500,000 bags, the deliveries from port stocks in consuming markets about 16,000,000 bags, showing that production and consumption closely approached each other.

"The earlier expectations of a considerable deficiency in the supplies have not been realized, and experience has again been purchased dearly by traders, investors, and speculators. The world has learned that it is no longer possible for Brazilians to estimate their crops with any degree of accuracy since the area under cultivation has grown to such vast dimensions."

\* \* \*

**Porto Rican Coffee Growers.**—The first thing that should be done to help the coffee-planters out of the hole, says the *San Juan News*, is for themselves to organize and contribute to their organization to make it strong and powerful. It will soon become evident that a coffee-planter cannot afford to stay out of the organization and that it is for his benefit to keep in.

After the organization is well on its feet, we can safely leave the details of the advancement of the trade to the organization. A company could, no doubt, be formed among the planters themselves to handle the coffee, protect it from imitations and carry on a campaign of advertising in the United States. The advance in price, due to the advertisement of the coffee, would no doubt pay for the expense in one year, and probably a great deal more. Business men with whom we have talked about these matters agree that it would be a success if properly started and handled, but the trouble is in getting planters sufficiently interested to go into it for their good.

The Porto Rico experimental station is now investigating the coffee situation and experimenting on the best methods for reviving the production. Arrangements have been made to carry on experiments at "La Carmelita" estate, near Ponce. Experiments are also being made with different kinds of coffee to find out which brand of seed is most applicable to the soil. We have little to complain of, however, in regard to the brand of the coffee grown here. It is probably the best in the world. It is so rated by those people who know the coffee. In the United States they do not know the coffee and do not know how to prepare it. It is advertising then that is needed.

For many years before the hurricane, the coffee crop was the most important on the island. Its values exceeded that of all other crops combined, often. Most of the 200,000 acres of soil planted in coffee are now idle and producing nothing, because of the conditions well-known to all of us. There should certainly be a determined and intelligent effort made to return to the times when coffee was the wealth of the island.

\* \* \*

**Coffee in the U. S.**—The annual report of the Coffee Exchange has been made public by Mr. C. B. Stroud, Superintendent of the Exchange. The year under review is that

which closed June 30, and in that time the total sales on Exchange have amounted to 9,956,250 bags, compared with 9,707,000 bags during 1901-02, an increase last year of 149,250 bags. In 1900-01 the total sales amounted to 7,393,000 bags. The highest price reached was in November 1901, when September and October sold for 8c.; the lowest figure, 3.60c. was reached last June.

The following show the deliveries of coffee for the last five years:—

		U. S.	Europe.	Total.
1898-1899	...	5,682,636	7,798,268	13,480,904
1899-1900	...	6,035,623	8,937,076	14,972,699
1900-1901	...	5,843,883	8,486,042	14,329,925
1901-1902	...	6,663,569	8,853,094	15,516,663
1902-1903	...	6,847,877	9,118,621	15,966,498

The highest and lowest prices at which sales of each month were made are as follow:—

Delivery. Mos. 1902.	Highest.	Lowest.
July	Nov. 1901—7.80c	July 1902—4.65c
August	Nov. 1901—7.90c	July 1902—4.70c
September	Nov. 1901—8.00c	July 1902—4.70c
October	Nov. 1901—8.00c	July 1902—4.80c
November	Dec. 1901—7.75c	Nov. 1902—4.40c
December	Dec. 1901—7.75c	Nov. 1902—4.35c
1903—		
January	Mch. 1902—6.25c	Jan. 1903—4.20c
February	Mch. 1902—6.25c	Jan. 1903—4.15c
March	Feb. 1902—6.30c	Mch. 1903—4.10c
April	May 1902—6.05c	Apr. 1903—3.75c
May	Aug. 1902—6.00c	Apr. 1903—3.65c
June	Aug. 1902—6.00c	June 1903—3.60c
	*	*

**The U. S. Coffee Market.**—Coffee is quiet with little change in prices at any point, says the *Tea and Coffee Trade Journal* of 14th ultimo. The speculative market has had advances and reactions, and, on the whole, remains but little changed. In the course of the week the Lewisohns did some buying and the market strengthened a little on the expectation that they had returned as active buyers. The buying and the expectation were not continued and the Exchange trading relapsed. The Brazil markets at the end of the week took an easier turn after an inclination to firmness. Firm offers were accepted on a lower basis of values. A sale was 7,500 bags of Santos, Nos. 3 to 6, averaging Nos. 4 to 5 at 5½ c. and f. The movement of the crop continues very full, the average Santos interior receipts being 75,000 bags daily. Spot invoices closed slow at 4½c. for Rio No. 8, 5½c. for Rio No. 7, 5¾c. for Rio No. 4, and 6 to 6½c. for Santos No. 4. In jobbing business during the week was fairly active, closing flat, however.

In mild coffee offerings are free generally, but buyers for large lots are scarce. Hand to mouth buying seems to be the rule. The supply of West India growths is now very abundant in the market, and all signs indicate swelling of the plethora. No firming-up of prices can hence be hoped for in the immediate present. Good Cucuta is 8c. East India growths are steady and quiet.

**Hawaiian Coffee in New York.**—San Francisco coffee men showed samples of Hawaiian coffee in the New York market recently. They did not please, although having fine cup quality. They lacked a handsome appearance in the roast, and grade for grade could not as to price dislodge coffee already well received here.

According to the Dairy and Food Commissioner of the State of Michigan, the Woolson Spice Company, of Toledo, O., has been

offering for sale in Michigan a coffee consisting of broken coffee berries, sticks, pieces of husks, charred and immature berries, etc. It would be interesting to learn what else under the name of the Sun could possibly be included under the "etc."

Dr. B. H. Warren, the new Pennsylvania Food Commissioner, has signalled his advent in the department by making the discovery that among coffees in Pennsylvania ground coffee shows the largest percentage of adulterants. Incidentally he has vouchsafed the information that "in one case a neighbouring State found a ground coffee in the open market which contained 12 per cent. of finely ground coal." And this, too, in the face of an advancing coal market and a declining coffee market!

## TEA NOTES.

**Indian Tea Prospects.**—The following telegram has been sent from Calcutta to the Tea Association in London:—

**ASSAM.**—The outturn for July is normal and the immediate prospect fair. Blight is now not so severe.

**CACHAR, SYLHET, DUARS AND TERAI.**—The outturn is normal and immediate prospects good.

**DARJEELING.**—The outturn is poor and prospects poor. Blight generally is severe and is checking leaf.

**Indian Tea Exports.**—The Indian tea exports from Calcutta and Chittagong from 1st April to 31st July are 30,631,175 lbs. against 29,917,108 lbs. last year.

It is estimated that through a fire that occurred on the ss. *Heathford* last month some 1,300,000 lbs., mostly of one grade of Formosa tea, was so damaged as to be unmarketable. This tea was intended for the American market, where stocks of this type are unusually low.

**Colombo Tea Sales.**—A strong tone prevailed throughout the sale on the 5th instant, and all kinds met with good competitions, particularly medium to good broken Pekoes. Prices, although irregular, were distinctly firmer, medium kinds recovering from last week's dull tendency. Green teas were steady at previous rates.

**Tea Stocks in London.**—Commercial advices state that on the 31st July the Ceylon tea stock was 25,100,000 lbs. and the Indian stock 24,300,000 lbs. This is described as 1,300,000 lbs. up and 6,500,000 lbs. down, respectively; but, according to Messrs. Geo. White & Co.'s latest figures, the differences are 1,700,000 lbs. and 7,500,000 lbs.

**The Tea Market.**—In a quiet way considerable business is being transacted in tea, says the *Tea and Coffee Trade Journal* of 14th ultimo. Several substantial invoices, especially in Formosa, were disposed of last week, and it would seem that a more active market were imminent. The fire in the *Heathford* has caused a rise of ½c. in the price of Formosas, of which she carried a large quantity in her hold. About a similar quantity was destroyed one year ago by the burning at Suez of the steamer *Satsuma*, and the price of tea advanced 2 and 3 cents, to the injury of the market in Formosas. The lesson has been appreciated in a degree, but in view of the probable exportation of 19,000,000 pounds, the rise of even ½c. a pound is not justified. Except in the choice grades, which are relatively scarce, there should be enough Formosas to go around. The loss which probably has

occurred can well be repaired. On account of the London inquiry Congous have hardened locally, and cannot now be had under 8½c. Japans continue fairly held, but it is thought that common grades will presently rule softer. A recent sale of Pingsueys amounted to 2,000 packages, but spot quotations for these as well as Country greens are nominal. India and Ceylons are firm. Apparently there is some easing in the price, but this is due to the arrival of inferior tea, with consequent lowering of quotations. Grade for grade, prices continue at least unchanged. Present conditions have been at least preshadowed by the reports from Colombo and Calcutta.

Not a few samples, and from nearly all markets, arrived Monday, July 13, to be discussed this week, and be the basis for present transactions.

\* \* \*

**South Indian Tea in London.**—Messrs. George White and Co., in their Report, July 23, say: There was a rather better tone in the market, and the attention of buyers was chiefly centred on the offerings from Assam and Darjeeling, which included a more attractive selection of the current season's crop than has been shown hitherto. From South India 2,500 packages were brought forward, quality being ordinary. A fair demand was experienced, previous rates being maintained.

\* \* \*

A writer in the *Spice Mill* remarks:—The American Tea Growing Company of Charleston, S.C., general agents for the Pinehurst tea gardens at Somerville, in the same State, has kindly favoured me with some samples of its American-grown teas. Not being an expert on tea, I turned them over to Mrs. Oracle, who at least thinks she is qualified, and she has assured me that they are all right—or words to that effect. It strikes me, however, that the company has a lot of educating to do before it can hope to lure the tea-drinking public away from its East Indian loves. I also think it will have to come down on its price somewhat. One dollar a pound is too "sudden."

\* \* \*

**The U. S. Tea Market.**—Mr. A. R. Robertson writes in the *Spice Mill*:—In reviewing movements in tea for the month of June it would impress one that "conservatism" prevailed, and only "hand to mouth" buying had taken place, yet at the close of the month careful inquiry shows that orders were decidedly more numerous, and requests for samples were far in excess of anything noted for several months.

Thus, while trade is not especially active, there are buyers taking advantage of easier quotations on some "spot" teas.

Formosa Oolong is quoted at lower figures, and even this, in conjunction with high prices at primary markets, fails to stir up any great demand. Some wonderful values are offered in medium and finer teas.

New teas are beginning to arrive, quality and leaf being reported good. The high prices asked, however, tend to check buying abroad, and native packers are said "to be mixing inferior leaf," with the view of reducing cost, an unfortunate procedure, for while "teas for price" held sway during the period of duty, we now look to see more demand for the better teas.

Congous are still slow of sale, with good value to be had. From Hankow we learn that the quality is the best in the

past two or three seasons. Prices are higher, with an active market. Teas to pass Government standard are quoted up to ten cents. Some excellent trades can be picked up "spot." It would appear from heavy Russian buying that supplies for United States will be curtailed.

India and Ceylons have had fair attention, the demand running on the better grade teas. This is to be accounted for by the prices asked for Pekoe Souchongs, which readily bring fourteen cents. While desirable, good leaf Pekoes, with cup, can be had sixteen to eighteen cents, and handsome, good liquoring Orange Pekoes from twenty-one cents up. The "Greens" are gradually making their way into consumption in all forms, that is, blended with Japans and colored, to take the place of China, Hysons and Young Hysons. Of course the result consequent to this is that consumers get educated to taste, and later will not be so particular as to whether they are colored or not. Some beautiful teas in the "natural" leaf are being sold at eighteen to twenty cents.

Japans are reported to show most excellent quality for reason, with prices also higher than last year. First crop teas closed earlier than expected, and the stock remaining at last advices were from "fine downwards." Prices are still uncertain, but no concession is expected from holders.

Pingsueys remain very firm in price on this market. The new season market opened at Shanghai on the 2nd ultimo with prices above those of last year's opening. The teas are well made, with good, attractive leaf and color, but the liquor lacks the brightness of the past two seasons. County Greens are quiet and steady in price.

\* \* \*

**Consumption of India, Ceylon, and Chinese Teas.**—In the last ten seasons the consumption of Indian tea has grown from 48 to 54 per cent., and that of Ceylon tea from 30 to 35 per cent., while the figure for China tea has dropped from 21 to 9 per cent. Comparing the two seasons 1902-03 and 1901-02, the percentage of India tea has remained stationary at 54, but that of Ceylon has receded from 36 to 35 per cent., to the advantage of China, which has risen from 8 to 9 per cent. This is the first upward movement shown by the China product in ten years, though in the previous season the decline had been arrested.

\* \* \*

**Cape Bush Tea.**—There could be no formal report on this article, so Messrs. Forbes & Walker, to whom the *Times of Ceylon* sent a "sample," replied as follows:—

This South African estate evidently possesses no factory, for the so-called "tea" is not manufactured at all, and has apparently never been inside a factory. The leaf is small and oval in shape. In some cases it is broken, in others it is whole and untwisted and in its natural state, but the planter has not failed to leave the stalks in the tea, also in a natural state. Probably the only attempt at manufacture is sun-drying. The liquor tastes of *nothing at all!* The infusion is a mixture of bright red stalks and green leaves.

\* \* \*

**Green Teas for America.**—The finished teas are taking time to reach the Pacific Coast, but a former Ceylon planter, now resident there, sends the *Times of Ceylon* a letter from which we quote the following:—

I see a letter in the *Overland Times* of the 22nd May on green tea in the U. S. of A. I think the writer on "finished greens" has hit the nail on the head when he advises his fellow-planters to finish their teas according to Japan ideas. The unfinished greens have

very little sale on this coast, anyway, whereas a finished green, not too broken up, has a ready sale, and can early influence the Japan article; but this never will be done on the present lines. The grant seems to me to be against the best interests of the green tea producer. "Pure tea," unfaced tea, never will have a ready sale, and why not take a higher price for what will sell than attempt to force the sale of an article that no one will look at. Faced teas are now arriving in 'Frisco from two or three different firms in Colombo, and will find a ready sale on this market. Japans have gone up in price some 15 cents since the 1st January, and higher prices are asked for. What is wanted is a grass-green tea, like the Japan tea, of a leafy appearance. Appearance goes more than quality with the American buyer, and why not make the thing that is wanted and will sell. The forced article would fetch 6 to 8 cents more than can be got for the uncoloured tea.

What spoils the sale of tea more than anything in America is the price charged by the grocer, which is out of all proportion to the buying price. Some want as much as 300 per cent., and most charge 200 per cent. more than it cost them. Very little pure Ceylon is sold. China tea is mixed and sold as Ceylon tea to make a bigger profit.

Most of the Ceylon greens now shipped are "finished," without being adulterated with Prussian blue, for example. Producers and merchants are justified in still going ahead if our correspondent is correct in describing the waiting market in California.

\* \* \*

**Record Tea Shipment direct to America.**—A Colombo paper says:—The "Schönfels," running for the joint direct service of the "Hansa" line and Bucknalls lines to Boston and New York (American and Indian line), which sailed from Colombo on the 24th July, took, in addition to a large general cargo of Ceylon produce, a record shipment of Ceylon tea to America, viz.:—527,772 lbs. green tea, 424,195 lbs. black tea=951,967 lbs.

\* \* \*

Mr. Dawson, an Indian tea expert, reports that there is a good opening for investment in tea cultivation in Jamaica.—*Sell's*.

### NOTES.

#### German Quinine, etc.

The exports of quinine-preparations, etc., from Germany during the four months ending April amounted to—

	1903.	1902.	1901.
Kilos. ... ..	51,000	48,800	69,800

#### Scientific Investigation.

Mr. H. H. Mann, Scientific Officer to the Indian Tea Association, has announced his intention of devoting his attention next year to that dangerous tea pest, "Red Rust." Mr. Mann has been so successful hitherto that the best results may be anticipated.

#### Calcutta Tea Sale.

At the sale on 7th instant 18,800 packages were offered at to-day's tea sale, making a total of 162,146 against 147,112 for the same date last year. There was a strong competition for outside markets, prices being firm at last week's rates. Green tea was a shade dearer: Assam Company's teas sold well.

#### Vanilla in Trinidad.

In the Annual Report of the Trinidad Botanical Department for the year ended 31st March, 1903, it is stated that the small plantation of Vanilla did fairly well for its age and in April last was producing numerous flowers which were setting freely by the aid of artificial pollination. A few pods of good quality were produced last year from flowers that opened late in the season of 1902.

#### Freight on Tea.

We are glad to learn that this subject was lately discussed by the Tea and Produce Committee, and that the Secretary was directed to write to the Shipping Conference, protesting against rates being raised without any notice to shippers, and without consulting them. The rate and shipping ton is now 27s. 6d. from Colombo to London. A few years ago it touched 7s. 6d., but has gradually been rising for some time. Freights from India also are capable of reduction without unfairness to shipowners.

#### The London Tea Clearing House.

According to the London correspondent of a Colombo paper, the Clearing House, except as a medium for clearing tea, is dead. Dead also, or very nearly so, are all the schemes of which we have heard so much during the last few months. The latest one—for the appointment of an experimental council—came before the Tea and Produce Committee this week, but found no favour with them. The Indian Association is to have a meeting shortly to consider the subject, but we already know the views of the bulk of the members—that they consider the C. H. should confine itself strictly to its ostensible objects.

#### The French Customs Tariff.

It will be remembered that the Ceylon Government reduced by 50 per cent. the duty on vinegar in casks and green copperah imported into the island, and the French Government agreed recently to apply the minimum tariff to cocoa in the event of its being decided to introduce a dual scale of duty. It is now notified that the French Government has decided to raise the minimum duty on coffee from 136 francs for 100 kilos. to the former rate of 156 francs per 100 kilos. The change comes into effect on 1st January next. The despatch to this effect has, says the *Times of Ceylon*, been received at the Secretariat from the Home Government.

#### Venezuelan Coffee.

Exports of coffee from Maracaibo in 1902 amounted to 17,692,832 kilos. as against 25,626,629 in the previous year. Another statement shows the following exports:—

	1901.	1902.
La Guaira ... ..	120,217	126,848 bags.
Maracaibo ... ..	422,386	294,880 "

Puerto Cabello figures are given in metrical tons, 5,008 in 1902 against 9,280 in 1901, and 10,842, the average of five years. The average price of coffee per 100 lbs., f.o.b., Maracaibo may be calculated at £1 6s., the same as in 1901 and 1900, against £1 5s. for 1899, and £2 4s. for 1897. During the whole of 1902 coffee was free of export duty.

#### Tea in Paraguay.

"When the natives of Paraguay drink tea they do not pour it from a teapot into a cup, but fill a goblet made out of a pumpkin or gourd and then suck up the hot liquid through a long reed. The tea is altogether different from that which comes from China, being made out of dried and roasted leaves of a palmlike plant which grows in Paraguay and Southern Brazil. The natives say that this tea is an excellent remedy for fever and rheumatism, and chemical tests which have been made by German physicians seem to show that there is good ground for this statement. Certain it is that tea is

widely used throughout Paraguay in cases of illness and that, so far as has been observed, the effects produced by it are highly beneficial." The above is from the *Tea and Coffee Trade Journal*, but surely "Maté" is what is referred to, not "tea"?

**St. Louis Exhibition.** No duties will be levied upon exhibits at the St. Louis Exhibition except for goods sold for delivery after the close of the Exhibition, in which case they will pay the regular taxes fixed by law. Goods intended for exhibit may be shipped to any port, whence they will be transported in bond to the Exhibition grounds—made by law a bonded warehouse—in which the goods will remain until their removal before March 1, 1905. If not sold they will be returned to the country of origin through the port of entrance. The freight rates are simple. Thus far about £2,000,000 has been spent by the management. This includes the preparation of the grounds and the cost of advertising in foreign countries and at home, but the principal part of it has gone into buildings. Of these, ten are now fairly complete, and it is expected that all will be practically finished by the end of the current year.

**The Man on the Spot.** Mr. J. T. Verner, Chairman of the Empire of India and Ceylon Tea Company, has recently observed at the Annual General Meeting of the Company:—"The success or non-success of each individual garden forming the Company's property is dependent, I may say, almost entirely on the staff in India. With good superintendents, and on each garden a capable manager, supported by an efficient European and native establishment, every garden in this Company ought to be successfully worked, and in normal times give satisfactory results. Without a good local staff the working of the best tea garden in India may show no profitable result. I speak from personal knowledge, and from what I have frequently observed and noted during my eighteen years experience as a planter. I may sum up by saying everything depends upon the 'man on the spot.' The Board fully recognise this." Nevertheless, in fact, in many cases 'the man on the spot' gets little but the crumbs that fall from the Board!

**Shells an Adulterant.** The amended New York State pure food law, known as Chapter 524 of the laws of 1903, which went into effect on May 9, contains certain definitions of adulterated and misbranded foods which appear to have caused more or less confusion among manufacturers in the trade. There has been considerable speculation among grinders of spices in particular as to whether pepper shells would be considered an adulterant within the meaning of this Act. An opinion from the office of Commissioner Chas. A. Wieting, of the Department of Agriculture, states "that in the judgment of this department the mixing of ground pepper shells with pepper would be a violation of the provisions of Chapter 524 of the laws of 1903, unless the commodity is labelled, branded, or tagged so as to show that they are mixtures, compounds, combinations, imitations or blends, and to show the character or constituents of the product." As there seems to be an impression abroad that other food laws were passed by the Legislature of 1903, it might be well to state here that the Act of May 9, 1903, was the only pure food law passed during the winter, and that it took effect immediately.

## GENERAL ARTICLES.

### FRUIT TREE FUNGUS.

The following extract is from Leaflet, No. 87, supplied gratuitously by the Board of Agriculture (4, Whitehall-place, London), and relates to a fungus disease of young fruit trees.

*EUTYPELLA PRUNASTRI* (Sacc.).

Every now and again this minute but very destructive parasite appears under the form of a disease wave, causing a very considerable amount of damage, hundred, or, in some instances, thousands of young trees being injured or completely killed during one of these sporadic attacks.

Young standard fruit trees, up to the age of eight years, are most liable to the disease, and, as the stem or stock is the part attacked, the girdling of this portion of the plant by the fungus growing in the bark and cambium means the death of the entire tree, which, in a dull and damp season favourable to the rapid growth of the parasite, usually occurs during the Spring following the first year of attack.

In the case of nursery stock, plum (especially the variety called Victoria) and apple trees have suffered most severely in this country; peach, apricot, and cherry to a less extent. The fungus is also often very abundant on wild plum, bullace, black thorn, etc., and it is the spores produced on such wild trees that infect cultivated stock.

The first indication of the presence of the disease is the premature yellowing and fall of the leaves, followed by a drying up, browning, and shrivelling of the bark of the stem. During the Spring following the first year's inoculation, numerous minute, elongated cracks, arranged in dense clusters, appear in the dried-up bark. These represent the first form of fruit produced by the fungus, and are followed during the second season after inspection by larger, fewer, and more irregularly-scattered cracks, always transversely arranged in the now dead bark, containing a second and more highly-developed kind (ascigirous) of fungus fruit.

The spores of the fungus are mature during late Spring and early Summer, and it is at this season that infection of young fruit trees takes place, the spores gaining access to the stem either through the unprotected ends of pruned twigs or through the living bark itself.

All wounds on the stem exposed by cutting of shoots, however small, should be protected at once by a coating of gas tar, until the tree is at least ten years old. If this precaution is neglected, spores frequently alight on the newly-formed wounds, where they quickly germinate and spread upward and downward in the living bark, which becomes discoloured; finally, the fungus bursts through the bark it has killed, and produces spores on the surface.

#### REMEDIAL MEASURES.

In order to prevent spores from germinating on the surface of the stem, and then entering through the bark directly, the entire stem of the tree should be painted with the following composition: Reduce soft soap to the consistency of thick paint by the addition of a strong solution of washing soda in water. Add 1 lb. of powdered quick-lime to every five gallons of the dissolved soap and stir the whole until thoroughly mixed. Apply to the trunk with a paint brush being careful to cover every part. This mixture is tenacious, not easily dissolved by rain, and usually lasts for one season, if properly made and applied.

Up to the present disease has only been observed on a large scale where the trees are growing in stiff clay. Under such conditions it is very important to avoid deep planting, otherwise the roots are liable to be killed, owing to the presence of stagnant water, lack of air, etc., during a continuous rainy period especially in Spring or early Summer. If the trees are not actually killed by this means alone, which is very frequently the case, their vitality is considerably weakened, and they are thus rendered more susceptible to the attacks of parasitic fungi.

In a case of an extensive attack which the Board investigated in the county of Nottingham in 1902, the trees had evidently been seriously crippled by being planted too deep in a strong soil, and were consequently specially susceptible to attack.

It is important that the fungus should be recognised by gardeners, as its frequent occurrence on wild trees in hedgerows might lead to the infection of nursery stock in a wholesale manner, as has, in fact, taken place more than once, unless detected and removed without delay.

All diseased plants should be burned at once, as, if allowed to lie about, the spores mature on the dead wood, and are scattered by wind, a risk of further infection being thereby incurred.

#### DISEASE AND INSECTS AFFECTING FRUIT TREES.

A small but influential deputation of gentlemen interested in fruit-growing, comprising representatives from the Association of Herefordshire Fruit-growers and Horticulturists and the National Federation of Fruit-growers, waited on Lord Onslow, the new President of the Board of Agriculture, to represent to him the desirability of taking some steps to prevent the spread of disease and injurious insects in nurseries and fruit plantations. It will be remembered that the Herefordshire County Council, acting on a report from the Association of Herefordshire Fruit-growers, recommended legislation on the subject, and requested the members for the county and city to draft a measure to effect this object. Consequently Sir James Rankin, Capt. Clive, Mr. Arkwright, and other members brought in the Prevention of Diseases (Fruit Trees) Bill, which followed the lines of several colonial enactments, but was confined in its application to nurserymen in accordance with the report of the Association. When the attention of the trade was called to this Bill a unanimous feeling was expressed that any measure of the kind ought to apply to all fruit-growers as well as to nurserymen. The latter, of course, were strongly in favour of this extension, contending, not unreasonably, that where, as in many cases, their nurseries were adjacent to fruit plantations it was useless and harassing to require them to keep their nursery stock clean when it was always liable to be reinfected from the neighbouring fruit plantations. Sir James Rankin, in introducing the deputation, stated that they did not ask for immediate action on the part of the Government, but rather an inquiry into the necessity for legislation and the form which it should take. . . . Some doubt was expressed as to whether a compulsory measure was demanded, but, on the whole, the feeling of the deputation evidently was that without compulsion any measure would be a dead letter. . . . Lord Onslow . . . assented to the appointment of a departmental Committee to consider the whole question.

#### A COMMITTEE OF ENQUIRY.

The points with which the Committee will have to deal are not so much the existence of disease and injurious insects and the damage caused by them, for these are admitted on all hands, as what are the best methods of combating these evils, and how legislation should be framed so as to be effective with as little cost to and dislocation of the trade as possible. That legislation, and this of a compulsory character, will be necessary is hardly to be questioned, as otherwise concerted action cannot be obtained. At present. . . while the largest and most enterprising nurserymen and fruit-growers took all available steps in their own interest to keep their plantations free from disease and injurious insects, there was no means of obliging their neighbours to adopt the like measures, so that their labour and money was often vainly expended, owing to the ignorance or apathy of others. The example of the colonies and many of the States of America shows that the first countries in the world have been compelled to pass restrictive measures for the protection of their fruit industries. Although the laws in force in these communities have not been many years in operation, they have already been productive of excellent results. Mr. Alfred Dobson, the Agent-General for Tasmania, writing lately to the President of the Herefordshire Fruit-growers' Association, was emphatic on this point. "The operation," he said, "of the laws (the Codlin Moth Act 1888 and amending Acts) has been most beneficial, and has practically saved the fruit industry of Tasmania from absolute ruin."—*The Field*.

#### TEA PESTS.

At a Meeting of the Dimbula Planters' Association on the 27th ultimo some correspondence relating to Vigilance Committee business was read. It included a circular letter from the Honorary Secretary of the Pussellawa P. A., enclosing a copy of a circular that that Association had addressed to all estates in that district (and which we have already published), and asking the Dimbula P. A. to supply them with information as to what steps they were taking in this matter.

The Honorary Secretary read the following letter regarding the shot-hole borer from Mr. Green, under date June 23rd:—

In view of the importance of keeping a watch on the spread of the above pest, it is most necessary that I should be acquainted with the total

acreage of tea at present involved. I would, therefore, ask you to *voluntarily* supply me with the necessary information, by obtaining and sending me approximate figures of the acreage affected in the area embraced by your Association. Please note that it is unnecessary that names of estates should be mentioned.

I should ask for similar returns after an interval of 12 months, by which means it may be possible to gauge the result of any defensive measures that may be employed. As it is important that this information should be available as soon as possible, may I suggest that you circulate this letter amongst the members of your Association, without waiting for the next Meeting, which may, perhaps, not take place for some weeks.

The Honorary Secretary also read a letter from Mr. A. Philip, Secretary to the Planters' Association of Ceylon, enclosing Minute and Resolutions on the 'shot-hole borer' question:—

Mr. E. E. Green was introduced to the Meeting and gave an address on the subject, answering the questions of members thereafter.

*Resolved*:—"That having heard Mr. Green the Committee is of opinion that the legislation on the lines indicated is desirable. (2) That meantime it be again pointed out to the District Associations that the proposed legislation will be purely confined to the absolute prohibition of the distribution of tea-plants, or any parts of tea-plants from affected estates until such estates shall have been certified by the Government Entomologist as free from the disease. (Tea seed need not be included in the prohibition.) (3) That a hearty vote of thanks accorded to Mr. Green."

The CHAIRMAN:—At the proceedings of the last Committee meeting in Kandy at which Mr. Green was present I was much impressed by his speech as to the effects of this pest. He pointed out that it had been on one estate for 16 years and that estate is not dead yet. (Laughter.) What Mr. Green really wants is that steps should be taken to stop the spread of the shot-hole borer. He does not want to take possession of your estates. He merely wants to make it illegal to sell plants which have this pest in them. That is the only way in which the disease spreads. The pest does not travel very far in its own natural life. What you are wanted to do is to cancel your opposition to Mr. Green's scheme. At the first I was very much opposed to it altogether; but now that it has been cut down to such a small point I think we should support it.

Mr. WIGGIN:—Who is to decide as to infected districts?

The CHAIRMAN:—The Government Entomologist. If anybody knows or suspects that the shot-hole borer is in the district he has merely got to call in the Government Entomologist to state what plants are infected.

Mr. Jackson stated that three years ago he had found a shot-hole borer on his estate and had reported to Mr. Green. It was investigated and got rid of. He thought it was the very shot-hole borer they were talking about.

Several members disputed this; but the Chairman remarked that if it was so it was very satisfactory to know that it had been eradicated. Still he was very doubtful that what Mr. Jackson had said would point to the pest being the shot-hole borer.

On the Chairman's motion that the P. A. resolution be supported being put to the Meeting, it was carried with one dissentient.—Col. Farquharson.

#### PRODUCE AND PLANTING.

There are several lovers of humanity at home who claim to possess a special knowledge of Indian affairs, and are not slow in calling attention to cases of alleged oppression on the part of planters in the treatment of their coolies. The planter meanwhile finds very few champions eager to do him justice. If in the performance of his daily task he carries his life in his hand it is presumed that a risk of this kind is naturally associated with his duties, and that all the machinery of law and order is at his disposal with a view to his protection against the weaklings who do his bidding. The reverse of this picture does not present itself to the vision of the philanthropists absorbed in contemplating the wrongs of the oppressed labourer. But a study of the cases recently reported in the Indian papers shows clearly to those who wish to inform themselves on the subject, that life on a tea garden, apart from its average ups and downs, has become of late increasingly risky owing to the lawless habits of some of the coolie labourers. Riots and assaults on planters seem now everyday incidents in some districts of Assam. If we may judge by a note in the *Englishman* of July 2, the aid the planter in Assam receives at the hands of the local authorities leaves much to be desired. We learn that while

the military police of Assam are given an excellent record for the past year in the annual police report, "the discipline of the civil police force during the year is unfavourably noticed in the report, the number of resignations, which had been on the decline during the previous three years, again increased. Punishments, however, show a decrease. The Inspector-General has dealt at length with this subject, and he attributes the high percentage of resignations, as well as the lack of discipline in the force, to the fact that the police in Assam are both overworked and underpaid. The year was marked by an increase of rioting, especially in Sylhet, where there were sixty more cases than in the preceding year."

Who knows but that some friend of India, inspired by the love of justice and fair play burning within his breast, may relax for a brief period his study of the planter and his iniquities to enlarge the point of view? The fact that the planter is living in a remote province of India should not entirely cut him off from the sympathy and consideration of those who seem to possess such a large stock of these admirable qualities. The tea-grower may not exhibit all the endearing qualities of the coolie, who is supposed to do his bidding, but he has claims on his own countrymen, and one of these is that as he is not very plentifully distributed over the land, it is necessary that he should be fully and properly protected from those who are in the majority when they happen to be inclined to the crime known in the West as "hooliganism."

The Germans are not great tea-drinkers, and this is not surprising. According to the report of H. M. Consul at Hamburg the tea duties at the present time are no less than £4 18s. per 220 lbs. avoirdupois, and to show the great margin there is in this excessive duty it has only to be mentioned that under the new tariff the amount will only be £1 4s. 6d. To compare these sums is to see how heavily the consumption of tea has been hitherto handicapped among the poorer classes of the population.

The Consul's report has already been quoted as an argument against any fiscal system of food taxation in this country. But preferential traders here seem in favour of free tea. The preferential trade proposals of the Imperial Tariff League (now absorbed with the Tariff Reform League), as set forth by Mr. Ernest Williams, the Honorary Secretary, in his well-known work, "The Case for Protection," show that they are for "an all-round 10 per cent. duty on such colonial imports as come into competition with home produce, allowing the rest—such as raw sugar and tea—free admittance, and an all-round duty of 25 per cent. *ad valorem* on competing foreign merchandise, and of 15 per cent. on foreign merchandise which competes only with colonial produce." Mr. Farrer Ecroyd, writing in Monday's *Times*, propounds a scheme of 2s. a quarter on foreign wheat,  $7\frac{1}{2}$  per cent. on foreign meat, 15 per cent. on foreign manufacture of metals and textiles ( $7\frac{1}{2}$  per cent. on half manufactures), and the repeal of the duty on tea. He believes that this would leave the consumer not a penny the worse.

The increasing consumption of Indian and Ceylon teas is making itself felt in the Dominion. According to a circular from Japan the exports of Japan tea to Canada to June 1 fall short of those for 1902 to an enormous extent, and still more so compared with those for 1901. Exports from Yokohama and Kobe up to June 1 to Canada were only 28,825 lbs. against 130,618 lbs. for the same period in 1902, and 413,716 lbs. for the same period in 1901. On the other hand, the total shipments to North America exceed those of 1902, being 3,628,167 lbs. against 1,841,773 lbs., but are less than those of 1901, which were 4,653,592 lbs.

The remarks of the British Consul at Foochow on the subject of Chinese tea-growers and their ways are instructive. They prove, if further proof were needed, that the hopeless conservatism of the Far East removes all chance of the Celestial successfully competing with India and Ceylon in the tea trade of the world—at any rate just yet. The United States market seems to be the mainstay of the Foochow trade. The Consul says: "The trade in tea has always been the life-blood of foreign commerce at Foochow. It has for many years been a decadent industry, and on the causes of this decadence I animadverted in my trade report for 1901. In that document I recommended British merchants to make a bold bid

for the retention of a market which appeared to be slipping from them by imitating the tactics pursued in Ceylon and India, or, at least, some of them. It was, I confessed, hopeless to expect the native grower to adopt their improved methods of culture and manufacture, which are, I doubt not, to be credited with the larger part of the success met with by the produce of Ceylon and Assam. The native agriculturist is so insanely and indissolubly wedded to the methods of his ancestors that, even when ruin is obviously staring him in the face, he will consent to use no device which savours of novelty. The adder is not only congenitally deaf, but he stops his ears into the bargain, however wisely the European may charm. I pointed out, however, that China tea, though its preparation leaves much, desperately much, to be desired, is in its essence an admirable article, and, thanks to its delicate flavour, can, even when handicapped by faulty manufacture, give points to the robust Indian article. I therefore recommended the British merchants interested in tea to imitate the practice of his competitors of the nearer East, by making the wares better known to possible customers by the medium of advertising. I believe it to be a fact that many people in the United Kingdom would distinctly prefer to drink China tea if they only knew where to buy it, but that there is only one China tea company which advertises at all. My recommendations were widely admitted to be well-grounded, and one British merchant at Foochow strove earnestly to give my abstract counsels a concrete form; but his attempts have not met with the success he hoped and perhaps anticipated. He gave the wheel of the Foochow tea-cart a vigorous heave, but it has sunk back into the rut, and, I am afraid, will remain 'bogged.' No single effort could avail, and cohesion in the Far East tea trade appears to be a hopeless consummation. I remain of the opinion that in advertisement lies the only real remedy; for a sudden change in popular taste, which should replace the teas of China on the pinnacle they once occupied, would be too much of the nature of a miracle to be safely looked for. The export of tea in 1902 shows a large advance on that for 1901. This was due to an increased demand in America. Mr. Cave Thomas was so good as to communicate to me the following remarks on the state of the Foochow tea market in 1902: 'There was a falling-off in the trade to the United Kingdom and Australia, caused by the increased consumption in those countries of the teas of India and Ceylon. In this respect there appears to be no prospect of immediate improvement. In the trade with America there was a considerable increase, mainly due to a speculative demand brought about by the rescinding of the war tax of 10c. gold per lb., but also partly to the circumstance that stocks had been allowed to fall low in anticipation of the above tax. The Russian brick tea trade is practically dead. The Russian firms at Foochow appeared at one time to be thinking of closing their establishments, but have relinquished that intention. The export duty on tea, which had pressed heavily on tea buyers for many years, and had been the cause of much complaint, was reduced to 1.25 taels per picul (*i.e.*, about 12 per cent. *ad valorem*), but the concession was granted too late to check the downward tendency of the trade. The crop in 1902 was of a fair average quality, and met with a good reception from the European buyer. When the market opened the prices were slightly higher than those of 1901, but later in the year they gradually receded.'

The food-consuming public has become hardened upon the subject of warnings in the medical papers, and is now prepared to learn that most of its food is mildly or acutely poisonous. But the *Lancet* lets coffee down gently this week. It says: "Although coffee is little used for breakfast in this country, it is very commonly drunk after dinner, a custom which perhaps is justified, particularly when wine-drinking accompanies the meal, for coffee is an antidote to alcohol. On the other hand, a cup of hot coffee disagrees with many persons, and the dyspeptic must eschew hot strong coffee as well as tea. The excessive drinking of coffee is in any case an evil. But it is often forgotten that coffee can be taken in other ways, and in none better than in the form of jelly. A clear coffee jelly after dinner is every bit as good as the hot infusion, while it is free from some of the drawbacks of the latter. Coffee, unlike alcohol, diminishes organic waste, rouses the muscular energy without the collapse which follows alcoholic imbibition, and gelatin in the form of jelly is cooling, assuages thirst, is soothing, and has a tendency to absorb any excessive acidity of the stomach. Gelatin is what is known as a 'proteid sparer'—that is, it saves

the destruction of proteid, such as albumin. Moreover, the astringent principles of coffee, which, however, are different in kind and degree from those present in tea, are nullified by the gelatin. In short, jelly is an excellent vehicle for coffee, but, as is necessary in making the infusion, the quantity of coffee in the jelly should not be stinted. Coffee serves an admirable purpose in dietetics, and those with whom it disagrees when taken in the form of a hot infusion will very probably find the jelly quite satisfactory."

While there is a great desire on the part of Indian planters to give attention to rhea cultivation they seem at present in doubt as to the right methods to be employed. Apparently the so-called new method of decorticating the ramie fibre by salt water or a saline solution is not being regarded very favourably in India. The process of steeping ramie has been employed for many years past in a primitive way in Bengal, Assam, Burmah, and other parts of India where rhea for native requirements has been produced. With reference to the Algerian patent, it is remarked by a Calcutta authority that a process which takes five days for fermentation, ten days for the removal of the bark from the stem, and six days for the drying of the fibre, or twenty-one days in all, before baling can be proceeded with is no improvement on the method of treatment already employed by the natives. Rhea, it is added, cannot be treated like jute; it will not thrive on low-lying lands where rice and hemp are grown, nor near the sea, and experts declare that the fibre suffers unless the stems are decorticated almost immediately after being cut. Apart, however, from these objections, any steeping process which takes twenty-one days' time and labour cannot compete commercially with a machine which turns out marketable fibre within twenty-four hours. This, it is added, was recognised some time ago when the Indian Government offered a prize of £5,000 for the best decorticating machine. The Algerian patent, it is concluded, may be dismissed as regards its application to India on account of the time required and the expenses involved. The cartage of saline solutions and the construction of extensive arrangements for steeping, which would involve a very great outlay, will not appeal to the Behar and Assam planter, and it is their soil which is required for the successful cultivation of rhea.

Cocoa-planting prospects on the Gold Coast are encouraging. No systematic effort was put forward to encourage cocoa-planting among the natives until 1898. In that year the Gold Coast Government sent the Curator of the Botanic Gardens—an institution which has proved its utility—on tours throughout the eastern and northern districts of the colony to instruct the natives in the cultivation of the plant. At the same time thousands of seeds were distributed gratuitously throughout the country, and to encourage the native planters the Government itself took charge of the native crops and forwarded them to the home markets. From that moment the industry went up by leaps and bounds. In 1898, 414,201 lbs. of cocoa were exported, valued at £9,616 4s. Four years later the output had increased to 5,367,405 lbs., valued at £94,944 2s! The present results have been obtained without any expenditure of European capital.

### LABOUR RECRUITING FOR CEYLON.

Mr. J. H. Westland writes to the Colombo Press:—

Permit me to thank the Chairman of the Ambegamuwa Planters' Association for the kind way he handled the subject of recruiting coolies from the Telugu district and for the resolution carried by the meeting. The small increase of pay we agreed to give to induce coolies to come to work on our estates from a distance of 267 miles north of Madras is not so serious as the present state of affairs, as exemplified in the paragraph headed kangany's promissory notes.

Under the arrangement by which the Telugu coolies have been brought to the estate not a pro-note has been signed. Each individual cooly is responsible for the money advanced to him and the actual expenses incurred on his journey from his village to the estate, and for rice, curry-stuffs, cumbly, and cloths supplied, if required, on his arrival.

I hope the system of recruiting will be discussed and modified, if coolies can be induced to come to Ceylon estates on easier terms, but it must be remembered that in breaking ground in a new district, some inducements had to be held out to the coolies to come to Ceylon, to them an unknown country. The difficulty was to

get them to believe they were to be taken to Ceylon, seeing that at almost every station at which the coolies stopped to be fed the Natal recruiters tried to prevent them from going on, and, in not a few cases, succeeded.

As to raising the standing rates of pay, how many estates pay their coolies according to standing rates in their district? It would puzzle some to say what the standing rates are.

Have we not pluckers earning from 50 to 75 cents and even more per day in busy crop time? Do all pay alike per lb. of leaf? Have we not factory coolies from 33 to 50 cents per day? and some estates paying field workers 33 to 37 cents with 4 to 6 cents head money (on all coolies)? Where does the standard come in? In certain districts the rate is supposed to be much higher than in other districts. How about P. W. D. and rates of pay to road coolies; do coolies complain of the inequality? There are reasons for the various rates, and coolies must realise the fact.

In reply to the second objection, let me refer to the following paragraph of that most valuable letter of Mr. E. V. Carey published in the local press last month:—"During the last four years some 300 coolies have been imported direct from the coast, and the advance account at the end of March stood at \$76.10 cts. with a force of 191 Tamil coolies, each of whom has had to pay off from \$16 to \$20, for in the case of free labour all coast advances are recovered from the coolies." This may not be our experience at the end of two years, but it is worthy of a trial.

During the past 30 years I have on pay-day always assisted to recover debts due by coolies to their kangany. If any complaints are raised at the pay-table, the cooly, as a rule, gets his pay and deals with the kangany himself. The result of this system is that a record of the amounts recovered is kept in the check-roll, and a large number of the coolies soon wipe off their debts, and, but for their agreeing to become security for money paid to, or on account of, their friends, their debts would be *nil*.

We may not be legally entitled to recover debts in this way, but the system of recovering at the pay-table has the full consent of the coolies.

The weak point of the individual indebtedness is touched on by the Chairman, *viz.*:—"That long before you would be able to recover these expenses from coolies some might die, others desert, or give notice and leave, and, not having a responsible kangany, their debts would be irrecoverable." Those risks must be run, the notice and leaving coolies can do so now, and we have even heard of kangany doing likewise. Our two-cent fund, which has not to be drawn upon by a cooly until his debts are paid and his two years' service completed, some of it may become available to go against loss by bolters or death.

Should the Ceylon planters adopt the recommendation of the Sub-Committee of the Planters' Association and establish an agency in the new districts, he can extend the term of service should he find that coolies flock to his standard and are eager to be drafted to Ceylon.

At the end of their two years' service, when they become entitled to 2 cents per day for every day they have worked, and their train-fare paid back to the railway station nearest their village, the probability is they may not want to return but wish to send over money to bring over their friends, so that the sender of the money may become a kangany on the same lines as the kangany from the older districts.

If the right class of coolies are brought from the new districts, men with wives and families, the chances are, after they get used to the climate (which is very different from theirs) they come to stay; but if the coolies recruited are the scum of the townsmen, who don't work in their own country, they will be loafers whom the recruiting agent can get any number of willing to take his money and go to Ceylon. The employer of such will find them of so little use that, when they bolt, as they are almost sure to do, he may not care to spend money in having them apprehended and put in jail; but if he does it will have good effect on the others who may have intended to change their abode or return to their country without squaring accounts. Like other new coolies, Telugus have to be taught their work; but they are quiet, able, and willing workers at what they can do, and compare favourably with the Tamils.

If it be admitted that estates have not sufficient coolies, that they are unable to get their requirements from the older districts, and that recruiting in new districts is possible, and desirable, why should the consideration of the proposed agency, recommended by the Commissioners, be allowed to drop? Surely not because the

first lot of coolies have been engaged at a slightly higher average rate of pay, all risks included, than has been ruling; cannot this be considered by a meeting of planters who support the idea of recruiting labour from new districts?

Bringing over a few coolies as a first venture need not prevent others being brought to Ceylon on, perhaps, more favourable terms; but to attempt recruiting without a suitable agency, will, in my opinion, be found a very expensive method of adding to one's labour force. This letter is already too long or I might give my reasons for this opinion.

As an appendix to this the following appears :—

SOME NOTES OF A TRIP IN THE COOLY DISTRICTS OF SOUTH INDIA.

Left Colombo on the evening of 8th May, and, after a pleasant passage in ss. *Africa*, arrived at Tuticorin at 9 a.m. next day.

Entrained at once for Madras—22 hours' run by express. The country from Tuticorin to Madura is absolutely flat and all under cultivation, generally cotton or other dry crop in the south. When the Petiaar water is reached this is replaced by wet crops, rice, tobacco, betel, etc. As far as the eye could reach was seen one vast rice field, broken at intervals by villages and clumps of palmyrahs. All this part of the country was rejoicing at the late harvest. Seldom has one been so abundant and never has labour been so scarce to reap it. The landowners complained that up to 30 years ago rates were paid to their coolies which have obtained since there were records in South India. Since Ceylon, the Straits, Natal, and others have offered the cooly such inducements to emigrate, wages have been steadily rising, and they are now double what they were a generation ago.

Was told that the landholders look upon the coolies on their properties as assets or live-stock, much as we regard cattle and horses. The property may change hands, but the cooly never leaves the soil and is practically as much a fixture as the building on it.

The more valuable estates, along river banks and under tanks, are of fabulous value. Land has, in some cases, changed owners recently at over Rs.2,000 to Rs.3,000 per acre.

COPY OF OLD ENGLISH SERFDOM.

The mirasidars, or landholders, find that emigration is now so general in these districts that in Negapatam there is actually a landholders' *Anti-emigration Association*.

The cooly is, in many cases, in debt to his master, but, as long as he remains on the estate, the amount is seldom worked off, and may gradually increase to anything from Rs.10 to Rs.20.

The recruiting kanganies or agents for Ceylon or elsewhere get hold of the cooly, represent to him that he is a slave and point out the advantages of other countries and induce him to bolt with them. As soon as the mirasidar hears of it he wires to the agent of his Association to watch the nearest shipping port or railway station, and is often successful in getting back his man.

This does not apply to any great extent to Ceylon, where our own kanganies, who know the island and are more or less in touch with their relatives in S. India, find it to their advantage to be open in their dealings with their village authorities.

The rate of commission paid to recruiters by the Straits for able-bodied single men and marriageable girls is Rs.35 per head. No children are accepted, and the recruiter gets his commission on presenting the cooly at the depôt, in Negapatam or Madras. For Natal the commission is Rs.29 for men and Rs.32 for girls, and medical examination is not so strict as for the Straits. Failing both the Rangoon companies pay Rs.12 per head with few questions asked.

In view of these large sums it is not surprising that the recruiting agents sail as near the wind as they dare. I am told that they make a clear Rs.20 a head off each cooly for the Straits and Natal, and that after allowing a very liberal percentage for rejections. One other point in this connection, the cooly from Tuticorin to Bezwada and Madras to Cuddapah has heard of Natal and hates and fears the name. The recruiter for that country knows this and uses Ceylon as a bait. Wherever I was our island had a good name if known at all, and it is hard that we should have other countries trading on it. To the average cooly, Ceylon and Natal are adjacent districts, and he does not discover the true state of things till too late.

THE FERTILE PLAINS.

A great many coolies come to Ceylon from Trichinopoly district, but the supply is not unlimited. From Tanjore Junction to Chingleput, he would be a fool, indeed, who would think of emigrating to any other country, as this is a land flowing with milk

and honey. Cultivation to the highest degree meets one on every side, and the run is very similar to Colombo to Hanwella by road on a much larger scale.

I saw a recruiter at Chingleput, who said he had supplied some coolies to Ceylon, and the Rest-house book contained some well-known names in proof of his statements. He also showed me letters from Ceylon planters offering in one case Rs.7 per head, and in another Rs.12 per head for all coolies supplied. He told me it was hopeless to get coolies from Chingleput district, but they were to be had in Salem.

After a month's work he got me 8 coolies, pariahs, two of them had been in the Wynaad and wanted to go back to tea-planting. Their village was a long way from Chingleput, and they were for the time without employment.

From Madras to Bezwada the country changes completely and there are miles and miles of sandy, scrub-covered tracts without a house or sign of cultivation. Gudur is a large village in the centre of a poor population, who find it hard to make a living. The same may be said of Ongole and Bapatta. These are very good centres and a great many labourers emigrate to other parts from thence.

Bezwada itself is on the edge of an enormous district, the Kistna, one of the richest in all India. It is hopeless to think of getting coolies from here as there are large areas of irrigable land waiting for cultivators to take them up. There is a good sea-port within reach, a railway passes through the centre of it, and there is abundant water. The natives are Telugus, fine, well-set powerful men, quite the finest men I saw anywhere.

From Bezwada to Guntur district dry cultivation is met with and, as we went further west, the country got poorer till at Phirangipuram, 53 miles from Bezwada, I found what we wanted—a people accustomed, able, anxious to work, and subject to famines.

THE HOME OF THE ESTATE COOLY.

The country is a series of flat plains surrounded by steep, low rocky hills, covered with prickly-pear and, except for wells, absolutely without water. The crops are cotton, cholum, chillies, and ragi—all dry country products. There has been no monsoon here for six years and all the wells in one district had dried up except one, fifty feet deep, to which all the villagers near had to go for water.

I was assured that there would be a famine there this year and, from appearances, one could easily believe it likely. Guntur is the centre of this district and is surrounded by such coolies. The average rate of pay for a man is 2½ annas, a woman 1½ annas, and for that they have to work hard all day long. I had great difficulty in persuading a gang to emigrate as they feared they were to be shipped to Natal. I found the most powerful inducement was the promise that, if they worked, they were sure of at least one square meal a day.

We started eventually, and, as most kanganies have similar experiences, they may be of interest. All went well till we stopped at one station to wait for a connecting train. Here some Natal agents got at my coolies and persuaded 6 of them, that Ceylon was a dreadful country, all going to it were treated like slaves or died in a few months, etc., and frightened them so much that they refused to proceed. The police were appealed to, but without result. I found afterwards that the police get a commission from these recruiters for every man they can stop in the trains on any pretext whatever.

BLEEDING COOLIES.

The usual way of blackmailing a gang is to ask a cooly who his maistri is, then to charge him with travelling without a ticket, boarding the train while in motion, or similar trifling act. Rather than be detained, the unfortunate kangany or maistri tips the constable fifty cents or a rupee, only to have the same experience further on. Since the kidnapping laws have been so strictly enforced, the favourite dodge is to pretend that a woman in the gang is being taken away against her husband's wish or is under age, the demands of these sharks are limited only by the amount of money the cooly has on his person, and he is systematically bled all the way down to Tataparai Camp. I saw clear cases of this myself and am prepared to give the superintendent of railway police any further information as to dates, stations and names he may desire. It is scandalous and one of the greatest evils our coolies have to face on their journey to Ceylon.

Arrived at Tataparai the cooly is at once under the protecting wing of the Ceylon Government and his troubles are practically at an end.

I visited the Camp early one morning during the absence of the superintendent. I had thus an excellent opportunity of seeing the ordinary everyday work of his staff, and I can truly say that if the cooly complains of Tataparai he does so without cause.

He is housed, fed like a fighting cock (3 curries and as much rice as he can hold) and taken on boardship at Tuticorin by the Camp peons, who look after him and are responsible for him until he is safely handed over to their friends at Ragama. If the weather be rough the passage is a long night of horror for the cooly who is, as a rule, no sailor.

Just two words on the Cuddapah district in which I spent some days. Coolies were to be had in plenty, they were strong healthy men, of a much more independent class than the Telugu appears to be in other districts, and many professed a willingness to come with me if I could convince them that they would not be taken to Natal. Two men came with me and say they are delighted. They have written good accounts of this country to their friends and more may follow.

#### UNIVERSAL DISLIKE OF NATAL.

The most striking point in the trip was the universal dislike to Natal. Of the many hundreds of coolies who have gone there, few have returned and none of those will go back at any price, preferring famine and death in their own country.

Should a Ceylon man wish to try recruiting in Cuddapah, Guntur or Negapatam district, he must be prepared at all points, the country is being thoroughly worked by the native agents for Natal and the Straits, and they do not always play the game. In one district of a few miles in diameter one agent has 300 recruiters working for him. They leave no village untried, as the high commission is worth their best energies.

I could not expect the Collectors, or other high officials, to give any assistance to one more than another, and letters of recommendation from Ceylon to these gentlemen are of little value, except to prove one's identity and the object of his mission. However willing they may be to render assistance, they have not time to do more than mention the fact to the deputy collectors, tahsildars, and other headmen in their districts. As these latter are the landholders and actual owners of the coolies we have come to take away, we cannot expect very great help from them.

The best aids we have are the coolies who have already come over, to spread the fame of Ceylon through their village and the next, and, *in time*, the others may think of trying this new country—Ceylon.

The Telugu coolies now in Ceylon, as a result of this trip, are nearly all family men. Those who did not bring their wives are now anxious to send for them. Those who have their wives and children here will soon settle down and will think twice before undertaking the long and trying journey back to their country.

Guntur is, I think, the most promising of any of the many centres of labour I visited and saw with my own eyes. Many hundreds would gladly exchange the constant toil and frequent famines of their native land for the easy work and happy life of the Ceylon estate cooly.

#### OOLONGS FOR AMERICA.

The London correspondent of the *Ceylon Observer* gives the following account of an interview with Mr. Larkin:—

I one day visited Mr. Larkin who is over here for a stay of some weeks, but missed him. A second attempt this week was more successful, and I happened in on him at the Hotel Metropole just as he and Mr. Wm. Mackenzie were finishing breakfast together. Mr. Larkin is very sanguine on the subject of Ceylon tea in America. If his conversation could be called a sermon, then "Ceylon tea" would be the text, and Greens and Oolongs the two heads into which the discourse was divided. He has only one regret for the past, and that is that the Ceylon planters did not go in for green tea long ago. Had they done so they would to-day be in practical command of the market in the United States, and the hard times caused by accumulation of stocks in the home market would never have happened. America and Canada would have absorbed these black tea accumulations in the form of green teas and the Japanese trader would have been to-day nowhere. To Mr. Mackenzie's zeal in inducing Ceylon growers to make the trial, Mr. Larkin bears the heartiest testimony. As regards the present

he is, as I said, sanguine. Now that the kind of tea that is acceptable to American consumers is being sent from Ceylon, the crushing out of her Japanese rival is only a question of time. In a few years, three or so in Canada and perhaps rather longer in the States, Mr. Larkin prophesies Japanese tea must wholly disappear, provided Ceylon continues sending good quality teas, and goes on advertising. "Some people think," I remarked, "that advertising should be about come to an end in America, that the taste for Ceylon tea has been formed, and that there is hardly so much need for spending money in campaign work now as there was, that the industry should be able to stand on its own legs now in fact."

"Well," drawled Mr. Larkin in the true Yankee manner which no man, born on this side of the herring pond, has ever been able to imitate, "so it should. So it would, and you know if we were all going

#### TO LIVE FOR FIVE HUNDRED YEARS

that would be all right. But seeing we're only to be here for a few years, and we want to make the money while we are here, well, I take it advertising's the only thing that's going to do it. The Ceylon planter may think that because he's got the public in America to take his tea and to like it, there's no call for him to do any more; but while he's waiting for the trade to grow, somebody else is going to cut in, and take it away from him. That's what he's going to find, you depend upon that. Its advertising in newspapers and advertising by samples, and advertising by demonstrations that makes any business pay and that will make the tea business pay. I spent last year 80,000 dollars on advertising and I mean to spend more this year because I find it pay. And so will the Ceylon planters. In the first five months of this year the increase of trade over the whole of the Salada business total up to about 44 per cent., that is on the whole, black teas, green teas and everything. But the approximate increase on the green teas sales amounted to 128 per cent. on the corresponding period of last year. My manager, who looks after the New England branches in which are included Boston and New York, reports an increase of 140 per cent. on his sales during the same time, and that shows you how Ceylon green tea is going in America."

As to whether Ceylon will be able to displace fifteen or sixteen million pounds of Japan green teas during the coming season, Mr. Larkin, however, refused to commit himself. "Mind you," he remarked, "it's a big thing, but Mr. Kingsford is a first-rate man, and understands that it's worth baiting the line with a minnow to catch a 'salmon.'" From all of which it may be seen that Mr. Larkin is not on the side of the cautious party.

But, perhaps, his greatest point was that to which he next directed attention. "Now here is what the Ceylon planter has to do," he resumed, "if he wants to

#### CAPTURE THE AMERICAN MARKET.

He has got to make Oolongs and Formosa Oolongs. Nothing but Formosa will do. We want that peculiar flavour which is only given to the teas manufactured in Formosa, and it, surely, ought to be possible to find a shrewd, clear-headed, capable man in Ceylon with tact and patience who would go down to Formosa and find out how these teas are made, and be able to come back to Ceylon and make them himself."

"The Japanese might have a word to say to him first"? I suggested. "Well, they might if they knew, but he would have to chance that. And they are not Japanese in Formosa you must remember, though the country belongs to them now. It is the Chinese who make the tea, and ten to one they would never trouble to ask what he came there for. I question very much if they even would know there were such places as India or Ceylon where tea could be grown. Any way that's what we want in America, and what we must have."

"The man that's at the bottom of the shoot knows better than the man at the top whether the right stuff is coming out, eh, Mr. Larkin"?

"That's it. If Ceylon is at the one end of the pipe, I'm at the other, so to speak. That is to say, I know what people will buy. But I'm not complaining of the pipe. What I should like to impress your Ceylon planters with is that we want ANOTHER pipe. Let them send as much green tea as they can along to us and black tea to England, but make the Oolongs as well. There is a splendid demand for that special tea with us, and I can promise the Ceylon planters they will find it pay. It isn't a matter of soil or climate I am convinced, but simply some peculiarity in the manufacture

THAT GIVES FORMOSA OOLONGS THEIR SPECIAL FLAVOUR and, as I said before, I can see no reason whatever why they cannot be produced just as well if not better in Ceylon. And then your market here would be less liable to stagnation. The more you can send us, the better for your London markets, I take it." "Have you any plan of campaign for the St. Louis Exhibition by the way I asked?" "Well, we shall have a stall in the Exhibition, and though I haven't settled it quite yet, I expect we shall open a branch in the city. That was where you Ceylon people failed in Chicago. The tea was in the Exhibition, but when folks wanted to buy it, there was no place outside where they could get it. Well, good-bye. Mind you put it strong to Ceylon about the Oolongs." And Mr. Larkin, with a farewell wave of his hand, left me at the door-step, to rejoin his family who accompany him on his trip, and, as he says, make him feel at home wherever he is.

In a great deal of this everyone will be ready to agree. There is no question that the making of green tea should have been entered on long ago by Ceylon, and this adds point to Mr. Larkin's suggestions which, I fancy, he put forward before when last here about the manufacture of Oolongs. But on the whole, Mr. Larkin ought to be pretty well satisfied with the Ceylon planters, for they have given him mostly everything he has asked for up-to-date, and to do him justice he is perfectly willing to admit the fact.

#### A CEYLON PLANTER'S VIEW.

*Apropos* of the above Mr. H. Walthew writes:—

Oolong is a partially sound and a partially unsound tea, skilfully fired by the manufacturers of Formosa and Amoy and Foochow.

The flavour is all in the firing and the fumes off the chulahs.

If a tea-maker attempted to make green teas with a partially-fermented leaf, after presenting the order of the boot to the tea-maker, the planter to save himself from loss might make a piebald tea of what the tea-maker had spoiled; that is a tea neither green nor black, or in other words an Oolong. This is only a question of firing, hard firing, fierce firing, scented firing. He need have no care for his infusion, the essential oil, the theine, the natural flavour of tea, soundness, or, in fact of any of the essentials of real good tea, provided he is able to scorch all the sourness out of partially rotten leaf and impregnate it with the fumes of the proper sort of charcoal.

Having done this the planter *may* (?) make a profit—and Ceylon may congratulate herself upon having made her first retrograde step in tea manufacture.

You infer in your note in yesterday's paper that the writer in the *Tea and Coffee Trade Journal* of July 7th, who questions the wisdom of Mr. Larkin's advice, has an interest of his own to serve. The refreshing innocence of this inference is, as I once heard an auctioneer in New York city remark,—*lovely*.

Everybody in Colombo who has dealt with your Canadian friend will agree, that though others may advertise and strive and sweat for interests of their own, at least the *Times of Ceylon*—OUR "TIMES"—supports an advertising Bayard, *sans tache and sans reproche*, whose crusade is solely dictated by the purest ideals for the benefit of our island.

Nobody who has ever had a parcel thrown up (and which of us has not?) in a falling market fails to recognise the salutary lesson for him personally and the island generally in the incident.

### TEA AND COFFEE IN THE STATES.

The Chamber of Commerce of the City of New York honors as usual this year in its annual report, just issued, the tea trade with a review. The situation in the past year is thoroughly canvassed, but the writer is guilty of some heresy, says the *Tea and Coffee Trade Journal*. Of such seems to be the following, which we cull from the report:—

"The removal of the tea duty cannot be said to be beneficial in any respect, so far as this country is concerned. A duty is the only practical barrier to the importation of low grade, undesirable tea; hence it vastly improves the quality of our supply. Consumers do not obtain cheaper but inferior tea, prices being only reduced by the substitution of inferior quality; and, finally, the Government loses a revenue that is easily collected, and is no burden upon the tax-payer. From the trade point of view, the placing of tea upon the free list was a political rather than an economic measure."

The matter has been heretofore thoroughly threshed out and the specious argument needs no reputation here. In several and

obvious instances the logic is very much at fault. Anyway no tea inferior to the standard set by the United States government can be admitted and so we in this country are receiving no worse teas in duty free times than one year ago when a duty was collected. To be sure in not a few instances we are this year paying for tea as much as was paid for the same tea with the tax of ten cents on, but the advance is not so much caused by the removal of the tax as by market conditions. Conditions next season may bring about a market ten cents lower and yet the same class of tea will come—none lower. We are sure that the major portion of the tea trade, and especially that portion of it that does its business in New York, will read with surprise the statement in the report, which considering the source and the use that may be made of it by economists and statisticians is very important. It may be said with some emphasis that it was politics that sought to retain the duty on tea, and it was economics that finally caused the erasure of the tax from the revenue laws. The review closes with the following:—

"The early purchases for the season of 1903-04 have not developed any new feature in the primary markets. Prices remain firm and the supply will be fully adequate for all requirements; but, as already remarked, low-grade teas have again invaded the market, and the inspection law will scarcely prevent the evil. The removal of the tea has operated, as might naturally be expected, and as has been the case in other similar instances; that is, it has increased values in China and Japan to very nearly the equivalent of the duty, so that practically the producer now receives what was formerly paid to the Government."

The Indian and Ceylon tea traders will also have their "regrets" we are sure when they read the following, found in the review on tea:—

"INDIA AND CEYLON.—These descriptions have gradually pushed their way to the front on account of the scarcity of China greens; manufacturers of these kinds have been, therefore, encouraged to imitate Shanghai varieties; and it is intimated from India that the supply of colored teas shipped hither the next season will aggregate ten or twelve million pounds.

"The ordinary uncolored teas India and Ceylon teas are used, to a certain extent, for mixing and making of blends that have become popular with consumers; but it is scarcely probable that with a normal supply of China teas, for which use these are used as substitutes, there will be any material increase in the demand."

Nine-tenths of this inference is wrong. The teas in question are making their way because of their inherent merits and the business push behind them. If they have superseded China teas, it is because by comparison these are inferior in quality, and when once successfully substituted, they remain so. Indeed, the trade is not a little impressed with the suspicion that the Indian and Ceylon teas will quite drive out most China teas, and rather than a diminution in the importation of them because of the recovery of plentifulness in the China sorts, larger and larger importations in the immediate years will occur. The trade at large knows this, and we say it that the Chamber may know.

Coffee has been favored with a more accurate review of conditions. We are quite sure that no exception will be taken to the following observation:—

"The growth of the roasting industry within the past few years has been one of the phenomenal developments of the trade in the United States, and is responsible for the complete change that has taken place during that period in almost the entire method of conducting the trade. A very large percentage of the consumption is now distributed green, as was the case a few years ago. The demand is now chiefly for 'package' and roasted coffee, and this industry is now concentrated in the hands of a few large concerns, whose keen rivalry a few years ago was a disturbing factor, but who seem to have conducted their business during the past year without apparent friction."

Or this:—

"Only once during the year was the situation relieved by a ray of hope and that was during the month of August, when a syndicate of operators in this market, who had a large speculative interest, endeavoured to create a bull sentiment by active speculative dealing based upon reports that the growing crops were endangered by drought, but the movement was scarcely launched, and prices

## Food is Poison, UNLESS DIGESTED.

The vigour of health depends on good digestion. Undigested food poisons the blood, which clogs up the skin, the liver and the kidneys. Food properly digested makes new strength, new blood, new flesh, new life. Relish for food and power to digest it comes with Seigel's Syrup. Compounded of fruits, roots and herbs, it tones and cleanses the liver and kidneys, and clears the stomach of the decayed products of indigestion—the fruitful cause of headaches, languor, brain fag, constipation and anæmia.

# SEIGEL'S SYRUP

"For a number of years I suffered, especially during the hot summer months, from acute indigestion and severe bilious attacks. On such occasions I was completely prostrated by spitting headaches. I had no appetite, slept poorly, was low-spirited and extremely nervous. I tried many tonics, and reputed headache cures, but got no relief until I took Mother Seigel's Syrup, and in a few weeks that remedy set me up again. I can now eat well, sleep well and perform my duties with ease." Mrs. Belle Conlon, 4, Parnell Place, Newcastle, N.S.W.

**AIDS  
Digestion.**

had responded by a light advance, when abundant rains deprived the weather of its terrors. On the 18th of August a sudden drop in the temperature in the district of São Paulo caused a frost that slightly damaged the young trees, but the loss was so trifling compared with the enormous proportions of the prospective crop that it failed to receive more than passing notice. In other words drought, frost and the operations of an American syndicate combined, were ineffectual in neutralizing the influences of supply and demand."

The quotation will have to be corrected in the first mention of the month of August, where the word "Winter" would have suited the actual facts better.

### DISTRICT ASSOCIATIONS.

#### WYNAAD.

Proceedings of a General Meeting held at Meppadi Club, August 5th, 1903. PRESENT:—Messrs. Atzenwiler, Behr, Day, Mackinlay, Nicolls, Taylor, Waddington and B. Malcolm, *Honorary Secretary*.

Mr. Waddington in the Chair.

1. **Proceedings of last Meeting.**—Taken as read.
2. **Roads.**—Read letter of July 12, 1903, to President, District Board, to which no reply had been received. The *Honorary Secretary* was instructed to ask for an early reply. It was further *Resolved*, that this Association strongly protests against the "Cutch" metal, which has been collected on parts of the Chundale-Meppadi road, being put down—, as should this be done the road, though it may look repaired, will not last.

3. **Currency and Cash.**—Read correspondence with the Collector of Malabar, ending with his letter of July 27th, stating that Currency Notes could not be cashed at the Treasury at a commission.

*Resolved*, that the Collector be addressed, requesting him to consider whether arrangements could not be made by which Planters may be supplied with small change at the Vayitri Sub-Treasury in future.

4. **U. P. A. S. I. Delegate.**—Read correspondence with Mr. Romilly ending with *Honorary Secretary's* reply of July 27, 1903.—The *Honorary Secretary's* letter was approved and confirmed.

5. **Labour Law.**—Madras Planters' Labour Act.

A vote of thanks to the Chair terminated the proceedings.

(Signed) H. WADDINGTON,

*Chairman.*

( " ) BERNARD MALCOLM,  
*Honorary Secretary.*

### MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated July 24th, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ... ..	121,985	183,058	14,674
1902-1903 ... ..	132,620	222,408	15,147
11,687 pkgs. INDIAN 22,618 " CEYLON 2,158 " JAVA	Total 36,463 packages were offered in public auction this week.		

With the use of Indian and Ceylon tea continually expanding in foreign and Colonial markets, the subject of duties levied in different countries increases in importance.

Anything that can be done to widen the area of consumption will be of advantage to the industry, and with the object of drawing attention to this matter we print the following table:—

APPROXIMATE DUTY ON TEA LEVIED IN DIFFERENT COUNTRIES  
PER ENGLISH POUND.

CEYLON GREEN TEA FOR NORTH AMERICA.—Since the bonus was first given for the manufacture of Ceylon Green Tea in October, 1898, very steady progress has been made, the total quantity on which the Grant was paid up to the 31st December last being 6,075,985 lbs., viz.:—1898, lbs. 13,302; 1899, lbs. 86,327; 1900, lbs. 472,294; 1901, lbs. 1,590,000; 1902, lbs. 3,914,062—Total lbs. 6,075,985. From the first January to the 27th June this year Certificates had been granted on lbs. 5,483,264.

INDIAN.—Although bidding was somewhat languid, no change was noticeable in quotations for the small quantity of New Tea brought forward. Quality of arrivals to date is fair average from Darjeeling, Assam and Dooars, but a little disappointing from Cachar and Sylhet. Latest musters received appear to indicate improving quality from all districts except the Dooars, where weather has been unfavourable. The following averages are worthy of note:—"Doom Dooma Co. Samdang," 1/2½; "A. F. T. Co. Hilika," 1/1¼; "Hokangoorie," 1/-; "Talup," 11½d.

Week's av. of New Season's tea sold on Garden Acct. 1903, 7,897 pkgs., av. 7'67d. 1902, 10,948 pkgs., av. 6'17d.

New Season's tea sold on Garden Acct. 1st June to date 1903, 35,108 pkgs., av. 7'33d. 1902, 32,782 pkgs., av. 6'16d.

CEYLON.—Offerings continue for the most part of poor quality, hence quotations are low, although no change has taken place in

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

## CURES

RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,

And all Aches and Pains usually treated by outward application.

IT HAS NO EQUAL ON EARTH AS A PAIN  
RELIEVER.

It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

the market. The following averages may be mentioned:—"Wanarajah T. Co. W.," 10d.; "Talawakelle T. E. Co. T.," "Troup" and "Waltrim," 9½d.; "Portmore T. Co. P.," 9d.

Average for week 6·97d. against 6·08d. in 1902.

Ceylon tea sold on Garden Acct. 1st January to date, 572,336 pkgs., av. 7·56d. 1902, 657,697 pkgs., av. 6·75d.

JAVA.—Sold without material change with fair general competition, the Teas being nearly all of direct import, although a few brought over from Holland were included in the sale.

Bank Rate 3 per cent. Exchange on London three months' sight:—Calcutta 1/4<sup>5</sup>/<sub>32</sub>. Colombo 1/4<sup>3</sup>/<sub>16</sub>.

### QUININE.

The firmer tone noted in the second-hand market last week has since continued, owing, it is said, to a better demand for consumption. On Monday a fair business was done, including spot and August delivery, at 11d. per oz. for good German sulphate in bulk. Subsequently further spot sales were made at 11d., August at 11½d. and January-February at 11½d. To-day (Wednesday) 11½d. has been paid for spot stuff.

### CINCHONA.

At the bark auctions on July 23rd 25,382 kilos. manufacturers' and 2,164 kilos. druggists' bark were sold. The amount worked out at 6·55 cents per ½ kilo. (about 1½d. per lb.).

#### SALES OF INDIAN TEA IN INDIA.

IN OUR present issue we publish in full the latest report of the Commissioners in connection with the Indian Tea Markets Expansion Commission. The series of reports issued up to the present time has not dealt simply with the intervals between the various reports. For instance, the one under reference deals with the work of the Commission from its beginning, so that we have a period of two years discussed in very convenient form, the latest date being July 31, 1903. There can be no doubt that the Commissioners have pushed Indian tea under the notice of people to whom it was previously unknown. Generally speaking, their sales have not, we believe, diverted trade to any marked degree from former channels. They have largely opened up new channels, and it is to the keeping open, the widening, and the "feeding" of these that Indian tea-planters must look for satisfactory returns for the expenditure they have incurred. Judged by results up to the 1st ultimo, the expansion schemes, however well it may have worked, has proved very costly; and the chief point at issue now, is whether it is or is not likely to be desirable to continue operations when the three years' work that was undertaken by the Commission shall have been completed. The third year will end on July 31, 1904. It is with special reference to the above issue that we propose to review the present report. If some of our remarks appear to express dissatisfaction, let it not be thought that they are unfriendly. As a matter of fact, we regard the working of the scheme in the friendliest of attitudes, and, recognising the magnitude of the task that was undertaken,

we cannot be surprised if the tangible results show that the direct return has not been proportionate to the outlay.

The financial aspect of matters is of the first importance. It is on record that during the two years of work the total disbursements are Rs.1,84,701; but the cost of working is put at about Rs.1,33,000. The total amount of tea disposed of is 552,323 lbs. Taking this estimate of working expenses and setting it against sales, we find that the expenses amount to about 3as. 10p. per pound. The bulk of the tea—nearly 75 per cent.—was contributed by subscribers. The value of 438,193 lbs. is put at Rs.1,04,269 or say a little under 3as. 10p. per lb. The cost of 154,561 lbs. of tea purchased was Rs.49,261; or about 5as. 2p. per lb. Taking tea subscriptions and purchases together we may say that the Commissioners have had control over 592,754 lbs., the average value of which was a little under 4as. 2p. per lb. It is not altogether encouraging that the expense of placing on the market an article that cost (or was estimated at) 50 pies should be 46 pies. In fact, even if we take as a basis the actual cost of the purchased portion, it is not satisfactory to see that tea that was bought for 62 pies cost 46 pies to place on the market. The figures before us are not such as to enable an exhaustive criticism to be made, however, as some of the tea was given away. The Commissioners state that they will, when giving their final report, try to summarise the results in such a way as to make the record of the scheme as complete as possible. To do this they should at least show the exact quantity that was given away, the quantity sold in chests, half-chests or tins (and average sale price), the quantity sold in packets (and the average price per pound), and the quantity used for sales in the cup (with the average nett price per pound) after deducting the cost of brewing the tea and incidental expenses other than those incurred up to the time of the distribution of the tea for brewing purposes.

It is stated that an extensive area has been covered, embracing over 2,500 villages and towns in India and Burma, and

that all classes of Society have been approached. After all, 2,500 is but a small proportion of the total villages and towns in India and Burma. Nearly 4 million pice packets have been put into circulation, which represents little more than an average of two packets per day in each of the 2,500 towns and villages referred to. Obviously, the Commissioners have only reached the very fringe of the Home demand that must be regarded as a potentiality. Roughly, the sales of packet tea and brewed may be stated to have more than doubled in the second year; but during the last few months sales cannot be said to have increased. It is said that the falling off shown in sales of packet tea during the last few months is attributed to tea being more often taken in larger quantity, in preference to packets. "Many small traders, after selling packets, for a time, ask for the same class of tea in bulk or tins, for purposes of retailing." There is nothing to show how many pounds of tea were thus sold, or how many in packets, or the quantity brewed and sold as an infusion. Sale in bulk or tin is no doubt what should be eventually looked forward to, but it has this demerit, that it may easily lead to adulteration—and thus damage the work of the Commission. As we have said, however, it is to the future that planters must look rather than to the past. Considering the vast area they had to attack, the difficulties of organization for distribution purposes, the novelty of the undertaking, they must be held to have rendered a good account of their stewardship so far; and as, for lack of support, they have had to restrict some of their operations, it would be unfair to criticise results harshly. Properly regarded, this trade that they have opened up should prove to be, in great measure, a permanency. We do not mean that it would be profitable to go on spending Rs.66,000 a year in order to sell 266,000 lbs. of tea; but if the work of expansion be continued for another year or two a permanent demand should be created. A great share of the benefit of this may possibly fall to Messrs. ANDREW YULE & Co. themselves, but they will have worked without commission for three years and will at the end of that period be exposed to competition if they try to secure for themselves the bulk of the Indian trade in tea for Home use. We had, we confess, hoped for larger results, and less costly, from the Expansion scheme; but in years to come it is possible that all the outlay incurred may yield very handsome dividends. This will depend chiefly upon whether a permanent or only an evanescent demand for tea can be established among the peoples of this country.

#### U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

#### LOUISIANA PURCHASE EXPOSITION, 1904.

The Indian Tea Association (Calcutta) has issued the following circular:—

I am directed by the General Committee of the Indian Tea Association to inform you that arrangements are being made, in conjunction with the Committee of the Indian Tea Association, London, for an adequate representation of Indian teas at the International Exposition to be opened at St. Louis, U. S. A., in 1904.

The exhibit, it is intended, shall include a collection of teas, both black and green, from the various tea districts of India, and the General Committee are desirous of having samples prepared before the end of the present manufacturing season. The samples preferred are ordinary trade samples say of 2 lbs. weight and they should be securely packed in lead so as to ensure their keeping until next year.

Samples may be consigned to the Secretary, Indian Tea Association, Calcutta, and the Committee will make arrangements for forwarding them to the London Branch of the Association. Further information will be given as to the latest time for receiving samples.

The General Committee are particularly desirous of sending a representative exhibit of Green Teas, in order to follow up the good beginning already made in America with teas of this class.

#### INDIAN TEA MARKETS EXPANSION COMMISSION.

##### REPORT OF THE COMMISSIONERS FOR THE PERIOD ENDING 31ST JULY, 1903.

The Commission came into operation two years ago, and is now entering on the final period of its existence. Former reports having described the various channels of work initiated to further the consumption of tea in India, it would only savour of repetition to go over these details again, and the present Report is therefore a short one.

The Tea Industry to-day is fortunately in a very different position to what it was when the Commission was started. As to what share the scheme may have had in bringing about the improvement, is an open question, but there is not the slightest doubt, but that the steadily persistent effort to introduce tea-drinking to the people of India, has resulted beneficially in many ways. Not only has tea been placed in villages where previously it was unknown, but in many of the larger towns foreign rubbish has been supplanted by sound Indian tea. The foundation has thus, it is hoped, been laid of a demand which, although of slow growth, may be confidently expected to expand until India herself becomes one of the largest consumers of Indian tea.

The previous report indicated that unless further help were accorded an extension of working was impracticable. Such additional support has not been forthcoming, and it has therefore been found necessary, in some measure, to restrict the operations previously initiated. No effort, however, has been spared to make the most of the means available.

An extensive area has been covered, embracing over 2,500 villages and towns in India and Burmah, and all classes of Society have been approached.

The cost of working for the past two years is approximately Rs.1,33,000. The apparent increase for the last six months of this period is due to the adjustment of the Delhi Durbar demonstration account and other ventures. The resources still available roughly amount to Rs.65,000, supposing tea in stock and outstandings realize valuations.

PICE PACKETS.—Nearly 4 million packets have been put into circulation during the period under review. When it is remembered that these are purchased by people who mostly cannot afford to take more than one or two at a time, it will be admitted that this large total shows a considerable amount of work.

The figures for the various months are as follows :—

	1901-02.	1902-03.
August	Nil	171,088
September	45,901	203,580
October	82,588	203,894
November	86,521	210,155
December	64,327	220,107
January	111,640	230,983
February	135,038	215,003
March	67,298	199,310
April	109,761	188,956
May	191,660	193,402
June	195,743	170,200
July	207,589	183,023

The falling off during the latter months is attributed to tea being now often taken in larger quantity, in preference to packets. Many small traders, after selling packets for a time, ask for the same class of tea in bulk or tins, for purposes of retailing.

BREWED TEA.—The demand for brewed tea continues to expand, nearly one million cups having now been sold, as follows :—

	1901-02.	1902-03.
August	1,130	38,574
September	13,880	53,758
October	16,440	49,869
November	18,922	53,368
December	16,458	53,758
January	18,705	56,388
February	30,687	59,084
March	31,714	58,864
April	35,086	56,726
May	36,222	54,537
June	37,533	54,608
July	46,133	57,869

Considering the excessive heat of the past few months the figures are distinctly encouraging.

The above by no means represent the actual quantity of cups of tea disposed of, but only what have been accounted for, for it is impossible to secure accurate returns from the vendors. These figures, moreover, do not include a large number that have at various times been distributed free of charge, the most notable occasion being the feeding of the poor on the Calcutta maidan, in connection with the Coronation Festivities, when 85,000 cups were given away.

OFFICIAL AND NON-OFFICIAL OPINION.—The following are a few of the opinions expressed on the last Report :—

HIS EXCELLENCY THE VICEROY.—“Congratulate you on the steady progress made.”

THE GOVERNOR OF MADRAS.—“Read the Review with interest, and delighted to see that the satisfactory progress of last year has been maintained.”

THE COMMANDER-IN-CHIEF.—“Acknowledge with thanks the receipt of the interesting Report.”

LIEUTENANT-GOVERNOR OF BURMAH.—“Perused the Report with interest.”

THE CHIEF COMMISSIONER OF ASSAM.—“Read the Report with much satisfaction. The success obtained is most encouraging.”

H. H. THE NIZAM OF HYDERABAD.—“The Hon'ble the Resident has read the Review with much interest. One copy of the Review has been forwarded to H. H. the Nizam's Minister for the information of His Highness' Government.

H. H. THE MAHARAJAH OF DURBHUNGA.—“Congratulate you on the progress made.”

THE SECRETARY, INDIAN TEA ASSOCIATION, LONDON.—“Read the Report with much interest, and note it continues to show satisfactory progress. Best wishes for a continuance of same.”

HON. MR. J. BUCKINGHAM, C.I.E.—“The progress made seems highly satisfactory, and I am sure we all are indebted to you for the interest you have taken in this matter.”

MR. JOHN HENDERSON, CHAIRMAN, NOWGONG BRANCH, INDIAN TEA ASSOCIATION.—“Most encouraging results, and the Tea Industry are greatly indebted to you for the success of the scheme.”

MR. W. EDWARDS, CHAIRMAN, BISHNAUTH BRANCH, INDIAN TEA ASSOCIATION.—“Remarkably satisfactory results. The Industry owes a debt of gratitude to you for the successful way in which you have coped with the undertaking.”

MESSRS. MCLEOD & Co.—“Progress distinctly encouraging.”

MESSRS. W. S. CRESSWELL & Co.—“Congratulate you on the steady progress made in pushing the sale of Indian tea, both by pice packets and brewed tea, as shewn month by month. Few people realize the difficulties incurred, and the volume of detail work that has to be put through in connection with it.”

MESSRS. BEGG DUNLOP & Co., LONDON.—“Glad to note the satisfactory progress made and the encouraging comments of subscribers and others interested in the scheme.”

MESSRS. GOW, WILSON & STANTON, LONDON.—“The result of the work so far is most encouraging, especially as the pice packets and number of cups of tea sold during the past six months of the Commission amount to about as much as during the whole previous year. This seems to show that a market for Indian tea can be found amongst the natives of India, and we most heartily wish you every success in the sustained efforts you are making in this direction.”

MESSRS. WM. JAS. & HY. THOMPSON, LONDON.—“You are due the gratitude of all concerned in Indian tea. The difficult and arduous work of pioneering has been more than ably carried out by your firm. We note the steady improvement in sales month by month, and consider that you have now tapped the source of a demand which may easily exceed the hopes of even the most sanguine.”

MESSRS. GEORGE WHITE & Co., LONDON :—“Pleased to note the progress that has been made in cultivating a taste for Indian tea amongst the native population.”

MESSRS. LLOYD, MATHESON & CARRITT, LONDON.—“Pleased to see such gratifying results from your efforts.”

MESSRS. SHEPARD & Co., LONDON.—“Glad to note the progress which has been made, and heartily wish you continued success.”

W. A. DRING, ESQ., AGENT, EAST INDIA RAILWAY.—“My congratulations on the great progress shown.”

MESSRS. PARRY & Co., MADRAS.—“Congratulate you on the success that has met your efforts.”

HON. MR. GRANVILLE L. ACWORTH, CHAIRMAN, CENTRAL TRAVANCORE PLANTERS' ASSOCIATION.—“A most satisfactory record of satisfactory progress, and I congratulate you most heartily on the result achieved in the brief space of 18 months. Further I congratulate you on the public spirit you display in inviting others into the field. I myself consider that the whole planting community of both N. and S. India is most deeply indebted to you for the public spirit, for the energy and intelligence you have brought to bear on the work, and for proving that we have a market in this Empire if we take a little trouble to acquire it. The most satisfactory feature of your Report is the steady monthly increase in the sale of pice packets. This goes to prove that the native is learning how to brew tea for himself, and that he is also acquiring a taste for sound tea.”

SUPPORT RECEIVED TO 31st JULY, 1903—Is as follows :—

Received from Contributors.	438,193
" by purchase	154,561
	592,754
Tea disposed of in 24 months	552,323
Tea in stock on 31st July, 1903	40,431

**COST OF WORKING** for the 24 months is approximately Rs.1,33,000 and the

**RESOURCES STILL AVAILABLE**—May be put roughly at Rs.65,000—thus—

Cash in hand	...	say	Rs.	41,000	0	0
Tea in stock	...	"	"	12,000	0	0
Outstandings	...	"	"	16,000	0	0
			Rs.	69,000	0	0
less deposits from Agents	...	"	"	4,000	0	0
			Rs.	65,000	0	0

Subscribers may rely on the continued efforts of the Commissioners to do the best possible with the resources at their disposal, which, with care, it is hoped, will enable the working to be carried on for the remainder of the period for which it was framed, and which will terminate on 31st of July next.

More detailed Reports might be furnished, but this would entail an amount of work which at present can be applied more usefully in other directions. The Commissioners will, however, endeavour, if possible, in giving their final Report, to summarise the results in such a way as to make the record of the scheme as complete as possible.

(Signed) ANDREW YULE & CO.,  
Commissioners.

CALCUTTA,  
8th August, 1903. }

## TEA IN CACHAR AND SYLHET.

### POSSIBILITY OF IMPROVING QUALITY.

The following are extracts from Mr. Harold Mann's latest pamphlet, entitled "The Tea Soils of Cachar and Sylhet":—

When all allowances are made for exhausted teela lands, low lying rank lands, or even exhausted or droughty flats, there remain some gardens and some areas which ought, by every consideration of soil, to produce high-class tea, or at any rate tea at least equal in value to that of the Jorhat District of Assam. Thus the upland of Kalline seems quite capable of making excellent tea. The same applies to the older parts, at any rate, of Doloo, to a large part of the Koombergram plateau, and many places in Sylhet. Why, however, is it that the produce does not compare with that in the district I have named, and is constantly two pence or three pence per pound below the latter in value? The question of the necessity for this state of affairs becomes all the more pronounced when certain gardens, as, for instance, some in the Monoo or the Luskerpur Valleys in Sylhet, have been able to maintain a fairly high quality for several years, or recently to attain to it. In fact, when everything is taken into consideration, I am not only unable to account for the low dead level of quality said to be unavoidable in the districts we are considering on such gardens and types of land as I have named, but positively I can hardly believe it to be unavoidable at all in many places. When it is remembered that the quantity of tea demanded from the land is very large as compared say with the Jorhat, Sibsagar, and Golaghat Districts in Assam, it cannot but be regarded as a necessity that the quality of tea should be correspondingly lower. Into the vexed question of whether it pays best to go in for making a large quantity of low medium or common tea, or for producing a smaller quantity of high medium or fine tea, I cannot, of course, enter here. But I can see no reason, if a corresponding reduction in the demand for quantity is made, why a type of tea at least of high medium quality cannot be obtained in the cases above cited, and some others.

But I do not want it to be understood that it is my opinion that all gardens can make fine quality teas by merely plucking finer, and so reducing the amount demanded. By no means. This is a fallacy which has too often led to disaster in the past three or four years. There are gardens in which no amount of fine plucking will give really fine teas, and were only "a bud" plucked in many places, I have much doubt as to whether the tea would fetch a very high price. Such places are exhausted teelas, and rank low lying lands, or the stiff and shallow soils with which I have dealt above. In many of these it is a case of quantity or nothing. But to condemn Cachar and Sylhet to produce teas more or less common, and say that no place there can produce the high quality of Assam, seems to be to make far too wide a statement, and to apply what may be true of some properties to all. There is no reason, in my opinion, why a much higher grade tea should not be produced in Sylhet, than has hitherto been the case, always postulating, of course, that less tea be made.

But is it not possible, without materially reducing the yield, to make a much higher grade tea? It is known that in many of the Dibrugarh and Sadiya Road (Assam) properties, a very large yield of very high quality tea is made by a particular process of plucking, which, however, is said to be inapplicable elsewhere.

The yield on these gardens is as high as almost any properties (except those on bheels) give, and yet the quality stands about the highest in the plains districts of India. As is well known, this is produced by a system of close plucking, the exact character of which, as it is not generally understood in Cachar and Sylhet, I will indicate here. The growth of the bushes is allowed to become a good length in the early spring, and then plucked, say in early April, leaving three or four (preferably four) leaves on the new growth. This is again allowed to grow, and again plucked in May, leaving two more leaves on the secondary shoots thus produced. From that point every shoot containing two leaves and a bud or less is plucked at every round of the garden, and thus in every case very fine leaf is obtained, which in Dibrugarh makes very fine tea,—and yet a large quantity is obtained. The objections always raised to this system are two.

- 1. It cannot be carried out without an exceedingly large labour force, owing to the difficulty of plucking the small leaf obtained, end owing, as it is said, to the rapidity with which the round of the garden would have to be made.
- 2. It means that under the climatic and soil conditions of Cachar and Sylhet, and even of the lower Assam Valley, the bushes would be ruined, for what with the long droughts which prevail, and the hot weather, the bushes have not the recuperative power of those at Dibrugarh and would hence quickly suffer and probably die.

In its bare form, as used in the Sadiya Road District, these objections are almost certainly (especially No. 2) well founded, and I could not in any way be a party to recommending its adoption in Cachar and Sylhet. But I do suggest that on a small scale experiments should be carried out as to its applicability on those gardens capable of making high medium quality, with such modifications as would be necessary to suit the different conditions. These modifications would be—

- (a) Instead of plucking all leaf two leaves and a bud old and under at as early a date as the end of May, this could on no account be done till the end of June.
- (b) Instead of plucking the secondary shoots down to two leaves and thereafter taking everything, it would be wise to leave one or even two leaves on the third and perhaps fourth flushes, and only after this adopt the method which is characteristic of the system.

With such modifications I would much like to see this method tried in Cachar and Sylhet, it being understood that it ought in the first instance to be considered merely in the light of an experiment, and hence only carried out on a very limited area, and further that it can only be possibly applicable where the soil passes a certain standard. It will be seen that this method differs from ordinary plucking late in the season, by not merely taking every shoot which has two leaves and a bud on it when the leaf is plucked, but also every shoot younger than this at the same time.

EXCEPTIONAL GARDENS.

Another point which has led to a good deal of anxiety during the progress of this investigation is the existence in one or two places in special situations close under the Khasia or Naga hills in which the characters of the tea are not what one would expect from an examination of the soil. I have already alluded to one of these previously in speaking of Kalline upland soil. Another equally striking is shown by the Lackatoorah garden in North Sylhet. These gardens,—and especially the latter,—are in the samples studied, poor in Nitrogen and Organic matter, but rich in Phosphoric Acid,

and moderately so in Potash. It undoubtedly needs Organic manures, such as cattle manure and oil cake, and these have already been applied with great effect. But why does it not give better tea than is actually the case? I must own that to the present I have been unable to answer the question. In Kalline, it is probably the case that the upland tea is mixed with a much larger amount of tea from low flats, and hence its quality is never detected among the mass of tea with which it is mixed, but this cause can hardly be operative in the other case cited. The excessive rainfall in North Sylhet may be the cause of a non-mature growth, but until one can make a close examination on the spot of these apparently exceptional soils, one cannot know quite to what cause the results may be attributed.

COFFEE NOTES.

**Brazil 1902-03 Coffee Crop.**—The Board of Trade are in receipt, through the Foreign Office, of a despatch from H.M. Minister at Rio de Janeiro to the effect that, according to the latest available returns, the export coffee up to date (despatch dated June 17) from Brazil of this season's crop, which, beginning in July, ends in June, is given at 11,753,441 sacks, of the value of 17,607,975l., as against 13,693,602 sacks, of the value of 22,889,683l., showing a decrease in value of 5,281,708l., or over 100,000 contos of réis. There is a diminution in value of coffee in Brazil per arroba of 25 lbs. of about one (milréis 2s. 3d.) as compared with the month of June, 1902, whilst the price in the London market has diminished by about 3s. per cwt. in the same period.

\* \* \*

**Bickford's Coffee Circular.**—The market is apathetic. During and since the July holidays business has been very quiet, and little improvement in this respect may be expected for the remainder of the month. Price changes have been few and unimportant, but naturally tending lower where changes have been made at all. Receipts at the ports of Brazil for the crop year ending June 30th were 12,324,000 bags, as against 1901-02, 15,439,000 bags and 1900-01, 10,927,000 bags. The receipts for the first few days of July exceed those of the two preceding years; the period of comparison is too short to really be indicative one way or the other. It is said, however, that the receipts are mainly new crop, comparatively little of the old remaining in the interior. To-day's first hand stock consists of 12,837 bags Costa Rica, 2,482 Nicaragua, 29 Honduras, 18,679 Salvador, 49,429 Guatemala, 3,148 Mexican, and 6,921 various; in all, 93,525 bags.—*Weekly Commercial News* (S. Francisco, 16th July).

\* \* \*

**Coffee in Ceylon.**—Poor old Coffee has once again shrunk in Ceylon, the difference being

		Arabian.	Liberian.
June 1902 (acres) ...	...	4,304	758
July 1903 " ...	...	3,686	615
Reduction--acres ..		618	143

\* \* \*

**Brazil Coffee Popular.**—Although the production of what are called "mild" coffees seems to be shrinking while that of Rio and Santos grades is expanding from year to year, the supply of the former in our market seems to be sufficient for all requirements, says the *Merchants' Review* of 17th ultimo, and instead of improving in tone as the crops grow com-

paratively smaller, as would seem to be natural for the mild coffees to do, they have gradually lost strength in sympathy with the declining tendency of Brazil coffees.

The fact is, no doubt, that the Brazilian supply is not only ample as regards its magnitude; but also as regards its variety, being sufficient, or very nearly so, for the gratification of all of the varied tastes of the coffee consumers of the world. Hence, if the supply of mild coffees should actually decrease almost to the vanishing point, the consuming public might not be the wiser. This fact, if fact it is, would partly explain why coffee-raising continues to be fairly profitable in Brazil at the low prices ruling in recent years. According to this view great quantities of Brazil coffee grade as East Indian or Central American, and sell at corresponding prices. It is a feather in the cap of the Brazilians, their turning out of coffee which vies with some of the finest in the world, but we could wish that they were equally skilful in turning out crop estimates in advance of the crop.

About a year ago the trade here were gravely assured by Brazilian coffee men that the Rio and Santos crops then being marketed would aggregate only from about 8,000,000 to 9,000,000 bags. Actually the crops reached a total of 12,250,000 bags. Those Brazilian statisticians would delight American taxpayers if they were put in charge of real estate assessments, for one could be always certain that their assessments would be low, even though inaccurate.

During the fiscal year 1903 the total production of coffee, as measured by the world's receipts, was about 16,500,000 bags, or about 500,000 bags in excess of the total deliveries of coffee. Deliveries are the only guide to the consumptive capacity, but these figures represent a consumption so extraordinary, as compared with the quantities of coffee annually consumed only a very few years ago, that we may be pardoned for suspecting that speculative purchases have had considerable to do in producing the total of 16,000,000 bags.

The following table shows the world's production and apparent consumption of coffee during the past four years:—

	Production			Consumption.
	Rio and Santos.	All other Countres.	Total.	
1899-1900	8,959,000	5,654,247	14,613,247	14,972,699
1900-1901	10,927,000	4,429,991	15,356,991	14,329,925
1901-1902	15,439,000	4,471,367	19,910,367	15,516,663
1902-1903	12,324,000	4,282,746	16,606,746	15,967,904
	*	*	*	

**Market and Prospects.**—In their report dated 31st ultimo Messrs. G. Duuring & Zoon say:—The market continues in the same lethargic state. The weight of supplies has been light, whereas nothing has occurred to make buyers emerge from the policy of caution adopted hitherto.

First hand dealings were very moderate, chiefly consisting of Java Plantation, husked in Holland; several parcels, being of an attractive quality, realized full values. Supplies will be on a more liberal scale during the next months. Previous values of Liberian were freely maintained; this year's crop promising to be smaller.

Little doing privately. With regard to Santos, it is to be noticed that there is a wider range of values than previously between desirable and indifferent descriptions; good qualities are attracting attention, whilst with unattractive and poor grades, progress has been more difficult than ever. The trade is much looking forward to new crop Coffee, which ought to command better prices, although the bean is reported smaller.

Arrivals with us were on a moderate scale, only 31,600 bags from Java and 72,900 bags from Santos. Deliveries of the latter amounting to 66,000 bags, our stock has slightly increased by 6,900 bags Santos Coffee.

Loading ss. *Bali, Flores, Sindoro, Oranje, Timor, Salak* and *Bogor*.

Terme dull and featureless, business restricted to 40,000 bags or 497,500 bags since 1st January. Quotations  $\frac{1}{2}$ ct. down for the month, viz. 14 $\frac{3}{4}$ cts. per September, 14 $\frac{3}{8}$ cts. per December, 15cts. per March and 15 $\frac{1}{4}$ cts. per May. July contracts 20,500 bags, tenders 13,500 bags. The September liquidation, which is rather heavy, is now going to play a prominent part and under circumstances may have a depressing influence.

The Santos crop is an early one this year; this accounts for the liberal range of receipts, almost identical with those of 1901 (crop about 10,100,000 bags). It is almost impossible to make any deductions as to the volume of the crop, receipts being the only tangible fact to go by. Last year about 1 $\frac{1}{2}$  million bags were carried over from the previous bumper crop, such is not the case this time and if production should be on the same scale (8,350,000 bags Santos), export figures would be less by 1 $\frac{1}{2}$  million bags, which is another feature worth noticing. The heavy receipts in Santos had no adverse influence upon values, shipments holding the balance, although the market in Santos is held above European parity.

The position of fazendeiros in Brazil is getting most critical; it seems no longer possible to grow Coffee without losing money. Exchange continues firm at present rates and the labour question is quite to the front. Immigration of Italians is almost suspended; the following figures speak for themselves:

	First three months	1903.	1902.
Immigrants	...	6,869	24,344
Emigrants	...	9,147	9,583

European stocks at the end of June were 2,350 tons more, a revision of stocks in Hamburg giving an excess of 6,880 tons. It is hard to understand how the biggest Coffee market in Europe, with all modern installations is unable or unwilling to control its stock, stored in bonded warehouses. The trade in Hamburg is evidently satisfied with private returns, which are beyond control. The visible supply was 2,000 tons less.

**Java Coffee.**—The Government *Java* crop is estimated at 209,000 Peculs.

**The Year's Coffee Movement in the U. S.**—On June 30 the most phenomenal year in coffee came to a close, says the *American Grocer*. It was notable for the heaviest deliveries on record, the largest visible supply July 1, ever held at that

date, showing an increase in two years of 5,032,546 bags; the lowest price on record, 3.55c. for No. 7 Rio; prospective supply for 1903-04 ahead of any previous record.

The total receipts at Rio during the year 1902-03 were 3,974,000 bags; at Santos, 8,350,000 bags; at both ports, 12,324,000 bags, against 15,439,000 bags, 1901-02; 10,927,000 bags, 1900-01; total three years, 38,690,000 bags; annual average, 12,896,666 bags.

The total receipts of all kinds of coffee in the United States was 6,871,027 bags; against 7,905,815 bags in 1901-02; in Europe, 10,018,813 bags, against 11,107,552 bags, 1901-02; total both countries, 16,889,840, in 1902-03, against 19,013,367 bags in 1901-02.

The total deliveries in the United States of all kinds of coffee in 1902-03 were 6,847,877 bags; in Europe, 9,118,621 bags; total United States and Europe, 15,966,498 bags, against 15,516,663 bags, 1901-02; 14,329,925 bags in 1900-01; total three years, 45,813,086 bags; yearly average, 15,271,028 bags.

The total sales on the New York Coffee Exchange for the year ending June 30, 1903, were 9,956,250 bags, against 9,707,000 bags during 1901-02. The sales during June were 510,500 bags; highest price, 4.80c. for May; lowest, 3.55c., July. Spot No. 7 Rio ranged between 5  $\frac{1}{16}$  @ 5  $\frac{1}{4}$ c.

Prices fluctuated between 8c., the highest for No. 7 Rio, and the lowest, 3.55c. The highest price since July, 1889, was 9.20c., March, 1901, delivery. June prices were the lowest on record.

The following statement shows the June movement in detail:

Total deliveries, twelve months, 1901	...	14,329,925
Average deliveries monthly, year 1902-03	...	1,330,541

Of the total deliveries in the United States, 5,695,970 bags were Brazil and 1,151,207 bags of all other sorts; total, 6,847,877. About 83.2 per cent. of the total deliveries were of Brazil sorts and 16.8 per cent. of all other kinds.

The above indicates the tremendous growth of the coffee industry in Brazil, made more apparent when we recall that

during the nine years 1881-88, the average yearly deliveries were 658,066 tons, of which Brazil furnished about one-half. The latest Government report of the imports of coffee to May 31 shows that about 80 per cent. of the imports came from Brazil; 8 per cent. from other South American countries; 8.3 per cent. from Central America and Mexico; less than 2 per cent. from the East Indies. It is evident that Brazil must be supplying most of the Java and Mocha coffee sold.

The outlook for 1903-04 is for a supply far ahead of any previous year. The Brazil crop will be larger than last year, so that with a carry over of nearly 12,000,000 bags in first hands and the largest invisible stock ever known, prices must rule low.

\* \* \*

**The U. S. Coffee Market.**—Coffee prices are weakening, says the *Tea and Coffee Trade Journal* of 21st ultimo, under stress of the rapidly-growing additions to the world's supplies, already immense; the market itself is quiet. In options July has again fallen to 3.50 bid, the low-record mark, but while actual coffee is fractionally weaker the very low quotations of last month have not been reached. The cry continues for good roasting coffee and these are relatively difficult to obtain, commanding always a premium from  $\frac{1}{4}$  to  $\frac{3}{4}$ c.

The receipts in Brazil are exceptionally heavy, indeed so heavy as to inspire some with the belief that a 15,000,000-bag world's visible supply will be reached by October, bringing coffee prices down to a mark that must make its effect felt on the prolific Brazil growers, and invite purchase and holding coffee for speculation against a possible and even probable upward coffee movement to follow. In this probably the rumour that the Lewisohns are organizing another 1,000,000-bag syndicate has its foundation.

Brazil firm offers are easier and ragged. Locally spot invoice is easier and but little active, quotations closing at 4  $\frac{7}{8}$ c. for No. 8 Rio, 5  $\frac{1}{8}$ c. for Rio No. 7, 5  $\frac{5}{8}$ c. for Rio No. 4, and 5  $\frac{7}{8}$  to 6c. for Santos No. 4. A sale at Rio was 2,500 bags of Rio No. 7 at 5  $\frac{1}{4}$ c., store terms, for shipment to New York. Jobbing business has been light.

In milds there is a dull market and prices are easier. Supplies continue arriving in large quantity, but not buyers. Stocks are much heavier than one year ago. Good Cucuta is now 7  $\frac{3}{4}$ c. East Indies are quiet.

\* \* \*

Arrivals of mild coffee at New York since July 1st, to July 18, have been 62,219 bags, including invoices from Savanalla of 10,887, 2,774, 5,047, 5,628 bags, 7,805, and 12,103 bags Maracaibo and 1,315 and 95, bags La Guayra and exports to same date have been 10,197 bags.

\* \* \*

Chicago imported during June last 24,000 lbs. of coffee from Aden, according to Customs report.

\* \* \*

Now is the time, says the *American Grocer*, to work up fine blends, introduce and advertise them. There is more money in coffee, if properly handled, than in any other staple the grocer handles.

## TEA NOTES.

**New Season's China Teas.**—The *China Express* of 24th ultimo says:—The reception that has been accorded to the first arrivals of the New Season's China Teas is quite encouraging to those who are still interested in that once great trade. "The trade make the China Teas very fine this year, especially the Kintucks," is a fair sample of the expressions that have been made to us in response to enquiries. It is evi-

dence of the belief in them that some of the earlier purchases of the fine and finest kinds which originally fetched good prices have been resold at higher rates.

**The Importation of Inferior Tea.**—The London correspondent of a Colombo paper writes:—The Secretary of the Ceylon Association has now heard from the Treasury (to where the matter had gone from the Board of Trade) regarding the tea rejected in America which it was stated had been shipped to this country. They report that, as the tea is not mixed with other substances or exhausted tea, it is not considered unfit for human consumption, though of inferior quality. The letter adds that my lords have no power to prohibit its importation. This is a matter which requires looking into, and it has been suggested to Mr. Leake that he should send the letter to the *Times*. It is not generally known, though of interest in connection with this subject, that Ceylon and other teas are often exposed for sale in Mincing Lane “for exportation only;” that is to say, the Customs will not allow them to go into consumption in this country, but they may be exported for drinking purposes under bond. Only a few weeks ago 20 chests of Ceylon tea with the mark “Asna” were put up in this way and taken out at twopence a lb. It would almost appear as if there were three kinds of tea. First, teas which are fit for the citizens of the United States; second, teas which are not good enough for them, but which are suitable for the inhabitants of the United Kingdom; third, teas which will not do for Britishers, but are good enough for “foreign devils,” as the Chinese have it.

**Selling to an Eighth.**—I mentioned recently, says the London correspondent of a Colombo paper, that some of the benevolent buyers, who are always looking about for an excuse to give planters a better price for their tea, were agitating to get the farthing bids done away with and bids of an eighth substituted. Since then the matter has run a very curious course. It has not been brought officially before the Associations, and, with an exception to be referred to, the catalogues continue to be printed with the words on them “to advance a farthing.” One firm of brokers, however, now omits these words and takes bids of an eighth. This may seem a small matter, and one affecting only that firm and their clients, but it is very far from being so in reality. The farthing advance is part and parcel of the “conditions of sale,” and they are the magna charta of the producer in the London market. Besides, this inconsistency of practice leads to all sorts of rowdyism and disputes in the room as to whether the new bids shall be received or not. The innovation may be a good one for the seller, or it may not; but before the conditions of sale are tampered with the question ought to be thoroughly threshed out by the various Associations, and not decided in this back-door fashion at the caprice of individual brokers.

**Ceylon and Indian Tea.**—The *Ceylon Observer* gives the aggregate area under Tea in Ceylon as follows:—

Total of Tea Area,	Acres.
June 1902 =	382,334
Do. do. July 1903 =	382,917
Increase...	acres 574

and remarks, against this we may place the extent of tea in India at the end of 1902, which was 525,252 acres or an

increase of only 485 acres on the previous year! The grand total for India and Ceylon is, therefore, 908,169 acres of our staple—an extent which includes very little young tea, nothing worth speaking of.

**Ceylon Tea: Monthly Shipments to United Kingdom and Estimate—**

Estimate for	July 1903	— 10 to 10½ million. lbs.
Total Shipments	1903	9,500,000 „
Do.	1902	10,724,781 „
Do.	1901	8,488,409 „
[Estimate for August 1903—7 to 7½ million lbs.]		

**Coarse Plucking.**—The *Englishman* has received the following note of warning by this mail from London from a very influential correspondent:—

From recent telegrams there appears now to be a certainty of a largely increased crop of common tea from India this season. This is due, to a great extent, to free plucking done mainly from choice, although with a few a too short labour force to take off the leaf in time may be the reason. It seems hopeless to expect many growers to restrain their desire to obtain a small advantage, even though it is done at the cost of great ultimate loss to the tea industry, themselves included.

No lesson, however severe, appears to be able to cure this mania for coarse plucking immediately a paying level of prices is reached. The result of this is that common tea must fall in quality and commonest may go very low in price in the course of the next few months, as there will be more of it than the trade can take. Coarse plucking in a season after there has been a shortage of common tea with a rise in price does little harm, provided only a few do so, and may even be considered smart, but when the few begin the many follow as appears to be the case this year and then it becomes the extreme of folly and is disastrous to everyone connected with tea. It will be of undoubted advantage here, as in America, to purchaser, dealer and consumer alike, that a stop be put to the importation into this market of the poorest kinds of tea, which are the worst bargain of all to the consumer. Allowing their importation without restriction seems to be rather less than fair to the British tea-drinker. Some 60,000 packages of the worst class of China tea have been shipped back to London from New York this year. A considerable proportion of this large quantity was condemned by the American Customs as unfit for use in America. Is there any good reason why the Britisher should be made to drink tea considered too bad for the American Consumer, whether it be China tea or the too coarse kinds from India and Ceylon? Does it not seem unwise for Indian Tea-Growers to be sending forward tea to compete with this rubbish, and so injure the reputation of Indian tea?

**Java Teas via Siberia.**—A correspondent writing to the *Straits Times* from “Netherlands India” says:—Tea-planters in Java look forward to the proposed Java-Japan steamer line doing them a profitable turn. The boats call at Shanghai, where Java tea can be transhipped for despatch to Russia by the Siberian railway, on which that article is carried free. Ceylon planters have already taken advantage of the railway for despatching their teas to Odessa, instead of by the Suez Canal route (*sic*) which means payment of import duty at that port.

**Calcutta Tea Market.**—At the tea sale on 14th instant 26,534 packages were offered and 24,410 sold. The market was steady for all descriptions, the quality of a fair average, and the bidding brisk for outside markets.

\* \* \*

The Government of Bengal, in the Municipal Department, has addressed a circular letter to the managers of tea gardens round about Darjeeling inquiring if they would be willing to substitute electrical power for working their machinery if Government could supply the same, says the Darjeeling correspondent of the *Englishman*.

\* \* \*

**London Tea Market.**—Weekly special telegram dated 13th instant from Messrs. Gow, Wilson & Stanton to Colombo reports that the market generally shows a fractional advance and that the market for medium liquoring Pekoes and Broken Pekoes is steady, while the market for common Pekoes and Broken Pekoe is also steady. The price of fair liquoring Ceylon Pekoe Souchong is 6½d. (same as last report) and the average 7d. (½d. up). The average for the same period last year was 6¼. Reuter reports that common and fine qualities of Ceylon tea is rather dearer. Fair Pekoe Souchong is quoted at 6d. (½d. up) and the average for the week is 7d. (same as last report). 31,000 packages of Ceylon tea were offered for sale and 30,000 disposed of. Indian tea:—Packages offered 26,000 and sold 24,000. Average price of Indian tea 8½d. (⅔ of a penny higher than last report).

\* \* \*

**Japan Tea.**—In his report for 1902 the British Consul remarks thus on the Yokohama Tea Market, 1902:—In consequence of the exceptionally cold weather prevailing in April arrivals of new crops tea were considerably retarded, and it was not until the first week in May that any quantity was received in Yokohama, supplies continuing to be scant throughout that month. An active demand immediately set in, at prices averaging about 7 per cent., over the previous year. Reports that have been circulated to the effect that the leaf had been considerably damaged by late frosts proved to be correct, and an increasing inquiry speedily resulted in a strong advance over opening prices, so that, by the end of May, rates ruled fully 20 per cent. over values for similar teas in the previous season. The damage by frost proved very serious, the quantity of the first packings falling short by 25 per cent. of the average crop, whilst the quality of the leaf was very disappointing, owing as much, perhaps, to hasty preparation as to the unfavourable climatic conditions.

The United States Government having notified the removal of the existing duty of 10c. per lb. on teas, to take effect from January 1, 1903, the season throughout was marked by speculation to a large extent and considerable quantities of tea were held in Japan until late in the year, in order to time its arrival in the United States subsequent to the time fixed for the removal of the duty. The later crop teas therefore continued to maintain the high level of values, and by the end of October stocks of raw leaf in the country were practically exhausted. The abnormally high value of Japan teas during the year has been the opportunity of the Ceylon and Indian tea-planters, and a large increase in shipments of their growths to the United States and Canada has taken place in consequence. Experiments have also been made in both India and Ceylon in imitation of the Japan green leaf which have met with considerable success, particularly in Canada.

In fact, as far as the Canadian market is concerned, the Ceylon leaf has practically monopolised the trade to the exclusion of Japan teas, and there is little doubt that, unless the latter can be produced and sold at considerably lower prices than have ruled during 1902, Canada is a lost market for Japan; while in the United States also the lower grades of Ceylon are steadily and increasingly forcing their way into districts in which Japan teas had formerly no competitor. Exports from Yokohama in 1902 totalled 24,507,966 lbs., against 24,687,170 lbs. in 1901.

\* \* \*

**The U. S. Tea Market.**—In tea the market is moderate, says the *Tea and Coffee Trade Journal* of 21st ultimo. This is an improvement, and is conditioned by inquiry for the new teas, which are now arriving in no inconsiderable quantity. Sales naturally follow, although up to the present time no large ones are reported. The expectation is that from now on a larger business will be done.

Locally, Japans are easier, as might be expected from the heavy exports to this country. Market circulars from Japan report that it is proposed to stop picking tea after August 1, but inasmuch as the third crop is picked during that month, it is probable that September is meant. In fact this is as good as certain. In former years tea has been picked as late even as November, and the trees naturally have been deprived of the resuscitating power needed to prevent deterioration of the quality of the leaf.

Congous are firmer, and London inquiry continues for this tea, but recent offers have not been accepted. They were at 9¼c., but the shipper was to pay freight charges. North China is hard to get, even there, at 9½c. Formosas are steadier, as also Foochows, another small quantity of which has been rejected. It is astonishing how much chance has been taken in bringing tea of this kind under standard into this country. The temptation no doubt is alluring, but the losses in the end must act to dissuade from such enterprise. Country Greens and Pingsueys are very strong. India and Ceylons are firm, which is also true of Ceylon greens. From Calcutta the news is that the market in Indias is strong for good teas, and the competition keen for all grades. Outside interests, including Russian, are operating freely, taking large quantities. Few greens are offered on slack demand and unsettled market. More attention is expected as soon as the prospects in China and Japan are clearer. Advices from London say that in China teas common grades are again being asked for for home use, while exporters quietly absorb a parcel now and again. New York thin liquoring Oolongs looked cheap at auction at 2½ to 3d. per lb. A small green tea sale passed quietly, but prices were steady. In Indian tea there has been more desire on the part of holders to quit stocks of the old teas, and prices have frequently receded ½d. per lb. on bids recently refused. New season's offered a better selection. Darjeelings were in request at steady rates, most grades showing fair average quality. In Ceylon teas the market has a weak tone, which is due principally to disappointing quality. At this period of the year fine teas are generally scarce, but tea with point and flavour has been in very short supply. Young Hyson was sold at 6d., also Hyson and No. 1 at 5½d.

\* \* \*

**Formosa Tea.**—From Amoy, June 15, Tait & Company say:

"During the period under review demand has not been strong except for fine and up grades, these grades meet with a good

reception, and anything really 'Choice' commands an extreme price. The general character of the crop just to market is not altogether approved of, not being true crop teas, natives holding back a good lot of the Spring teas with good leaf, and are now mixing with present crop, but choice grades are good style having very desirable cup flavour but are in small supply, and competition amongst buyers for the few lots on offer, has forced prices up out of all reason. Low grades have not received much attention, and holders show some anxiety to sell, but the same desirable character is not to be had now, as was the case earlier in the season."

There is more tannic acid, or tannin, in China green tea than in black, the quantity ranging from 13 to 20 per cent. in green and 8 to 12 per cent. in black, and there is from 15 to 20 per cent. in India teas.

Chicago importations of tea during June last were 128,016 lbs., which the Collector values at \$22,391. During May the imports were 810,000 lbs.

### NOTES.

#### Cinchona in Ceylon.

Cinchona is slowly increasing from additional plantings in some of the higher districts, the return standing at 3,469 acres representing perhaps 7 millions of growing trees or plants.

#### Cardamoms in Ceylon.

Cardamom planting between June 1902 and July 1903 is represented by an increase of 1,125 acres, the total now being 9,746 acres; but, we may be sure, very little if any more will be planted in the face of the risk of over-production, until there is evidence of new markets or an increased demand becoming available.

#### Insect Pests in Ceylon.

It is notified by the Ceylon Government, under the Insect Pest Ordinance, that the importation of pepper plants into Ceylon from any part of India is prohibited. The Customs authorities will destroy all pepper plants landed in Ceylon from India after the 16th August, and will give no compensation for them. The dried seed of the pepper plant imported for commercial use is exempt from this prohibition.

#### New Cinchona-derivatives.

Messrs. F. Bayer & Co. have obtained a patent (D.R.P. 137,207) for the preparation of salicylic derivatives of the alkaloids of cinchona. The alkaloids are heated with salicylide in chloroform under pressure at 150° C. By this means salicyl-derivatives of the bases result. Salicyl-quinine melts at 140° C., salicyl-cinchonidine at 65°-70° C.

#### Java Quinine.

The result of the tender held on Wednesday, July 22nd, at Batavia is as follows: Of 5,978 kilos. Ed. II. offered, 96 kilos. were sold at an average of 18fl. per kilo. (equal to 10½d. per oz. net in Java, or a unit of 6¾c. Amsterdam), against 15fl. per kilo. at the previous tender. The exports of quinine from Java from January 1 to May 31 amounted to—

	1903.	1902.	1901.	1900.	1899.
Cases...	519	414	821	657	755

#### Cacao in Ceylon.

Last year Cacao showed a total area on plantations of 24,136 acres apart from 7,000 to 8,000 acres in native gardens; while

for last month we got 24,867 acres on regular plantations—an increase of 731 acres—apart from native gardens which some persons now estimate at from 9,000 to 10,000 acres. Say that we count 35,000 acres as an outside estimate for Cacao in Ceylon; and even if 70,000 cwts. are shipped this year, that would only give an average of two cwts. per acre. Surely, says the *Ceylon Observer*, as canker gets checked and eradicated and cultivation is more carefully attended to, we may look forward to the day when Ceylon's export of this product will not be less than 100,000 cwts. and to a remunerative market, considering the growing popularity of of "cocoa" and chocolate.

#### Journal d'Agriculture Tropicale.

#### Coffee in Sweden.

The British Consular report for 1902 says:—The year 1902 has proved of little advantage to all interested in the coffee trade. This market has not escaped the general adverse tendencies that have prevailed, especially as during the latter part of 1901 and commencement of 1902 absolute top prices prevailed, and an excessive import took place in anticipation of a possible raising of the duty. Polished Santos continues to form the greater part imported. The expense of manipulating the article, the taste of which is in no way improved thereby, is equivalent to so much money being thrown away. The worst, however, is that on certain hands mischief is done, inasmuch as with the ignorant public the article is represented to be superior to what it really is, and is sold at prices for which far better qualities are to be obtained. Imports into Gothenburg totalled 7,132 tons, as against 8,738 tons in 1901; Warberg imported 170 tons, as against 196 tons; Halmsted 800 tons, against 854; Malmö 2,225 tons, against 1,972; and Ystad 375 tons, against 327. Sweden may thus be regarded as importing full 10,000 tons of Coffee in the year.

#### Standard Pepper in the U. S.

The Pure Food Committee on Definitions and Standards suggests the following in reference to Pepper:—  
"Standard black pepper is black pepper containing not less than 6 per cent. of non-volatile ether extract; not less than 22 per cent. of starch by the diastase method; not less than 28 per cent. of starch by direct inversion (copper-reducing matters by direct inversion, calculated as starch); not more

than 6·5 per cent. of total ash; not more than 2 per cent. of ash insoluble in hydrochloric acid, and not more than 15 per cent. of crude fibre. One hundred parts of the non-volatile ether extract contain not less than 3·25 parts of nitrogen. The admixture of pepper shells, pepper dust, and other pepper by-products with pepper is an adulteration. Standard white pepper is pepper containing not less than 6 per cent. of non-volatile ether extract; not less than 53 per cent. of starch by the diastase method; not less than 40 per cent. of starch by direct inversion (copper-reducing matters by direct inversion, calculated as starch); not more than 3 per cent. of total ash; not more than 0·5 per cent. of ash insoluble in hydrochloric acid, and not more than 5 per cent. of crude fibre. One hundred parts of the non-volatile ether extract contain not less than 4 parts of nitrogen.

## GENERAL ARTICLES.

### PRODUCE AND PLANTING.

There is one point with reference to the great fiscal controversy which planters will be glad to note. In all the arguments for and against Mr. Chamberlain's proposals no one defends the tea duty. Indeed, both sides abuse it with pleasant impartiality. A writer in the *Daily Telegraph* advocating Imperial reciprocity, and anxious to prove that Codlin is the friend of everyone, especially the consumer of produce now unduly taxed, launches some sarcasm at the "free breakfast table" politicians, and asks what they have really done for the consumer. He says: "If you are to give a preference to the colonies you must put a tax on food." But have the Cobdenites conducted national finance hitherto without a tax on food? If they are to balance the Budget they must put a tax on food, and they do it. If they are to maintain the Fleet they must put a tax on food, and they do it. If they are to pay the Civil List or preserve free education they must put a tax on food, and for years they have been doing it. Mr. Chamberlain has never been at the Treasury. It is not he who set the precedent. But what is true is that every one of the three Chancellors of the Exchequer understood to be opposed to fiscal revision has maintained taxes on food as one of the main sources of national revenue. Lord Goschen taxed it. Sir Michael Hicks-Beach found himself forced to tax it. Mr. Ritchie taxes it, and soundly. At the present moment, even after the disappearance of the registration duty has enabled the Liverpool bakers to raise the price of bread, your tea and coffee, your cocoa, your sugar, your figs and raisins, your currants, and your prunes are compelled to contribute to the Treasury at the rate of £13,000,000 a year, or more than six shillings per head. Take from the national accounts for 1901-02 the following interesting statement of what may be called the 'Free Trade taxes' on food:—

Article of Food.	Rate of Duty.	Total tax.
		£
Tea .. .. .	6 d. per lb.	5,800,000
Sugar ... ..	3d. " nearly	6,400,000
Coffee ... ..	1½d. "	170,000
Chicory ... ..	2 d. "	50,000
Cocoa ... ..	1 d. "	250,000
Figs, Plums, Raisins	1½d. "	280,000
Currants ... ..	4d. "	100,000
		13,050,000

"The 'Free Trade taxes on food,' it will be seen, are heavier than any Mr. Chamberlain would need to impose for the purposes of a trade-extension policy. They are, besides, antiquated in principle, wasteful to collect, and useless for any indirect purpose; while there is no more astounding vagary of our fiscal system than that we should levy nearly £6,000,000 of annual taxation against a product of the Empire like tea. But the point for the working-man to remember is that those who tell him that preference would mean 'taxed food,' and that Free Trade means

untaxed food, are practising upon his intelligence. When workmen sit down to their breakfast they are taxed. They are taxed when they come home to their tea. When their wives buy a pound of that article at 1s. 4d. they receive only tenpence-worth of tea, and they must pay sixpence—that is to say, 60 per cent.—to Mr. Ritchie. And not only every spoonful of leaf in the teapot is taxed. Every lump of sugar in the bowl is taxed. When the baby begs for a lump of sugar it becomes a taxable consumer, and the Treasury takes toll on the baby. Every pot of jam on the table is taxed; every currant in the fruit-loaf is taxed; and whenever the working-man in the evening takes out his taxed tobacco after his taxed tea and lights his pipe he pays more than any other man in any other country who attempts the same soothing operation. Where are the Radical leaders who have ever made a serious effort to mitigate these imposts? And where are the Unionist 'free-fooders' who have ever thought hitherto of proving that they have the slightest title to that name by proposing to remove the existing food taxes, which take 8d. or 9d. a week out of the wages of every man in fair employment who has to pay the grocer's bill for an ordinary household. The truth is that under Free Trade there is no party which would dare, if definitely challenged by Mr. Chamberlain upon the point, to give an official pledge to remove the £13,000,000 of annual taxation now levied upon food. Irresponsible enthusiasts may be encouraged for electoral purposes to talk about 'a free breakfast-table,' but the talk would be a form of amiable futility in the future, precisely as it has been up to now." He goes on to say: "Whichever way we turn the question, whether we reckon in gross for the nation or in detail for separate households, it is clear that the people cannot be injured even to the extent of one farthing upon the weekly grocer's bill by adopting Mr. Chamberlain's plan of taxing food for trade extension purposes, instead of Sir Michael Hicks-Beach's plan of taxing food to waste. Where is the household in the land in which bread is used, but in which tea and sugar are not used in proportion? Everyone who has ever penetrated a modern slum, and made a personal attempt to investigate at first hand the condition of the people, knows that where the submerged third are underfed it is because they cannot afford meat. But they drink more tea in proportion than any other class. The poorest of the poor would gain most of all by no longer being taxed on every cup of tea and every lump of sugar. Half the sixpenny duty on a pound of the cheapest tea would pay the extra halfpenny on six quarter loaves, and the other threepence would be available for meat. So much for the cry of 'dear food,' for the shrieks about 'terror, horror, famine,' and for the electoral chances of the most flagrant episode of demagogic imposture in the whole of our modern politics."

A "Revenue Officer," writing to the *Times*, endeavours to throw some light on the ideas in the mind of the Colonial Secretary. He finds that Mr. Chamberlain expressly discards the notion of taxing raw materials. Then he finds that Mr. Chamberlain expressly pledges himself not to increase the cost of living for the working men, unless they should be pleased to pay something upon food by way of premium for old-age pensions. This correspondent thinks they will not make any sacrifice of that kind for the sake of old-age pensions, and, if not, there is an end of that part of the business. Then, if there is to be no tax on raw materials, no taxation for pensions, and no increase in the cost of living, what has Mr. Chamberlain to work with? Two things, the correspondent points out, one of them not raising the Free Trade question at all, because it only varies the form of restrictive taxes already existing, and the other offering a form of protection which is not unlikely to attract the working man rather forcibly. We raise at present £13,600,000 on articles of general consumption—tea, coffee, sugar, cocoa, and dried fruits. Suppose we remit that taxation and put 5 per cent. upon other articles of general consumption, such as corn and mutton. We could raise in that way £7,500,000, or more than half what we have taken off. If the matter stopped there the revenue would lose £6,100,000 and the food of the people would be cheapened by that amount. But as the revenue cannot afford that loss Mr. Chamberlain might raise the money by a 7 per cent. *ad valorem* tax upon manufactured articles coming from abroad. The working man would find his cost of living somewhat reduced, and at the same time he would find his employment increased, because the 7 per cent. would enable us to bargain for markets now closed, and taxing one part of his diet instead of another would give him still more employment from the colonies."

In Messrs. Gow, Wilson & Stanton's last week's tea report a table was given setting forth the approximate duty on tea levied in different countries per English pound. While tea is duty free in Australia, Belgium, the Straits Settlements, Tasmania, and the United States, and in Canada is free from the country of production and from the United Kingdom, but is otherwise subject to 10 per cent., the duties enforced by other countries range up to between 9d. and 11½d. in France, 1s. 0½d. in Greece, and from 8d. to 1s. 10½d. in Russia. With the use of Indian and Ceylon tea continually expanding in foreign and colonial markets, the subject of the duties levied in different countries increases in importance, and, as the circular says, anything that can be done to widen the area of consumption will be of advantage to the industry.

It is sometimes suggested that Indian coffee-planters might follow to their own advantage the example of tea-planters by endeavouring to push their coffee as a specialty on the market here. While it may be doubted if the result would have justified the considerable outlay necessary to do this on a large scale, there is a middle course, and that is to form some Indian Coffee Association in London with a view to the watching of the interests of the grower and pushing the sale of Indian coffee with the trade and the consumer. Discussing the coffee position generally, we notice that the *London Commercial Record* refers to the necessity for finding new outlets for Indian coffee. It says: "If there is one trade more than another which baffles those connected with it, it is the coffee trade. The enormous supplies of Brazil sorts have been the surprise of bears and the alarm of bulls for a long time, and although the planter vowed some years ago the production of his coffees was carried on at a great loss, yet the shipments from Brazil have been larger year after year. No frost, storm, or vermin have been able to ensure a diminution of those gigantic supplies. Most extraordinary resolutions have at various times been passed calculated to establish a falling off in receipts, or even in the total yield of the crops, but all to no purpose. It would seem that the planters of Rio and Santos descriptions are anxious to make up in quantity what they cannot attain in quality. Ruinous as the decline in the value of Brazils must be to their producers, the sorry part is that coffees of less magnitude and importance have to suffer in sympathy. They are unable to make up their losses by doubling or trebling their outputs, and they will have to go to the wall unless some means can be devised to save them from such a calamity. We have all followed with regret the low values which East Indian sorts—which, perhaps, more than other coffees, suffer from the over-production of Brazils—have fetched this season, feeling, as we must do, that to many planters such prices as London paid, or rather had to pay, could not possibly compensate the Indian planter for his trouble and expense. We all saw that a crisis in India would undoubtedly be the outcome of the depression in the coffee trade, and we are seriously afraid that such a crisis is near at hand, for, according to reports just received from the coffee-growing districts, the monsoon has so far been very unfavourable to the new crop, and small yields are likely to ensue at a time when big ones are most urgently wanted. No wonder that great depression prevails among the planters generally, and that the coming season is looked forward to with considerable misgiving, and even alarm. We hear that European managers and superintendents are dismissed from many plantations, manure is sparsely used, or not at all, and some estates are allowed to grow wild, as their owners no longer possess the means of maintaining them. This must be regarded as a very serious matter, not to India alone, but to London as well, and support should be given to the struggling planter where consistent with fair competition. We understand some planters are desirous of sending a delegation to London to study the coffee question here, and to find if possible some way or other of pushing their products, or find new outlets for them. There is no doubt that some wholesale coffee-dealers are responsible for the little appreciation in which the fine East Indian coffees are held in some parts of our country. As a matter of fact they are not known to the average man, to the ordinary consumer, and hence they are not asked for at the grocers by those fond of a good cup of coffee. The preparation of a really good cup of coffee is an almost unknown art in England. The introduction of East Indian sorts to the public would perhaps insure the saving of the East Indian coffee culture, and the obtaining of a really good cup of coffee in England.—*H. & C. Mail.*

## STREET SCENES WHERE RIO SHIPS COFFEE.

The Special Correspondent of the *Tea and Coffee Trade Journal* writes:—

RIO JANEIRO, June 1, 1903.

### COFFEE WHARVES AND COFFEE THIEVES.

Most of the coffee is shipped from what are known as the coffee wharves. The scene about is most interesting. Come with me and look. We jump upon a car containing about three tons of coffee. It is hauled by two mules, which drag it over the street railroad through one narrow street after another down to the bay. We stop at the wharves, where a gang of negroes stands ready to take in the bags. The men back themselves up against the cars and balance the great sacks on their heads. They carry them in on the trot, and we hear the thud! thud! thud! of their bare feet as they go over the floor. They run, for they are paid by the piece. Each man receives 1½ cents for every bag he brings in, and the best of the workers make from \$35 to \$40 a month, which are high wages here.

What a lot of policemen there are everywhere! At the ends of the wharves there are soliders in uniform to keep order. A custom-house officer is always on hand to see that nothing goes on or off the ship without paying duty, and there are many private detectives. A close watch has to be kept to guard against stealing, for the wharves are great places for thieves.

### CLEVER BOAT THIEVERY.

The detectives have to look out for stealing below the wharves as well as above them, for sometimes thieves come in boats under the wooden floors and stop just below one of the big piles of bags. With an auger they make a hole through the floor, then a piercer or pipe is stuck up through the hole and into a bag so that the coffee pours down through the pipe in a stream to the boat. In a short time a half dozen bags can be emptied, and if this is taken from a large pile no one will be the wiser unless the detectives spy the men under the wharves.

Stealing is also done by the negroes who load and unload the coffee. They come to their work with piercers in their sleeves. By a dexterous thrust, they drive the piercer into a bag as they are carrying it in on their heads and allow some of the coffee to roll down their sleeves to their waists. This they do with one bag after another, going off for a drink now and then to secrete their stealings. Such thefts, however, are well known, and the men are carefully watched. Some of the men in consequence work half naked and others have their sleeves rolled up to their shoulders. Thieves are at once arrested. The factors pay large sums, I am told, for detectives to watch such rogues.

## THE MADRAS CINCHONA DEPARTMENT IN 1902-03.

The review by the Government of the Annual Report on the Government Cinchona Plantations for the year 1902-03, discloses a state of affairs highly creditable to all concerned and has elicited an order in the following terms:—"The results recorded in the Report testify to the energy and efficiency with which Mr. Standon and Mr. G. Romilly who acted as his *locum tenens* for seven months have managed the plantations and the factory. The Government are pleased to notice, also the good work done by their subordinates."

The main points dealt with by Government are the changes introduced under the orders of the Government of India assimilating these Reports with those of the Government of Bengal, when dealing with the Darjeeling and Sikkim plantations: the valuing of the stock of Quinine and Febrifuge as the amount at which it is proposed to sell these drugs; and omitting to take into account depreciation of machinery in use and sums spent on the purchase of new machinery, which tends to exhibit stock at an enhanced value and so much as to increase the amount shown as profit on the year's working. The development and improvement of the plantation received due attention in the year, and propagation from selected seed and heavy manuring promised beneficial results. The year's crop of Rs.144,292 though of an inferior quality, Government observe, was distinctly above the average demand from purchased bark.

The factory results are such as establish a record in several respects. The quantity of bark worked up, *viz.*, 528,000 lbs. exceeded

that so used in any previous year, while the cost of manufacture per pound of bark was considerably less than that of any other previous year. These satisfactory results are attributed to the improved machinery recently introduced and to the great care taken by Mr. Standon to get it into successful working order. Another important fact is that the saving in the cost of manufacture effected by the introduction of the new machinery will more than cover the cost of the improved appliances in the end of the current official year.

The cost of manufacture per pound of Quinine is said to be Rs.11-11-3 per lb. which compares favourably with those of the past two years which were Rs.14-13-2 and Rs.16-7-0, respectively.

The quantity of Quinine issued by the department in the year was 13,179 lbs. and this is higher than that of any previous year. The sales of Quinine at Post Offices in the shape of the pice packets system also show an improvement, as 15,914 packets were sold, this being 4,522 packets more than in the previous year.

The sales of Febrifuge are said to be increased and this is probably an article not so much sought after as the more highly valued quinine, in a therapeutic sense, as Government note this as satisfactory.

Turning to cultural operations, the system of field nurseries as practised at Dodabetta ought to produce beneficial results and give valuable advice to planters. Under this system, trenches are dug between rows of Cinchona, filled in the surface soil, and then planted with seedlings six inches apart. The shade afforded by the Cinchona presents undue moisture from the soil and admits of the young plants being left to themselves, and obviates thus the necessity for watering them. This has many advantages, it costs less, the plants are ready for use when required, and if the mortality is large, the trenches serve as cultivation for the trees.

Another important matter is the raising of seedlings from seed of selected trees known to possess a high percentage of Quinine. Those selected being over 10 and 11 per cent. By this system, the worthless kinds can be eliminated, and in course of time, the plantations will be composed of trees containing a high percentage of Quinine, which will be invaluable for use in the factory, for while it costs just as much to harvest and work up poor as well as rich bark, the larger output of Quinine in the case of rich bark is an admitted advantage in its care, when used in the factory. Financially the department has done well in the year. The receipts by sale of Quinine, etc., were Rs.2,43,150, the highest realized for the past twenty years, while the expenditure was Rs.187,024, an outlay covered to the good by some Rs.50,000 by the money received in the year, while the net result of the year's working show a profit on the enterprise since its commencement of Rs.1,645,621 to say nothing of the valuable Cinchona estates owned by Government, an improved factory for outturn of Quinine, and a large stock of Quinine and Febrifuge in store at the end of the year, a result which cannot but be regarded as creditable to Messrs. Standon and Romilly as exhibiting indefatigable energy and attention to all points connected with the plantations and factory during the year and which have deservedly won praise from Government.

## COFFEE IN DISTANT LANDS.

**Costa Rica.**—Half-tone pictures from recent photographs are published in the *Spice Mill* and tell even more plainly than mere words could do of the great superiority of the American, English and German plantation methods over those of the native Costa Rican peons. These methods are now obtaining in most of the South American countries and are demonstrating that it is possible to increase the crop yield nearly 300 per cent.

The conditions in most tropical countries cannot be said to be very favorable to the taking of photographs and the developing and printing of the plates, and they are even less favorable in Costa Rica, situated as it is so much nearer to the Equator than the Mexican or Brazilian countries. After experiencing many difficulties and surmounting most of them, Mr. Wilhelm has been fortunate enough to secure over a hundred exceptionally fine pictures, all of which are remarkable for their faithful portraiture of the scenes represented.

One picture shows a native coffee plantation with the coffee trees in full bloom. This is a rare picture of the beautiful blossoms. They only last about three days, and Mr. Wilhelm was fortunate in

having the weather conditions favorable to his taking the views at that time. The fragrance of these blooms is so rich and powerful that it is noticed by incoming sea captains miles out at sea. Coffee trees, like fig trees, bear fruit, leaf, and blossom all at the same time. This picture shows the irregular way in which the natives plant. They make no effort to prune the trees, and never think of weeding. Even the pineapples are permitted to grow among the coffee trees, and are to be seen in the picture. The natives average one pound two ounces to the tree, as against three pounds to the tree on the Americans' plantations. This lack of attention is in the main responsible for the poor yields obtained from the native crops. The native trees are permitted to run up from 20 to 23 feet, while the others are kept down to 8 feet.

The contrast between the two methods of growing is very strikingly shown in the second picture, which gives a view of a model American plantation at Agua Caliente, near Catargo, Costa Rica. Here the bananas and plantains are used for shade, the grounds are clean, the grass is lined up in the centre of the rows, where it fertilizes the soil, no branches are permitted to trail on the ground, and the trees are not allowed to exceed 8 feet in height. This picture also illustrates the method of planting fourteen feet apart, and two years later planting the young trees down the centre. These trees from the Almásago (trees from the nursery, ten months old) are to be seen growing in the centre of the picture.

The other pictures show the method of picking by hand and a coffee drying ground. The coffee patio or drying ground picture was taken on a plantation 5,000 feet above the sea. It is a natural drying ground and belongs to one of eighteen estates within an area of thirty to forty miles. Upward of 200 hands are employed on this particular plantation. After the coffee is picked—this work being done mostly by the women and children—it is brought in the fruit and dried in the sun on the cement floor of the drying ground. This process usually takes from four to six weeks, the native Costa Rica peons turning it over and over in the sun by means of wooden shovels, several times each day. The tarpaulins are used for coverings in case of rain. Into the trough shown water is turned for washing off the slime on the fruit. After drying, the coffee is piled up in heaps and then removed to the buildings in the background, where it is run through the hullers to remove the hull and parchment, and next through the milling machines to remove the silver skin and give the bean its polish.

The native women in the other picture pick out the imperfections from the perfect coffee. There are two round holes in the table before each picker. The good beans are dropped in one, the bad beans in the other, bags being placed under the tables to receive them. A skilled girl can pick two bags a day, for which she receives seventy-five cents—about thirty cents in United States money.

**Mexico.**—Reporting on the trade of Vera Cruz and District Mr. Consul Leay says:—The coffee crop just over, 1902-03, was only about 40 per cent. of the normal—I cannot give the actual figures—this having been occasioned by the long drought during the Summer months, and, to a certain extent, by the fact that the previous crop was a very large one, for, when such is the case, the trees in the year following do not bear so well but seem to need a slack year in which to recuperate. The indications are favourable to a fair crop for next season unless drought, hail or frost, interfere before the coffee is gathered. The percentage of natural or unwashed coffee becomes less each year by reason of the premium on washed coffee over the unwashed grade. All growers that can do so are washing their berries, and either selling in the parchment or preparing it for sale in the finished state.

There have been many extensive installations of machinery in the various towns where coffee enters, and while in years past coffee was only sold when ready for market, it is now frequently sold on the tree, the buyer naturally assuming all risks of the fluctuations in exchange, market price, etc. These installations have not been made by the producers but by those who buy for export principally, and it even frequently happens that while a haciendado has machinery on his branch he prefers to sell his coffee in parchment at a better profit than he can make on it cleaned. Conditions have altered very greatly and the grower is the one who makes the money, though perhaps not very much, by reason of the very active competition of the buyers for the comparatively little coffee that is produced.

The great fall in the price of coffee in the last ten years has resulted in a much greater local consumption.

The consumption of coffee throughout Mexico is put at about 6,000 tons.

Total exports of coffee from Mexico are shown in the following table :—

1897-98	...	...	...	20,000 tons.
1898-99	...	...	...	17,400 "
1899-00	...	...	...	22,519 "
1900-01	...	...	...	15,180 "
1901-02	...	...	...	22,000 "

Of this quantity something over three-quarters appears to pass through Vera Cruz.

### A NASCENT INDUSTRY FOR INDIA.

The London correspondent of the *Pioneer* writes :—

The oft-debated question whether planters in India in search of profitable forms of cultivation can grow rhea fibre for manufacturing purposes of a quality enabling them to compete with the China grass grown in the Far East has, you recently informed your readers, been put to practical test by the Bengal Rhea Syndicate, who already have some 5,000 acres under cultivation, and have been exhibiting in Calcutta sample underclothing, velvets, tray cloths, incandescent gas mantles and other articles made therefrom. These goods were manufactured, I believe, on the Continent, but at a time when the problem of developing inter-Imperial trade is uppermost in the public mind it is a matter for gratification that the pioneers of what is, I believe, destined to be a great industry are to be found in this country as well as on the Continent. The Ramie Fibre Spinning Syndicate, Ltd., of 50, Lime Street, E.C., have for the last two or three years been quietly, but steadily, been feeling their way, patenting processes, learning trade secrets and gaining experience by experiments on a comparatively small scale, and therefore at much smaller cost than would have been the case had great things been attempted too soon. I have no sort or kind of personal interest in the concern, and it was from the standpoint of a detached observer, desirous of obtaining information for your readers, that I paid a visit to the factory of the Syndicate the other day. The works are situated on the outskirts of the developing town of Romford, which is within very easy reach of London and is well served by the Great Eastern Railway.

I was conducted over the factory by Mr. Frank Birdwood, who as Secretary to the concern has given a great deal of time and thought to its interests, and has made himself as much at home in discussing the intricacies of textile manufacture and the relative advantages of this or that machine as he is amongst his law books and briefs. The Syndicate have hitherto mainly relied on the China market for raw material, but the directors, not only from a business point of view, but also because they have in most cases had long connection with India, official or mercantile, are very desirous of bringing the Indian planter into the benefits of co-operation in their enterprise. As Mr. Birdwood pointed out recently in the *Anglo-Indian Review*, the cultivation of ramie is not a task upon which the planter can profitably enter haphazard and without due enquiry. Inadequate preliminary investigation has been the cause of failure of various experimental efforts in the past, and these have resulted in widespread scepticism as to possibility of profitable cultivation. The planter should master the facts as to the climatic conditions and soil best suited for ramie-growing, and as to the best methods of cultivation, given in the *Agricultural Ledger*, No. 15, by Sir George Watt. He should make sure, by sending home samples, that the fibre he can produce is of the right class; and in preparing the raw material for export to the mills he must be abreast of the times.

Many planters are fully aware of the need for careful study and well thought-out methods on the lines indicated, but they are doubtful of the capacity of the market to take large additional supplies of the fibre. The sceptic should visit the Romford factory, where he would see the beginnings of a great industry, steadily feeling its way to the expansion that lies before it. In any case, rapid advance in the first instance would have been impossible, owing to the uncertainty of supply of raw material and the great fluctuations in price consequent upon manufacturers being mainly dependent upon the Chinese grower. Last year the price of the fibre was about £24 per ton, this year, owing to drought and the

increasing demand in Europe, £40 per ton has been paid. In some respects this dependence upon a country so politically unstable as China, whose cultivators and dealers are not the most trustworthy of men, has not been disadvantageous, for it has deterred the Syndicate from experimenting on a large scale. While output has been restricted for want of raw material, the concern has felt its way, and, under the skilled advice of a most capable and experienced manager, a cool-headed Yorkshireman, it has now arrived at a stage where the expansion all along kept in view can safely be undertaken. Its manufactures have gained a footing in the English markets from which wealthy spinning combinations have tried in vain to dislodge them. This attempt has been especially pronounced in respect to the large trade in boot thread that has been built up by the Syndicate. A well-known combine tried the cutting game until it was selling below cost, but the Ramie Company was able to go one better right through without loss. For it is to be remembered that, although the supply of raw material of the right kind is so scant and fluctuating that prices are comparatively high, ramie threads are not only much stronger than linen, but can also be produced much more cheaply, even on the present comparatively limited scale of manufacture. When larger quantities of the fibre are available and the outturn is correspondingly increased, the ratio of the cost of production will be lessened. The boot and saddlery thread were, in the first instance, only introduced into the London market, but a demand is now growing up in Leicestershire and Northamptonshire, the centres of the boot trade, and there can be no doubt that the combination of strength and cheapness will ensure the growth and stability of this trade against the competition of the most powerful combines manufacturing linen thread.

In pursuance of the wise policy, in the initial stages of a new industry, of *festina lente*, the Syndicate have not as yet undertaken their own spinning. The processes I saw at the mills were those of degumming, cleaning, drying, separating, equalising lengths, weaving and dyeing, and thread manufacture. The machinery is of the most modern type, and so far as a casual visitor could judge, the methods of working, no less than the general supervision, are most efficient. I had previously been shown, at the offices of the Syndicate, samples of the spun goods manufactured from the woven fibre turned out at Romford by the Bunbeg Mills Company. There can be no doubt that ramie-made cloths and other goods are not only far superior to linen but will, ere long, compete with silk, by reason of their being very much cheaper, and with cotton, by reason of their greater strength and durability. There are very few articles, if any, among manufactured textiles with which ramie-made goods cannot and will not enter into competition, from khaki and sail cloth to dainty dresses and tapestries and curtains. The principal demand thus far has been for vestings and underclothing, but other departments of manufacture are opening out as merchants come to recognise that among the advantages of ramie-goods are that they are rot-proof, that they bleach a pure lustrous white and that they are unshrinkable. If the claim that ramie "even survives the attentions of the Oriental *dhoby* no matter how much it is beaten on stone" can be substantiated (and it can soon be put to the test), we may anticipate that this, with other advantages mentioned, will, in course of time, lead to great demand in India. Already there has been some manufacture of white washing poplins for the Tropics. Sportsmen in the East should note that the manufactures include "extremely durable unions for riding and hard wear," while the general public may bear in mind the claim, and put it to the test, that ramie-goods are "lustrous as silk, more durable than linen, inexpensive and handsome." My tour of the Romford factory convinced me that there is a great future before this industry, and that Mr. Birdwood had solid ground to rest upon in expressing the conviction that the Indian planter need not be apprehensive of flooding the market with raw material, inasmuch as the demand is bound to keep fully abreast of the supply. "When they know that they may look beyond China for their supplies," wrote Mr. Birdwood in the February *Anglo-Indian Review*, "manufacturers will be prepared to increase their outturn very considerably. It would, therefore, appear that the Indian planter, if he will attack the problem soberly and with sufficient capital, could not only capture the markets hitherto dominated by China, but could find fresh outlets for his production. One thing, however, he must clearly bear in mind: the manufacturer knows what he wants and can get what he wants from existing sources."

He will run no risks in his raw material. Indian planters must not imagine that knowledge will leap fully armed from their heads or that fortune will stop with them at the holding up of a little finger."

The question whether India is or is not to participate as a producer of the raw material in this nascent industry, has a wider bearing on her industrial future than that which relates to the initiation of new avenues for the employment of planting capital, at a time when, in some directions, it has been hard hit by currency changes and excess of production. There can be no doubt whatever that if the raw material is extensively grown in India for utilisation by the English and Continental manufacturers, ramie spinning and weaving mills will in course of time spring up in the great commercial centres of the country, and thus India will participate in ramie manufacture, as she participates to-day in the production of cotton goods made from her own raw material. Thus a great step forward will be taken in the industrial development so essential to adequately relieving the pressure on the soil which, though temporarily retarded of late by an unusual succession of famines, must become more and more acute with the growth of population and the rise in the standard of comfort now being witnessed. Even in the early years of ramie cultivation we may expect to see some of the preliminary processes of manufacture, particularly that of degumming, carried out on the plantations before shipment to Western factories, in order to reduce the cost of freight. On economic grounds, therefore, every encouragement should be given the Indian planters to grow ramie of the right kind and in the right way. There is reason to believe that the plant can be cultivated successfully in other countries besides China and India, and it behoves the captains of the planting industry in the latter Empire to establish her share in this promising industry before the ground is occupied elsewhere and India is put of the running. At the very least, to quote the formula in such general use just now in connection with inter-Imperial fiscal relations, the case is one for full and careful inquiry—for the policy of the open eye and open mind.

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION (CALCUTTA).

The following is from an abstract of the proceedings of a Meeting of the General Committee held on 4th instant.

The Louisiana Purchase Exposition, 1904.—In the proceedings of the last Meeting reference was made to a letter dated the 24th June from the Indian Tea Cess Executive Committee offering to allot a sum of Rs.50,000 to the exhibition of Indian tea at St. Louis in 1904 on the understanding that a sum of £10,000 were raised for this purpose.

The matter was now brought up for further consideration, and it was agreed to apply the available balance at credit of the American and Foreign Market Fund, approximately Rs.21,000, towards the proposed exhibit.

A telegram from the Hon. Mr. G. L. Acworth which had been received just before the Meeting was placed on the table. Mr. Acworth stated that the Southern India Planters' Association would subscribe Rs.10,000, and that the various local Governments were being approached with a view to their contributing donations to augment this amount.

It was decided to accept the Tea Cess Committee's offer of Rs.50,000, and to inform them that the General Committee were able to see their way to collecting from various sources, the minimum of £10,000 stipulated for. The Secretary was instructed to prepare a circular regarding samples of tea for exhibition as had been done on previous occasions. Particular attention was to be drawn to the desirability of having an effective exhibit of green teas.

National Tea Association of the United States.—The General Committee were in receipt of a notice regarding the formation of the above Association which was to be composed of the leading Importers and wholesale Grocers of all the large cities of the Union. The primary objects of the Association, it appeared, were to promote the sale of tea as a leading article of merchandise; to preserve tea from adulteration and spurious imitation so that the

American public would not be imposed upon either by an impure article or by one of such inferior quality as to render the beverage worthless and unpalatable, and to disseminate information in regard to its quality and particularly in regard to its preparation. A large number of members had already been secured.

The General Committee noted the information with much interest. While the efforts of the Association would be directed to encouraging the tea trade as a whole, it appeared to them that Indian teas must of necessity share in any revival or increase of trade brought about by its means.

MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated July 31st, 1903, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904	134,102	215,305	15,782
1902-1903	150,003	251,457	17,091
12,117 pkgs. INDIAN	Total 45,472 packages were offered in public auction this week.		
32,247 " CEYLON			
1,108 " JAVA			

The last Public Sales of Indian and Java teas before Bank Holiday were held on the 27th instant, and of Ceylon tea on the 28th instant. Auctions will probably recommence on the 10th proximo for Indian, the 11th for Ceylon, and the 13th for Java teas.

INDIAN GREEN TEA.—The manufacture of Indian Green Tea for the North American market appears likely to make better progress now that the Tea Cess Act has been passed, so that the output of Black Tea will probably be reduced by this means and the North American market further exploited.

Exports of Tea direct from Ceylon to places outside the United Kingdom to the end of June show a slight increase over the same period last year, chiefly consisting of Green Tea for North America, as well as Black Tea for China, which probably finds its ultimate destination either in Russia or North America.

Distribution of Tea Exports from Ceylon from 1st January to end of June.

INDIAN.—The auction was again small, comprising 12,117 packages, and with a good general demand prices were very firm, any Teas with quality attracting attention, while a few good liquoring parcels from Assam and Darjeeling were well competed for and sold at fairly high prices. The following averages from Assam may be mentioned, viz.:—Ass. Fron. Co. "Hapjan," 1/2½; "Khobong," 1/1; "Mokalbari," 1/0½; "Jokai T Co. Dikom," 1/0¼;

and from Darjeeling:—"British Darjeeling Co. Thurbo," 1/3½; and "Darjeeling Con. Co. Ting Ling," 1/1¼.

Week's av. of New Season's tea sold on Garden Acct. 1903, 6,470 pkgs., av. 7·67d. 1902, 10,332 pkgs., av. 6·74d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 31,578 pkgs., av. 7·30d. 1902, 43,114 pkgs., av. 6·30d.

CEYLON.—Although the auction was heavy, consisting of 32,247 packages, competition was well distributed and prices were firm, probably owing to there being no further auction until after Bank Holiday. The quality still continues poor, although there are indications of an improvement likely to be seen before very long.

Average for week 6·89d., against 6·25d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 602,695 pkgs., av. 7·52d. 1902, 686,461 pkgs., av. 6·73d.

JAVA.—With a comparatively light auction, prices in sympathy with other grades were very steady, the Teas mostly selling at full valuations. The next auction is advertised for 13th August for which date 3,117 packages are at present catalogued.

### QUININE.

The market has been quiet throughout, small sales of the usual German brands of sulphate in bulk being effected from second hands at 11½d. to 11¾d. per oz. spot, and December at the same figures. To-day, however, a "bear" sale of 5,000 oz. has been made at 10¾d. per oz., spot, and 11¾d. for December, being lower.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, AUGUST 29, 1903.

[No. 34.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 4th proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*August 25th.—Weather—*Monsoon moderating, bright sun appearing occasionally; fires have to be kept going to keep the bungalows dry. *Supplies—*are a source of anxiety through so much rain, and so little sun, the late planters will be in the best condition this year. *Health—*Poor—much fever. *Labour—*Short—owing to Gouri feast. *Coffee prospects—*Moderate. *Interesting item—*The district has been without an amildar of full powers for two months.

### COFFEE AND THE ST. LOUIS EXHIBITION.

IN URGING planters in South India to exhibit at the St. Louis Exhibition next year, we addressed ourselves more particularly to Coffee-planters, because it was well understood that the interests of Tea-planters would be adequately cared for by the Indian Tea Association. Remarks made by Mr. H. B. HODGSON at the recent Annual Meeting of the U. P. A. S. I. remind us that there was one point to which we did not give attention. It seemed to us to "go without saying;" but Mr. HODGSON's reference to the Paris Exhibition has shown that this is not so. Our first point is this: Exhibit! Exhibit of your best; but always exhibit qualities that you can supply on a commercial scale, however small that scale may be in proportion to the Brazilian scale. A market for inferior coffees need not be sought in the United States. The expenses of transport and sale are very heavy, and the finer qualities can better bear than the lower this heavy burden. Our second point is, though it has escaped reference

until now, be not satisfied with exhibits, they are but the means whereby to create a permanent demand. It is of this second point that Mr. HODGSON's words have reminded us; and we would impress it most earnestly upon all our readers. Gold medals are very nice things in their way; we by no means despise them. But they are less valuable intrinsically than as adjuncts to advertisement; and if the influence of Exhibitions is regarded as ending with themselves the money spent in respect to exhibits is likely to be wasted.

The St. Louis Exhibition may serve as a medium for effecting a few sales—mostly "in the cup." If it be rightly used, it should help Coffee-planters in this country to make an entry into the great market of the United States, and if their plans are well laid and carried out with enterprise and vigour they should find the opening of the door a very great benefit to them. First, through the means of the Exhibition they have to *create* a demand; but if that demand is to live it must be fed. The Paris Exhibition has taught this lesson, let it not be lost sight of. Planters have to arrange to keep supplies going so as to meet demand. They ought not even to await the news that a demand has been established. Our own feeling is that planters should regard as part of the expenditure incidental to the Exhibition the provision of at least small supplies of Indian coffee, available for immediate purchase by consumers in America. If the demand that is desired is actually created, further supplies can be sent forward on cable or mail requisition; but the very first sign of demand should be encouraged and stimulated by the offer of supplies from stock. If the demand does not arise, should Indian coffees not at once find favour in the sight of American dealers and consumers, there will be a loss on this stock. That is one of the risks that have to be run; it is a risk similar to that which is run when exhibits and "coffee in the cup" are provided. It is a risk that *ought* to be run, for he who only gets to the middle of the bridge, then timidly stops, has no chance against the man who steadily works his way to the other side. When the exhibits are forwarded, a certain quantity of stock ought to be forwarded, not only for the provision of what is likely to be wanted for sale in the cup, but in order to meet trade demand. Planters, knowing the excellence of their coffee, should *back it* from the outset. According to the confidence they display, the estimate of consumers is likely to be affected.

Another point has been raised. The wisdom of working through the Indian Tea Association has been questioned. It has been said that Coffee may not be afforded a fair chance. We think nothing of these remarks. In the first place, we believe in the integrity and good faith of the I. T. A. Commissioner and his staff. Secondly, it is so simple a matter for "Coffee" to make its own arrangements to lighten the labours of these gentlemen, and to send out a special representative whose duty it shall be to *push Coffee*. This would not be a very costly matter, and if a thing is worth doing it is worth doing well. For that matter, there is no good reason why the selection of permanent agents or connections for Indian Coffee should be left to the Commissioner to the I. T. A. There are a number of well-known dealers in America who would probably be glad to take the business in hand, and follow up any success achieved at St. Louis. They would have experience to assist them, self-interest to urge them forward; and we cannot but think that it would be a comparatively easy matter to induce such dealers to put Indian Coffee on their lists and give it a little special attention. We would remark that even for the purposes of the St. Louis Exhibition the aid of a firm of roasters and grinders will have to be obtained, if Indian Coffee is to be successfully sold *in the cup*. From such help to a permanent arrangement is but a step, and it is a step that ought to be provided for with due foresight and caution. It has been said that the United Kingdom affords a sufficient market for India's finest Coffees. Possibly it does. What we want to see, however, is keen competition. Two buyers bidding against each other are preferable to one who has, and knows that he has, a monopoly. It is with our finest Coffee that we are most likely to open out the American market on terms satisfactory to ourselves, and it is to them, therefore, that the chief efforts should be directed in connection with the Exhibition at St. Louis. If medium qualities can also be sold, so much the better; but that can be seen to later, when the finer sorts have made their way.

#### U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

#### CINCHONA CULTURE IN INDIA AND JAVA.

Professor Verne, who was sent by the French Minister of Instruction to investigate the cinchona culture, mentions the following interesting facts in his report: The Indian plantations are found about 27° north latitude, 3,600 feet high, in a territory having temperature ranging between 28° and 85° F. The mechanical labour is performed by the natives, who receive from \$1 to \$1.70 per month, without food according to age and sex. The favourite species of cinchona is the *C. ledgeriana*. The plants are raised on mossy ground, sheltered from the winds one side by a hill and on the other side by thickets of bamboo, the young shoots being particularly susceptible to sudden changes of temperature. By the third year after planting, the tree is sufficiently grown to permit the removal of the bark, which grown on again three years without recourse to mossing operations. The same system is in vogue in Java, where, however, the variety of cinchona is not the English *C. ledgeriana* (Howard's) but

the *C. ledgeriana* of Moen, the latter being found to yield 9 per cent. of quinine; or, if only the trunk bark about a metre above the ground is chosen, it yields 14 per cent. of quinine. On the other hand, the English *C. ledgeriana* assays on an average 4 per cent. In Java the cultivation of the latter variety is abandoned; while *C. succirubra* planting is diminishing. In both the English and Javanese plantation a very large source of profit is the manufacture of quinine on the spot of small and defective pieces of bark, unfit for shipment. Particularly striking is the method of quinine extraction as practised in Java, it simply consisting of treating the powdered bark with a 5 per cent. solution of caustic soda, heated to 50° C. throwing this mechanically agitated mass into a reservoir containing Java petroleum of specific gravity .999, removing the petrolic solution of alkaloids by mechanical devices into a warm reservoir, into which is poured water acidulated with sulphuric acid. This watery layer is removed, evaporated and from the concentrated solution the quinine sulphate separates by crystallization, which it is not necessary to recrystallize, since it contains only one-half of 1 per cent. of cinchonine. Of such quinine 50,000 kilogrammes are exported annually to the United States. The special reason of the success of this quinine manufacture is due to the exceedingly clever mechanical devices used in the extraction.

#### THE COST PRICE OF SANTOS COFFEE.

[Specially translated from *De Indische Mercur*, 23-6-03.]

We have received the *Brazilian Review* issued at Rio de Janeiro and *Le Café*, a fortnightly periodical, the publication of which was commenced at Havre last month; both containing an estimate of the cost price of Santos Coffee.

As a rule, one can only attach value to a calculation of the cost price of such articles as coffee, sugar, tobacco, etc., which are grown under very variable conditions if the calculations are based on full and reliable data obtained from a large number of concerns. In our issues of 22nd July, 1902, and 26th May, 1903, we gave figures showing the cost of Java sugar and German beet sugar, and to these we can attach some value because the calculations were based on figures given by a comparatively large number of factories.

In the case of Santos coffee, however, such data are not available, neither in the *Brazilian Review* nor in *Le Café* are the sources from which the figures are obtained given, so that as regards the reliability of the data we are in the hands of the writers.

Mr. Lazerda, from whose pen several articles on coffee production have appeared, gives the following estimate in the *Brazilian Review* of the cost of production of Santos Coffee for a plantation of 100,000 trees:—

	Milréis.
Weeding ... ..	8,000
Crop ... ..	6,000
Transport, drying, and sorting ... ..	6 000
Carriage to railway station ... ..	600
Upkeep of machinery, carts, cattle, etc. ... ..	2,500
Management ... ..	4,000
Local taxes ... ..	0,240
Miscellaneous ... ..	1,000
	<hr/>
Milréis ... ..	28,340

An average estimated yield of 60 arrobas (of 14.68 kilos. each) gives 4,723 milréis as the cost of production per arroba.

Further charges are—		Milréis.
Freight on empty bags from Santos	...	00,125
Average freight per bag of coffee	...	15,200
Transit dues	...	00,375
Transport to Warehouse at Santos	...	00,100
Commission	...	00,200
Local tax at Santos	...	00,150
Classification of the coffee	...	03,400
Tax on jute packing	...	00,850
Export duty at 11 % on 4,200 milréis	...	06,930
Dock charges	...	00,750
Transport to Dock	...	01,000
		2,908
Add cost of production per arroba	...	4,723

Total cost price per arroba ... 7,631 Milréis,  
or per ½ kilo. f0.1625 (= 3.25 pence).

Even for "superior" Santos Coffee, which is worth about 10 per cent. more than "good average," a cost price of 16½ cents appears to us rather high. The present spot price for exporters at Santos would be 20 per cent. below cost of production.

The calculations given in *Le Café* are nearer the mark. Instead of reckoning the cost from the plantation the writer takes as his starting point the market price of good average Santos at Havre and works backwards.

The quotations of the following month for "good average" at Havre are—

Frs.	30	35	40	45	50
Corresponding to the following prices for "superior."					
Frs.	33	38	43	48	53
Which are equivalent to the following prices at Santos:—					
Milréis	3,525	4,150	4,800	5,425	6,075.

To arrive at the sum which the planter receives, the following deductions must be made:—Sale commission at Santos, 3 per cent. Transport to warehouse at Santos, milréis 100. Rail freight from the plantation 1 milréi per 10 kilos. These amount to—

Milréis	1,205	1,225	1,245	1,265	1,280.
So that the planter receives for coffee delivered at Santos—					
Milréis	2,320	2,925	3,555	4,160	4,795.

*Le Café* calculates the cost price per 10 kilos. on the plantation itself, taking an average yield of 67 arrobas (of 14.68 kilos. cash) per 1,000 sq. feet, as follows:—

		Milréis.
Upkeep	...	800 to 1,000
Crop	...	500 to 700
Transport to station	...	200
Drying, sorting, etc.	...	400
Management	...	400
Miscellaneous	...	500
Total Milréis		2,800 to 3,200
Average		3,000 milréis.

This calculation shows that a quotation of frs.35 at Havre for the following month will not cover the cost of production. Indeed frs.35 for good average at Havre is equal to 4.150 milréis for superior at Santos and to 2.925 on the plantation while the average cost to the planter is 3.000 milréis.

In comparison with the estimate of the *Brazilian Review*, the following shows the cost price, F.O.B., Santos according to *Le Café*.

		Milréis.
Cost of production, including carriage to rail per 10 kilo.	2,800	to 3,000
Transport to and expenses at Santos	...	1,200
Total		4,000 to 4,400

Taking the lower figure the cost per ½ kilo. is .125 guilder (= 2.5 pence); even this low cost price is not covered by the present sale price. In most cases the plantations in Brazil are worked with borrowed capital and the interest on crop advances is very high, amounting to from 10 per cent. to 15 per cent., so that the cost price is actually higher than .125 guilder.

In neither periodical is any figure given for the cost of opening and of new extensions. Our readers are aware that a peculiar custom obtains in Brazil. The planters allow the settlers to open fresh ground each year. They charge them with the cost of cultivation and the planting of the young trees and in return the settlers have the privilege of growing maize and other crops among the young coffee trees for their exclusive benefit. In this way the proprietor can make new extensions at little cost and at the present time the laying out of new plantations is in progress.

*Le Café* takes as a basis a yield of 67 arrobas per 1,000 feet. On an average there is 1 tree per sq. foot (?), so that the yield per tree is 1 kilo. This estimate is surely not too high. In 1901-02 there were 530 million trees in the state of San Paulo over 4 years old. A yield of 1 kilo. per tree would be equal to a crop of 9 million bags while the actual yield was 10,175,000 bags.

According to the official estimate of the Department of Agriculture of San Paulo there were 15,828 coffee-planters employing about 300,000 labourers.

The capital invested in coffee in 1901-02 is estimated by the Department of Agriculture as follows:—

		Milréis.
Coffee over 4 years	...	1,050,000,000
Do. under 4 "	...	135,000,000
Machinery, etc.	...	240,000,000
Roads, etc.	...	300,000,000
Total		1,725,000,000
or 1,073,125,000 guilders,		£89,427,083.

It seems to us that this capital cost is over rather than under estimated. It is difficult to make out from these figures the amount of Capital introduced for the cultivation of coffee. However that may be the welfare of coffee cultivation must be considered one of the first conditions of the prosperity of Brazil, while it is of vital importance to San Paulo.

## INDIAN AND CHRISTMAS ISLAND PHOSPHATES.

The following circular has been issued by the Indian Tea Association (Calcutta):—

MEMO.—The subjoined correspondence is published for the information of members.

No. 1208 of 1903, dated Nagpur, C. P., the 16th July, 1903.  
From

J. W. MOLLISON, Esq., M.R.A.C., *Inspector-General of Agriculture in India.*

To  
THE SECRETARY, *Indian Tea Association, Calcutta.*

I have the honour to send herewith a copy of a letter from the Managing Director, Christmas Island Phosphate Company, Limited, which he addressed to the Director, Geological Survey of India, Calcutta. I also send a statement which compares the analyses of certain Indian Phosphatic Minerals with that of the Christmas Island Phosphate. These analyses of Indian Phosphates were recently made by the Agricultural Chemist to the Government of India. The Trichinopoly

Phosphate nodules are obtainable in very large quantity, but are not very suitable for treatment with sulphuric acid owing to the high percentages of iron and alumina. These nodules can be collected at or near the surface in immense quantities and at trifling cost. Freight charges by road are at present heavy. The Hazirabag appatite is not available in large commercial quantities. It would appear that Christmas Island Phosphates can be landed in India at a moderate price and for the manufacture of Superphosphate are probably less costly than the indigenous minerals.

Copy of a letter dated London, 5th June, 1903, from the Managing Director, Christmas Island Phosphate Company, Limited, to the Director, Geological Survey of India, Calcutta.

I am duly in receipt of your letter of the 12th May last. With regard to Christmas Island Phosphate for India, I shall be glad to give you any details which may be of interest to you in this matter, and beg to give you herewith a full analyses of this article. The Phosphate of Lime varies from 80 to 85 per cent. It is shipped from Christmas Island as a raw material, and in an unground state. It is used principally by artificial fertilizer manufacturers, and is shipped largely to Japan, Australia, Germany, and Great Britain. The price c.i.f. Calcutta would be £2-10-0 per ton on the basis of 80 per cent., and for Bombay £2-12-6 per ton on the basis of 80 per cent. Phosphate of Lime.

Any further particulars which you may desire I shall be very pleased to afford.

*Statement comparing the results of analyses of the phosphates of different sources.*

## THE LOUISIANA PURCHASE EXPOSITION.

A deputation from the United Planters' Association of Southern India, Incorporated, recently waited upon His Highness the Maharaja of Mysore and upon the Dewan, requesting the aid of the Mysore Government in efforts to get the coffee industry of Southern India and Mysore adequately represented at the Louisiana Purchase Exposition, to be held at St. Louis next year. On a consideration of the present circumstances of the coffee industry in Mysore, and of the fact that the above Exhibition will afford a favourable opportunity for bringing the excellence of the Mysore product to the notice of the public in all parts of the world, the Government of His Highness have sanctioned the liberal donation of Rs.5,000, in response to the appeal made by the deputation.

Exhibits are to be arranged for through the medium of the Indian Tea Association, Calcutta, which is also to make special efforts in respect to Indian Tea. The U. P. A. S. I. is working in conjunction with the Indian Tea Association, and intends to provide exhibits of coffee, cardamoms, and pepper. It has also in special view the making of arrangements for pushing sales of these products in the United States, not only at the Exhibition or while this is in progress, but more particularly afterwards. It is hoped that the Exhibition will facilitate the creation of a demand, and that subsequent efforts will assure the permanency of American taste for Indian coffees. At its recent Annual Meeting, the Association voted Rs.10,000, out of its funds, for employment in connection with the above Exhibition, and with the help of the Madras Government and private subscriptions, it is hoped that at least Rs.25,000 will be made available.

## COFFEE NOTES.

**The Coffee Market.**—Coffee is languid all around except in the receipts thereof, says the *Tea and Coffee Trade Journal* of 28th ultimo. The speculative market has been almost stagnant excepting for yesterday, Monday, when considerable trading developed. There was extensive switching from August to the distant months, but the activity induced no improvement in prices worthy of note. March sold at 4.40 and September at 3.75. It will be seen rock-bottom prices prevail. The transactions are pitifully small but look large in these dull days.

In actual coffee there is no feature except the size of the Brazil receipts which promise all that predictions threatened. July will probably finish with receipts of nearly 1,500,000 bags, the 1,000,000 mark having been passed last week. It seems certain that the world's visible supply will have increased 750,000 bags on August 1. Brazil markets are reported firm and not below New York. It has been said for a long time that spot was cheaper in New York. Still, Brazil has sold its coffee at its own rates, which seems indicative that the Brazilians are shrewd enough to get the better of the buyers or that there is some falsification somewhere. Probably there is no hypnotism, and probably the Brazil coffee-planters manage still to find profit in coffee-growing. Prices in invocies at New York are unchanged at 4½c. for Rio No. 8, 5½c. for Rio No. 7, 5½ to 5¾c. for Rio No. 4, and 5½ to 6c. for Santos No. 4. Jobbing is likewise dull.

In mild coffee receipts continue full and there is some pressure to sell, consequently prices tend to weaken, but a steady undertone is noticed. Good Cucuta is 7½c.; three months ago it was 2 cents higher. East India coffees are unchanged.

\* \* \*

The hope of the Brazilian coffee-growers is, says the *Merchants' Review*, that the consumers will take the present big coffee crop off their hands before the price slumps materially. After the crop is out of their hands they won't care what happens. If in the meantime surprisingly firm advices come from Brazil, the grocery trade will do well to attach no importance to them. Coffee-growing has come to resemble "promoting" in one important respect, namely, the ever-present desire to unload a "good thing" on the public.

Messrs. Zerrenner, Bulow & Co., Santos, cable, "quality of the new crop promises well, only smaller bean." The bean of the new Rio crop is also small.

\* \* \*

Mail advices from Porto Rico bespeak a shortage there as probable in coffee. A drouth is prevalent, now several weeks in duration and working much damage to the coffee plantations. The extent of the injury remains to be seen.

\* \* \*

An estimate in certain coffee circles makes the yield of Brazil coffee by October 1, as 7,000,000 bags, and puts the entire world's visible supply on that date at 15,000,000 bags.

\* \* \*

**Coffee Legislation in Brazil.**—A despatch to the New York *Herald* from Rio de Janeiro says that Senator Alfredo Ellio has proposed the free transportation of coffee on railroads and suggested other projects for improving the situation of the planters. The representative of the Belgian syndicate has presented to the Government a scheme to increase the value of coffee, and he announces that the capital necessary to carry it into effect is available. He says the value of the crop is twenty million pounds. This sum, he proposes, shall be employed in buying the coffee stock in hand and in advancing eighty per cent. of the value of their crops to producers. In return the Syndicate asks the Government to suspend the tariff upon its importations

\* \* \*

**Various Import Taxes on Coffee.**—The following is a statement showing the import tax of different countries on coffee and their respective consumption *per capita*.

		Duty. U. S. Cur- rency, per lb. Cts.	Consump- tion per Capita. Lbs.
France:	From foreign countries ..	12 to 26	4 $\frac{3}{4}$
	From her own colonies ..	5	...
Italy	... ..	11 $\frac{1}{2}$ to 13 $\frac{1}{4}$	1 $\frac{1}{8}$

**"Plantation Roasted."**—The Milwaukee-Mexican Coffee Company, Milwaukee, Wis., has been granted an exemption of taxes for five years from the Republic of Mexico, and has effected an arrangement whereby all the coffee roasted by the company at its \$10,000 plant, on its Vera Cruz plantation, will be sealed and stamped by the Governor of the State of Vera Cruz.

The Milwaukee-Mexican Coffee Company proposes to grow coffee upon its plantations in the counties of Jalapa and Misantla, State of Vera Cruz, roast it on the plantation where grown, and then sell it direct to the consumer in the original Mexican package. The company will pack its product in fancy Mexican baskets. The housewife, by this new arrangement, will simply call for a package containing the number of pounds wanted, and it will be handed to her without the grocer weighing it out from a hundred-pound sack.

The plantations are under the management of Edward A. Sims, formerly assistant treasurer of Milwaukee County, Wis. Others interested in the company are Albert von Hoffman, H. S. Green, E. A. Conway, F. C. Bunde, J. W. Suetterle, L. J. Conway and A. V. Klefisch.

\* \* \*

**Coffee.**—Messrs. Branson & Co. (Limited), of Clapham, write to the *Grocer*:—A great outcry has been made about the falling-off of the consumption of coffee in this country! We herewith enclose circular we received this morning, thinking you might like to comment upon it in your paper. If such stuff as is suggested is retailed to the public under the name of coffee, it is no wonder the consumption of the genuine article diminishes!

[ENCLOSURE.]

Prospectus relating to the sale of British patent—(subject, A New Substitute for Coffee; inventor, Dr. A. Grünfeld).—Dr. Grünfeld, a well-known physician, has, after careful study, invented an exact and harmless substitute for coffee in the form of a liquid extract. The ingredients of the manufacture are extremely cheap, so that a very large percentage of profit should be made. Shortly described, the method of preparing the substitute is as follows:—"The ingredients are horse-chestnuts, sodium chloride, potash, sugar, and water. The horse-chestnuts are first roasted and then pulverised, water is added, and the mixture, after standing, is boiled, precipitated, and skimmed; the liquid is evaporated, and salt and sugar added in the prescribed manner and quantities. A small amount of potash is next mixed with result, after which a rectifying solution may be used. When prepared, the resulting mixture is kept hermetically sealed for some time, and is then ready for sale. This description is not sufficient instruction for making the substitute, and is only intended to give any prospective purchaser a good idea of the cost and ingredients. Small samples will be submitted, and if these are considered satisfactory, fuller particulars will gladly be given to any prospective buyer of the rights of manufacture and sale in Great Britain. It is submitted that this substitute is more wholesome, and has a finer aroma than the so-called coffee extracts now on the market, while its extreme cheapness should allow of a ready sale at a fair profit. Enquiries as to sale of this patent should be addressed to—," etc.

\* \* \*

**"Good Eating"** furnishes an antidote to the maudlin gibberish about the harmfulness of coffee, spread broadcast over the United States by the makers of a cereal mixture costing two to three cents per pound and foisted on a humbugged public at 20 to 25 cents.

This antidote is in the following statement:—

There is a wonderful amount of invigoration in a cup of good coffee. Taken at breakfast it keeps the energies to the right pitch for successful accomplishment. Taken after dinner it has a restful influence more soothing than anything else in the world.

Two things are essential, however, to secure a cup of good coffee. These are good cooking and good coffee. The first cannot fail, it

the directions given below are followed. The second depends upon the care with which the bean has been selected, the skill which blends the different varieties and the scientific knowledge that measures to the minute the time for roasting each kind requires.

The experts who have made our "Stuart Blend" famous have thoroughly mastered these points, and it is our proud boast that no other coffee can even approach it in flavour, fragrance and strength.

The finishing touch of a good dinner is good coffee; the appetizing part of a breakfast is good coffee. More comments emanate from the guests, as to its quality, than of anything else that is served.

### TEA NOTES.

**London Tea Market.**—Weekly special telegram dated 20th instant from Messrs. Gow, Wilson & Stanton to Colombo reports that the market generally is steady and that the market for good liquoring Pekoes are in improving demand, while the market for common Pekoes and Broken Pekoe shows a fractional advance. The price of fair liquoring Ceylon Pekoe Souchong is 6½d. (same as last week) and the average 7½d. (½d. up). The average for the same period last year was 6½. Renter reports that fine qualities of Ceylon tea command full rates. Fair Pekoe Souchong is quoted at 6d. (the same as last week) and the average for the week is 7½d. (½d. higher than last week). 24,000 packages of Ceylon tea were offered for sale and 23,000 disposed of. Indian tea:—Packages offered 26,000 and sold 24,000. Average price of Indian tea 8¼d. (½ of a penny higher than last week).

\* \* \*

**Calcutta Tea Sales.**—At the tea auction at Calcutta on the 21st instant 22,458 packages were offered and 21,825 sold. The sale was a satisfactory one, finding buyers at better rates even than those ruling last week. This was especially noticeable in the case of all teas suitable for Russia, which were keenly competed for, and helped to stimulate the sale throughout. Lower classes of leaf teas were dearer, and medium and good grades firm at last week's rates. Darjeelings with quality and flavour were distinctly dearer, selling annas above valuations.

\* \* \*

**Tea in Australia.**—With light supplies business is somewhat restricted, but the demand, and especially for teas with quality, has been strong. Leaf Ceylon teas of all descriptions are in small supply, flavoury kinds being conspicuous by their absence. Fine Broken Pekoes have sold well. Private sales of Panyongs at 5d. to 6d. have been fair; and S.O.P. at 9d. to 14d. Buds particularly dull, and the demand has practically reached vanishing point.—Melbourne *Leader*, August 1.

\* \* \*

**Shipments from Calcutta.**—At a Meeting of the Calcutta Port Commissioners on the 10th August, 1903, it was resolved that a Special Committee be appointed to consider and report on the provisions of special facilities for direct shipment per steamers loading in the docks of teas brought by the Inland Vessel Companies.

\* \* \*

**Indian Exports.**—The Indian Tea Association publish the following figures:—Sailings to Great Britain from Calcutta in July, 1,611,835 lbs.; to Great Britain from Chittagong in July, 4,117,796 lbs.; to Great Britain from 1st April to 31st July including (Chittagong), 28,125,156 lbs.; to Australia and New Zealand in July, 91,631 lbs.;

to Australia and New Zealand from 1st April to 31st July, 121,116 lbs.; to America in July, 776,456 lbs.; to America from 1st April to 31st July, 1,047,325 lbs.; to other places in July, 1,491,012 lbs.; to other places from 1st April to 31st July, 2,545,859 lbs.; total sailing from 1st April to 31st July, 31,839,456 lbs.

\* \* \*

**Colombo Tea Sales.**—A good selection was offered on 19th instant, and the few invoices of finest teas met with the keenest competition and realised extreme prices. Common teas were steady and in demand, but otherwise the market was irregular, though prices were fairly good, particularly early in the sale—a dragging tendency being noticeable towards the end. Green teas were unchanged.

\* \* \*

**The U. S. Tea Market.**—The market in tea may be said to be slow, and yet considerable is doing in a small way, says the *Tea and Coffee Trade Journal* of 28th ultimo. All this is quite in accordance with what might be expected at this time of the season. Inquiry is reported brisk in not a few instances, showing that stocks in the country are not so replete as some bears say. Diminishing canisters are beginning to give expression to their needs.

Abroad and at home the markets hold their own in prices. They are firm therefore. The expectations in general are for easier quotations in Japans, but there may be a disappointment. No weakening can hardly be expected in first crops, and it is said that a revision will have to be made in the estimate of the second crop, which it is now thought will prove less because of the large pickings induced by the high price first picking brought, so that growers sacrificed their plants, naturally. Canada so far has not been getting much of Japan tea, but expects in the next few weeks some large consignments ranging from 16 to 18c. and upwards, a price equal to the old level, and close to India and Ceylon greens.

New York has been a buyer in London of Congou teas of the better grades according to a report. Thus do we exchange our low-grade Congous, 50,000 packages of which London has bought from us since January 1. There is here as good Congou tea as London has got, but probably some importers failed in their purchases in the east, owing to the very large Russian purchases and so they have had recourse to London. Latest inside figures give London to June 26, 3,800,152 lbs. of black tea from Shanghai and the United States 1,887,775 lbs., against 2,573,000 lbs. in 1902. The tea in Hankow was said to be coming in slowly, with a demand for all grades up to good medium; only finest Ningchow was easier. Pingsueys on that date were reported falling off in style, and to the degree that many lines would not pass U. S. inspection. In Country Greens many Shanghai packs are reported as too common to pass in America.

\* \* \*

**Indian Tea in Persia.**—Though Major P. Sykes, H. M's Consul in the Kerman District of Persia, classes Indian tea among "necessities in Persian transitists," and says the new tariff was likely to affect the commodity less than would at first sign appear, he observes that most of the transit trade of both Kerman and Persian Baluchistan with Central Asia has been killed by opening Batum for the conveyance of tea to Bokhara. Tea was imported at Batum from the U. K. more than 25 years ago, and it would be interesting to know what changes in the places of distribution have occurred at Batum (and Poti) during that period.

**Japan Tea.**—Messrs. Smith, Baker & Co., writing from Yokohama, July 2, say :

"Like first crop teas, second crop teas are a little earlier than usual in coming upon the market. Owing to dry weather during the flush, the leaf is short and the cup character a little earthy, but the prices paid by the interior merchants are long and from the point of view of the grower are heavenly. The country merchant has seen the avidity with which first crop teas were taken this year and remembers the extraordinary demand for second teas at advancing values last year, but forgets they were needed then to make good the deficiency of a very short first crop. Sales of his consignments on the Yokohama market have only been possible at a smart loss, which he regards as the result of artificial combinations on the part of buyers instead of natural causes, and on the slightest signs of any active business promptly puts prohibitory limits on his teas.

"An effort is being made by influential tea-men to effect an agreement among growers to cease picking August 1st, just after the best of third crop has been gathered. This is not for the purpose of maintaining prices, but for the ultimate good of the gardens. The steady deterioration in the quality of Japan teas noticed in the past five years is forcing the conviction that the gardens have been cropped too close. With the low prices following the period of commercial depression in 1893 and the advent of the U. S. duty a few years later, the acreage under tea cultivation rapidly diminished and when prices revived, close cropping began and quality has since then been worse every year. It will be two or three years before new gardens now being prepared will become producers. Faith in the success of an agreement to cease picking August 1st, is not very strong and fluctuates with the prices of low-grade teas."

From Kobe, July 1, the Japan Tea Exporting Co., Ltd., says :

"High-grade teas of the first crop leaf have nearly been exhausted, the stock now in the market consisting largely of finest and downward grades. Prices since our last report have declined by Y3 to Y4 per picul, the fall in value being particularly great for goods of medium and downward descriptions, which have now reached the level of prices ruling at the corresponding period last year. Such descriptions being not only cheaper here as compared with Yokohama, but low-grade teas being almost monopolised by the Kobe market, buyers seem to prefer the Kobe market to that of Yokohama for buying these descriptions.

"Transactions for the second crop leaf have been opened in Yokohama, but prices were very high; and though there has been a gradual decline, prices are still Y4 to Y5 higher as compared with last year. The quality, owing to the continued dry weather that has prevailed during the 'rainy season,' is not satisfactory. It is also reported that in some districts there has been damage—though to a small extent—by insects, and it is to be regretted that for the reasons already given the crop has not been as satisfactory as it was expected would be the case.

"Arrivals of the second crop leaf in Kobe have so far been small, but judging from what has already arrived, the quality does not appear very unsatisfactory. Purchases by one or two firms have been made at Y33 to Y40 per picul, which is Y2 to Y3 higher than last year. According to investigations made in various districts, the second crop this year is said to be an average one. The price of low-grade goods equal to the United States standard is expected to be about 16½ to 17 cents delivered in the United States."

The Central Tea Trades Association has issued a warning advising the general suspension of the picking of the tea leaf on and after July 31st. Whether this will actually be adopted or not, we cannot say; we will advise when we obtain definite information on the matter.

**China Tea.**—From Shanghai, June 26, Wisner & Company say :

"Black Teas:—Advices from Hankow dated the 22nd ultimo report a continued firm market, especially for lower grades. Total arrivals for 44 days are 565,587 half-chests against 581,694 half-chests in the same time last season. Only a few teas have so far been offered here; they include two 2nd crop Ningchows both of which point to these teas proving inferior to last season's. It is expected the 2nd crop will be of ample size.

"Green Teas:—Country teas.—One chop each of Soey Oan and Fychow has been offered, the price paid for the former and refused for the latter seems very high. No quantity of Country Teas is expected for some days. Pingsueys.—A considerable business has passed in these but the market has been a falling one since the 9th ultimo, on which date prices showing an advance of 5 taels over opening rates were recorded; this advance has all been lost and the market closes weak at slightly below opening prices. The quality of a good portion of these teas shows a small improvement on earliest offerings. Lines of Country Tea Hyson, Foong Mee and Chun Mee are selling at fancy prices viewed from the standpoint of former seasons."

Exports from Shanghai and Jangtsze ports this season are 1,966,340 lbs. black and 10,481,509 green for the U. S. and 231,865 lbs. black for Canada. Figures for the (U. S.) one year ago were 2,303,811 black and 906,508 green.

**Gloomy View held in Yokohama.**—Since its first appearance on the Yokohama market up to the 31st ultimo, the new tea of the season changed hands to the large amount of 8,130,800 catties, the quotation averaging 47.38 yen. This activity in the tea trade is said to be almost unprecedented on that market. The eager purchases made by many foreign firms may have been the causes of all this activity. But a gloomy prospect appears to be now before the tea trade in Yokohama for the remaining part of the year, for the advices from America continue, according to the *Nichi Nichi*, to say that the American tea market is dull and that Japanese tea is quoted there lower than in the Japanese markets.

On the other hand our tea-planters are now asking rather a high price for their produce, being probably encouraged by their recent success in their sales. At any rate, tea of the second season, which will shortly be brought to the market, will, it is expected, never sell so well as the tea of the present time has done thus far.—*Japan Times*.

**American Tea Market as Viewed in Yokohama.**—The New York representative of the Central Chamber of tea guilds reports under date of May 23, that the first consignment of Japanese new tea arrived at the city on May 18, and that transactions were immediately opened, though for small quantities of the goods. The high opening quotations for the new tea in Japan was quite unexpected in America. The tea of the first consignment was excellent in quality, so that it was all disposed of at tolerably good prices. The tea from Yokohama, the purchase price of which was 57 yen per picul, changed hands at 26.5 cents per pound, while that from Kobe purchased for 55 yen per picul, realized 34.5 cent. per pound. The quantity of the first consignment being, however, rather small, the good prices fetched by Japanese tea can by no means be held to foretell a good market in future. And yet it seems certain that good Japanese tea will be able to find a ready sale on the American market where tea of a better quality is now scarce. Reports from China and other countries join in telling of high quotations prevailing in these countries, so that it is expected that tea will this year command a rather high market price in America.—*Japan Times*.

A ruling by the U. S. Treasury Department of July 14 affects tea in passengers' baggage to the extent that hereafter collectors of customs are authorized to permit delivery of small packages of tea not exceeding 5 pounds, brought by passengers, without examination for purity, if the tea is for personal use and not merchandise nor for sale. Quantities in excess of this amount are to be reported for special instructions.

## NOTES.

**Oolong? Sir Thomas.**

The *Merchants' Review* cracks a quiet joke over the America Cup :—"If Sir Thomas Lipton lifts the cup he's sure to fill it full of tea. Oolong do you think you could keep the cup, Tommy?"

**Consumption.**

Says the *Merchants' Review* of New York :—Some Japanese are coming

here to find out, if they can, why we don't drink more Japan tea. And the Brazilian coffee-planters think it is mighty funny that we don't use a great deal more coffee.

#### Vanilla in Reunion.

Exports of Vanilla from Réunion during the last three years were as follows :—

1900	...	...	95 tons.
1901	...	...	50 "
1902	...	...	111 "

It is remarked that these supplies are exported through France, and that the export trade is almost entirely in German hands.

#### Necessaries.

Messrs. Clifton & Co., of Coimbatore, have favoured us with a copy of a comprehensive price-list of boots, shoes, harness, etc. The rapid way in which this business has developed from very modest beginnings, is the best testimony to the excellent work turned out by the firm. To planters good boots are necessities, and many of our readers have doubtless availed themselves of the opportunity of getting from Messrs. Clifton & Co. easy-fitting and good-wearing footgear at very reasonable prices. More will do so, as the firm's reputation becomes still more widely known.

#### Venezuelan Cocoa.

The following statistics of exports in 1902 and 1901 have been published :—

	1901.	1902.
La Guaira ... ..	70,085	111,627 bags.

Maracaibo exports are put at 193,562 kilos. last year against 114,061 in 1901; and Puerto Cabello exported 891 metric tons as against 456. Thus there was a large increase in exports. Moreover, the price of the article was sustained at a favourable figure in the European markets; in France 84 to 88 frs. (£3 6s. to £3 9s. 8d.) was obtained for the ordinary class of cocoa. The quality of the Rio Chico cocoa has lately commanded better prices owing to more careful methods of preparation for the market.

#### Tea and Coffee at Trieste.

The following are statistics of imports from the British Empire at this Port :—

		COFFEE.	
		1901.	1902.
From the U. K.	...	4,430	2,400 net tons.
" British India	...	94	114 "
		TEA.	
		1901.	1902.
From the U. K.	...	96	93 net tons.
" British India	...	42	33 "

These figures, it will be seen, related solely to imports from British India. In his report for 1902 Mr. Consul Churchill gives no clue to the extent of importation from Brazil and other foreign countries.

#### The Gardener's Highest Degree.

In the *World's Work* for July there is an interesting article on Kew Gardens, which deals with a side of its work little dreamt of by most visitors—viz., the training of young gardeners. Morning after morning small batches of young men are taken through the Museum. To the average visitor the Kew Museum is merely a dull collection of common-place looking objects. To the young gardener, who listens to the demonstrations of Mr. Hillier, the keeper

of the Museum, it shows the goal of the planter who plants a seed. For here he sees and handles the things that can be made out of the plants which he has been tending and bringing to maturity. What is the best broom for sweeping? He has seen the seed, tended the plant, and here is the broom. Does he aim at tea-planting? Here in the tea case he will find all manner of teas in balls or bricks as they come from China or Burmah. He sees the results of the back-bending labour of his profession, and realises that in the end the gardener is the purveyor to the human race. He, of course, learns much more besides before he gets the so-dearly-prized certificate, but most of those who read this will appreciate what the Museum work means to the tiller of the soil.

#### Fibres.

How many persons in India know that within the last few years there has been growing up with remarkable rapidity an export trade from Nepal in fibrous products to India? Four years ago this trade had already reached a value of over four lakhs; in 1902-03 it increased to over eleven lakhs. One of the articles comprised in the heading is jute, and the accounts of the Frontier Trade of India show that jute, the produce of Nepal, is being sent into Bengal in increasing quantities each year. In 1899-1900 the receipts amounted to 70,389 maunds, valued at Rs.2,80,341; in 1902-03 they had reached 149,518 maunds, valued at Rs.5,08,898. The remaining six lakhs (out of the eleven stated above), was the value of what are said to be "fibrous products raw (excluding jute)", and consist mostly of sabai grass sent into the United Provinces and Bengal for the manufacture of paper. Doubtless the railway lines now running into the Nepal terai at four points, give facilities for the jute and sabai trade. But might not the same advantages be turned to account for trade from this side? The total trade of Nepal with India amounts to a value of well over four crores of rupees, and the imports from that country into India have a recorded value about double that of the exports from India to Nepal.

#### Tea and Pensions.

Nelson & Co., the "Tea Pensioners," having now made a fine business for themselves by means of their unsound insurance scheme, have, says the *Financial Times*, at last taken fright at the Frankenstein which they had created, and they are beginning to modify certain features of the plan. No existing widow will now be allowed to earn £26 a year for life by the simple process of drinking her usual supply of tea for ten years. No longer may a young girl marry an aged man and be made rich for life by purchasing three stones of tea before the old fellow dies, for henceforth the wife must not be more than 15 years younger than the husband; but these alterations, although in the right direction, are only like pasting a piece of blotting paper over a leak, and will not appreciably delay the impending shipwreck. A useful summary of the whole position has just been published by Mr. A. T. Wilmot, in which he sets down in full detail the views which we had ourselves expressed on the subject, our article indeed being reproduced in the pamphlet, and the little book should be useful in opening the eyes of the public to the real position. Like too many others who have written on the subject, however, he lays undue weight on the "actuarial" deficiency which he claims to exceed £34,000,000, but as there are no binding contracts to pay the 10s. weekly, that sum cannot be held as being an actual "obligation."

## GENERAL ARTICLES.

## PRODUCE AND PLANTING.

In Canada tea importers are advocating the necessity for a Canadian Tea Association. One of the leading Montreal men recently said: "What we need in this country is an Association such as has been formed in the United States, which would have something to say about the quality of tea allowed to come into Canada. At present this is the dumping ground for teas that are refused in other countries. What is not good enough for the United States, for instance, should not be good enough for Canada. But the standard here is low, and prices are kept down. Here there is no duty, and a great deal of cheap tea can come in."

The Central Tea Association of Japan has sent a special commission to the United States for the purpose of increasing the sale of Japan teas there.

The *Times* last week published a letter from a leading firm on the Anglo-Persian Tariff. In it the writer said: "It is not without surprise that we learn from the Commercial Convention between Great Britain and Persia, just issued by the Foreign Office, that in the same month in which the Russo-Persian Tariff was promulgated (February) a Convention was signed between our Minister in Teheran and the Persian Government which affixes the seal of our Government to the Russo-Persian Tariff. We have compared the schedules of the tariff affixed to the British Convention with the similar schedules in the Russian Convention; and we find that, with the exception of a considerable increase in the duty on tea imported into Persia from India, the two tariffs are word for word the same. It would seem to the lay observer that the obviously better course would have been to protest against the Russo-Persian Tariff, and to wait for a favourable opportunity of negotiating a commercial treaty with Persia, which would be fair to British trade. What need was there for us to place our sign manual upon a transaction concluded between two foreign Powers, the effect of which is to penalise our trade?" With reference to the increased duties payable under the new tariff the writer says: "In conclusion, permit us to call your attention to the increases on tea and opium, both of which articles are principally exported from or imported to India and other British possessions."

There has just been published a budget of facsimiles which begins with the Roll of Battle Abbey and ends with a reprint of the *Times* of June 22, 1815. Amongst these reprints is an issue of the *Commonwealth Gazette*, which records the death of the Lord Protector. It boasted five advertisements, including one of "That Excellent, and by all Physicians approved, China Drink, called by the Chineans 'Toha, by other Nations 'Tay, alias Tee, is sold at the Sultanness Head, a cophee house in Sweetings Rents by the Royal Exchange, London."

A correspondent of the *Grocer*, referring to the falling-off in the consumption of coffee, expresses the view that coffee substitutes may have something to do with the diminution. He calls attention to the following circular: "Prospectus relating to the sale of British patent—(subject, A New Substitute for Coffee; inventor, Dr. A. Grünfeld).—Dr. Grünfeld, a well-known physician, has, after careful study, invented an exact and harmless substitute for coffee in the form of a liquid extract. The ingredients of the manufacture are extremely cheap, so that a very large percentage of profit should be made. Shortly described, the method of preparing the substitute is as follows: "The ingredients are horse-chestnuts, sodium chloride, potash, sugar, and water. The horse-chestnuts are first roasted and then pulverised, water is added, and the mixture, after standing, is boiled, precipitated, and skimmed; the liquid is evaporated, and salt and sugar added in the prescribed manner and quantities. A small amount of potash is next mixed with result, after which a rectifying solution may be used. When prepared, the resulting mixture is kept hermetically sealed for some time, and is then ready for sale. This description is not sufficient instruction for making the substitute, and is only intended to give any prospective purchaser a good idea of the cost and ingredients. Small samples will be submitted, and if these are considered satisfactory, fuller particulars will

gladly be given to any prospective buyer of the rights of manufacture and sale in Great Britain. It is submitted that this substitute is more wholesome and has a finer aroma than the so-called coffee extracts now on the market, while its extreme cheapness should allow of a ready sale at a fair profit. Enquiries as to sale of this patent should be addressed to—" etc.

Referring to the coffee trade of the United States the correspondent of a contemporary says: "The United States Government report on May 30 shows that about 80 per cent. of the imports came from Brazil, 8 per cent. from other South American countries, 8.3 per cent. from Central America and Mexico, and less than 2 per cent. from the East Indies. And yet Java coffee and Mocha is sold in nearly all stores as the leading coffee. If Brazil could have the credit for the really fine coffee it sends from the Santos district, the planters would get more for their product. It is possible to buy for 6d. or 8d. coffee grown in Central America, Venezuela, or Brazil that will roast as well and make as fine a beverage as East India coffee, costing 10½d. or 1s."

At the Meeting of the Dumont Coffee Company held last week, Mr. H. K. Rutherford, the Chairman of the Company, stated that the results recorded in the last report were the worst the Company had experienced. Referring to the position of the Brazilian coffee industry, Mr. Rutherford said: "At no time I believe in the history of coffee have there been such vast interests at stake, the fate of which, I do not think it is an exaggeration to say, hang this year trembling in the balance. As naturally there must be many shareholders who do not follow the movements in what is known as the coffee crisis in Brazil, I cannot perhaps do better than begin by quoting the words of President Rodrigues Alves in his message to the country. He said in that Message, 'The fall of prices of our staple product is disheartening to producers whose labours are almost fruitless. . . . The various classes of farmers and planters who have so honourably and with such sacrifices faced the gravest and most terrible difficulties must find an echo, each and all of them, in my administration, whose chief aim it is to attenuate the effects of a situation so precarious'; and in the month of May last at the opening of Congress he said, 'The economical situation, though unsatisfactory, is not hopeless. It is due mainly to the helplessness of the coffee producers in face of over-production. Their concerted efforts to counteract some of the evil effects of the crisis deserve aid from the public powers.' These utterances, by the head of the State, will serve to show you the gravity of the situation arising from the over-production of coffee in Brazil. After the enormous crop of 1901 of 15½ million bags, leaving the world's visible supply at June 30, 1902, at 673,150 tons, came the unexpected crop of last year of 12½ million bags, against an estimated crop of 7 to 8 millions, and this left the world's visible supply at 707,700 tons, or an increase of 34,550 tons. Under such a weight it was impossible for markets to improve. So much now depends on the output of the current crop that it is being studied with the utmost anxiety by all who have interests in coffee. In many quarters it is predicted it will fall considerably short of the previous year, for the following reason. Over a large area severe frosts last August are said to have destroyed either temporarily or permanently many millions of trees. Further, the low price to which coffee has fallen, the difficulty of obtaining the means, not only to carry on the cultivation, but the harvesting of the crop, the handing over the growing crops to the colonists in lieu of arrears of wages, the exodus of labourers from the country, and the prohibition of the Italian Government to allow further emigration to the coffee districts, unless under special conditions, and the failure of many local district banks, must all tend to diminish production. The State Congress at San Paulo passed a measure providing for the destruction of 20 per cent. of the lower grades of coffee, but, the other States not agreeing, it has not been put into force. A tax, however, has been placed on the opening out of any new coffee lands, sufficiently heavy to make it prohibitory to do so, and the latest information we have is that the San Paulo Government are seriously considering making advances to planters to the extent of £1,200,000, if they can find means of raising the money. I mention these things to bring home to you the difficulties of the situation in Brazil. I do not, however, believe any of these artificial means of bolstering the industry will succeed in remedying the evils of over-production, and the future position

will have to be fought out by the law of the survival of the fittest." Mr. Rutherford went on to say, referring to the position of the Company: "I think there can be no reasonable doubt, if this Company can keep afloat during these trying times, and it comes about that considerable areas of coffee have to be abandoned in Brazil during this crisis, the Dumont Company, with its plantations, buildings, railway and machinery, all well cared for and up-to-date, may yet reap the fruit of its long patient waiting for the turn of the tide."

At the same Meeting Mr. Rucker, the broker of the Company, gave the following particulars about the supply and demand. He said in the course of his remarks: "Last year there was not any very great adverse divergency between the amount of coffee ground and the amount of coffee consumed. About 17,200,000 bags of coffee came into the United States and into Europe, and about 16,300,000 bags were delivered to the consumers. At the end of the season just over we found our visible supply only 575,000 bags bigger than at the commencement of the season. That is nothing, because if you calculate the percentage out on 16,300,000 bags, it is a mere adverse *plus* of  $3\frac{1}{2}$  per cent. Neither do I think that this season—of course, that is more uncertain, but from what I hear and know I do not myself think there will be any very great adverse divergency between the amount of coffee grown and the amount of coffee consumed. But then, you will ask me why are things so bad? Why are prices at the lowest point ever known? Well, I can embody the answer in two phrases—visible supply and fear. 1895-6 was an epoch-making year in the history of coffee. Previously to that we had had ten years of unexampled prosperity. Coffee, which is worth to-day 24s., and which averaged last season some 26s. 8d., was worth then and was considered to be low at 50s. It had been up in the seventies; it had been as high as 84s. Now, what was our visible supply in 1895-6? It was 2,500,000 bags. The visible supply is our barometer; it is the weather gauge of the coffee market, and what do you think it is to-day? This shows the over-production. It is 11,800,000 bags. Every day 11,800,000 bags of coffee have to be carried, to be warehoused and to be financed, and that is a great weight round the throat of the coffee trade. But even that fact does not explain the present low prices. In order to explain that thoroughly you have to look at the word 'fear.' Two years ago the Brazils produced the huge crop of 15,500,000 bags, and possibly as much as 17,000,000 bags, on the trees, and the trade fears that what the Brazils have done once they may do again. Now, a great deal has happened since that bumper crop. As you have heard from your Chairman, there has been a drought and there has been frost, and my experience of life is that those things which are foreseen and generally expected very rarely happen in their entirety. It does not alarm me tremendously this fear of another huge crop. I doubt very much whether we will ever get it; but, of course, we may." Referring to the question of consumption he said: "Last year we delivered to the trade 16,300,000 bags of coffee. What do you think we delivered in 1895-6? 11,000,000 bags only. Just fancy what a tremendous increase in consumption; that is at the compound rate of 6 per cent. per annum; and if you carry that ordinary calculation on for another five years, in that time, unless prices advance enormously—because, after all, this increased consumption is not owing only to low prices, but greatly owing to the increase in population in coffee-consuming countries—I say that if you carry that calculation on you will find that we shall require 22,000,000 bags of coffee in five years' time, against 11,000,000 bags in 1895-6 —H. & C. Mail.

### CONGO INDIA-RUBBER.

Some facts regarding this subject are given in *Engineering à propos* of the indictment of the Congo State authorities in the House of Commons, as the gathering of the india-rubber is stated to have been attended with such dire forms of coercion. It is now some years since Sir H. M. Stanley prophesied the future greatness of the Congo lands as a source of rubber; but as regards competition, the rubber of Brazil and Bolivia is the product of altogether different trees from those which yield the rubber of Equatorial Africa, and

#### THE AFRICAN PRODUCT IS INFERIOR

in tensile strength, and quite unfitted to replace the Brazilian for many of the purposes to which this useful, and now well-nigh

indispensable, commodity is put. In East and West Africa the general rule is that the natives collect when, where, and how they like, and take their rubber to the merchant, receiving from him payment generally in kind. The native is a free agent; but this system does not seem to have commended itself to the owners of concessions in the Congo State, and the adoption of severe measures in order to enforce the collection of rubber by the natives was resorted to. No doubt, as a business speculation, the idea was in the happiest vein; a very large amount of rubber was collected and the ensuing regular shipments to Antwerp succeeded in making that port a very formidable rival to Liverpool and London as a distributing centre for this quality of rubber. The trees from which the bulk of the African rubber is obtained are various species of *Zandolphia*, which genus belongs to the order *Apocynaceae*. In order to obtain the rubber, a good deal of climbing is often necessitated on the part of the collectors. There is no doubt that, speaking generally of the various brands of rubber which come into the market from the Congo State,

#### A GREAT IMPROVEMENT IS NOTICEABLE

compared with the African qualities of twenty years ago. Not only is the open sophistication of the rubber with sand, dirt, and water almost unknown, but the coagulation of the rubber milk is now being carried out on lines which give a much less resinous product than used to be the case. Twenty years ago, continues *Engineering*, Congo ball-rubber from the lower reaches of the river used to contain 18 to 25 per cent. of resinous matter, while to-day from 4 to 8 per cent. is nearer the figure found. These figures, it should be said, refer to the washed and dried rubber, and not to the crude rubber as imported; this latter, according to contents of dirt and water, losing anything from 10 to 35 per cent. in going through the cleansing process in the factory. At the present time African rubber, such as is produced in the Congo State, finds much wider application than was the case some years ago. The incentive to its increased use may be traced in the high price to which Para rubber attained some four or five years ago, and the consequent necessity which entailed upon rubber manufacturers to cast about for means to tide over

#### THE DIFFICULTIES CREATED BY THE SITUATION.

It is not surprising, therefore, to find that the Congo authorities and concessionnaires have displayed a feeling akin to anxiety with regard to future profits, and have taken definite steps to insure a satisfactory situation in this respect. It has been enacted by the State that for every ton of rubber collected 150 new plants shall be set out. With regard to the business conducted in raw rubber at Antwerp, *Engineering* adds, that, while in 1890 it amounted to only 30 tons, this figure rose in 1895 to 531 tons, while successive years showed rapid increases to the neighbourhood of 6,000 tons in 1900.

### RUBBER IN FRENCH INDO-CHINA.

#### DR. YERSIN AS A PLANTER.

Dr. Yersin, the famous bacteriologist and plague expert, has started a rubber plantation at a place called Nha-Trang in French Indo-China. A description of the venture is given in a recent number of the *Journal d'Agriculture Tropicale*. The facts stated shew that, about some five years ago, Dr. Yersin, the then Director of the Pasteur Institute at Nha-Trang, established a plantation of Heveas there, about 10 hectares or 25 acres in area. He as yet can form no opinion on the rubber returns from these trees, as he cannot tell with any accuracy for another two years what the returns will be, but certain bits of available information show the plantation to be fairly satisfactory. One of the objections that is raised against planting Heveas outside the basin of the Amazon river, is the periodical dry season which prevents the gathering of the latex and hinders the good growth of the tree. However, in the Nha-Trang region there is a very marked dry season for four months, but it agrees perfectly with the same season observed in Amazonia at Rio Beni. Three years' observations in these two places give an average of 125 days of rain per annum at Nha-Trang, and 121 days of rain per annum at Rio Beni; the mean annual temperature being 26 degrees C. at Nha-Trang, and 25.7 degrees C. at Rio Beni. Dr. Yersin finds that his trees with an average growth in circumference of 10 millimetres (a millimetre is .039 inch) per annum, appear to be behind those of

Ceylon plantations by a year, and two years behind those of Malaya. But the most important factor is the soil; it should be low-lying, even swampy, and rich in alluvials; the sub-soil should be clay to retain moisture round the roots. These conditions are found more or less in the Nha-Trang Valley. It is Dr. Yersin's experience that the planting of Hevea in French Indo-China will be a success provided there is judicious choice in soil and climate, and attentive selection of individual trees. Ficus can be worked more quickly, it is true, but the product is undoubtedly inferior to that of Hevea in quality. Gutta is met within the forests of the country, so it is reported, and rubber vines abound, but all is left to native enterprise with its wasteful methods.—*Straits Times*, August 12th.

### RUBBER PLANTING IN ASSAM.

Considerable interest is at present being shown in the planting of rubber on Estates in Assam, though it appears as if planters had not fully realised the enormous profitableness of the undertaking. To say that the venture is very much more paying than tea-growing or coffee-growing would perhaps be saying too much at once, but that it compares more than favourably with either of these two occupations cannot be doubted for a moment. For example in one particular only it will be realised how favourably is the comparison and that is that the rubber industry can never suffer from over-production when one comes to consider the enormous and still daily growing demand for his material. To every manufacture of the present day rubber in one form and another seems to be necessary. The commonest West African rubber fetches £200 per ton at home while the Pará Rubber of South America reaches the ruling price of £400 a ton. About two years ago the Government of India, obviously foreseeing the advantages accruing from the plantation and production of rubber, started the cultivation of Pará rubber in the Southern extremity of Lower Burma known as Mergui and also on the adjacent King Island. A year prior to the action of Government, however, private enterprise had also launched into the trade. In 1899 a Yorkshireman (Mr. W. S. Todd) living at Amherst, near Moulmein, started a plantation of Pará rubber and has now fifty acres fully planted with 14,009 trees which even at this early stage have developed splendidly and give great promise of bringing Mr. Todd, in another five years, a very ample return. So that it is estimated that when all the plants in Burma begin to yield Europe will receive a good supply of nearly pure rubber which will only lose about one per cent. in the washing. This has been proved by samples recently sent home of cultivated rubber both from Ceylon and the Straits Settlements.

The *Hevea Brasiliensis*, however, is not the only variety of rubber that has been introduced into Burma. The seeds of the *Castilloa Elastica*, the variety now planted on a large scale in Mexico have been successfully introduced into Burma by Mr. Todd who imported the seed direct from San Salvador and Mexico. Some

of these seeds were afterwards forwarded by this gentleman to Samoa in the South Seas and are reported to have arrived there in good condition. This latter fact is all the more important considering that this seed loses its vitality very quickly. Its transmission, therefore, from one place to another must be accomplished as rapidly as possible, though if carefully packed it is possible for it to travel in good condition for a period of three months. This year there is a considerable demand for this seed in Ceylon as it has been found that it thrives on a wider range of country and climate than the Pará plant. These latter considerations naturally make for the popularity of this seed in India where conditions and country are so varying. That there is money in rubber planting there can be no doubt and we are so far informed that the country in North Bengal appears to be specially adapted for rubber cultivation so that private enterprise if not Government interest should at least be aroused and that the results will be satisfactory will be the hope of India's wellwishers since India as a country and not merely private enterprise will benefit by this industry.—*Englishman*.

### THE CHINA TEA TRADE.

#### ADVERTISING WANTED.

For years past it has been the cry of the China exporter that what was once the staple trade of the country is in a state of decline. In other directions, the export trade of China has been increasing by leaps and bounds, but when it comes to the tea trade nothing but retrogression is apparent. For this state of affairs the Chinese themselves are to blame. Their teas cannot, absolutely, be surpassed by those of any country under the sun. But the Chinese in their conservatism, will not conform to the modern ideas as regards advertisement. Whereas the tea-planters of Ceylon and India literally flood Europe and America with advertisement leaflets, setting forth the excellencies of the teas grown by them, the Chinese do not advertise at all. Indeed, they work under this disadvantage, that not only do their rivals of the nearer East advertise their own wares, but they lose no opportunity that offers to decry their neighbours' goods. Everybody, no doubt, has at one time or another seen the handbills which are so freely distributed in European countries purporting to show the vast difference in the methods of tea-preparing as followed by the Chinese and the Hindus and Singhalese. Of course, the Chinese always suffer in comparison. But when one looks into the matter and sees how actually the Chinese tea-preparers do their work, one cannot have a feeling of chagrin that they lack in the matter of advertisement; the writer has seen the making of tea carried on in other countries, and nowhere has he seen more care used in the preparation of the leaf than in China. The great argument used by the people who make their prosperity by decrying China tea is that the preparation of the tea is characterised by methods of operation that are dirty. There never was a greater fallacy propounded. The methods

followed by the Chinese are absolutely as clean as the most fastidious could desire. The Chinese are naturally a fastidious race themselves, and in nothing are they more particular than in the way in which their tea is prepared. There has been lately started here a society which aims at the publishing abroad of the qualities of the China plant, and this is an encouraging sign of the times; but the matter will require to be even more widely published before the old trade of China comes back to the position that it formerly held, and which it is quite able to hold yet if only the China merchant and grower were more cognisant of modern methods of making known to the world at large the qualities of the stuff in which they are ready to trade.—*Singapore Free Press.*

### A TRUE STORY.

England is a long way off and fifty-three years is rather far in the past; still there are a few people among us able to recall what the old country was like in 1850, the year of the incident to be related.

At that time there lived in a detached-cottage near an English cathedral city a very eccentric bachelor. He had formerly been wealthy; but having dissipated the greater part of his fortune, he went to the other extreme, and not only became a teetotaller but almost denied himself the necessities of life. For years he kept himself a prisoner in his cottage, his only companions being two ferocious bull dogs named Beer and Whisky.

Two tramps, who chanced to hear that this singular recluse was very well off, and that he was never without beer and whisky, resolved to rob him. Accordingly they one night broke into the lonely man's cottage, and immediately discovered that the Beer and Whisky therein were of quite different brands than they had expected to find. One of the tramps, fleeing in mad terror from the dogs, fell into a mill stream and was drowned. His companion, badly bitten, just managed to climb a tall fence; but fell over it and fractured his skull, so that he died the next day.

The incident caused much excitement at the time, and it had scarcely subsided when the local shopkeeper reported that the only

answer he could obtain to his knocking was the growls of Beer and Whisky; whereupon the police broke into the cottage and discovered the old man—dead. The inquest was remarkable for a dispute which it occasioned between two doctors. One maintained that death was the result of fright at the recent attempted robbery; the other, that deceased died from chronic indigestion brought about by improper diet and want of exercise, he not having been outside his cottage for eighteen years. The discussion was taken up by the giants of the medical profession, and ably debated, the conclusion reached being that indigestion is a disease arising from infinitely numerous causes, and itself productive of complaints hardly less numerous. But it was not then known (as it has been now for thirty-five years) that indigestion has one sure cure, *viz.*, Seigel's Syrup.

Mr. H. C. Blackie, of Post Office Chambers, Auckland, N. Z., has not kept within his house for eighteen years. On the contrary, he is a traveller and knows the world well. Writing on 16th March, 1903, Mr. Blackie observes: "For years I was a martyr to indigestion and flatulence. Wind used to press on the valve of my heart to such an alarming degree that on two occasions I fainted on the platform when publicly speaking. Dietary and medicinal treatment failed utterly until, on the recommendation of a Professor at the Working Men's College, Melbourne, I tried Mother Seigel's Syrup. By taking it regularly after each meal I very soon found relief, and have ever since been able to enjoy all foods without inconvenience. My cure was effected about four years ago, when I had consumed from six to eight bottles; but one bottle was sufficient to afford me relief. I have never ceased to praise the virtues of Seigel's Syrup in the Colonies I visit as commercial traveller, merely in gratitude for the great benefit derived from it—for I have no business connection whatever with its proprietors. What I now say is quite unsolicited. Certainly there is no other such potent and easy remedy for all forms of indigestion." Such is the testimony of an intelligent and experienced man. Of indigestion it may be said, as was said of fame, some inherit it, some achieve it, and some have it thrust upon them (as in the case of persons compelled to lead a sedentary life); but *all* may eradicate it by following the example of Mr. Blackie.

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

## CURES

### RHEUMATISM, NEURALGIA, GOUT, SPRAINS, SORENESS, SCIATICA, LUMBAGO, HEADACHE, BACKACHE,

And all Aches and Pains usually treated by outward application.

## IT HAS NO EQUAL ON EARTH AS A PAIN RELIEVER.

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

MADRAS, SATURDAY, SEPTEMBER 5, 1903.

[No. 35.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 11th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

September 2nd.—Weather—The weather is clearing a bit now, and sun appears at intervals. Works—Planting is generally finished. Weeding and getting estates clean. Crop prospects—Moderate. Health—round Saklaspur very poor. Labour—Plenty. Interesting item—3rd class powers have been given to the present temporary amildar for one month.

#### DISEASED PEPPER.

WE GIVE elsewhere the full text of the official report of Mr. C. A. BARBER, M.A., F.L.S., Government Botanist, Madras, on his investigations in respect to disease among pepper plants in the Wynaad. In his covering letter to the Secretary to the Commissioner of Revenue Settlement and Director of the Department of Land Records and Agriculture, Mr. BARBER says:—"It would appear that the pepper plantations generally are not in at all a satisfactory state. They are thoroughly diseased both in the Wynaad and in the low country of Malabar. The only suggestion at this stage of the investigation, besides the more careful selection of cuttings, is to introduce vitality into the cultivated race by a series of seminal crosses. This is a difficult piece of work and will require much time and care in selection both of parents and offspring." The difficulty referred to is greatly enhanced by the fact that there is so much so-called cultivation of pepper by Natives of India. The simple fact appears to be, that, under the charge of Europeans and Indians alike, Pepper

has "grewed" as TOPSY did, and the result has been an alarming spread of disease. Mr. BARBER states that it is proposed to continue the study of the pepper vine in his office as time permits, and he thinks that a short visit to North Mysore plantations is likely to lead to useful results. He then makes the following significant remarks:—"The pepper vines appear to differ materially in this tract" (he writes from Madras but evidently refers to Wynaad and Malabar). "from those I have hitherto examined; in that they are purely jungle kinds. Elsewhere the jungle kinds have been found to be worthless, but the very high price obtained for the North Mysore pepper points to there being a different species of the plant growing there. This is a fact of considerable importance in view of any possible crossing operations." Permission has been given to Mr. BARBER to arrange a visit to North Mysore at such a time as will not interfere with the ordinary work of his office.

Quite apart from the definite subject with which they deal these remarks are of very great importance. The European planter in India should adopt as his motto "Thorough." In regard to quality his cry should ever be "Excelsior." During the last few years lamentable proofs have been forthcoming that there has been neglect in regard to the maintenance of a high standard of quality in regard to Tea, Coffee, Pepper, and Cinchona. During still more recent years an improvement has been noticeable in respect to three of these products, and Pepper has at last begun to receive a fuller share of appreciation. In every instance, however, this appreciation has been the result of what the planter will probably term, "misfortune." One thing or another has caused him, through the medium of a strong appeal to his purse, to realise that his staple product has been losing ground in the race with rivals. The lesson thus taught should not have to be taught to him again and again. It is a bitter lesson of the kind that leaves an unpleasant taste behind, and should keep the strings of memory vibrant. When once the planter descends to the level of sowing and then waiting until he can gather in his crops, he reaches a plane upon which he cannot compete with the Indian cultivator, whose wants are less, his

patience greater, his indifference quite as great, so long as there is a livelihood to be had. A livelihood for the Indian is not one for the European; and it is only by superiority of culture that the latter can hold his own if he enters into direct competition with the former. In pepper cultivation he must do so, to a very large extent, though he has, of course, other rivals as well. What is obviously needed is, not that he should grow pepper, but that he should lay himself out to produce the very best pepper he can, and to conduct his cultivation according to scientific principles.

Mr. BARBER's report is far from being conclusive as to the causes of diseases among pepper vines. Enough is said, however, to show that these diseases are widespread. Either they are contagious or the same causes have been at work throughout large areas. It is quite evident that he is of opinion that the stage when mere cultural operations will bring relief has been passed. Well, when it comes to infusing new vigour into the stock by seminal reproduction the European should always have the advantage; but his progress will, in many cases, be hampered by the proximity of Pepper that receives no special care, that suffers from disease, and that is likely to convey this disease to neighbouring plantations. These are points that must be fully considered, if any real good is to result from investigation and experiments. Here and there a planter may be so favourably situated as to be able to regard with unconcern the condition of his neighbours' crops, but the general rule is that where disease is widespread the remedies applied must be applied widely, not simply within narrow areas. To all growers of pepper we commend a study of Mr. BARBER's report. It is one that demands more than simple perusal. It is one that calls for a united effort at improved methods of cultivation and improved methods of selecting seeds and seedlings, and efforts to improve the strain of the product cultivated. Mr. BARBER's suggestion as to cross-fertilization will certainly involve trouble if it be put into application with any approach to thoroughness, but there can be no question that it is one that bids fair to provide, in time, a remedy for much of the evil from which pepper cultivation in the Wynaad is now suffering.

#### FORMOSA TEA.

There was a large increase in the export of tea during the year 1902 as compared with that of the year 1901. Oolongs reached a total of £652,241 or an increase of £268,830 on the export of the preceding year. Pouchongs decreased by some £2,500 and there was a small export of tea dust to Japan amounting to £1,308 in value.

The following notes of the tea season of 1902-03, the figures for which necessarily do not tally with the export returns closing on December 31, were kindly furnished to the British Consul by one of the local firms.

The total export of Oolong tea for the season 1902-03 amounted to about 474,000 half-chests, against 403,000 half-chests for the previous season, thus showing an increase of 71,000 half-chests. Of this total, 428,700 half-chests were shipped *via* Amoy, 13,600 half-chests *via* Kobe for transshipment to the United States, and 31,500 half-chests direct to

the United States from Kelung *via* Suez. This is the first time that teas have been shipped direct to the United States from Kelung, and accounts for the falling off of the shipments to Kobe in Japan.

The crop, taken all through, must be described as inferior to that of the previous year, with the exception, perhaps, of the Spring arrivals, which showed good character, especially "in cup." Owing, however, to the strong demand from the United States coupled with the lowness of exchange, teas sold readily.

Buying commenced in Daitotei (Twatutia) at the beginning of May, *i.e.* nearly a month earlier than in the previous season, and with the certain knowledge of the removal of the tea duty in the United States of America on January 1, 1903, it was difficult to predict what would be the result of the market.

This, however, was never in doubt after buying commenced, as, owing to heavy purchases by some houses, the market advanced by leaps and bounds, and finally touched prices which have not been seen for years, and the market may be said to have never shown the slightest weakness. In fact, it is doubtful whether, "quality for price" it was not higher at the end of the season than at any other period.

With the expectation of the small direct shipment of 31,600 half-chests from Kelung to the United States, already mentioned, and the small lot which went *via* Japan, the whole export went *via* Amoy to the United States and London, the latter taking the usual requirement of about 10,000 half-chests.

Pouchong teas showed a decrease of 12,600 half-chests, as against the export of the previous season, which is probably due, in a large degree, to the high prices paid for Oolongs forcing Pouchongs out of the market.

#### U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

#### PEPPER-VINE DISEASE.

##### GOVERNMENT BOTANIST'S REPORT.

The latest report by Mr. C. A. Barber, Government Botanist, Madras, on the Pepper-Vine Disease that he has investigated in Wynaad, is in the form of a letter to the Honorary Secretary, South Wynaad Planters' Association, South Wynaad, dated Camp, Tellicherry, 9th June, 1903, No. 432.

Mr. Barber remarks:—

I have the honour to forward the following remarks in continuation of my letter of 22nd January last.

I have just concluded a second short visit to the pepper-growing districts, having this time spent some days in examining the gardens in the Kottayam taluk of the Malabar district, the chief pepper-producing area of the Presidency. I have thus been able to compare the Wynaad plantations with those of the plains, and I trust that the conclusions I have arrived at will be of greater value on that account. Before making a full examination of the specimens collected, I have decided, as before, to report progress, trusting that those interested in the cultivation will continue the investigation, while I am engaged on other matters. I do not at

all wish it to be understood that the present letter closes my share in the work of resuscitating the industry, and I shall be glad to correspond with any who wish to do so on the subject.

The vines in the Wynaad are suffering from a number of diseases rather than from one alone. I have at present examined three of these, but I have no doubt that if my search had extended further afield, fresh forms would have been met with. I do not here allude to the many minor insect and other attacks upon the leaves, stems and fruits, since the majority of these merely indicate an unhealthy condition, while others are the natural concomitant of ordinary decay.

The three diseases to which I refer may be called, "Canker" for want of a better name, "Eelworm" and "Fungus hyphae in the vessels."

(1) **Canker**.—I have already alluded to this disease. Since my last letter, I have examined a large series of specimens under the microscope and have not met with any organism which could cause this condition. The development of cankerous growths is a marked character of the pepper vine. The tissues are soft and easily injured. The slightest scratch will produce a small "sore" on the plant's surface. This is the case in both the wild and cultivated plants, whether healthy or not. But they differ in the following respect. Whereas the wild vine quickly and surely cuts off the dead cells by cork formation and thereby stops the wound; the cultivated plants which I have had under observation produce masses of corky tissues which in their turn become diseased, so that from a comparatively inconspicuous cause great cankerous growths are formed.

This readiness to form cankers in all its parts appears to me to indicate an unnatural condition in the pepper plant, possibly a lack of vitality in the cells. As would be expected, the place where the cankers are most frequently and injuriously formed is at the collar, and allusion to this fact has been made before.

A particular case of cankerous growths has been met with in my recent tour in the Wynaad. In this, the whole plant above ground was found to be bursting out in corky eruptions. I have not met with this disease in many places, but should recommend its being carefully watched. I have not yet had the opportunity of properly examining the tissues, but in the few sections I cut, mites were found to be present, and they may possibly be the cause of the out growths.

(2) A serious disease is caused by *Heterodera radiculicola*, the **root eelworm**. These are usually more or less local in their distribution, but they have the power in congenial surroundings of such enormous increase, that the holes in which they are found should be at least temporarily abandoned. Eelworms attack a great number of plants, in many cases without any very great harm being done. But the perfectly enormous wounds and gall-like swellings produced by them in the pepper plant are a strong argument in favour of the view of effeteness advanced above. I may say that I have never seen such a remarkable series of tumours in plant tissues as those lately met with in the infected plants in the Wynaad. When the old tissues have decayed for a sufficient time it is no longer easy to detect the eelworm remains, but some at least of the cankers referred to above have been proved to be the result of eelworm attack in the first instance. In my former letter I reported having met with these parasites on the way from Pudupadi to Calicut. In one of these plains' gardens there had been 20

vines. Five died last year, five are moribund, while the remaining ten are attacked. I have met with the same disease in Tellicherry, but was not able to do much digging about the roots because of the grudging attitude of the owners of the small gardens.

It would be wise, when an attack of this sort is met with, to carefully collect all the nodules formed on the roots and underground stems and to burn them. The hole should on no account be planted again for several years. As will be seen from the accompanying pamphlet on this pest, there is very little to be done to get rid of it, once it has got a firm hold of any particular tract of land. It might be worth while, after all the pepper roots have been destroyed, to try the "trapping" experiments which have sometimes proved successful elsewhere. I have noted the "goat-weed," *Ageratum conyzoides*, as a particular favourite of this pest. All that will have to be done is to plant the goat-weed in the abandoned hole. After a while it is probable that the great bulk of the eelworms will be collected in its roots when it may be pulled up and destroyed. This experiment, repeated once or twice, would probably clear the eelworms out, and at any rate indicate their relative abundance. It is obvious that a perennial, like the pepper plant, will have little chance, once the pest has obtained a firm footing, and cuttings should on no account be taken from near the ground in such cases.

(3) **Hyphae in the vessels**.—This disease is of a very puzzling nature. In the first place, there seems to be little connection between the presence of the hyphae and visible "sickness" on the part of the plant. Secondly, no fructification has been found which can be attributed to it. Lastly, it is present in every part of the affected plant from the youngest root to the smallest shoot, always being confined to the vessels of the fibrovascular bundles.

I have examined about 100 vines for it under the microscope. My experience has been that, if I did not meet with the hyphae in the first section cut, repeated sections from other parts did not reveal it. On the other hand, once found, no section taken from any part of the plant was without it.

Such are the characters of this fungus. I have not been able to form an opinion as to its point of entrance, but rather incline to the view that it has been handed on from parent to daughter for many generations. I have traced it from one standard to the next, through the "mound" and across the intervening space, no part of the "runner" being without it.

About 50 vines were examined for it in the Wynaad and it was found in about 15. The case was different in the plains. Plants collected at intervals over 15 miles inland from Tellicherry almost always showed it at once. The exact figures are as follows:—Fifty plants were examined. One of these was remarkably healthy-looking plant: another was an old plant on its last legs, but unfortunately only a very little bit of it was available. I did not find the hyphae in these two plants, but it was abundant in every other case. I have no hesitation in affirming that the fungus is the same in both localities, and it is at once evident that we have to do with a disease introduced from the plains to the Wynaad. I regard this parasite as a serious fungus disease which accounts for many deaths in plants of all ages, while in those that survive for a number of years the crops are seriously diminished.

The presence of a hostile organism inside the plant cannot be looked upon with equanimity. As I noted above the hyphae are entirely confined to the vessels of the fibrovascular

bundles probably obtaining their food by haustoria or suckers, through the pits in the walls from the neighbouring starch-filled parenchyma. When the tissues die, they become permeated in all directions by the hyphae, which probably also hasten destruction.

It is unwise to run the risk of planting cuttings from vines infested by this fungus. It is at once observable under the low power of the microscope and the shoots of a vine ought to be examined for the hyphae before planting cuttings from it.

The exudation of gum into the vessels near diseased or injured parts is another marked character of the pepper plant. While I was examining the cankerous growths in the stems at the collar, I was struck by the frequent presence of coloured "gum" in the vessels, and it occurred to me that we might have to do with a case of "gummosis" of the tissues, possibly caused by bacteria. On further study, however, I think it more probable that it is the means adopted by the pepper vine, just as thylosis in the sandalwood and other plants, to close the avenues whereby parasites might enter the tissues where they had been laid bare. The gumming of the vessels occurs in all the vines I have examined, both cultivated and "jungle," in full health or in the last stages of disease.

The readiness with which the cultivated pepper vines form cankerous growths from what seem to be insufficient causes as compared with their wild relatives, the case with which they succumb to various forms of disease, and the frequent dying out of even young vines for no apparent reason have led me to regard the vines under cultivation, on a whole, as lacking in vitality. They are not in robust condition, as is almost always the case with cultivated plants at some portion of their career. Owing to the complete lack of knowledge both in the plains and on the hills as to the needs of the pepper plant, it is difficult to assign any definite reason for this.

I make some suggestions as to the possible causes, but as this part of the subject is based on such observations as the planters can make much better than I, I do so with some diffidence. The pepper cultivation has been extended very largely to "worn-out coffee lands", and such I take are practically bare of humus, presumably one of the pepper plant's greatest needs.

A low country species of pepper has been introduced to a hilly region where the climate is very different to what it was accustomed to. And here we must remember that there are many species of pepper in Southern India, and these, like other plants, require different conditions of climate and locality. It is not then admissible to argue from the presence of "jungle pepper" around the lotes that the cultivated pepper is in its normal conditions. I have a photograph of a most excellent pepper vine from Ootacamund at an elevation of 7,400 feet, but no one would, I take it, recommend the planting of pepper at that elevation on this account.

Connected doubtless with this change of climate, the pepper vines of the Wynaad are very different from their ancestors in the plains. The vines in the Wynaad are, as a rule, far bigger and more luxuriant, and the yield of pepper is probably much greater per vine although I have no definite data to go upon. This of itself is exhausting, and likely, with insufficient food material, to work the plants out. But there is yet another aspect which indeed strikes me still more forcibly.

The pepper vine in the plains is a deciduous plant while that on the hills is evergreen. This is a strong way of putting it. There are all stages between these two extremes,

especially in the plains. It is none the less the habit of the vines in the low country to cast a very much larger proportion of their leaves in the dry weather than do those in the Wynaad. I have seen a very large vine without a single old leaf left, and the young leaves of the succeeding flush were very small and inconspicuous. I have, it is true, been led to connect these extreme cases with the attacks of the fungus hyphae already alluded to. None the less, the vines all over the plains are far more deciduous, and it may well be that this absence of a period of rest, so essential to many species of plants, may have something to do with the present enfeebled condition of the vines.

I have been again and again told that "the vines in the plains don't die out like this," "there is no disease in the plains' gardens," and so on. This is a very erroneous way of putting things. Deaths occur by hundreds in the plains. And not only in old vines, but often a whole set of young plants go out. This does not, however, concern the natives. In the case of the older plants, the death is certainly less dramatic than the sudden collapse of a fine healthy plant. But the plant appears to become more and more deciduous, the flushing less and less marked, so that for several years before death the tree is scored off the roll of active producers. As regards the younger plants it is universally recognised that their arrival at the age of bearing is always a matter of some doubt. The owners of gardens in the plains, then, are quite accustomed to the death of their vines and are satisfied with a much more precarious crop than the more exacting European planter.

Another point to be considered with regard to the young vines is that it is unfair to compare those taken as cuttings from moribund parents with those from healthy ones. And it may well be that much of the "infant mortality" is due to the attempt to prolong the life of a worn out vine. The struggle is continued for a short period and the final collapse merely postponed for a few years.

The treatment of the vines is radically different in some respects in the plains from that in the hills. For instance, the vines are ruthlessly exposed to the sun for the whole of the hot weather in the plains, while the surface of the ground is as carefully protected by cut leafy branches from the effect of the sun "on the roots" which they know to be so injurious. There is no trace of a "mound" at the base of the standard in the country I have examined around Tellicherry, and I cannot help thinking that it would be better to encourage a free spreading of the roots than their collection in a mound of earth which may become a hotbed of disease. I have already adverted to the importance of keeping this mound in good mechanical condition and protected from the sun. Of course absolute drainage is necessary for the pepper plant, but, if to obtain this it is necessary to build the mound, I should seriously question the suitability of such a place for pepper at all.

A more careful study of the plains' methods would doubtless bring other points to notice which might seriously engage the attention of those interested in the pepper cultivation.

The conclusions arrived at, then, at this stage of the investigation are that the pepper-vines, both in the plains and in the hills, are suffering from a number of diseases. The diseases in the plains are probably of long standing, so that no great and sudden diminution in the crops need be feared. On the other hand with more care there might be a large increase.

The diseases in the Wynaad will probably be on the increase for some time to come. It has been suggested that the recent abnormal seasons have been responsible for the great increase in the death-rate, and I should be happy to be able to agree in this view. The locality is evidently well adapted to reaping heavy crops for a number of years, and it is for the planters themselves to say whether it is worthwhile to make a strong effort to save the industry from what appears to be its "evil day." Every cultivation has its pests and hours of weakness, and these usually come after periods of phenomenal success. There should be no cause for surprise then in the present condition of affairs.

If we have passed the stage when merely cultural operations will bring relief, and by these I mean the various lines of experiment which have been suggested from time to time, there remains nothing but to infuse new vigour into the stock by seminal reproduction. It is not a question of getting new varieties of pepper, although that would be a legitimate and interesting field of work, but the plants have been long propagated vegetatively, and this mode of reproduction nearly always sooner or later renders the race liable to disease. This work will, however, have to be done by the planters on the spot as I have no garden under my charge where the experiments can be carried out. The arrangement of the male and female organs in the pepper raceme are, I think extremely favourable for experiments in cross-fertilization, since the plant seems to be markedly proterogynous, the stigmas being ready and receptive before the stamens are protruded. As many will doubtless know the superior bearing of the cultivated plant depends on the fact that there are two stamens at the base of each ovary, whereas hermaphrodite plants (with male and female organs on the same raceme) are extremely rare in wild plants. The males and females in "jungle" plants are usually on different vines altogether, which accounts for the fact that so many of these vines are "barren."

[The permission asked for in paragraph 4 of this letter has been granted.]

### COFFEE NOTES.

**Coffee in Bahrein Islands.**—The trade in coffee shows, says a consular report for the year 1902, a decided increase notwithstanding the unfavourable conditions prevailing in the Al Hassa district during the past year. The improvement is due to the cheap Brazilian coffee imported, which has brought the article within the reach of the poorer classes. With the fall in price, a larger consumption on the Arabian side of the Persian Gulf may be anticipated, and British firms are recommended to turn their attention to the possibilities of the commodity.

The Santos crop is said to be two months in advance of the one that was marketed one year ago.

**Guatemala Coffee Crop.**—E. J. Berg, of Cobau, was recently quoted in the New Orleans *Picayune* as follows:—

"The Guatemala coffee crop has been curtailed about one-third by the earthquakes and volcanic eruptions on the Pacific side. The loss falls heavily upon the planters in that part of the country, as many of them had drawn ahead on

the crop and will be unable to produce any coffee for five years. We produce the finest coffee in the world, but ship very little of it to the States because we get a better price for it in Europe."

**America's Offtake.**—Coffee importations of the United States in 1902-03 and comparisons:—

Imported from (pounds)	Twelve months ending June.		
	1901.	1902.	1903.
United Kingdom	4,340,855	2,582,512	2,727,170
France	16,250	265,232	26,950
Germany	3,559,858	936,540	310,541
Netherlands	1,545,177	2,218,742	1,148,331
Other Europe	497,678	9,995	81,738
Central America	60,530,913	46,514,654	56,249,399
Mexico	20,432,539	30,846,236	22,207,086
West Indies	7,324,116	11,001,197	8,192,316
Brazil	666,470,673	898,012,026	726,095,474
Other South America	72,272,403	76,497,316	72,526,318
East Indies	14,576,640	16,033,332	16,713,260
Other Asia and Oceania	3,112,175	5,905,306	8,380,758
Africa	64,028	22,150	350,542
Other countries	38,996	159,104	61,452

Total ... 854,871,310 1,091,094,252 915,066,380

The value of the 1903 importations were \$59,200,749, in 1902 \$70,982,155, and in 1901 \$62,861,399. The coffee has been imported cheaper than in any year heretofore, having been procured at the rate of .064c. per pound; in 1902 the rate was .065c. a pound.

A growing business in export of coffee is noted. Pounds exported in the twelve months under review were 47,701,306 in 1902, 34,462,615.

The net imports for the year were 867,365,094 lbs., and represent about 10½ pounds of coffee to each inhabitant of the nation proper. It is not stated whether or not coffees brought from Porto Rico and Hawaii were included in the tables.

In spot invoice trading is slow with prices steady and as follows: 4½c. for Rio No. 8; 5¼c. for Rio No. 7; 5½ to 5¾c. for Rio No. 4; and 6c. for Santos No. 4. Lack of animation continues in jobbing. In the option market while interest is developing in the September liquidation, lassitude sits heavily.

The firm offers from Brazil received Monday included Rio No. 7 at 5c., c. & f.; Rio No. 6, 5¼c. do.; Rio No. 5 at 5½c. do.; and Santos No. 3 and 4 at 5.75c. do.

In mild coffee the market has become steady and demand fairly active. Prices continue, however, on a low basis of value, but buyers are at last fairly confident and disposed to come out. This branch of the market is receiving speculative attention. Good Cucuta continues low at 7½c. East India coffees are quiet.

Brazil coffee in New York, July 27, 1,881,051 bags. Stock in other coffees, July 27, 329,977; in San Francisco, 94,618 bags and in New Orleans, 9,404 bags. Visible supply in the world of all coffees, July 1, 11,900,173 bags.

Warehouse deliveries since August 1st, 1903, New York, 13,163; Baltimore, 98; New Orleans, 157. Total, 415,658.

Receipts at	1903-04	1902-03
Rio, July 1 to August 1	531,000	413,000
Santos, July 1 to August 1	951,000	724,000

Total ... 1,482,000 1,137,000

Santos receipts week ending August 1, 231,000 bags, against 235,000 bags one year ago. Rio receipts 123,000 bags, against 113,000 bags a year ago. Total, 354,000 bags, against 348,000 bags one year ago.

If wishes were horses, says the *Tea and Coffee Trade Journal*, coffee would quickly ride into unprecedented use and prosperity, and it is too bad, therefore, that the following from the Minneapolis Tribune is nothing more substantial than an expression of opinion: "It is not a bad sign that coffee-drinking increases *per capita*. The stimulation which coffee gives, taken in moderation, is, except in special cases—often conservative to the best powers of the worker. Most men can think better and faster on the morning coffee than without it. Coffee is a great loosener of the social instincts also. A man likes his friends a great deal better after a cup or two of *café noir* in the evening. A nation of coffee-drinkers solely we shall probably never be, but with Porto Rico needing our help in this way, even more than a pound of coffee per month to each one of us might not be bad for the health of the nation." We thank the commentator for its benevolence of heart and words. An increase in the consumption of coffee in the United States of 12 pounds *per capita*, making a total in excess of 20 pounds per annum, would affect the present excessive coffee supply in the world as does a July sun a snow pile, and as for the needy Porto Ricans, whose crop would be included in the grand melting, they would become rich even to indulgences of automobiles, if not also of airships, which is form of vanity wealthy coffee-planters are proud to flaunt.

**The Coffee Market.**—Although the coffee market is slow and low as to values, the feature is, says the *Tea and Coffee Trade Journal* of 4th ultimo, that it retains firmly whatever strength it has, which to-day in the matter of price is where it was one month ago, and all this in the face of the enormous receipts of the new crop. A slump even from the latest was predicted, but the failure of new low records to arrive demonstrates that the market is not so weak as it has been thought. The fact is encouraging for better things in the near future, and especially should anything occur to start a bull movement, in which event speculative money might be expected to try coffee as something worth attention.

The receipts at Brazil at Rio and Santos, while in excess of the receipts in July of the bumper crop two years ago, did not come up to expectations climbing only to 1,423,000 bags whereas at least one million and a-half bags were expected. Karl Krische & Co. estimate the August receipts at the two ports at 1,800,000 bags, and should this prove true the receipts, while in excess of those of August last year, would fall short by 100,000 bags of the total received in August two years ago. The shipments from Santos and Rio during July have been heavy, approximating 1,000,000 bags of the total of 1,423,000 received. And yet the market has scarcely felt a tremor, and Brazil goes on doing business at what are practically firm terms! Now and then easier quotations are reported, but, as a rule, prices rule on a higher basis than that locally. Sales at the end of the week were 5,000 bags Rio No. 2 at 6.50c. store terms for September shipment, and 3,000 bags Rio No. 3 5.60c., c. & f.

**Coffee.**—July deliveries of Java Coffee in Holland by the Dutch Trading Company reached 19,340 bags, as opposed to 12,400 bags in July last year, and 16,710 bags in 1901; thus giving a total of 95,700 bags for the first seven months of 1903, against 69,650 bags in 1902, and 82,240 bags in the preceding year.

Arrivals of Brazil coffee in the United States in July were 451,341 bags and deliveries 504,186 bags.

## TEA NOTES.

**The U. S. Tea Market.**—Tea rules quiet to slowness, says the *Tea and Coffee Trade Journal* of 4th ultimo, and the lack of demand is not a little disappointing, to say the least. Considerable inquiry is reported but nothing further in a large way follows, and may be this is the fault of the importers and brokers themselves, a complaint being that as soon as a bid approximates to a purchase, a jump is made for more value and the intending buyer retires. If tea is actually needed, buying consequently is hand to mouth. The markets abroad are becoming more and more the wonder of the market here. They are stronger and, what is more, show the greatest confidence, as if they had something up their sleeves. So long as this situation prevails easier conditions can scarcely be hoped for here. A cable message yesterday from Shanghai reported an advance of three taels in the market there.

In the face of conditions the market here remains steady to firm, especially for the higher grades of tea. So little is reported doing in Japans that in some quarters it is said there is no market for the tea at all, not even in Chicago. It is certain that there will be no plucking of the third crop after September 1 and so Canada may find herself in a hole. The Dominion, so far as latest reports go, has taken only one million pounds of the tea, and the presumption is that they are waiting there for the third crop, which is hardly a good way to recover the market for the tea. Ceylon greens are viewed with greater favour and a sale recently of 13,000 half-chests to arrive is reported for that market. Some large sales were previously announced. All kinds of India and Ceylon teas are locally firm. A few fairly large sales were made during the week in Pingsueys at full values. The better grades of Formosas continue scarce and very firm; for the lower grades conditions incline to weakness.

The report last week by the tea examiner at New York was as follows for acceptances:—

PASSED.			Packages.	Pounds.
Japan ...	...	...	1,798	140,430
Formosa ...	...	...	2,777	80,613

The Tea Merchants' Association, of Australia, is not yet in evidence, says a New York Paper. One of the three

gentlemen employed in the delicate work of getting teamen together has gone West for a month or two, so that the work of consolidating interests has remained at a standstill.

\* \* \*

**The Indian Budget and the Tea Duty Question.**—During the debate on the Indian Budget last night Earl Percy, in opposing a Resolution asking the House to declare that in view of the satisfactory Indian Budgets of recent years the duties imposed on manufactured goods imported into India should be abolished, made an important reference to the tea duty. He said the suggestion that India should cease to impose duties against the mother-country was only legitimate on two hypotheses. The first was that, if India was to consider the mother-country in her fiscal relations, the mother-country should also consider India in her fiscal relations. (Cheers.) At the present moment we did nothing of the kind. For example, we taxed tea, of which India, with Ceylon, was almost the sole exporter, having driven Chinese tea almost out of the market to the extent of 80 per cent. of its value. And the second hypothesis was that, if India was to sacrifice a large revenue, those who suggested it should be prepared to suggest some alternative source from which she could derive a revenue as large, and one which inflicted as little burden on the population.

\* \* \*

The Japanese have assimilated one American trait, says the *Tea and Coffee Trade Journal* of 4th ultimo, to wit, being interviewed in the public Press in as many places and as many times as opportunity permits. The value of advertising under such auspices is well understood here and the knowledge has spread even across the Pacific. Thus it has come about that our western land has been told something of Japan tea by the special Commissioners journeying in America in the interest of that leaf. Their progress eastward was traceable by this ingenious manifestation. A year ago a Ceylon commissioner shrewdly employed a bureau of publicity, but greased the way by a sprinkling of paid advertising in local journals, in consequence of which more extensive results were realized. The Japanese should acquaint themselves with this fact, for it is important. It is a general impression that they do things in a Lilliputian way, and there certainly was nothing very mammoth in the appropriation last year by their National Tea Association of \$1,500 for advertising Japan tea in the United States and Canada. It all looked so comic as to suggest opera bouffe, though Anglo-Saxon traders in Japan tea were moved to tears and remonstrance. Even the expenditure of the entire Government grant of \$35,000 in mere advertising would still be picayunish in the light of the dimensions of the United States and Canada, and the sooner the Japanese understand that the only effective way with us is the large way the sooner will their position in defence of their market here become less vulnerable, to say nothing of extending their market. The Japan tea commission has learned something of the art of publicity, and plain duty requires that they learn it all; else there are breakers ahead.

\* \* \*

In his report on the Trade of the Consular District of Kobe for the year 1902, Mr. Consular-Assistant E. F. Crowe says anent Tea:—The new leaf was damaged by frost early in April, and the picking of first crop tea was considerably below the average. The total yield for the season, however,

was larger than for the past three years. The market ruled high throughout the season, owing to a speculative demand caused by the announcement that the duty of 10 C per lb. in the United States of America would be removed on January 1, 1903. Prices opened 10 per cent., higher than in 1901 and later on advanced almost another 10 per cent. Owing to unseasonable weather in the Spring the quality and preparation of the leaf was rather inferior; and there is danger of the trade being gradually lost unless the producers display more care to preserve the reputation of Japan teas in the American markets.

\* \* \*

**Colombo Tea Sale.**—On the 26th ultimo buying was less general, and prices were very irregular, with an easier tendency for common and medium kinds. Fine teas were again in demand at full rates, particularly the best invoices from the Uva side of the country. Green teas were dull and easier.

\* \* \*

**Strange Misapprehension about St. Louis.**—Our special telegram elsewhere, says the *Times of Ceylon*, gives a summary of the latest proceedings of the Indian Tea Association General Committee in Calcutta. The first subject is described in a remarkable way. Under the heading of "St. Louis Exposition" we are told that both Mr. Larkin and the Hon. Mr. Stanley Bois, Chairman of the Ceylon Chamber of Commerce, have suggested that India and Ceylon should combine. Although the inclusion of Mr. Bois' name has been obviously made under some strange misapprehension, it may be stated—after special reference to Mr. Bois—that, before the subject of Ceylon's participation in the St. Louis Exposition was taken in hand, and when India was making progress towards obtaining a tea cess, Mr. Bois wrote privately to Sir Montagu Turner relative to the two Cess Committees working in accord; but the enquiry had no more reference to America than to Europe or elsewhere, and an exchange of views was all, apparently, that was contemplated at the time. On the representation of Ceylon at St. Louis taking shape, Sir M. Turner wrote to Mr. Bois for some details of what Ceylon was doing; and these were supplied. That is all the foundation for the statement telegraphed to-day. Possibly some remark by Sir Montagu Turner, who is now in England, was misunderstood and has misled the Indian Committee—if it be possible that the fact that the Chairman of our Chamber of Commerce is also Ceylon's Commissioner for St. Louis did not, combined with other circumstances, cause some of the Calcutta Committee men to doubt their ears! The proposal, whether correctly telegraphed or not, cannot be entertained on this side; but Ceylon will wish its neighbours all success in their application to the Indian Government for funds, and will work cordially side by side with India—but with the enterprise of healthy rivalry—at St. Louis and elsewhere.

\* \* \*

**The Tea Market.**—"Anon" writes to the Editor of the *Home and Colonial Mail*.

"Allow me to draw attention to some news received by mail which has not obtained the notice it deserves.

"Messrs. Cresswell & Co., of Calcutta, writing on June 25, say that four gardens, usually selling their crops, amounting to 1½ million lbs., in Calcutta auctions, have sold them forward for London. *Indian Planting and Gardening* on July 4 announced that another, a large Sylhet estate

making about 2 million lbs. annually, has done the same, and on July 18 this journal reported that it is estimated that between 15 and 20 million lbs. of Ceylon and Indian tea have been sold in advance to London buyers.

"Those who are familiar with the traditions of the tea trade, and know the extraordinary difficulty of persuading anyone engaged in it to substitute modern methods for the antiquated machinery of their grandfathers, will appreciate the significance of this new departure.

"It means, among other things, (1) That a certain number of growers and their agents have found out how to protect themselves against the vagaries of the market, the whims of buyers, and hostile combinations in the sale-rooms abroad or at home. (2) That there are substantial buyers, true merchant-adventurers, who have such confidence in the future and in their own judgment that they will engage in business of a highly speculative nature. (3) That the prevalence of these conditions has at length enabled growers of tea to do what growers of other kinds of produce have done for a generation, *viz.*, to ensure beforehand, as far as it is possible to do so, a profit on their year's work.

"This is indeed news. Someone is awake and moving, progress is being made. So far so good. But how is it that we only hear of it casually from abroad, and that no mention has been made of it in the London brokers' circulars that you are so good as to publish? Is nothing of the kind being done here? Is business being taken out of the hands of London merchants? Is this the upshot of last season's struggle between the sellers and the buyers, and the outcome of the dissatisfaction felt at the action taken on the one side or the other during the course of it? Are merchants here so perfectly satisfied with the way in which business is conducted here that they neither desire nor aim at something better?

"If they be, it is no secret, I believe, that many shareholders are by no means satisfied with the results of last season; that they have lost confidence in the methods and measures adopted here, and do not consider the explanations given of failure to be adequate. For publicly or privately one authority after another has told us for months past that the position of tea is entirely altered; that demand has outstripped supply; that growers have the control of the market, and so on. But what good is it to us, and where is the result? You recorded that the average value of Ceylon tea at the end of July was less than 7d. per lb. On the merits of the position it should be at least 9d. per lb. Why is it not so? Is it possible that there has been mismanagement at home, and that the market has been spoilt by the attempts made to manipulate or regulate it?

"It has fallen to my lot to read a great many annual reports and some excellent speeches at the Meetings; they show a firm grasp of the problems which beset us abroad, but a failure to realise needs and difficulties at home, with general ignoring of the fact that the conditions of the home trade are entirely different to what they were twenty years ago.

"The frequent reference in these reports and speeches to the endeavour of buyers to buy cheaply—as though it were a grievance—seems to be perfectly childish; and the complacency with which some refer to regulation of sales, as though it were a factor of value instead of a mere administrative detail—part of the daily routine of a merchant's life in all produce markets—makes one uncommonly anxious about the future.

"For the coming season is going to be a very difficult one from a market point of view. The supplies from India in front of us are heavier than they were last year; we have taught the trade during the last six months that they can carry on their business without holding large stocks; we have seen what "old hands" knew was certain to happen, *viz.*, that a stiff quotation for common tea checks our re-exports of Indian and attracts supplies from other markets; and we have looming ahead of us the prospect of a serious disturbance to business next Spring, if not sooner, by the uncertainty of the political and fiscal position.

"These things being so, I do not think I am singular in envying those progressive proprietors who, we hear, have secured themselves against chance and change when they had the opportunity.

"Sell and repent" is a maxim that has helped to fortune many a doubtful merchant or broker."

\* \* \*

K. Aizawa and S. Katow, of Tokio, Japan, and I. Kapuchi, of Kobe, Japan, are the members of the Commission appointed by the Japanese Government with a view to developing the tea trade of Japan in the United States. The members of the Commission are all wealthy tea-merchants.

\* \* \*

**The Japan Tea Crop.**—The tea of the third season produced in Suruga and Totomi has, says the *Japan Times*, been putting in its appearance at Yokohama. Being the first goods of the kind on the market, it is necessarily quoted at a high figure, generally at 45 or 46 *yen*. By the way, the Central Chamber of Tea Guilds has issued instructions for the provincial tea guilds to the effect that the picking of tea leaves should be stopped by the end of July. But these instructions will hardly be practicable.

\* \* \*

**America's Offtake.**—Importation of tea into the United States in 1902-03 and comparisons:—

Imported from (pounds)	Twelve months ending June.		
	1901.	1902.	1903.
United Kingdom ...	2,891,720	3,740,100	6,151,822
British North America ...	1,256,543	1,852,319	2,135,065
Chinese Empire ...	46,962,264	35,998,219	55,064,296
East Indies ...	3,093,864	2,807,870	6,714,224
Japan ...	34,867,018	30,753,505	37,987,227
Other Asia and Oceania ...	703,687	328,152	508,138
Other countries ...	31,357	7,960	14,133

Total ... 85,806,453    75,579,125    108,574,905

The exports in 1903 were 3,942,645 pounds, leaving net imports at 104,632,260 pounds. The June, 1903 exports were 307,591 pounds, and imports 4,308,489 pounds. Value of the 1903 importations is placed at \$15,659,229 pounds, and that of 1902, \$9,390,128. The increase per pound from 1902 to 1903 is from 12 $\frac{1}{2}$  to 14 $\frac{1}{2}$ c.

\* \* \*

**Japan Tea Welfare.**—The Japan Tea Commission, now in the U. S. on a tour of inspection with a view to increasing the demand for Japan tea in this country, is composed, says the *Tea and Coffee Trade Journal* of 4th ultimo, of Comir Kihei Aizawa, Tokyo, Chairman of the Executive Committee of the Central Tea Association, who is also President of the Tokyo City Council and President of one of the principal banks in the City; Mr. Kawaguchi of Kobe, Mr. Katsow of Tokyo, and N. Shinode and T. Mitzatany of Chicago.

The party's progress eastward from Seattle has been marked by interviews with the members in the public Press, in

which some plans of the group are revealed. Japan tea has been most popular in this country in the West, and the opening of the great North-west has therefore most interested the visitors who have scrutinized with customary Japanese minuteness all things that were to be seen. They express themselves as pleased and determined that the soil shall become tributary to Japan tea.

The members have also been pleased to tell about the Japan Tea Central Association, which the American newspapers call the Japan Tea Trust, and, because sanctioned by Government, and consequently novel, worthy of respectful consideration. Concerning this Association Commissioiner Aizawa is quoted as having said :

"The Association numbers 1,200,000 members and controls not only the tea for export, but also the tea kept for home consumption, and there are practically no tea plantations outside the Association, which was formed under permission from the Government.

"A salient feature of the administration of the Association are the Committees which are constantly travelling over the country inspecting the plantations. The tea has to be of a certain grade and condition, or it is refused. In the factories also there are inspectors, and every shipment of tea is examined before it is put on the market, and if it does not come up to standard it is rejected. All exported teas go through this examination, as well as nearly all that sold for domestic use, so the mark of the Association is a guarantee that the grade and quality of any particular tea are what they are represented to be.

"The Association has already an Agency in Chicago and one in New York, and there is also a branch in Montreal, Canada, but we do not think we are doing the business in this country that we should. We consider that tea is a healthier drink than coffee, and that when Japanese teas are well known here a very large quantity will be consumed in the United States. The trade between the two countries is growing every year, and we intend to see that the tea trade shares in the general advance.

"My particular mission here is to examine into the market and to endeavour to ascertain the best steps to take to push the sale of Japanese teas. I shall visit nearly all the principal cities in the country before returning to Japan."

Mr. Aizawa was this week in Montreal. Mr. Kawaguchi has arrived in New York and is making the office of the Central Tea Association, 96, Front Street, his headquarters.

\* \* \*

British deliveries of Tea for July last were the largest on record for the month of July.

\* \* \*

Fifty chests of Java Green Tea recently realised an average of 5¾d. in London. The highest bid for Hyson No. 1 was 6¼d.

Java (Black) Tea has in one or two cases commanded unusual prices of late, as much as 12½d. per lb. having been realised in one instance, with an average of 11d. on 216 chests. Generally speaking, however, averages range between 5¾d. and 7d.

\* \* \*

**British Imports.**—Revised Customs Imports of Indian and Ceylon Tea from 1st June to end of May :—

Bengal Presidency (including Calcutta and Chittagong) ...	144,148,371	1902-03.	151,634,167	1901-02.
Madras Presidency (including Travancore)	4,854,866	lbs.	4,252,528	lbs.
Bombay Presidency	1,302,543		777,869	
Ceylon Tea		100,371,732		102,149,690

\* \* \*

**The China Market.**—Advices dated 7th ultimo point to a steady demand. Of Green Teas it is remarked that prices have been fully maintained and Teas are sold as soon as the

samples are put on the market. Some crack chops show a great increase over last year's rates. They are bright and fragrant and show an appreciable improvement on those of recent years in appearance. Exports to the United States up to 7th ultimo show 4,413,000 lbs. Black and 5,776,000 Green ; to Russia 10,354,000 lbs. Black, 2,500,000 lbs. Green.

\* \* \*

**Indian Tea for Russia.**—At the Calcutta tea sale of 28th ultimo 18,650 packages were sold. The market was very firm for all kinds. Common teas were dearer, several invoices realising prices over valuations. Buying for outside markets, especially Russia, was an important feature of the sale. To the above date 3¼ million lbs. had been shipped to Russia, being 1¾ million lbs. increase over 1902. Two steamers leave Calcutta direct for Odessa during September and October.

*Apropos of this, the Times of Ceylon writes :—*

A total of three-and-a-quarter million pounds shipped to Russia to date is significant. It is an increase of one and three-quarter million pounds over the total for a similar period last year; and should exports continue in the same proportion to the end of the present season India should increase 40 per cent. approximately on last year's sales to Russia. A few figures are interesting :—

	lbs.
1900 ... Indian tea exports to Russia ...	700,000
1901 ... Do do ...	1,600,000
1902 ... Do do ...	5,000,000
1903 ... Do do (rough estimate) ..	7,000,000

The fact that Ceylon tea exports to Russia show a decrease of 3,155,366 lbs., on last year's total to August 24th of 8,154,653 lbs., has caused some apprehension that Indian tea is being taken by Russia in preference to that of Ceylon. We understand that this is far from being the opinion of Russian buyers in Colombo, who are emphatic that Ceylon is not losing ground. They say the decrease is apparent only, and is capable of a simple explanation. It is contended that that explanation is to be found in the difference of 2,160,449 lbs. in the exports of tea from Ceylon to China to August 24th on a total of 4,845,683. Exports of tea by Russian firms to Russia *via* Dalny and the Siberian railway are becoming frequent, and the impression is that these exports, which generally have to be transhipped at Shanghai, Hongkong or Chefoo, are credited in the Chamber of Commerce returns and the Customs as exports to China, whereas, in reality, they are exports to Russia. Where there is direct communication between Colombo and Dalny the shipments are undoubtedly credited as exports to Russia; but transshipment frequently has to take place and through bills of lading are not given under such circumstances. We confess that the Ceylon figures in the aggregate are not so satisfactory to our minds as they are to our Russian friends.

Our telegram speaks of two steamers leaving Calcutta direct for Odessa during September and October. This is a new and important departure. We understand that the two steamers referred to belong to the Russian East Asiatic S. S. Company. The rapid strides forward made by India in the tea trade with Russia and the high freightage charge at present ruling between Calcutta and Odessa offer prospects of a profitable shipping trade; and, indeed, we must be prepared for the Russian Volunteer Fleet itself arranging that next season two of its ships shall call at Calcutta. The present freightage from Calcutta to Odessa, with transshipment into Russian bottoms at Port Said, is 37s. 6d. per 50 cubic feet, compared with 17s. 6d. from Colombo. It is likely, of course, that with competition the freightage charge from Calcutta will be reduced, although as the Volunteer Fleet boats will have to make a long detour from Singapore to Calcutta calling at Colombo on the way to Odessa, there must always be a difference between the charges from Calcutta and those from Colombo. We are informed, on the authority of a prominent Russian buyer, that the Indian tea exports to Russia are increasing at the expense of China and practically of China only; and that this has been foreseen for some time. The field for India and, of course, Ceylon is practically unlimited, considering the huge output of China tea for Russia, and the comparatively small place hitherto held by India and Ceylon teas.

When previously commenting upon Ceylon's market in Russia, we have laid considerable stress upon the opinions of expert Russian buyers that Ceylon planters are not paying sufficient attention to the requirements of the Russian market. The complaint is, and has been, that Ceylon, instead of providing Russia with strong-liquoring, good-fermented teas, insists upon catering for what it imagines to be the Russian taste. Whatever may have been the case years ago, the Russian taste has now gone beyond the stage of being catered for in a special way, and for Ceylon to sacrifice fermentation to flavour is a mistake. So well-known an authority as Mr. Isgareschoff, with an experience of well over twenty seasons of the China tea trade, and who knows what Russia wants probably better than anyone else, urged the planters through our columns eighteen months ago to give the Russian the strong-liquoring teas he required. The alternative stated was that Russians would be compelled to go elsewhere, where they could get what they wanted. Mr. Isgareschoff is again in Colombo and makes the same statement now. This refers to teas from 35 up to 38 and even 40 cents per lb. and we are assured that at this price it is quite the exception to get a good, well-fermented tea suitable for Russia. Formerly Russia could depend upon China for these teas; but now, when it is apparent that China cheap teas are growing weaker and weaker, and the price is higher than formerly, the Russians are inclined to buy more largely in India. This is what Mr. Isgareschoff told us that they would do. Indian teas, the Russians admit, have not the flavour of Ceylon teas, and they prefer Ceylon higher grades at 50 or 55 cents to high-priced Darjeelings at 75 cents. These are not the teas which the majority of the Russians drink, however, and the general demand is for teas at for 35 to 38 or 40 cents. In making tea for the Russian market the Ceylon planter lays too much emphasis on flavour, which is of little importance, and forgets the strength which is everything. It is satisfactory to know that the headway India is making is principally, if not wholly, at the expense of China, but exceptionally placed, in point of freight charges, as Ceylon certainly is, most people think we ought to show equal progress.

A Seattle news item says that the steamer *Shinano*, which arrived there July 15, had on board her 4,000,000 lbs. of Japan tea, the largest consignment that has ever reached that part.

#### A Cup of Tea.—

Naught else refreshes like a cup of tea!  
This is the drink for you, the drink for me.  
The most refreshing, grateful pick-me-up,  
No better drink e'er filled the fragrant cup.  
A cup of tea is every worker's boon.  
He waits the passing of the afternoon  
In summer; he may feel a little queer,  
Yet knows full well his tea will give him cheer.  
He likes a full ripe flavour, clear and strong;  
But not left brewing in the pot too long.  
An all-round flavour, pungent, pure and sweet—  
Such tea he ever estimates a treat.  
Then study to give value at the price.  
Let all your tea be tasty, pure and nice.  
Naught so refreshing known, on land or sea,  
As the delightful, fragrant cup of tea.—H. W. in the *Grocer*.

#### Tea Characteristics.—

The Amoy teas are "nutty,"  
But do not cut much ice;  
The Ceylon teas are "toasty,"  
And Capers smell quite nice;  
The Foochow teas are "mellow,"  
And "pungent" are the Green,  
How grateful to the "smeller"  
Formosa is, I ween;  
The India teas are "malty,"  
The Java teas are "sour,"  
Pingsuey oft is faulty,  
The Moyune's like a flower;  
Quite "piquant" are the Pekoes,  
And "tarry" the Souchongs,  
While "fruity" are the Congous,  
And "silky" the Panyongs.

#### NOTES.

##### Java Cinchona.

The shipments from Java for the half-month amount to 416,000 Amsterdam lbs., being small compared with the corresponding period of last year.

##### Tea and Coffee in Norway.

Imports (estimated) into Norway in 1902 were as follows:—Tea, 124 tons, as against 114 tons in 1901; Coffee, 12,523 tons, as against 12,190 tons in 1901.

##### Cocoa in Spain.

The importation of cocoa from Fernando Po to Barcelona increases every year, having increased from 752 tons in 1897 to 1,512 tons in 1902; the importation from Cuba reached 72 tons as compared to 34 tons in the year 1901.

##### Pepper in the U. S.

Peppers are especially strong, says the *Tea and Coffee Trade Journal* of 4th ultimo, and the very short supply, but little helped by the scant arrivals and the increasing consumption, tend to make bears nervous and bulls jubilant.

##### Chicory in the U. S.

The scarcity of domestic Chicory during 1902-03 has greatly assisted the bringing in of the imported article. There were imported during the twelve months ending June 30, of raw 1,411,202 pounds against 238,272 pounds in the same period one year ago, and 511,693 pounds two years ago. Of roasted chicory 442,311 pounds were imported, against 298,671 pounds one year ago and 348,597 two years ago.

##### Blends Coffee or Tea.

Mr. C. R. Cotton, the well known coffee merchant at Nashua, N. H., has perfected a device for the blending of teas and coffees. The invention is a box, an exact cube, and when tea or coffee is placed inside and the box made to revolve, its contents are moved carefully and a perfect blend is said to be obtained without injury to the tea leaves or beans. Every test which ingenuity could bring to bear has been tried and it has been found that the machine does the work in the best possible manner, report says. The machines have been placed on the market. They are sold in two sizes. The smaller one is for retail grocers, and each edge of the cube measures 12 inches. The larger one for wholesale grocers and coffee roasters, has a capacity of 50 pounds. A patent has been applied for.

##### Determination of Caffeine.

E. Léger describes in the *Journal de Pharm. et de Chim.* his process of assaying tea, coffee, kola, etc., for alkaloid. The method differs but slightly from that of Warin, the powdered sample being mixed with magnesia and a small quantity of water, and then boiled with chloroform; the latter is shaken with HCl to remove the bases (fats, etc., being thus eliminated), then re-extracted by fresh chloroform after alkalising with ammonia. The figures he obtained for mixed alkaloids were as follows (percentages on dry powder):—

Tea	...	...	...	...	2.24
Coffee	...	...	...	...	1.23
Guarana	...	...	...	...	4.19
Kola	...	...	...	...	1.35 to 1.48

**Louisiana Purchase  
Exposition.**

Interviewed the other day by a representative of the *Times of Ceylon*, the Hon. Mr. W. H. Figg remarked that the Ceylon Court at St. Louis will stand in the centre of the most interesting portion of the Exposition and added :—  
“Ceylon tea should obtain an excellent advertisement at St. Louis, for, as it happens, it is Japan tea which has hold of the market in the Southern States at present, although Ceylon tea is making satisfactory headway. That was one of the reasons why we wanted to make Ceylon tea known in that part of the States. Of course, in Canada, we are easily holding our own, and that,” said Mr. Figg, “I think is entirely due to the Thirty Committee. In the last few months we have made considerable headway.”

**America's Offtake of  
Cocoa.**

Cocoa importations into the United States in 1902-03 and comparisons:—

Crude, and Leaves and Shells (pounds)	Twelve months ending June.		
	1901.	1902.	1903.
United Kingdom ...	2 022,268	2,383,070	2,705,475
Netherlands ...	1,126,114	1,006 206	895,928
Other Europe ...	1,625,048	4,084 467	3 967,015
Central America ...	34,735	27,468	384,641
British West Indies ...	14,278,188	15,159,274	21,277,647
Other West Indies ...	5,518,624	4,567,618	7,103,588
Brazil ...	5,734,952	8,005,359	13,875,477

**BASEL MISSION WEAVING ESTABLISHMENT.**

The value of the 1903 importation was \$7,820,087. There were exported 3,208,554 pounds, making net exports 60,142,640 pounds.

**Capers.**

Capers are the buds of a plant growing in certain parts of France. The smallest buds fetch the highest price. After the capers have been picked, they are placed in trays under a shed, where they are left until they evaporate a certain amount of water which they contain, in order that fermentation may not set in. They are then placed in barrels of vinegar for preservation. Occasionally the brine is flavoured with sprigs of tarragon, elder flowers, cloves, and pepper in grains. The capers, having been thus preserved, are next classified, during the Winter, by being passed through sieves of different sizes. There are seven classifications, as follows : “Nonpareil” (smallest size), “surfine,” “capucine,” “capote,” “fine,” “mi-fine,” “commune” (largest size). Having thus been separated, the capers are replaced in barrels filled with vinegar and preserved until sold. When prepared for shipment, the capers are washed in vinegar of a standard of 12 deg., which renders them quite firm, and they are then placed in barrels without vinegar.

**GENERAL ARTICLES.**

**PRODUCE AND PLANTING.**

Discussion, both written and verbal, on what is now styled “Mr. Chamberlain's policy” continues to grow in volume. Several special organisations have been founded, either to promote or oppose the new policy. Existing organisations have also actively engaged in the debate, while the leading Chambers of Commerce have given more or less attention to the subject. Tea-growers will be interested to learn the attitude of the disputants towards the tea duty. As we have previously pointed out there is a disposition on both sides to point to the duty on tea as an object-lesson in unfair taxation, and we hope there is to be no “wobbling” on either side for the sake of strengthening any of the main issues of the argument. Free traders for the most part have declared their belief in a “free breakfast table,” and cannot well go back on it. The supporters of Mr. Chamberlain's policy wish to promote trade with the colonies, and presumably India, by means of preferential tariffs, and we shall learn shortly how far they are prepared to go. Anyway, the supporters of the policy are either against the tea duty as a whole, or would remove the greater portion of the present burden, so that between these rival fiscal policies the duty on tea is abolished or lowered in theory, although when it will be so in fact remains to be seen.

Some of the arguments on the Free Trade side are a little difficult to follow. A correspondent of the *Daily Chronicle*, for instance, writes the following, in which, after pointing out that “Protectionists pretend that the effect of a tax on tea, etc., limits the cheapening of the production of those articles,” he gives his own view. He says: “No sensible Free Trader contemplates this, except that a smaller production produced by a less demand may be more costly. But that point may be neglected here. A sixpenny tax, in spite of the advantage of bonding, will raise the price of a pound of tea by about sixpence-halfpenny at the most as long as the tax continues. But some improvements in production must help the market always. Expert growing, the opening up of wider areas of land, so that monopoly is checked, and the diminution of freights by improved navigation and shipping are three factors of cheapening. May I mention three instances? In 1871 a youngish Chinaman was going about in Upper India who had been imported to teach our planters to grow tea there. Now they have undersold the Chinese. A greater area

of land to grow tea on was secured by the Looshai expedition. I saw Colonel Roberts starting to join the column which punished the Looshais who had attacked our planters in 1871. The year before I saw the crew of the Deerfoot, one of the last batch of tea-clippers. The Suez Canal used by tea steamers cheapened freight and insurance. All these improvements cheapen tea, whether it was 1s. 4d. with a tax or 9½d. without it—or 1s. 10d. with and 1s. 3½d. without."

A correspondent of the *Times*, who is perplexed by the argument of "A Revenue Official," whose first letter we quoted last week, asks the latter to deal with his difficulty. "This correspondent," "Questioner," says: "'A Revenue Official' in his most interesting letters to you on this matter suggests that the cost of living will not be raised because 'the existing taxes on food—on tea, sugar, cocoa, coffee, and dried fruit . . . goods which cannot be produced in this country, will be abolished, and we shall get the same amount of revenue from small taxes on the goods which compete with our own productions or with the productions of our colonies.' The implication clearly is that the tea, sugar, cocoa, coffee, and dried fruit which come to us from abroad do not compete with similar products from our colonies. But that is not a fact. Our imports of these articles in 1901 appear to have been £26,756,511 from foreign countries and £11,033,507 from our colonies. Is it not, therefore, quite inconsistent with the principle of colonial preference simply to abolish these taxes? If we are to give the colonies a preference on corn, mutton, and bacon, why not on tea, cocoa, and sugar? But if these taxes are remitted only on colonial goods, and retained upon goods from abroad, a very large part of the £13,600,000 now levied on food will still be levied, in addition to the new taxes. The account will then read something like this: Taxes on food, old system, £13,600,000; taxes on food, new system (at least), £20,000,000; and it will be impossible to tell the working classes that their cost of living is not increased."

The idea that food in the form of bread will be taxed naturally gives the opponents of Mr. Chamberlain's proposals a rallying cry which they are able to make the most of. They do not pause for explanations or await details. The bare idea is enough for them, and already we are told members of the House of Commons who represent Labour interests have issued an appeal to the workmen in Canada, Australia, and New Zealand to help in defeating the fiscal proposals of the Colonial Secretary. In the course of a long letter they point out that we in the old country have experience to prove that a tax upon food produces an amount of misery, pressing more particularly upon the poorest, to which the colonists, with their vast natural resources and sparse population cannot be subjected.

In view of the agitation against food taxes it is interesting to note the remarks of a "Revenue Officer," who writes a second letter to the *Times*, which answers the correspondent "Questioner," and at the same time presents the point of view of those who would relieve the consumers of tea of the greater portion of their burden, even if other articles of food are taxed to do it. He says: "For the sake of argument, let us suppose that prices would rise, as they do in the case of heavily-taxed wheat in France, to the extent of 70 per cent. of the duty. Then, with a duty of 5 per cent., prices would rise 3½ per cent. Let us take the case of a family of the poorest class which spends 10s. a week on food. Out of that small sum at least half-a-pound of tea and four pounds of sugar are purchased, and on these alone this family pays in taxation at the present time 4½d. a week. How will this family be affected if we reduce the taxes on tea and sugar to 5 per cent. *ad valorem*, and put similar duties on all the other articles of food not now taxed? On the one hand, there will be a certain gain of 4½d., and, on the other hand, there will be a loss of 4½d., and the food of this family will not be dearer by the smallest fraction of a penny, even if we assume a larger increase of prices than there is any reason to anticipate. But this is not all. With even a small preference in our markets, the population of our colonies will increase by leaps and bounds, and there will be a corresponding increase in the amount of their purchases from us; and our toiling masses will have the regular employment which they need most of all, and probably a substantial increase of wages as well."

With reference to the arrival in the United States of two Japanese tea commissioners to report on the chance of extending the field for Japanese tea, the *Tea and Coffee Trade Journal*, of New York, says: "The view held by Mr. Otani, a well-known tea merchant of Yokohama, as to what course our tea manufacturers ought to take in view of the overwhelming competition of the cheap Ceylon green tea in the United States and Canada may be worthy of reproduction here. Mr. Otani says, according to the Tokyo 'Asahi,' that even those of our people who are interested in the tea trade are constrained to admit the fact that our tea can by no means withstand the competition of the Ceylon tea in point of price, and wishes to suggest a plan which may relieve the situation. Let our manufacturers, he suggests, make use only of the tea leaves of the first-period picking in the manufacture of green tea, and use the leaves of the latter picking for the production of black tea. Mr. Otani thinks that the future before the latter kind of tea is great and expects that England and other countries in Europe may in time become our customers."

"The Japs may well feel concern for the market here," says our New York contemporary. "Apart from their home demand, they have no other country where there is any extensive demand for Japan tea. To lose the United States, therefore, means to them very much. The India and Ceylon men are determined to capture this entire market, and they will make a fight for it with brains and resources that are very compelling, as proved by their capture of the rich British tea market from the Chinese. Indeed, that the Japs are faced by a proposition that has a way of driving the enemy *en masse* before it has been shown them by what has happened in Canada. The Dominion heretofore has used large quantities of Japan tea, but last year used much less, and this year, so far as export figures up to date go, scarcely any, the sentiment seeming to be exclusively for the Indias and Ceylons. The Britons have have not been permitted to gain the field without return blows from the Japanese, but somehow the mastery has not lain with the Asiatics. Will the same results follow here?"

"In practical effect the Japanese, too, have their tea cess, but the money available for propaganda is like cents to dollars compared with the money at the disposal of the Indian and Ceylon men, and we have seen it stated in plain print, by way of complaint, that the Japs' yens have not been efficaciously placed. The Japanese tea-men are shrewd fellows. The management of their tea dealings has called forth commendation, but managing the market at home and extending it in the white man's country is quite a different thing, and so far, it is evident, they have not the advantage the Britons have. The white man is likely to understand better how to deal with Caucasian minds than the Asiatic, who, therefore, has much to learn at the cost of experience and resources. They give and take in Canada shows that the Japs have not quite caught the British methods. They do not comprehend enough, and therefore do not understand thoroughly. Where, for instance, is that direct appeal to the consumer, extensively conducted, and Japan package teas? This strategy counts tremendously. Then, moreover, the Ceylon and India men have a way of enlisting for their teas the enterprise of wide-awake American wholesalers, who embrace and use in a very pushing and sweeping way the ideas of the Englishmen."

"Further, at present the Japanese labour is under the disadvantage of offering a very dear tea. Price always is a considerable factor, and when India and Ceylon greens are accessible much less in cost, and in the opinion of many fully as good in quality, something must give way, and the victory usually alights on the banners of least price. The India and Ceylon greens this season are striving for an outturn of at least 11,000,000 pounds, an increase of several hundred per cent. in excess over the quantity turned out last season, and the probable consequences are too obvious to need enumeration."

"The Japanese must meet price with price, that, however, is something to think about for the next season, as the present one has practically passed for such a purpose, although in this respect the Japanese will not have anything to grieve about, for they have already garnered their 'heavenly' profits; but the future has to be

reckoned with. Fortunately for them they recognise the possibilities that threaten in the small Ceylon cloud now down on the horizon. A plan is to manufacture black tea, and thus make the Ceylon and India men fight for their own particular markets. The Japs did once make black tea, imitating Congou, but did not make a success of the venture and abandoned the effort. All in all, how they will comport themselves in the coming battle will be interesting to watch."

The *Grocer* of August 8 has the following about green tea:—"Those of our readers who are not already acquainted with the fact may be interested to know that new Indian green teas are beginning to find their way to this market in larger quantities, and judging from samples which have lately been seen they compare favourably with China teas that are not of the highest class. The prices at which they are introduced are also in their favour by being below those obtainable for China green teas of second rate qualities, and for purity, strength, and flavour they require to be only more widely known to be appreciated at their true worth by grocers at large. At present, of course, the disposal of Indian or Ceylon green teas in London is merely in its experimental stage; and whilst the sale is in its infancy no very definite opinion can be formed as to the preference likely to be given them by the body of British consumers at home." The same journal also says:—"We have received from Messrs. Geo. Payne & Co., Limited, 31, Minories, London, samples of the new pan-fired Indian green teas, of which they have made very large purchases. Grocers should not fail to sample these Indian Hysons and Young Hysons, as they compare most favourably both in price and quality with the ordinary grades of China green teas, their liquor being exceptionally purer with a delicate flavour, and as a novelty they should be of utility for advertising purposes."

Messrs. C. J. Leech & Co., in their weekly report on the coffee market, state that Rio receipts show a moderate, but natural, increase but those at Santos are distinctly smaller than the previous week, although an increase was expected from the 1st instant, in consequence of reduced railway freights on the Paulista Line. Although it is altogether too early to attempt to estimate this season's Santos crop, the absence of any increase in the movement to the port during the past fortnight is certainly remarkable, and gives rise to the reflection that after all there may be more foundation for the talk of a crop of not more than seven million bags in Santos than coffee operators, after the deceptions of previous years, can at present bring themselves to believe. Mr. Karl Krische estimates the receipts for current month at Rio 550,000 bags and Santos 1,250,000 bags, but according to last week's movement his estimate for Santos looks improbable.—*H. & C. Mail*.

### TEA CORPORATION (LIMITED).

On August 7 a petition, presented by the liquidator and the Company, asking the Court to sanction a scheme of reconstruction, came before Mr. Justice Buckley. The Company was formed in 1897 with a nominal capital of 200,000*l.*, divided into 5*l.* shares, and to acquire and take over certain estates in the island of Ceylon, and to cultivate such estates, and to carry on the business of planters, merchants, traders, and dealers in tea, cocoa, coffee, and merchandise in general. In 1897 the Company issued debentures to the amount of 65,000*l.*, bearing interest at the rate of 5 per cent., and there was now fifteen months' interest in arrear. In consequence of the depression in the tea trade some two years ago the Company got into difficulties, and the trustees for the debenture-holders appointed a receiver, who was now in possession of the estates, and was carrying on the business. In March, 1903, Resolutions were passed for voluntary liquidation, and a scheme had been prepared by which it was proposed to pay the debenture-holders 20*l.* in cash, leaving all debt of 80*l.* in respect of each 100*l.*, and to reduce the rate of interest from 5 to 4½ per cent.; to pay the unsecured creditors in full, and to issue to each preference shareholder four shares of 1*l.* each in the new Company in place of the 5*l.* share, and shares to the ordinary shareholders upon which 10*s.* only was paid up. By this means it was sought to obtain further capital, the want of which alone had brought the Company to grief. Mr. Eve, K.C., and Mr. Clausen appeared for the petitioners. Mr. Levett, K.C., who

appeared for a Committee of ordinary shareholders, opposed, and read affidavits, the object of which was to show that the property was more valuable than the petitioners stated, there being a considerable deposit of plumbago on the estate, which, if properly worked would produce good profits. He submitted that the effect of the scheme was to sell the equity of redemption of the whole estates for 258*l.*, whereas the real value was about 20,000*l.* His Lordship, without calling for a reply, gave his sanction to the scheme, being of opinion, on the evidence, that the deferred shareholders had no real interest in the Company, and that the option which was offered them of taking shares with a liability of 10*s.* was really a gratuitous concession. He directed that a sufficient, but not too long, time should be allowed the ordinary shareholders within which the option should be exercised.

### AMERICAN IMPORTS, 1902-03.

The compilations of the Bureau of Statistics of the Department of Commerce for the fiscal year of twelve months closed June 30 last are being distributed, and included as usual are the tables bearing on the importations in the period into the United States of coffee, tea, cocoa, and chicory.

Despite the lower cost of coffee, the imports reveal less call in the United States for the bean in the last year, and to the considerable extent of 150,000,000 pounds, the figures refuting the often-reported large increase in consumption of coffee in the United States. The decline has been mostly at the expense of Brazil, and all countries have received, apparently, one-tenth of a cent less for their coffee than one year ago. But the coffee habit has in fact proceeded in this country by great leaps and bounds, and if there are reactions these are only temporary and mainly caused by stimulated supply. The average and trend is to expand rather than to contract. In effect the United States remains a one-billion-pound country.

Tea, under the stimulus of free entry and a general barrenness of supply caused by the assurance of the lifting of the late duty, shows an increase in importations of 33 per cent. compared with one year ago, the total reaching a figure high among the records. The increase in price on the average has been two cents a pound.

Cocoa is now imported to the extent of fifty million pounds and the year's increase has been most satisfactorily large. In pounds this commodity is beginning to run close to tea, but very much of it is used in confectionery and in the baking of cake and comparatively rarely as a drink.

The year has been very short in chicory. This was especially true of the domestic crop, and the foreign article was thus freely drawn upon. It has been expensive, but, notwithstanding, the increase in the importation was 600 per cent. Coffee is too cheap at present to make it worth while to use chicory as an adulterant, but seemingly chicory continues to be used largely for its own sake and is moreover in special demand by the manufacturers of cereal coffee who without it would be quite unable to simulate a coffee flavour.

### THE PRESENT TEA SITUATION.

BY C. R. BANKS.

As the earliest teas of the season to arrive are Japans, the writer will give them the first comment, by saying that the cup quality of the present season is decidedly better than it has been for several years past, on the general average. The prices are decidedly higher than last season, which has, in a measure, limited the sale, because the merchant will not make other than necessary purchases on a sharply-advanced market. The same condition exists with Basket-Fired Japans. The Japanese Government has endeavoured to aid the growers of teas by subsidizing that industry. An Association was formed by the growers, which is ably represented in the United States, to further their interests. For reasons unknown to the writer the market materially advanced, so much so that the merchant could not profitably sell Japan teas to the consumer at prices at which the buyer would take them, and they are substituting green Ceylons and Young Hysons. The former have been taken by the public very favourably in the sections where they want light liquor Japan teas, because the infusion of the green Ceylon, at a low cost tea, makes as fine a coloured liquor as many

of the choice Japans. It is a well-known fact that when the public get accustomed to drinking a kind of tea it takes a great deal of influence to cause them to change and we think the alert Japanese will see at too late a day their error, unless they market their teas on the basis of other kinds that are their equal, if not their superior, in cup quality.

The foreign Formosa market opened on a basis of 3 to 4c. higher than last year for early teas, which are thin and undesirable. The later pickings have gradually declined to a basis which seems reasonable to consider a fair business risk in dealing in them. The season is yet too early to give statistics of special value to the average grocer. The loss of the steamship *Heathford* by fire with 32,000 hc. Formosa and about 375 hc. Congou, is likely to have the same effect upon the market as did the loss of the *Satsuma* last season, and the smaller export to date is bound to be felt, owing to the unusually small stock now in warehouses.

The Congou market at Kui Kiang and Han Kow, the latter being a district where the finest cup teas come from, open at from 3 to 5c. per pound higher for the same grade, over last year, and maintained this basis for all first crop shipments to the finish because the Russian and English merchants were very large buyers, and practically swept their markets. The low grades are costing at least 2c. over our present market rates. The official reports show: 22nd July, 1902, export of Congou to the United States from Shanghai and Han Kow, \$3,600,000; 7th July, 1903, \$2,700,000; export to 7th July below last season, 900,000 pounds, or 25 per cent.

Owing to the advanced prices in Shanghai and Han Kow this year the American merchants, from careful figures, bought four million pounds less than last year up to the present time, which included purchases made for future shipments. As the above 900,000 pounds show, the shipments and the balance were for future shipments.

The indications are such that the United States buyers will not be able to make the heavy shipments this year of 52,000 hc. of

Congou and Foo Chow to England, because the English merchant has bought more freely than a year ago, and shippers will be more guarded in shipping only what will pass easily our Government standard. The standard law for quality has been maintained by our tea inspector, Mr. McGay, with as careful judgment as the writer believes it could be, although he considered it necessary to criticise some of the low-grade Formosas which have been on the market. I was informed by him that he was careful to admit nothing below the standard selected. The writer is free to express his opinion that the Commissioners appointed to make the standard must have selected a tea that deteriorated in cup quality to a great extent, more so than it seems would be good judgment to have for a Formosa standard. The unfortunate shippers and consignees of 20,000 Foo Chow, Oolong and Congou, which were rejected, have suffered a severe loss because of their ill-advised selections, but were very fortunate in having the English market, which was short of Congous, take the same at a slight advance over cost, and all the rejected teas now have been as the law requires them to be shipped out of the country.

The writer takes pleasure in expressing his praiseworthy opinion of the careful examination the Board of Appraisers gave the appeal on the rejected teas, and at the suggestion of the National Tea Association and others submitted the case to the Secretary of the Treasury, received the opinion of the Attorney-General that the request for having the rejected teas sifted, and that portion that was admissible admitted, was, in the opinion of the Attorney-General, impossible to be granted.

The Pingsuey foreign market opened on a basis of our own, which was about 20 per cent. higher than last year, and has gradually declined to about 10 per cent. advance of our present market.

The Moyune green market has opened at a sharp advance and the indications are that it will be in a measure sustained, because this market is almost entirely bare of desirable green teas. Some are unattainable at any price.

# CONQUERS PAIN

The Ceylon and Assam market here is decidedly lower than it is in London, which seem to many an impossibility.

The native Ceylon and India market shows a shortage of two to three million pounds for the month of June against the corresponding month of last year. The finest grades are higher, the medium and low grades remain at their high standard of price recently attained.

Our present tea market has been quiet, although there has been a steady demand for good cup grades. This proves that trashy teas are not wanted, and the merchant who buys other than good average stock lessens the general use of teas, and loses desirable customers, together with carrying dead stock. It is easy to assume that pure edible merchandise of any kind drives good trade to the merchant who with care selects choice drinking teas which only can be had by buying an article which has been selected with care at the proper season, fired in the proper way, and cared for as it should be, because we all know very well that tea is a delicate article. If care and judgment are use in the purchase of good teas we are confident the tea trade will increase and dealers will receive the benefit. During the writer's late visit to London and Paris he noticed a great many tea shops where tea is served by the cup, and learned that the tea trade is gradually increasing in many sections where he visited.—*American Grocer.*

## DISTRICT ASSOCIATIONS.

### INDIAN TEA ASSOCIATION.

#### COMMITTEE MEETING.

The following are extracts from the proceedings of a Meeting of the General Committee held on the 18th August:—

There were present: Messrs. T. McMorran (*Vice-Chairman*), Lockhart Smith, R. R. Toynbee, T. Trail, and W. Warrington.

CORRESPONDENCE WITH THE INDIAN TEA ASSOCIATION, LONDON.

Letters dated 24th and 30th July from the Secretary, Indian Tea Association, London, having been previously circulated, were brought up for final disposal. The principal subjects dealt with, were—

*The Louisiana Purchase Exposition.*—The letter of 30th July contained a summary of an interview with Mr. P. C. Larkin, of Toronto, regarding the above matter. Mr. Larkin strongly recommended co-operating, if possible, with Ceylon, and the London Committee suggested that the proposal might be considered.

After some discussion it was decided to communicate with the Thirty Committee in Ceylon with reference to Mr. Larkin's suggestion. It was also to be mentioned that a suggestion that India might co-operate with Ceylon had been made by Mr. Bois, Chairman of the Ceylon Chamber of Commerce, in a letter addressed to Sir Montagu Turner some time ago.

In the meantime the Secretary was instructed to prepare a memorandum for submission to the Government of India with reference to the question of the financial assistance to be granted from public funds.

*Manufacture of "Oolong" Teas.*—Mr. Larkin had also drawn the attention of the London Committee to the desirability of manufacturing teas resembling the Formosa Oolongs. From 16 to 20 million pounds of really fine Formosa Oolongs, he said, were sent to the United States last year, and people were willing to pay a higher price for these than for any "black" tea.

Mr. Larkin urged that a planter of some experience should be sent to Formosa by the Indian Tea Cess Committee to gain information as to how the peculiar flavour of these teas is acquired. Mr. Larkin felt certain that if India could make fine Oolongs a profitable business would be opened up.

It was decided to pass on to the Tea Cess Committee a copy of Mr. Larkin's remarks.

*Germany as a Market for Indian Teas.*—Reference was made in the letter of 30th July to a letter which the London Committee had received from Mr. J. S. M. Harrington regarding the possible effect which might be produced in Germany by the reduction of the duty from about 5½d. to about 1½d. per pound under the new German Tariff, which was expected to come into force at the beginning of 1904. In Belgium, Mr. Harrington pointed out, the total remission

of the tax on tea had raised the consumption from 143,686 lbs. to 519,446 lbs., an increase of 377 per cent. If the reduction of the duty in Germany, with its population of 57 millions had a like effect and raised the consumption to approximately that of Belgium, Germany would become the largest Tea Market on the Continent, except Russia, and a field well worth the attention of Indian planters. Mr. Harrington suggested that assistance should be given to a Tea House in Berlin.

It was decided to pass on the Tea Cess Committee a copy of Mr. Harrington's letter for such action as that body might deem advisable. The intimation of the reduction of the tea duty in Germany was noted with much satisfaction.

## MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated August 14th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ... ..	160,544	246,605	19,919
1902-1903 ... ..	182,516	282,132	19,943
26,442 pkgs. INDIAN 31,300 " CEYLON 4,137 " JAVA	Total 61,879 packages were offered in public auction this week.		

The stock of all tea in London was less at the end of July than at any time since June, 1900. The telegrams below show that exports from India and Ceylon both continue on a moderate scale, the latter being considerably below last year. Hence the industry is now in a sound position, and if coarse plucking can be avoided, prices may be on a more remunerative scale.

INDIAN.—The market opened with good general competition, firm to rather dearer rates ruling for all whole leaf grades, broken alone showing any indications of weakness. Teas for price were unchanged. Some Assam Teas made high prices. Exports to U. K. second half of July lbs. 11,120,000, against lbs. 9,310,000 last year. Total from 1st April lbs. 30,592,000, against lbs. 29,900,000.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 21,879 pkgs., av. 8·02d. 1902, 26,365 pkgs., av. 7·34d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 53,457 pkgs., av. 7·66d. 1902, 69,479 pkgs., av. 6·71d.

CEYLON.—The fortnight's cessation of auctions tended to a better all-round demand, prices of medium and good teas being very firm and occasionally showing a slight advance, while there was a better market for anything with fine quality. Exports to U. K. during July lbs. 9,500,000, against 10,750,000 lbs. last year. From 1st January lbs. 62,500,000, against lbs. 68,250,000 in 1902.

Average for week 7·00d., against 6·31d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 633,153 pkgs., av. 7·49d. 1902, 716,264 pkgs., av. 6·71d.

JAVA.—In spite of rather heavy supplies, bidding was animated and prices very firm with slight advances, teas of good quality attracting attention and bringing full prices. Since 1st June 18,803 packages Java Tea sold on Garden Account realised an average of 6·60d. per lb.

Bank Rate 3 per cent. Exchange on London three months' sight:—

## CINCHONA.

At the periodical auctions on Tuesday, seven brokers brought forward catalogues aggregating 1,439 packages, against 715 packages offered at the previous auction in July. There was a fair demand, and about half the offerings were sold at fully the last London sales rates; the average unit being 1½d., and the parity of the last Amsterdam sales 1<sup>3</sup>/<sub>16</sub>d.

The following table shows the amount of bark offered and sold:—

	Packages Offered.	Packages Sold.
East Indian cinchona ... ..	862	651
South American cinchona ... ..	333	..
Java cinchona ... ..	130	14
Ceylon cinchona ... ..	114	21
	1,439	686

The following are the approximate quantities of bark purchased by the various buyers:—

	Lbs.
The American factories	63,490
The Frankfort-on-Main and Stuttgart factories	39,188
Messrs. Howards & Sons	28,166
The Brunswick factory	17,185
The Imperial Quinine factory	15,267
The Mannheim and Amsterdam factories	1,726
Druggists, Brokers, etc.	17,850

Total quantity sold	182,872
Bought in or withdrawn	154,666

Total quantity offered ... 337,538

The following prices were paid:—

CEYLON.—Ledgeriana, good stem chips, 4½d.; ditto renewed, 5d. per lb.

JAVA.—Hybrid branch, 4½d. per lb.

SOUTH AMERICAN—Sixty-four bales Bolivian cultivated Calisaya were bought in, and a parcel of 266 bales soft Columbian (Z O), imported in 1883 and 1885, was also bought in, from 2¾d. to 3d. per lb. being wanted.

EAST INDIAN.—Succirubra chips, 2¾d. to 3¼d.; root, 2½d.; renewed, 3d. to 3½d.; chiefly crown siftings, 3½d. to 3¾d.; branch and small chips, 1¾d. to 4d.; fair to good stem chips and shavings, 4¼d. to 4¾d., fine rich, 5½d. to 5¾d.; root, common dull, 4½d. to 4¾d., medium 5½d. to 5¾d., rich, 5¾d. to 6¼d.; renewed, medium, 3½d., fair 4½d., good 5¾d. Ledgeriana siftings, 1¾d.; branch, 1½d. to 4d.; root, 4½d. to 4¾d.; rich, 6d. to 6¼d. per lb.

The exports from Holland during the five months ending May amounted to

	1901.	1902.	1903.
Tons ..	2,343	2,859	1,941

### QUININE.

The small bark shipments for the first half of the month have given a rather firmer tone to the second hand market to-day, and a small business has been done at 11d. per oz. on the spot, and 11½d. to 11¾d. for October delivery. September delivery had been sold on Wednesday at 10¾d., and spot at 10¾d.

The exports of quinine, quinine preparations, etc., from Germany during the five months ending May were as follows:—

	1901.	1902.	1903.
Kilos. ...	88,700	84,400	61,600

# PLANTING

# OPINION.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, SEPTEMBER 12, 1903.

[No. 36.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 18th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*September 9th.—Weather—*The sun has given us his welcome presence the last four days, but the sky is now again overcast, and rain falling. *Supplies—*There has been too much gloomy weather for these; the early supplies are very poor, and even the late ones are suffering from want of sun. *Works—*Handling, weeding, shade, digging. *Health—*This year is remarkable for its unhealthiness. *Labour—*Sufficient.

#### Coorg.

*POLLI BETTA, 9th September.—*  
*Weather—*From the 31st ultimo till the 7th instant inclusive there was a complete cessation of rain. On the 8th a fresh mild burst set in. *Plant diseases—*The break in the weather has been most beneficial to coffee. There are no signs of leaf-disease and little or no borer has shown up since what of it there was in June was removed. Works in hand are weeding and handling, mostly the former. Plague has now broken out at Gonicipal which brings it near the Estates.

#### Kotagiri.

*10th September.—Weather—*We have been having a particularly good monsoon, as we generally get practically no S.W. here. In 83 consecutive days ending 31st August there were only 22 days without rain. The only bad part of it is that there has been too little sunshine between the showers, and this, as is usual here, has brought on a very bad attack of leaf-disease on a number of Estates. *Crop* is approaching maturity, a few berries ripening up here and there, but not quite enough for fly-picking to commence just yet. *Health—*on the whole—very fair, but plague is creeping on steadily, and now seems to be getting hold of Coonoor. *Labour—*is a bit scarce, as locals are at work on their grain fields.

### THE LOUISIANA PURCHASE EXPOSITION.

THE fact that the U. P. A. S. I. has Rs.20,000 at command for employment in connection with the Louisiana Purchase Exposition has been made known in the chief trade centres of India. The Association made a grant of Rs.10,000, the Mysore Government promptly sanctioned Rs.5,000, and the Government of Madras followed with another Rs.5,000. Then confident hopes have been expressed that the Governments of Travancore and Cochin will give substantial assistance. It does not seem to us, however, that there are good grounds for this hope. Hitherto these two Governments have not manifested any very liberal tendency in respect to grants-in-aid of planters. Then it must be remembered that the Madras and Mysore authorities were approached *personally*. No arrangements appear to have been made for deputations to wait upon the Travancore and Cochin rulers. It is perhaps safer to assume that if these Governments make grants at all, the total will be small. The sum required to assure proper representation through the medium of the Indian Tea Association is Rs.20,000 to Rs.25,000. Even taking the smaller sum as a basis, there is nothing at present available, and there is no immediate prospect of a substantial surplus, which can be utilised so as to provide for the most important work in connection with the Exhibition. That work is not the sending forward of exhibits, but the organization of a definite scheme for pushing sales of Indian Coffee, Tea, etc., in the United States. We take it that the District Planting Associations will arrange to subscribe, at least, all supplies required as exhibits and for the production of coffee "in the cup" for sale during the Exhibition. If they stop here, however, there may be a repetition of that occurred at the Paris Exhibition. A demand may be created, and no supplies immediately forthcoming to meet that demand. This is what planters have to try to avoid. It is to be hoped, therefore, that every District Association will bear in mind the necessity of subscribing, either in money or in "kind,"

in such a way that ample supplies may be available, during and after the Exhibition, for the purpose of pushing trade.

Certainly the time is not propitious for appeals to District Associations to supply money for the purchase of stocks to be offered for sale in the United States. Every planter who realises the necessity for push and the expediency of combination can, however, do one thing: he can set aside a small portion of his crop for Exhibition purposes. This portion may be sub-divided. One lot can be given outright for use as an exhibit or for the purposes of the coffee-room where coffee will be sold in the cup. The second part may be regarded as a consignment. In respect to the first part the planter will expect and will receive no return whatever: it will be his subscription. The second parts, put together, might be offered for sale through any agent or agents who may be selected, and the nett proceeds would be ultimately divided *pro rata* among the contributors. By some such co-operative procedure as this, a sufficiency might be made available for all the purposes of the Exposition itself and the campaign in the American markets. The burden on each planter would be light, yet the total supply would suffice for practical purposes. If the campaign failed, the individual outlay would be small, for the coffee sold would at least yield *something* for each contributor. If the campaign succeeded, each contributor would get back something very like the full value of his coffee, and would have a share in the improved prospects opened up by the introduction of Indian Coffee into markets where it has hitherto been practically unknown. So far as planters are concerned, some such method as this appears to be the most likely to bring about good results, but much will depend upon the manifestation of unanimity of purpose, and determination to give the new experiment a fair trial on what may be termed a commercial scale.

There is yet one other source of supplies that should not be overlooked. Every coffee curer in India, every Coast Agent who is interested in coffee estates or in the export of coffee, should be convinced of the advantages that will accrue to all concerned if the American markets are successfully opened up to Indian Coffee. They, as well as planters, have much to lose should present depression become intensified, and much to gain if it can be lightened. To them, therefore, as well as the District Associations and individual planters, should an earnest appeal be addressed. They could contribute in "kind" or in money. Among them they ought to be able to make up a very fair amount, and with assistance from them the U. P. A. S. I. should be placed in a position to make a really good fight for the victory it seeks. Those who are sceptical as to results will hesitate to subscribe; let them, however, do something, however small, to help to put the new experiment on a business footing. Those who believe, as we do, that there is a large market which only needs to be properly attacked in order to assure a permanent demand for Indian Coffee, may contribute more freely. Coffee is an expensive commodity. A very few tons run to a great deal of money; but we believe that representations made in the right quarters would cause the requisite supplies to be forthcoming and would also bring about a very desirable reduction of freight and perhaps of railway carriage and curing expenses in respect to every hundredweight of coffee sent forward in connection with the above exposition, whether for exhibition, for sale at the Exposition, or for sale with a view to the opening

out of a direct trade with American dealers and roasters. If the experiment succeeds, steamship owners and curers of coffee should benefit as well as planters. The object from the very first should, therefore, be to enlist the active co-operation of all interested in the welfare of the coffee industry. Our remarks deal chiefly with this, because it is the staple industry that the U. P. A. S. I. has in view in all the arrangements it proposes or desires to make in connection with the great show at St. Louis next year.

### BRITISH BOARD OF TRADE RETURNS. JULY 1903.

**Cocoa** (*raw*) arrived in the United Kingdom to only a limited extent during July, and the stock in bond was considerably narrowed down.

In the first seven months.		1903.	1902.	1901.
Imports	lbs.	35,423,062	37,849,826	35,836,763
Home consumption	"	25,870,753	30,583,365	26,636,009
Exports	"	7,175,589	8,206,683	6,713,001

RUSSIA'S TEA DUTIES.

An announcement was lately made that, with reference to the decision of the Sugar Convention, Russia intended to institute a course of reprisals against Great Britain, and that Tea would receive attention in the first place. This statement was scoffed at in various quarters. Russian merchants in Colombo asserted that there could be no foundation for it, as they had no advice from their houses in Russia that any such course was contemplated. However, Reuter has now announced that Russia has raised the import duty on Ceylon and Indian Teas imported across the European frontier or through the Black Sea from 31½ to 33 roubles per pood (40 lbs.). The duty on Chinese Tea has not been raised. The increase is not a very serious one, but it may check the development of trade to some extent. At any rate, Russia's action furnishes Indian and Ceylon tea-planters with a fresh claim for consideration of their interests on the part of the various Governments concerned. Rightly employed, it may also provide Mr. Chamberlain with some useful arguments in support of a preferential system of tariff.

COFFEE NOTES.

**Mocha Coffee Crop.**—The coffee crop at Yemen this year is said to leave a good deal to be desired, owing to the scarcity of rain during the past few months. This state of things naturally makes itself felt on the value of the products, and the result is a rise in the price of the article. The exports from Abyssinia, *via* Djibouti, are less than was the case last year.

It is said that the civil war in the United States caused a reduction in coffee consumption of fully 200,000 tons, partly

counterbalanced perhaps by the great increase in the use of adulterated blends or substitutes.

Messrs. Karl Krische & Co. have estimated the August receipts at Rio and Santos combined at 1,800,000 bags, and the fact that their estimate for July came within 2,000 bags of the actual number tends to inspire confidence in their latest figures. This represents a very heavy movement, and with stocks slowly accumulating the trade is looking forward for some sign of weakness in the primary markets.

The visible supply statement of the New York Coffee Exchange for August 1st shows a gain of 470,000 bags during July. Here is the visible supply of the world on the 1st ultimo :—

Although the importation of coffee into the United States in the 12 months ending in June fell 1,360,000 bags according to Government statistics, an examination of more trustworthy data, is of the most encouraging character, says the *Tea and Coffee Trade Journal* of August 11. In the first place a decline in the imports was quite natural, arrivals in previous years having more than exceeded consumption, and a reaction, expressed in diminishing importations, was a consequent procedure. If, on the average, the years' advances exceed recessions general progress has occurred, and that is found to be the fact for coffee importations into the United States. The arrivals of coffee were in 1902-03 6,871,027 bags, whereas in 1901-02 they were 7,905,815 bags—a diminution of 1,034,000 bags according to the trustworthy figures found in the Coffee exchange Supplement. In 1900-01 the arrivals were 6,116,290 bags, so that the importations of this year are ahead of that year, and in fact they exceed all previous years expecting 1901-02. Meantime, deliveries, which approximate consumption, show an increase rather than a decrease. They were for 1902-03, 6,847,877 bags, within 25,000 bags of the entire arrivals, and are an increase of 284,000 bags over the arrivals of the year 1901-02 of 6,663,569 bags. Indeed, the deliveries in 1902-03 are the largest on record, and represent a consumption of 887 million pounds. The increase is 37,500,000 bags or about ½ pound for each inhabitant. To remark in other words, never before has there been so much coffee used in the United States.

A survey of the figures back to 1882 offers still more encouragement, showing the vastness of the expansion of

coffee usage in this country in 20 years. In 1882-83 the deliveries were only 2,416,107 bags against Europe's 7,042,080 bags. We consumed less than 25 per cent. of the coffee grown, whereas in 1902-03 we consumed more than 42 per cent. Europe's increase has been from 7 to 9 million bags, whereas ours has been from 2,400,000 to 6,850,000 bags, the world's crops in the interim having increased from 11,161,279 bags in 1883 to 16,889,840 bags in 1903. It would appear that the coffee industry in the United States has little to complain about, and if all the world had done as well, a coffee surplus would not now exist worth the while.

The world's own figures justify roseate views. The deliveries or consumption in 1902-03 were 15,966,498 bags, the largest on record, and an increase of 450,000 bags over 1901-02. A year ago the increase was 800,000 bags, but this was abnormal, and so this year's figures should prove gratifying enough, especially in the light of a shrinkage of total arrivals in the United States and Europe from 19,013,367 bags in 1901-02 to 16,889,840 bags in 1902-03, a decrease of 2,123,927 bags, leaving an addition to the world's supply over consumption of only 923,242 bags against that of 1901-02 of 3,496,704 bags.

**Option Coffee Prices.**—Surprise is often expressed, says the *Spice Mill*, that there seems to be so little harmony between the option coffee market and the prices at which the ordinary merchant is able to purchase his supply, and the impression often prevails that some one is getting an immense profit, while quite the contrary is often the case. Take, for instance, a quotation of five cents or less for option coffee when the larger merchant pays about ten cents for his lowest grade.

It is really surprising on what very small margins these goods are sold among the coffee men, who often turn over large invoices of coffee that show a margin of only 1 or 2 per cent., while perhaps 3 per cent. would be considered a very large profit, although less than a quarter of a cent. per pound. The feature about the option market not always understood is that any kind of coffee may be delivered on an option at its corresponding trade value as listed on the exchange, and the exchange standard takes no account of roasting merit or cup quality. For instance, a man may have an option on No. 7 (low ordinary) coffee at 5 cents and he may receive on it No. 3 (fair coffee) at 2 cents per pound more, and as his expense of the exchange will be about one quarter of a cent, the coffee will cost him  $7\frac{1}{4}$  cents then he will probably receive a coffee that looks well green but makes a bad roast, and after standing shrinks, amounting to  $1\frac{1}{4}$  cents in roasting. He would find it hard to get  $8\frac{1}{2}$  cents for the roasted coffee. Much of this coffee delivered on options is mere trading stock, and lies in warehouses for years, changing hands hundreds of times.

In view of this condition, the legitimate trader does not go to the option market, but will buy where he can get a fair selection of coffee, based on the roasting merits of the goods and the cup quality, and for such goods he pays much more than options are quoted.

**The U. S. Coffee Market.**—The downward tendency to prices continues, says the *Spice Mill*, the tone of the market being weak, and values for both contracts and invoices were lowered slightly. Liquidation of the speculative interest in September contracts continues to be reported, and as there

was only indifferent buying to absorb the offerings, prices were gradually yielding. Adding to the depression was an increasing desire on the part of Brazil to market coffee, Rio selling on August 5 Rio No. 6 at the lowest prices for this grade of coffee ever recorded in the history of the trade; the transaction was 3,000 bags Rio No. 6 at  $4\frac{1}{2}$  c. c. & f.; other firm offers received included Rio Nos. 6 to 8, averaging No. 7, at 4.80c. c. & f.; Rio No. 2 at 6c. do.; Santos Nos. 3 and 4 at 7.50c., and described Bourbon Santos No. 4 at 5.70c. The world's visible supply of coffee increased during July 470,000 bags, but this was about as expected, and consequently had no especial influence. The spot market for invoices was weak. The jobbing business continued without spirit, and of a hand-to-mouth character.

Speculation in the market for contracts continues on a very moderate scale only.

The position of fazendeiros in Brazil is getting most critical, a report says; it seems no longer possible to grow coffee without losing money. Exchange continues firm at present rates and the labour question is quite to the front. Immigration of Italians is almost suspended.

**"Essence" of Coffee.**—The report of the public analyst at Liverpool for the past quarter refers to a certain so-called "coffee essence," which, on being analysed, was found to contain not more than 10 per cent. of coffee, not less than 55 per cent. of chicory, and 35 per cent. of water.

**The U. S. Coffee World's Market.**—The situation in coffee has very much improved, says the *Tea and Coffee Trade Journal* of 11th ultimo. The world's stocks to be sure are larger than ever, but at last interest so long dormant is aroused sufficiently to begin buying coffee for investment's sake, and despite all tales to the contrary, the consuming market is more than doing its share in taking care of the great stocks. The deliveries during the month of July in the United States were in excess of any monthly delivery in the last twelve months, and if traders are inclined to complain of a lack of business, they ought to see that somehow they are not on the ground floor. Someone is doing business. To be sure prices are low, very low, but at the same time and at last they are attractive to buyers, and be the profits what they may, at any rate, the market is more than merely stirring, and this should give satisfaction.

A new interest entered the market last week on the Exchange and purchased 100,000 bags of coffee, evidently confident that coffee now is remarkably cheap and offers a fine promise for profit. The interest, it is said, has been successful in the past in such investments and sees ahead a rise in the market. It is not of the metal ring which has to a great extent liquidated its coffee. On this sudden purchase, which the Lehmans handled, the market advanced fifteen points and more, and while since there has been a reaction, even to twenty points yesterday, it is believed there will be a counter demonstration from this on forays by the new interest. It must protect its purchases. In the irregularity the market will be found to gain steadily. An enduring improvement is scarcely ever on the sky rocket order and the present ups and downs therefore are wholly natural for a good future. At least the market is no longer stagnant, there is something stirring, and the air is tonic for a brace. Europe duly felt the influence.

An improved speculative market will have its effect on the active market. There has been much active coffee sold as is evidenced by the large July deliveries. To be sure some of the Brazil prices reached last week low record prices, such as a sale of 3,000 bags Rio No. 6 at 4 $\frac{7}{8}$ c. c. & f., the lowest price at which Brazil has ever sold this grade of coffee, yet the market is firmer than might have been expected. Some sales were : 2,000 bags Rio No. 7 at 4 $\frac{8}{16}$ c. c. & f., 2,000 bags Rio No. 7 described as good roasters at 4 $\frac{7}{8}$ c. do., 1,000 Rio No. 6 do. at 5 $\frac{1}{8}$ c. do., and Bourbon Santos No. 2 at 6 $\frac{1}{16}$ c. c. & f., and Bourbon Santos No. 3 at 5 $\frac{7}{8}$ c. do. The spot market for invoices closed firmer at 5c. for Rio No. 8, 5 $\frac{1}{4}$ c. for Rio. No. 7, 5 $\frac{3}{8}$ c. for Rio No. 4, and 6c. for Santos No. 4. Jobbing is reported as being done in larger proportions.

In milds there is a steadier undertone, partly the influence of the stronger turn in Brazil coffees. Supplies are plentiful enough but are not coming in the large quantities as heretofore. Good Cucuta is 7 $\frac{1}{2}$ c. East India coffees are quiet.

Total stock in United States August 1, 2,400,040 bags against 2,574,631 bags August 1, 1902. Brazil stock in the United States August 8, in store and afloat, 2,495,744 bags against 2,723,995 bags at the same time last year. Other than Brazilian, 405,120 bags, against 315,391 bags last year.

Brazil coffee in New York August 8, 1,799,054 bags. Stock in other coffees August 1, 302,222; in San Francisco, 92,116 bags; and in New Orleans, 10,782 bags. Visible supply in the world of all coffees, August 1, 12,370,566 bags.

Warehouse deliveries since August 1, 1903, New York, 95,186; Baltimore, 5,542; New Orleans, 10,874. Total 415,658.

## TEA NOTES.

**Brick Tea as Current Coin.**—It is one of the peculiarities of Mongolia, says a Chinese official in the course of his "Recollections" now appearing in the *North China Herald*, that the ordinary medium of currency does not find acceptance there. "Payments not made in kind," such as a sheep, which was the daily wage of Shen, the banished Taotai of Shanghai, when at Kalgan, "are usually made in the form of brick tea, the required quantity being broken off the brick."

**Ceylon Tea Shipments to the United Kingdom.**—The following is the Ceylon Chamber of Commerce official tea telegram to London on the 1st instant :—

August shipments 6 $\frac{1}{2}$  millions.  
September estimate 6 $\frac{1}{2}$  to 7 millions.

The August estimate was 7 to 7 $\frac{1}{2}$  millions. The shipments for July and August last year were 10,765,355 lbs. and 7,467,514 lbs. respectively ; and for September were six and three-quarter millions.

It is, says the *Merchants' Review*, a reflection on the good judgment of American tea-men when authorities on Ceylon tea culture recommend the packing of teas of certain tints for American trade. Tea ought to be judged by its drinking qualities.

**Exports from Wenchow, 1902.**—Mr. Consul Mortimore reports :—The total value of the export trade was 644,370 Haikuan taels (83,672 lbs.), nearly double that of 1901, and due to the increased export of tea, brought about by the reduction of the duty to an effective 5 per cent., and a very satisfactory season. Much of the commoner teas, however,

are still unable to bear the duty and are consumed locally. Owing to the season having proved so successful to the growers, I am informed that much new ground, as well as ground previously used for other crops, is to be utilised for tea planting. The green teas, which mostly go to the United States, were a very satisfactory crop, and good profits were realised by the merchants. The export of unfired tea, which is sent to Shanghai for firing and then exported to the United Kingdom, Russia, and the United States, more than doubled that of any previous year.

**Excess of China Green Teas.**—Messrs. Reid, Evans & Co., of Shanghai, venture to estimate that there will be this season an excess of 30,000 half-chests of Pingsuey tea, 30,000 half-chests of country teas proper and 20,000 half-chests of Wenchows, S. Packs and new Districts, a total excess of 80,000 half-chests. This would give available for export, say they, to Europe and America some 5,000,000 lbs. of Green Tea. Allowing that Europe takes 1 million lbs., there remain for America 4 million pounds more than 1902. This quantity, provided prices were moderate, would not be excessive when the small stocks in many parts of that country and the removal of the 10 per cent. duty is taken into account. It remains to be seen whether America can take this extra quantity at present prices with profit to importers.

**In Coffee and Tea.**—Japan has decided, a despatch says, to continue the subsidy to the Central Tea Guild for the purpose of extending the tea market in the United States. The subsidy has been paid six years. When the question of renewal came up early in the year, six American, English, and German firms engaged in Yokohama tea trade urged its discountenance.

The Germans are not great tea-drinkers, and this is not surprising. According to the report of His Majesty's Consul at Hamburg, the tea duties at the present time are no less than £4 18s. per 220 lbs. avoirdupois, and to show the great margin there is in this excessive duty it has only to be mentioned that under the new tariff the amount will only be £1 4s. 6d. To compare these sums is to see how heavily the consumption of tea has been hitherto handicapped among the poorer classes of the population.

**A Japanese Tea Trust.**—TACOMA, Wash., July 17.—The Japan Central Tea Association, of Japan, has sent Kihe Aizawa as a Special Commissioner to the United States to look after and increase American sales. This Association is practically a tea trust, but differs from trusts in this country. The Association numbers more than a million growers, and controls not only tea for export, but also tea kept for home consumption. There are practically no tea plantations outside of the Association, which was formed with the consent of the Government.

According to Commissioner Aizawa, the salient features of the administration of the Association are Committees which are constantly travelling over the country inspecting plantations. Tea has to be up to standard or it is refused. In factories as well there are inspectors, who examine every shipment of tea before it is put upon the market, and if it does not come up to standard it is rejected. The Association has established agencies in New York and Chicago, and in

Montreal, Canada, and through these it is intended to push the sale of tea, which is considered in Japan a more healthful drink than coffee.

\* \* \*

**The U. S. Tea Market.**—Mr. A. R. Robertson writes in the *Spice Mill*:—

The market on all kinds of tea continues quiet, buyers looking critically at offerings, but being slow to respond. The general opinion is that in the near future some active purchasing will begin, and prices will harden.

It is reported that nearly every jobbing house and wholesale grocery firm find themselves more or less short in a general assortment of stock, and it is a question of holding off to see "how the cat jumps." The markets abroad show little, if any, change, although better grade teas are quoted dearer.

**Formosas.**—For spot stock, quotations are lower in price, and good values are to be had in last season's tea. In new, invoices from 16 to 17 cents. have been inquired for, but holders are firm.

**Congous.**—Quoted steady, with light demand. It begins to be an interesting question as to whether this growth of tea may not be entirely supplanted by Ceylons and Indias.

**Oolongs.**—Demand slow, with prices a shade lower than last month.

**Pingsuey and China Greens.**—Firm.

**Japans.**—Steady, with only moderate business doing. Lower and medium grades show no alteration in prices, while finer teas are quietly being picked up, so that an advance is not unlikely.

**Indians and Ceylons.**—No changes to report; foreign markets are cabled strong, and spot greens are receiving much more attention.

\* \* \*

**Report on Japan Tea.**—The Japan Tea Exporting Co., writing from Kobe, July 22, says:—

"The demand is chiefly for good medium and downward descriptions, suitable qualities of which are being taken up under favourable consideration. Good common grade being particularly in demand at Yokohama, no small quantity is being shipped to that port. Owing to the falling-off in quality of recent arrivals, prices have gradually been declining, the quotations for certain descriptions being from Y2 to Y3 lower since the date of our last report, though still Y1 to Y2 higher as compared with the corresponding period last year. There has latterly, however, been indications of a stronger feeling prevailing for low-grade teas, while prices are tending upwards.

"In consequence of this year's demand having chiefly been directed to high grades, very little attention has been given since the opening of the season to low-grade teas, the result being a smaller crop than in any average year. The consequent scarcity of supplies has induced buyers to take up the goods eagerly. Besides, goods of desirable descriptions being chiefly required for home consumption, arrivals have for the moment greatly decreased. The production of the second crop teas appears to be below that of an average year, instead of above as was anticipated; this may be attributed to the fact that prices declined just at the time the crop was being gathered. Judging from the foregoing circumstances, it may be expected that the low-grade teas

will continue in demand, with more or less hardening in prices, and that active business is likely to take place."

Shipments from Kobe and Yokohama to July 17 have been 6,910,935 pounds against 5,621,174 pounds same period 1902; to Chicago and the West 9,584,857 pounds, 6,083,836 pounds in 1902 same period; to Canada 580,009 pounds against 671,886 pounds 1902; to Pacific Coast 2,452,875 pounds against 1,208,933 pounds 1902; total, 19,528,676 pounds against 13,585,829 pounds in 1902.

\* \* \*

**Colombo Tea Sales.**—At the public sale of tea at the Chamber of Commerce room, Colombo, on 2nd instant, 11,869 packages = 900,251 lbs. were offered, of which 9,108 packages = 787,058 lbs. were sold. The selection of tea offered was hardly as good as last week, but prices were about steady. Good medium to fine Broken Pekoes again met with competition at full rates. Green teas were lower.

\* \* \*

**Liquid Fuel on Tea Estates.**—The *Times of Ceylon* says:—Following the successful use of liquid fuel for tea-driers at St. Clair, Talawakele, a good many tea estates in various parts of the island are now having tea-driers fitted up for burning liquid fuel. We learn from Messrs. Delmege, Forsyth & Co. that the use of liquid fuel on estates continues to make headway, and that the firm are erecting tank installations at stations where a great demand is shown for the fuel. Such installations have already been erected at Peradeniya and Hatton, and it is proposed to erect one at Kandy and another at Talawakele. At other stations, where there is only a small demand for the fuel, it is sent up in the railway tank wagons.

\* \* \*

There is to be an establishment for the preparation of soluble tea in India. Mr. J. Roger informed a *Times of Ceylon* interviewer on his return to the island:—"At present all the soluble tea is prepared in Ceylon. Now, Mr. Roger thinks, it will be necessary to provide a separate establishment in India, just as is done in Ceylon, because it would be absurd to manufacture the tea in Ceylon for a place like India."

\* \* \*

**Tea in Russia.**—In his report on the Foreign Commerce of Russia and Trade of the Consular District of St. Petersburg for the year 1902, Mr. Consul General J. Michell remarks:—It is satisfactory to note the growing importation into this country of Ceylon and Indian teas, the impetus to which was given by judicious advertisements made by a special agent in the Russian press.

\* \* \*

**London Tea Market.**—According to a London cablegram, Messrs. Ewart and McCaughey's Tea Report, dated the 7th instant, says that 30,975 packages were offered for sale in a fairly steady market. Except for bad teas, which were easier, Assams with any character were again well taken, and bidding for Darjeelings was rather tame, and a good many parcels were taken out. Clean Pekoe Souchongs were quoted at 6d.

\* \* \*

**Calcutta Tea Sales.**—At the tea sale on the 4th instant 22,465 packages were sold to a brisk market. Common teas were slightly dearer. Flavory Assams and Darjeelings were in strong demand, several invoices realising over a rupee per lb. A large quantity was taken by Russian buyers and for other outside markets.

# NOTES.

## Chinde Rubber.

The Export Duty on Chinde Rubber is 6 per cent. *ad valorem* if shipments are made to Portuguese ports; 8 per cent. if to foreign ports.

## A Small Market.

Madeira takes annually about 6 tons of Tea, which reaches the island either from the Azores or the United Kingdom. Coffee is not specially referred to in import statistics.

## Damascus.

In 1902 Damascus imported Tea from India to the value of £4,000; and Coffee, from Brazil and Mocha, to the value of £22,500. Nine-tenths of this was Brazilian.

## Japan Coffee!

Among entries of imports into Oregon in 1902 appears one curious item, *viz.* coffee (from Japan!) £2,644. Tea from the same country amounted to £98,061 in value. From the United Kingdom tea to the value of only £925 was received.

## Coffee in Bahia.

The returns show an export from Bahia of coffee to the value of £129,514 (44 per cent.) less than in 1901. There was no improvement in the quality of the crop, and, with the exception of a brief spurt in July, prices ruled so low that absolutely no margin was left to the planter. The gloomy anticipations of last year's report being thus justified, it may be safely assumed, says Mr. Consul Medhurst, that unless a rapid improvement occurs the cultivation of coffee in this State is doomed in the near future. Prices varied from 17s. to £1 10s. per cwt. for the best quality.

## India-rubber in Bahia.

It is pleasing, says the British Consul, to have to report an improvement in india-rubber, which two years ago appeared likely to disappear entirely from the Bahia export list. More attention was given to Manicoba, and large numbers of trees were, within the last few years, planted in San Francisco district. These recent plantations are now producing good rubber, which is finding its way to market, and, despite the heavy charges incurred for transport, the rubber collectors manage to secure a fair profit. Manicoba fetched from 1s. 8d. to 2s. 4d. per lb., and the inferior quality, Mangabeira, from 1s. 3d. to 1s. 8d. per lb., cost and freight.

## Entomology.

The Trustees of the Indian Museum have begun the issue of a series of circulars on Agricultural Economic Entomology. The first three deal with the Bengal Rice Hispa (*Hispa Aenescens*), the Rice Sapper (*Leptocoris Acutta*), and the Sugarcane Borer (*Chilo Simplex*). The circulars have been prepared by Mr. E. P. Stebbing, of the Natural History Department, Indian Museum. They are written in simple language, are clearly illustrated with woodcuts, and are so cheap as to be within the reach of all. They should be of widespread benefit to agriculturists of every class, and it is hoped that they will help to popularise the study of economic entomology. The undertaking is cordially to be commended, and the issue of the leaflets ought to be made widely known.

## Canada and the United States.

"It has been said, with some suspicion of truth, that the chief difference between Canada and the

United States is that you can't get a decent cup of coffee on this side of the line, nor decent tea on the other," says the *Canadian Grocer*. "What is the cause of this state of affairs? Anyone who has travelled at all knows the wretched concoction that passes for coffee at most Canadian hotels and lunch counters, while at even the most unpretentious house of entertainment across the line one is reasonably sure of a good cup of coffee. Coffee is very much like the little girl with the curl right down her forehead, 'When it is good it is very good, and when it is bad it is horrid.' Very little coffee, comparatively speaking, is used in Canada. Whether our bad coffee is due to the small amount we use, or use so little because it is so bad, is a conundrum. The answer very probably lies in the coffee pot. Very few people know how to manipulate it, and the best coffee is often made to yield indifferent results."

## Ceylon Produce.

In their report on trade for the first half of the current year the Committee of the Ceylon Chamber of Commerce say:—COCOA.—The market opened firm at the beginning of the year and has kept fairly level with an occasional slight rise and fall, and may be said to have compared favourably with the London market. Export again shew a considerable increase compared with the corresponding period last year, as the following figures show:—

1903	...	...	...	34,546	cwts.
1902	...	...	...	26,090	"

CARDAMOMS.—This product shews a steady fall in prices from the commencement of the year, due to the continued over-production and decided falling-off in quality, and in view of the increased acreage being opened up, the staple can hardly be considered to be in a healthy state.

## Exports are—

1903	...	...	...	431,974	lbs.
1902	...	...	...	314,188	"

## Vanilla in the Society Islands.

Except in a few instances, where great care has been exercised in the selection of the vine before planting, in its subsequent cultivation and in the preparation of its bean, vanilla is no longer a lucrative production in Tahiti, owing to the inefficient and unskilled manner in which the bean has oftentimes been cured and prepared for shipment, to large stocks on hand at Bordeaux, San Francisco and other places, and to indifferent quality compared with that from Mexico, Bourbon, Seychelles, Fiji, etc. In 1893 the price of Tahiti vanilla averaged 2s. 7½d. per lb., and its export was practically insignificant. In 1896 its market value had increased to prices ranging between 4s. 6½d. and 9s. 1d. per lb., and advanced in January, 1897, to 16s. 4d. per lb., dropping in April of that year to 7s. 3d. per lb. From that date its price has gradually declined until, during the year 1902, it realised but an average of 2s. 11d. per lb. The following table may be of use to those interested in the matter:—

Export of Vanilla from Tahiti during the years 1893 and 1897 to 1902.

Year.	Quantity.	Value.	Average price
	lbs.	£	per lb.
1893	29,858	3,938	2 7½
1897	75,740	35,862	9 5½
1898	92,137	20,468	4 5½
1899	130,113	33,701	5 2
1900	162,636	32,132	3 11½
1901	203,737	43,912	4 4
1902	324,340	47,417	2 11

**Cocoa at Bahia.**

The 1902 crop of cocoa was the largest known in Bahia. Heavy rains either destroyed a considerable portion of the new fruit or prevented it from ripening, otherwise even still larger parcels would have reached market. The new plantations in the district of Ilheos, Una and neighbouring districts are coming into bearing and supplied 50 per cent. of the total crop. From April, 1902, to March, 1903, 300,000 bags were shipped to Europe and the United States. The 1901-02 crop only furnished 232,000 bags, so that the season's increase consisted of 68,000 bags (29 per cent.). The quality was certainly below the average, having deteriorated owing to the rains, and claims arose in Europe respecting many of the parcels shipped, nearly all of them being settled in favour of the buyer. Exporters are said to be very dissatisfied at these decisions. Their contention is that as sales are usually made on this side as being on "the average of the season's crop," they are free from liability, once it is proved that the average of the year's crop is of inferior quality. Prices opened at from £2 12s. to £2 16s. per cwt. (cost and freight), but later fell to £2 9s. per cwt., large crops here and in other countries and the poor quality of the cocoa being accountable for the drop in prices. It is presumed that the 1903-04 crop will amount to some 300,000 bags, but no improvement is noticeable in the method of gathering or the preparation of the bean. If planters could only be persuaded that it is their own interest to give more care and attention to these important operations the quality would certainly improve. At present in proportion to the increase in the area of production there is a falling-off in the care shown to the bean, and the same primitive methods continue to be employed when the crop is gathered.

**Adulteration.**

The report of Professor Thorpe, the principal chemist of the British Government Laboratory, upon the work of the laboratory for the year ending March 31, states that the bulk of the coffee sampled is intended for ships' stores, and when so used is entitled to drawback, if pure. The number of samples of coffee submitted has decreased from 1,721 in 1901-02 to 1,328 in 1902-03, the fall being no doubt due to the smaller quantity exported on drawback since the termination of the war. Coffee substitutes other than chicory are not dutiable *per se*, but as a matter of fact frequently consist of dutiable substances, as caramel (burnt sugar), roasted cereals (as wheat and barley), and roasted figs. The extensive use of these substitutes is no doubt prejudicial to the revenue from coffee, but importations are reported to the Inland Revenue with a view to the Excise duty being imposed. Chicory is charged at the same rate of duty as coffee, *viz.*, 2d. per lb. when roasted or ground, but pays only 13s. 3d. per cwt. when kiln-dried. Questions have arisen as to whether the cylinder-dried chicory from the Continent was not liable to the higher rate as *roasted* chicory, but the result of the laboratory tests showed that in the samples submitted there was no essential difference between the kiln-dried and the cylinder-dried chicory, and the latter was accordingly admitted at the lower rate of duty. Comparatively few samples of cocoa or dutiable fruits are sent for test as these have fixed rates of duty, and are readily assessed by the landing officers. Tea is examined by tea inspectors, appointed under the Sale of Food and Drugs Act, 1875, at certain of the principal places of importation, and consignments

suspected to be of doubtful purity are sampled and sent to the Customs Laboratory for further test. During the past year these samples have increased from 998 to 1,521, but the proportion of those rejected as unsuitable for home consumption was almost exactly equal to the average for the last ten years, *viz.*, a little over 11 per cent. One of the most frequent causes of rejection is excess of sand, which often exceeds 10 per cent., and in one instance was as high as 16 per cent. The rejected tea is allowed either to be exported or to be used duty-free in the manufacture of caffeine. More than 90 per cent. of the tea imported comes from India and Ceylon, India sending by far the larger portion; and less than 10 per cent. comes from China and all other countries. The importation of extract of tea (as well as extracts of coffee, chicory, and tobacco) is prohibited, but occasionally samples suspected to be of this nature are submitted for test.

**GENERAL ARTICLES.****COFFEE IN DISTANT LANDS.**

**Reunion.**—This colony is of no great account as a coffee-producer, but has increased its exports. In 1900 it shipped 10 tons; in 1901 the quantity had risen to 69 tons, and in 1902 to 84 tons, all exported to France.

**Philippine Islands.**—Exports of coffee in 1902 were only 110 piculs (7 tons), the crop, owing to the plants having died some years ago in many districts, being now scarcely sufficient to supply the local demand.

**Brazil.**—Coffee movements in Brazil for the first nine months of the year 1901 and 1902 show a decrease in the export of coffee of 326,596 bags valued at £490,917.

The following table gives the coffee values for the last four years:—

Return showing Extreme Prices in Cents per lb. for Coffee Grade No. 7, in New York, during the years 1902—1899.

Month.	1902.		1901.		1900.		1899.	
	From	To	From	To	From	To	From	To
January	9 $\frac{1}{2}$	7	7	7 $\frac{1}{2}$	7 $\frac{1}{8}$	8 $\frac{3}{8}$	6 $\frac{1}{2}$	6 $\frac{3}{4}$
February	5 $\frac{3}{8}$	5 $\frac{5}{8}$	7	7 $\frac{1}{2}$	8 $\frac{3}{8}$	8	6 $\frac{1}{2}$	6 $\frac{3}{4}$
March	5 $\frac{3}{8}$	5 $\frac{3}{8}$	7	7 $\frac{3}{8}$	7 $\frac{1}{2}$	8 $\frac{1}{2}$	6 $\frac{1}{2}$	6 $\frac{1}{4}$
April	5 $\frac{3}{8}$	5 $\frac{1}{2}$	6	7	7	8	6 $\frac{1}{2}$	6 $\frac{1}{4}$

September	5 $\frac{1}{4}$	5 $\frac{5}{8}$	5 $\frac{1}{2}$	5	8 $\frac{1}{8}$	8 $\frac{3}{8}$	5 $\frac{1}{2}$	5 $\frac{3}{8}$
October	5 $\frac{1}{4}$	5 $\frac{5}{8}$	5 $\frac{5}{8}$	7	8 $\frac{1}{8}$	8 $\frac{1}{2}$	5	6 $\frac{1}{8}$
November	5	5 $\frac{5}{8}$	6 $\frac{1}{2}$	7 $\frac{1}{4}$	7 $\frac{1}{8}$	8 $\frac{1}{2}$	6 $\frac{1}{8}$	7
December	5 $\frac{1}{4}$	...	6 $\frac{3}{4}$	7 $\frac{1}{8}$	6 $\frac{1}{4}$	7 $\frac{1}{2}$	6 $\frac{3}{4}$	7
Extremes	5	7	5 $\frac{1}{2}$	7 $\frac{3}{8}$	6 $\frac{3}{4}$	9 $\frac{3}{8}$	5	7

On May 16, 1903, the price was 5 $\frac{1}{2}$ c. The fall in the price of coffee is due to over-production. Coffee represents some 50 to 60 per cent. of the export trade and the amount of capital invested in coffee is very great. The principal revenue of the States of Rio de Janeiro, San Paulo, Minas Geraes, and Espirito Santo is derived from the export tax on coffee, many of the railways exist on coffee freights and sea freights are affected by these exports. Plantations are heavily mortgaged, wages are in arrears, money is scarce, and the effects of this crisis is felt throughout the population.

A new law of the State of San Paulo comes into force on July 1st and imposes a prohibitive export tax on low grades of coffee. In Minas Geraes a project for a similar law is being discussed by the State, and Rio de Janeiro will probably follow the lead of that State. In Rio de Janeiro and Minas Geraes low grades represent

some 40 to 50 per cent. of the coffee produced, and these States cannot afford to kill the industry, whilst San Paulo is in a better position financially. It is hoped that by restricting the export of low grades prices would rise. This would probably be the result for a short time, but the large stocks abroad would, under these conditions, commence to unload and prices again fall. Planters in San Paulo evidently expect to be benefited by this law, for coffee planting still continues in that State; but, in all probability, the uneconomical result of such legislation will become so apparent that the law will eventually become a dead letter.

The coffee crop for 1901-02 was the largest on record, that for 1902-03 (from July 1 to June 30) will probably be a minimum of 12,000,000 bags.

## THE STUDY OF INSECT LIFE IN INDIA.

LECTURE BY MR. E. P. STEBBING.

The following very instructive lecture was read by Mr. E. P. Stebbing to an interested audience in the hall of the Royal Asiatic Society building at Calcutta on September 2:—

I wish to draw your attention this evening to a division of the Animal Kingdom which has been, until within the last few years, much neglected in India. I allude to that portion of it comprising the Insect Life of this great continent. When once taken up its study exerts a peculiar fascination over its devotees, and when I tell you that the larger part of the animal matter existing on the earth is probably locked up in the forms of Insects it will become apparent that their study is likely to prove of some importance to man in addition to the interest that attaches to it.

It is a curious fact that many of the great men of the world have commenced their introduction to Science by a study of this Class of animals and have started on the road to fame through the portals of the Insect World. He who revolutionized scientific thought, but little over half a century ago, I mean Charles Darwin, tells us in the pages of his life that no pursuit was followed by him at Cambridge with so much eagerness or gave him so much pleasure as collecting beetles. He says that at first he was possessed by the mere passion for collecting, for he did not dissect his specimens and rarely compared their external characters, but got them named anyhow. The eminent scientist always considered, however, in after days that this passion for collecting beetles was the beginning upon which his after life's work was built up, and who can say what bearing this taste had upon that master mind. "I am surprised," he says "at the indelible impression many of the beetles which I caught at Cambridge have left on my mind. I can remember the appearance of certain posts, old trees and banks where I made a good capture" a quickening of the powers of observation which renders the study of nature, so desirable an occupation. Darwin draws attention to the fact that, although a man may so to speak graduate through this portal, it being one which certainly sharpens the senses and develops the powers for minute observation it need not necessarily follow that he will remain within the precincts of this particular temple of Science. He mentions that of two of his contemporaries at Cambridge, both keen insect collectors, and his companions on many an eager hunt the one became eventually a distinguished Archaeologist, the other a leading Agriculturist, Chairman of a great Railway and a Member of Parliament. "It seems therefore" he quaintly adds "that a taste for collecting beetles is some indication of future success in life."

**Aspects of Study.**—The study of any form of Animal or Plant life may be considered from several points of view. We have the mere collector whose only wish is to amass a number of specimens without regard to their classification, their distribution—in itself a most fascinating study—or the scientific importance they may have. We next have the collector who collects with a view to getting together a large number of specimens of all the different groups which he names or endeavours to get named. These he keeps in cabinets for his own personal delectation. Or we may have the collector who is concerned with the scientific classification of the Insect World. He will in all probability confine himself to one or two groups as was the case with that distinguished Entomologist, the late Mr. de Niceville who, devoting his life to the

collection and study of the Indian Butterflies (*Lepidoptera*), amassed before his death a perfectly unique and exceedingly valuable collection. This collection, which is without a rival in the world has been secured by the Trustees of the Indian Museum and now forms not the least valuable of the many interesting and valuable collections existing in that Institution. Or we may have the collector who concerns himself with variation, mimicry and protective resemblance and who collects and classifies more with reference to these particular phases of Insect Life than to any accepted system. Next we come to the collector who busies himself with the distribution of Insects. This is a question of great importance and one which we will consider briefly at a later stage. Finally we have the collector who, in addition to wishing to collect Insects wishes also to know something more about them than their mere names or positions in a classificatory system. He wants to find out where they live, how long they take to pass through the various stages of their life—for it will be known to you all that the mature Insect does not develop as such, from the egg but passes through intermediate stages known as the grub or caterpillar stage and, in some cases, a chrysalis or pupal stage. He wishes to know what they feed upon, what relation they bear to one another and finally, and this is perhaps not the least important point in a great agricultural country like India, what is their relation to man? What is their position in the economy of nature? Are they a factor to be taken into account in the world's progress?

**The First Stages.**—These are some of the aspects which the study of Insect Life presents, and which I would briefly consider to-night, and more especially with reference to their bearing upon India. We have then first the mere collector to consider, he who collects without especially wishing to learn anything about what he collects. Probably there are few of us who are not, or at any rate during some period of our lives have not been, possessed by this passion for collecting in some form or another and all such will remember moments during which they have been within an ace of acquiring some coveted treasure which through bad luck they have just missed. Darwin tells a good story against himself on this subject and many a collector must have been placed in dilemmas as tantalizing as that in which the great Naturalist found himself one day. He was out collecting in the Cambridge fens and "tearing off some bark I saw two rare beetles, and seized one in each hand, then I saw a third and new kind, which I could not bear to lose, so that I popped the one that I held in my right hand into my mouth. Alas! it ejected some intensely acrid fluid which burnt my tongue so that I was forced to spit the beetle out—it was lost as was the third one." The intense disgust of the keen collector as such a fiasco can be readily pictured. The mere collection then of specimens may be said to be the first stage in the study of Insect Life and if the collector makes no further use of his specimens he will at least have increased to some extent his powers of observation and reasoning while at the same time he will have spent many pleasant hours with nature and have obtained a knowledge of places and scenes which an inspection of his cabinets in after days will ever recall to his memory. But a day may come when our collector takes something out of the common and that day comes to him very rapidly in India. He then has recourse to books to endeavour to find out what his specimen is, or sends it away to some one who will be able to tell him or, if he has the opportunity, he consults other collections. From the mere collecting enthusiast he is, if he continues to act in this way with all the unknown specimens he takes, now beginning to give help in the scientific world. If he is collecting in India and goes no further than this he will nevertheless be rendering the most valuable assistance to the study of the Insect Life of this great continent, provided he always records the locality, with, if possible, elevation and date of taking, for each of his captures. I would wish to dwell upon this aspect of the study for a brief space. I have often heard men say that they wished they had something to employ their leisure moments on in camp, and to such a camping community as we Europeans in India form the wish comes to many. The lines upon which this desire will take shape depends upon the individual characteristics and temperament of each. Many have a natural bent for Natural History and would gladly devote their time to a branch if they knew how to begin. My brief to-night is one for the study of Insect Life and to all who wish to turn profitless wearisome hours in camp into agreeable interesting ones—ones fraught with bright memories and recollections which the study of the cabinets in after days will ever conjure up—to such I would recommend the study

of that class of the Animal Kingdom whose body structure exhibits a perfection that, from a mechanical point of view, is unsurpassed, while the external beauty of some of its members makes them fit associates of the most delicate flowers and no mean rivals of the most gorgeous of the feathered world. While thus profitably employing his time he will have the satisfaction of knowing that he is enriching his own knowledge of Nature and her handiwork and at the same time his labours will also be adding valuable additions to the collections of the Great Museums of the World. To all whose leisure or inclination will not permit them to go further I would say that this help alone will be of the greatest value.

**The Third Stage.**—We have now reached the third stage—that of the collector who has the inclination and leisure to go further and takes up the study of the subject with the object of learning how to correctly name and classify his specimens. To enable him to do this he will first secure some elementary work on Entomology and make himself acquainted with the technical terms of the science. And at this point we may pause to consider how the Insect World is broadly classified. Probably most of us have heard the old question asked. When is the difference between a butterfly and a moth! or, more subtle conundrum, between a beetle and a bug! Roughly speaking the nature of the wings and mouth parts present will enable us to classify insects into their main divisions or Orders, as they are called. Thus in the Order Orthoptera to which belong the cockroach and the earwig, the praying mantis and the stick insect, the locust, grasshopper and cricket, the insects are provided with a biting mouth and four wings, the upper ones of which are straight and horny while the lower ones are membraneous and fold up like a fan. A beautiful example of this orthopterous under wing is to be found in the earwig of which I will later show you a slide. The cockroaches, or I should say the commoner ones, are known to all and here in Calcutta one of the family by name *Periplaneta americana* chums uninvited with most of us. Perhaps it would interest many housewives to know of a recipe which has often been found most effective for reducing the numbers of this undesirable intruder. Prepare a mixture of equal parts of finely-powdered chocolate and borax and dust it into the crevices where the insects hide. The mixture must be well made in order that with each particle of chocolate, of which the cockroaches are very fond, they will get a particle of borax which is poisonous to them. The mixture is cheap and non-poisonous to man. The best known, as they are the most dangerous insects economically in the group are the locusts and grasshoppers. These appear to have been plagues to man from the very earliest times and reference to their operations are to be found both in the classics and in the Bible. What made some of the species such a scourge is their habit, only put in force at varying intervals of time, of extensive migrations. When on those incursions they invade large tracts of country and clean off everything green in their path, leaving ruin in their wake. In the case of our Indian migratory locust, the dreaded so-called N.-W. locust, *Acridium peregrinum*, the first swarms to leave their own country advance a certain distance and then lay eggs. These eggs give rise to fresh swarms which, on maturing and acquiring their wings, carry on the invasion into fresh tracts and so the process goes on till the whole of this great continent is completely invaded by an insect whose real home is up in the sandy deserts of Rajputana and the North-West frontier. The last successful invasion of this insect may be remembered by many of you. It commenced in 1889 and was not finally over until 1893. In 1901 the pest spread as far south as Ganjam in the north of Madras and east to the Brahmaputra, but the enormous masses of eggs which must have been laid by the numerous swarms of that year have not as yet developed. A very curious point of this migratory instinct that is, when the period is over the existing swarms return to the northern homes although they themselves were hatched far south and neither the nor, in all probability, several generations before them have ever seen their headquarters.

**The Neuroptera.**—The next Order in the class is the Neuroptera of which the common so-called "white-ant" or termite and dragon flies, whose grub stage is passed in water, are the best known representatives. These are insects furnished with biting mouths and four membraneous net-veined wings of equal size, the lower ones of which are not folded up. The white ants are known to all dwellers in tropical countries and are often the cause of serious vexation and loss. They are interesting from their habit of living

in communities which are run on lines not unlike those which civilized man follows. Thus they have their citizen workers, who build the nest and look after the young, their soldiers to guard the nest and mete out justice to intruders. There are also the leisured classes consisting of the winged males and females. These are the forms which are to be seen at the beginning of the rains leaving the nest in large swarms on their honey-moon trip, one fraught with considerable peril as the numbers of kites, crows, mainas et hoc genus omne, who collect to the welcome feast indicate.

The third Order is that of the Hymenoptera or the wood wasps, saw-flies, ichneumon-flies, bees, ants, and wasps. These may be distinguished by having 4 membraneous wings the upper of which are larger than the lower. The upper and lower wing on a side are usually joined together by a hook attachment. The mouth parts may be adapted for both biting and sucking. This Order of insects also contains species which live in communities having a system of organisation similar to, if it does not outvie, that of man. Lord Avebury, better known as Sir John Lubbock, who has made such close and important researches into the internal economy of the ants, considers them to be the highest developed forms of insect life. The marvellous ingenuity with which the bee constructs its waxen comb and stores it with provender for its young is doubtless known to you all. Equally ingenious are those interesting wasps, *Polistes*, who build their inverted cone-shaped paper-walled nests on our verandah ceilings. Another form of wasp constructs the small mud cells we find on our venetians and walls. If we open one of these mud cells we shall find a living green caterpillar inside. This grub, after having been paralysed by the wasp, has had an egg laid in it. From this egg will hatch out a young wasp grub, which thus finds a fresh store of meat ready for its sustenance long after its mother is dead and gone. The instinct which thus enables insects to provide for offspring which they will never see is not one of the least marvellous things in Nature.

**Beetles.**—The next Order on our list is that of the Coleoptera or beetles. You all know what a beetle is like, the hard horny upper wings fitting close together so as to completely cover the folded up lower membraneous ones beneath. The mouth parts are for biting. Look where you will you will find beetles. Their food is very varied and every vegetable and animal product is attacked and eaten by some member or members of the order. There are two beetles in Calcutta the result of whose work is known to many of us. The one is the bamboo-borer (*Dinoderus pili-rons*), which bores into bamboo furniture and lays its eggs inside. The grubs hatching out from these eggs live in and feed on the bamboo reducing it to powder. Another pest is known to all smokers, the so-called cheroot-weevil (*Lasioderma testaceum*). It is not a weevil but a Ptinid beetle and closely related to the bamboo borer. It lays its eggs in cheroots and the grubs bore inside and riddle the cigars.

**Butterflies.**—The fifth Order is the well-known one of the Lepidoptera or butterflies and moths, insects furnished with four wings covered with coloured scales and a suctional mouth in the form of a long tube with which they suck up honey and at times other much less delectable substances. Except when in use this tube is kept coiled up under the head. One of the distinguishing features between the butterfly and moth is to be found in the difference in the structure of the antennæ or feelers on the head. In the butterfly these are simple and end in a knob while in the moth they may often be feathered and rarely end in a knob. Probably some of Nature's most beautiful objects are to be found among the gaudy butterflies and it is for this reason perhaps that they are so much collected. So great in fact is the attraction which their charms exercise that cases are extant when even the fairer portion of our community have been known to have become so captivated and fascinated by these lovely creatures that they have been led thereby to desert these higher walks of life, which are devoted to considerations of dress and other social amenities, to pursue with enthusiasm the bye-paths of the naturalist and bug-hunter! Beautiful, however, as is this order of insects from an æsthetic point of view it has, like most things beautiful, its darker side. For, whilst some of the most glorious among the butterflies sip with evident relish the filth in slimy pools or hover lingeringly over putrifying substances, the grub stage to many is one of gross gluttony and pilfering in the succulent domains of the botanist, and the agriculturist. It thus becomes difficult in many cases

to remain convinced that their proverbial beauty is really worth the sacrifices it has cost to produce it. The next Order is that of the Diptera or flies, insects furnished with two wings only and a sucking padlike mouth. The common house fly is known to all. It is ubiquitous and when I tell you that the progeny of one female fly would, if they all survived to reproduce their species number at the end of the year 200,000,000 individuals you will understand the reason for their excessive numbers. Another well-known family of this Order are the Mosquitoes. It has lately become quite unnecessary for any Entomologist to discourse on these insects. In fact very often he finds himself in a minority of one when the subject is discussed and a girl in her teens will tell him all about *Anopheles* and *Culex*. A near relation of the Diptera is the flea B, of worldwide fame and distribution, a polar variety of which has recently been valued at £1,600.

Our last Order is known as the Rhynchota or bugs, blights and scale insects. This group is easy to distinguish since all its members are furnished with a mouth in the form of a straight, short and hard beak or sucking tube. With this apparatus the insects pierce the tissues of plants or animals and suck up the sap or blood. I shall have a few words to say about these insects later on.

Having thus touched upon the general classification of the Insect World it will be unnecessary here to follow our collector further into the more minute stages of this subject.

**Mimicry.**—But there are other bye-paths for him for whom minute classification possesses no charms. His attention during his numerous collecting operations may have been attracted to the curious likenesses which one insect possesses to another belonging to quite a different family or even order. His attention once riveted upon this feature of insect life he will soon find that it opens out a wide field of research into the subject of mimicry and protective resemblance, instances of which are numerous amongst insects, for reason both protective and aggressive. We have remarkable cases of these curious forms of mimicry and protective resemblance among the stick and leaf insects (*Phasmidae*). These insects are unprovided with weapons of defence or offence and in order both to ensure some degree of protection and also with the object of obtaining their food they have come to simulate twigs or grass stems, leaves, flowers, etc., the resemblance being often so perfect as to render their detection difficult even to the trained eye of the Entomologist on the look out for such vagaries. One of the best known of these insects is one of the leaf-insects of Eastern Bengal known as *Phyllium scythe*. Natives down Chittagong may have themselves assured me that this insect started life as a leaf which subsequently took to walking. Another interesting insect from the same locality (*Gongylus gonglyoides*) simulates the corolla of a papilionaceous flower so closely that insects fly up to and settle upon it when they are promptly seized and devoured. Among the butterflies mimicry for protective purposes is common. A well-known instance of protective resemblance is that of the butterfly *Kallima* in which the under surface of the wings are marked and veined to closely imitate dead leaves. The upper wings are brightly coloured and so this insect invariably settles with wings closed and is then extremely difficult to see. A few examples of these mimetic groups will be shown upon the screen.

There is yet another bye-path into which the feet of the collector may stray and that is the one which concerns itself with the distribution of insects. I regret that considerations of time will prevent me from telling you this evening anything about this branch which is one, not only of exceeding interest but at the same time of the greatest importance. For research in this field may not only lead the worker to great discoveries in his own domain, but these discoveries may have a direct bearing upon branches other than his own and the Botanist and Geologist may both derive benefit from such researches. We have now reached the last point for consideration that of the collector who wishes to learn something about the life histories of the particular insects he is acquainted with.

**Economic Entomology.**—This side of the study of Insect Life has come to be known by the name of Economic Entomology. Briefly it deals with the study of the life histories of insects with the object of finding out what portions of their lives are passed respectively in the egg, grub, chrysalis (if there is one), and adult stages of their existence. This subject is rendered a difficult one owing to the fact that, whereas some insects pass through their life cycle of egg, grub, chrysalis and adult in a year, others may take several

years to pass through this cycle, while others again, and more especially is the case in tropical countries, may run through several of these cycles in a year. Is this latter case the adults of one cycle may differ from those of a succeeding one. It will soon be discovered also that a considerable proportion of insect life is predacious and preys upon its fellows, either directly, or indirectly as parasites.

Among perhaps the most useful of the insects of this kind known to man are the little lady-bird beetles. These prey to a large extent upon the blights (*Aphidæ*) and scales (*Coccidæ*) and thus are of almost incalculable service. The aphids and coccids are, owing to their enormously rapid multiplying powers, among the worst pests on the face of the earth. Their food is chiefly confined to the vegetable kingdom and it is not too much to say that man exists upon the globe solely owing to the presence of the predacious and parasitic foes which keep in check these blights and scales. Were there checks to be removed it has been calculated that in the course of two or three years the blights would leave no plant nutriment available for other animals save that which they might derive from plants they did not attack. In other words Man himself would become as extinct as the Mammoth and the Dodo and other Palæontological relics. Startling though this statement may appear it will, I think, be better understood when I tell you that Huxley calculated that the progeny of a single aphid (blight) would in the course of ten generations, supposing all the individuals to survive, contain more ponderable substance than 500 millions of stout men, that is, more than the population of China. With these facts before us it can be readily understood that man owes a great deal to his insect friends and that the parts they and his insect foes play in the economy of the world is one of no mean kind. Various poisonous solutions, emulsions, etc., have been invented for combating insect pests, but it is unnecessary to consider them here. It is interesting, however, to note that, after all, the modern attempts at checking these attacks of insect pests are no new idea. History contains many references to destruction wrought by insects and some most interesting accounts of the means taken by our forefathers to check their depredations. There are two records by Plisy, about A.D. 77, one of which suggested the use of white hellebore for the destruction of flies, "the poison being put into milk, so that all the flies eating of it die." The other relates to the destruction of locusts, which in those early days was carried out with great success, the law making it a penal offence not to turn out and give aid in exterminating the swarms when they settled. Biblical references to insect plagues are, of course, numerous and I have on my travels often thought the lamentations of Joel were at times curiously applicable to India:—"That which the palmer worm hath left hath the locust eaten; and that which the canker worm hath left hath the caterpillar eaten. . . . The field is wasted, the land mourneth . . . howl, O ye windressers, for the wheat and for the barley, because the harvest of the field is perished."

## U. S. IMPORTS AND EXPORTS.

The preliminary commercial statement of the Bureau of Statistics of the Commerce Department (O. P. Austin, Chief) for the closing month of the fiscal year 1903, contains statistics showing the commerce of the country for the entire twelve months, and also furnishes opportunities for a comparison with the import and export movement during the preceding fiscal year.

### TEA.

Following is a table showing the imports of tea into this country for two years, also the average value of the article per pound in the places of exportation:—

	1903.	1902.
	Lbs.	Lbs.
Imports ...	108,574,905	75,579,125
Exports ...	3,942,645	1,205,084
Net imports ...	104,632,260	74,374,041
Average value, per lb. ...	14'42c.	12'42c.

In 1901 the net imports of tea were 88,502,554 lbs., of an average value of 12'18c. per lb.; in 1900 they were 83,303,622 lbs., of an average value of 12'45c. per lbs. The *per capita* consumption of tea averages 1½ lbs.

The principal countries supplying us with tea last year ranked as follows: China, 55,064,296 lbs.; Japan, 37,987,227 lbs.; East Indies, 6,714,224 lbs.; United Kingdom, 6,151,822 lbs.; British North America, 2,135,065 lbs.

Compared with the preceding year the imports of tea from Japan in 1903 increased over 7,000,000 lbs., and the 1902 imports from Japan decreased 3,000,000 lbs. compared with 1901. There was an increase in the imports from China of over 19,000,000 lbs. in 1903, compared with 1902. East Indian and British imports increased considerably in 1903.

#### CHICORY.

Prepared chicory to the amount of 442,311 lbs., of the average value of 3·95c. per lb., was imported last year, as compared with 298,671 lbs., of the average value of 3·50c., in the fiscal year 1902.

Raw chicory root was imported in the following quantities during the fiscal year:—

	1903. Lbs.	1902. Lbs.
Net imports ...	1,411,202	238,272
Average value, per lb. ...	1·98c.	1·92c.

In 1901 the imports of raw chicory were 511,693 lbs., of the average value of 1·92c. per lb.

#### COFFEE.

The net imports of coffee in the fiscal year 1902 were the largest ever recorded between July and July in the history of the coffee trade. In 1903 the coffee imports continued liberal, but fell behind the total for the preceding year.

The following table shows the gross imports and the exports for the two latest fiscal years, also the average value per pound at places of shipment:—

	1903. Lbs.	1902. Lbs.
Imports ...	915,066,380	1,091,004,252
Exports ...	47,701,306	34,462,615
Net imports ...	867,365,074	1,056,541,637
Average value, per lb. ...	6·47c.	6·41c.

In 1901 the net imports of coffee were 809,871,310 lbs., of an average value of 7·35c.; in 1900, 749,792,471 lbs., of an average value of 6·66c.

The principal sources of our supply of coffee in the fiscal year 1903 were as follows: Brazil, 726,095,474 lbs.; Central America, 56,249,399 lbs.; South America, exclusive of Brazil, 72,526,000 lbs.; Mexico, 22,207,000 lbs.; West Indies, 8,129,316 lbs.; East Indies, 16,713,000 lbs.; United Kingdom, 2,722,170 lbs.; Netherlands, 1,148,331 lbs.

The *per capita* consumption of coffee is about 13 lbs. The tremendous predominance of the Brazilian imports should not be taken by our readers as signifying that three-fourths of our supply of coffee comprise inferior grades. The truth is that the finer grades of Rio and Santos are often graded and sold under other names, their quality being all that buyers could ask, and there is really no deception practiced.

#### COCOA.

The United States imported the following quantity of crude cocoa during the fiscal year:—

	1903. Lbs.	1902. Lbs.
Imports ...	63,351,294	51,379,396
Exports ...	3,208,554	2,593,708
Net imports ...	60,142,740	48,785,688
Average value, per lb. ...	12·34c.	12·95c.

In 1901 the net imports of crude cocoa were 43,876,628 lbs., of an average value of 14·08c. per lb. In 1900 the net imports of crude cocoa were 38,619,187 lbs., of an average value of 13·55c. The rapid increase of the importations speaks well for the healthy state of the consumptive demand for chocolate, breakfast cocoa and chocolate confectionery.

Prepared cocoa to the following amount was imported:

	1903. Lbs.	1902. Lbs.
Imports ...	1,004,766	973,970
Exports ...	2,433	200
Net imports ...	1,001,333	973,770
Average value, per lb. ...	29·11c.	30·40c.

Net imports of prepared cocoa in 1901 were 975,585 lbs., of an average value of 29·56c.

Importations of prepared chocolate, exclusive of confectionery, were—

	1903. Lbs.	1902. Lbs.
Imports ...	690,824	525,221
Exports ...	3,146	3,887
Net imports ...	687,678	521,334
Average value, per lb. ...	20·96c.	19·33c.

The net imports of chocolate in 1901 were 695,225 lbs., of an average value of 19·73c.

#### COMPARATIVE PRICES.

In the following table we give the yearly average value of certain groceries during the past five years:—

	1899. P lb	1900. P lb	1901. P lb	1902. P lb	1903. P lb
Coffee ...	6·64	6·66	7·35	6·41	6·47
Tea ...	13·05	12·45	12·18	12·42	14·42
Raw sugar ...	2·38	2·48	2·26	1·46	1·70
Rice ...	2·06	2·03	2·13	2·13	2·21
Cocoa ...	14·26	13·55	14·08	12·95	12·34
Chicory ...	1·47	1·46	1·92	1·92	1·98
Pepper ...	8·78	9·80	11·23	10·81	10·51
Nutmegs ...	24·10	22·08	19·65	18·45	18·71

In 1902 the following articles: Pepper, coffee, cocoa, sugar, and nutmegs averaged lower in value than in 1901, tea alone showing an advance, while rice and chicory were unchanged.

#### PEPPER.

Mr. R. E. Doolittle, State Analyst, Michigan Dairy and Food Department, reports:—

Pepper is the fruit of the *Piper nigrum* L., a perennial climbing shrub native to the forests of western and southern India but long cultivated in Sumatra, Java, Borneo, Ceylon, Malay Peninsula, Siam and various other tropical countries. The fruit is a small, round berry which grows in loosely packed clusters, each cluster consisting of from twenty to thirty of these berries closely attached to a common pendulous fruit stalk. Pieces of this fruit stalk may often be found in samples of whole black pepper, and when examined will show the depression formed where the berries were attached. The pepper vine grows to a height of eight to twelve feet and is usually supported by poles or by trees planted for that purpose.

Black pepper is the dried immature berries of the *Piper nigrum* L. To obtain black pepper, the berries are gathered as soon as one or two on the cluster commences to turn red. After removing them from the stem they are dried in the sun or near a mild fire. By this treatment the outer fleshy portion of the berry shrivels, turns to a brown or black colour and becomes quite hard and brittle and adherent to the stony, inner portion, thus forming a hardened wrinkled cortex. The manner of drying the pepper berry is of considerable importance. We are informed that many varieties of black pepper are dried on the ground. "A piece of ground is carefully smoothed and pounded and made as hard as possible, and the berries are piled up on this piece of ground to dry. When the goods are dry they are taken up and bagged. In the process of taking up from the ground, there is a little earth taken up with the berries; some of the berries also become coated with earth from the mere fact of lying on the ground." This may be observed by an examination of sample of whole sun-dried black pepper; it has also been said that a good deal of the sand and clay found in some peppers is due to the creeping habit of the vine which brings the penetrated clusters in close proximity to the ground. From what information we have been able to obtain, however, it seems that the lumps of dirt and the greater part of the earth on the berries themselves comes not from the trailing habit of the vines, but from the fact that the goods themselves are dried on the ground. No pepper should, however, contain an excessive amount of dirt.

The commercial varieties of black pepper are Singapore, Tellicherry, Alleppey, Trang, Acheen, etc., named probably from the province in which they are grown or port from which shipped. We also obtained in this investigation two other varieties of black

pepper prepared by some process that improves their appearance. They are known as Shot Pepper and Mangalore Pepper.

Shot Black Pepper, it is said, is sometimes prepared by floating in water, that going to the bottom forming the shot pepper, while the lighter portions are skimmed from the surface. This process has, however, proved to be injurious to the berry, and the pepper is now generally separated in a column of air. It is oiled to give it a better appearance.

Mangalore Pepper.—The corns of this variety are very large, twice the size of ordinary pepper, of a deep, black color, very clean and of uniform size. When ground they give a powder of characteristic greenish-black appearance.

Singapore Pepper is grown in the Malay Peninsula, principally in the southern extremity known as State of Johore. It constitutes a considerable portion of all the pepper raised, and by reason of its dark color and fairly uniform quality, is a good looking pepper, for which it is esteemed, but for grinding purposes it has not been heretofore so highly regarded because of its smoky odor. Singapore pepper is dried over smoke. The pepper plantations and gambier plantations of Johore are usually under one management, and in boiling down the gambier to make the vegetable extract there is suspended over the kettle mats on which are placed quantities of the Singapore pepper. The smoke from the furnace dries, and at the same time blackens and gives the unmistakable smoky smell which is characteristic of Singapore pepper. This smoky odor is retained to a considerable degree even after the pepper is ground. It is one of the tests by which the pepper merchant determines whether a given sample is Singapore or not.

Tellicherry and Alleppey peppers are from British India. They are very similar in appearance, being of light brown colour. They are sun-dried. Malabar pepper also comes from India.

Trang Pepper is shipped from Penang, and is grown in either Java or Sumatra.

Lamong Pepper is grown on the east end of the island of Sumatra near the Straits of Sunda. The pepper corns are less uniform in size than the varieties above described, also of a lighter color and surface shows considerable dirt. It is also sun-dried.

Acheen, Sumatra or West Coast are names applied to the pepper obtained from Acheen, the pattern extremity of the island of Sumatra. "The designation 'East' and 'West' coast, which were formerly used, have been lost track of, and the pepper is now designated according to its specific gravity, as 'A,' 'B,' 'C,' or 'D' grade."

"A" grade weighs at least 4 lbs. 13 oz. to the imperial gallon (481 grams per liter).

"B" grade weighs at least 4 lbs. 5 oz. to the imperial gallon (431 grams per liter).

"C" grade weighs at least 3 lbs. 13 oz. to the imperial gallon (381 grams per liter).

"D" grade weighs at least 3 lbs. 5 oz. to the imperial gallon (356 grams per liter).

There probably has not been any of the "A" grade of Acheen black pepper in this country for several years, for the reason that it is this grade of pepper that is preferred by the manufacturers of Penang white pepper, and being used up this way does not reach our markets except as white pepper.

The samples of Acheen pepper obtained by us in this investigation are of much poorer quality than any of the other varieties. They contain many "shelly" and broken berries, pieces of stems, dirt, etc.

White pepper is the berries of the *Piper nigrum* L., from which the outer shell or pericarp has been removed to a greater or less extent. The manufacture of white pepper is a separate and distinct business of itself. It is not always done at the plantations, but may be done at a distance from them by manufacturers who buy the pepper in open market, merely selecting a lot which they

## Dyspeptics,

nervous, debilitated, weak, languid, half-dead people will find fresh life, energy and strength in Mother Seigel's Syrup, because it does the only thing which can give permanent relief—helps you to digest your food. Food is a strength-maker and health-maker, but it must be digested. Discomfort after meals, pains in the chest and shoulders, headaches, palpitation, flatulence, loss of appetite, these are sure signs of indigestion and are cured by

**SEIGEL'S  
SYRUP**

"For many years I suffered greatly from obstinate indigestion and constipation, accompanied with giddiness and pains in the head. A friend strongly advised me to try Seigel's Syrup, and perseverance in its use restored me to health and strength." So says Mr. T. J. Hastings, of Bombowlie, Tumut, N.S.W., in a solemn Declaration recently made before a Justice of Peace. Such testimony leaves no room for doubt.

**will cure you.**

deem suitable for the purpose. It is generally understood that berries that have been allowed to ripen before picking are used for making white pepper, as they are more easily decorticated, but not all white pepper is made from fully ripened berries. The shells are removed by friction after soaking the berries in water. The white peppercorns are often bleached and otherwise treated to improve their appearance.

There are several varieties of white pepper on the markets corresponding in a general way with the black peppers. Thus we have Singapore, Penang, Tellicherry, Siam, etc. All the samples of Penang white pepper analyzed during this investigation were coated with a brown-coloured preparation of carbonate of lime as was also a sample of Java white pepper.

Decorticated white pepper is the term applied to a variety which, for the most part, has the seed coats entirely removed, thus forming smooth, hard kernels. There are various qualities of decorticated white pepper, depending upon the extent to which the decortication or pearling process has been carried. Thus we may have decorticated pepper from which all three of the seed coats are removed, or only one or two of them. Other varieties of white pepper have only the first or dark shell part removed.

Coriander white pepper is made in imitation of coriander by cutting off from the end of each corn a piece of the outer hull so that the dark coloured inner portion shows.

Ground pepper should be nothing but the peppercorns of either the black or white pepper reduced to a proper fineness by passing through a suitable spice mill and over sieves.

The Adulteration of Pepper.—As pepper usually reaches the consumer in the ground form, the addition of adulterants is not easily detected. Various materials have been used to adulterate ground pepper, those most commonly used being pepper shells, middlings and other by-products of wheat, corn and rice; ground olive pits; cocoanut shells, and almond shells, mustard husks, long pepper, cayenne, etc. These are usually sold by spice grinders under the name of "P. D. Pepper," "Pepper Adulterant" and "Pepper Mixture," and consist of such products as the grinder has at hand or can obtain at the lowest price, the mixer requiring only that the colour shall be such as is suitable for his trade. These

adulterants are usually mixtures of some dark-coloured material (probably roasted cocoanut or other shells) with some light-coloured starchy matter. Cayenne is used to give a pungency to the mixture.

Long Pepper is, for the most part, derived from wild plants of the genus *Chavica* Miq., formerly included under the genus *Piper* L. It consists of long cylindrical spikes, covered with closely packed, small, round berries. It is picked when green, and as found on the market is composed of the small berries with the husks and all hardened together and to the woody stem. It always carries with it large amounts of dirt and other extraneous matter. It does not possess the fine flavour of true pepper, and its addition to the same is regarded as an adulteration.

Pepper shells is the term applied to the shells, dirt, etc., obtained as a by-product in the manufacture of white pepper.

## DISTRICT ASSOCIATIONS.

### INDIAN TEA ASSOCIATION.

The following are the proceedings of a Meeting of the General Committee held on the 1st instant, when there were present: Mr. H. C. Begg (*Chairman*); Messrs. T. McMorran (*Vice-Chairman*); Lockhart Smith, R. R. Toynbee, T. Traill, and W. Warrington.

Letters dated 7th and 14th August from the Secretary, Indian Tea Association, London, having been previously circulated, were brought up for final disposal. The principal subject dealt with was—

#### THE LOUISIANA PURCHASE EXPOSITION.

In their letter of 14th August, the London Committee approved of the proposal of the General Committee to utilise the balance at credit of the American and Foreign Markets Fund for the purposes of the proposed exhibit at St. Louis. At the same time, the London Committee drew special attention to the importance of

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

## CURES

RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,

And all Aches and Pains usually treated by outward application.

IT HAS NO EQUAL ON EARTH AS A PAIN RELIEVER.

It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

continuing the advertisement of Indian teas in America, and requested that the Tea Cess Committee should be asked to reserve a sum of £2,000 from the Cess Funds as a separate allocation from the money to be spent at St. Louis in connection with the Exhibition. The London Committee again referred to the advisability of India and Ceylon uniting in the matter of their respective exhibits. In regard to the latter proposal the General Committee had addressed the Thirty Committee of Ceylon, and were awaiting their reply. Pending receipt of this no definite action was being taken in regard to general arrangements. The Secretary was instructed to communicate with the Tea Cess Committee regarding the request of the London Committee for the allocation of funds for advertising in America.

SUPPLIES TO THE LONDON MARKET.

On the 28th August a telegram was received from the London Committee, stating that at an important Meeting of producers it had been unanimously resolved to regulate supplies. The co-operation of producers on this side was requested in the direction of not unduly hastening tea forward. The details of the scheme, it appeared, had not been finally settled, but it was expected that everything would be arranged by the 10th September when the details would be telegraphed. The General Committee noted the proposal pending receipt of the details promised.

MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated August 21st, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1903-1904 ...	186,904	271,363	23,487
1902-1903 ...	213,782	311,094	21,038
26,360 pkgs. INDIAN	Total 54,686 packages were offered in public auction this week.		
24,758 „ CEYLON			
3,568 „ JAVA			

Duty payments for Home consumption continue to show an increase over those of last year. Producers should carefully watch the increase, and bear in mind that the duty payments on Indian Tea for the first two months of the season, viz., June and July, were 4 millions in excess of those of last year. It is scarcely likely that such a rapid rate of increase will continue, but the fact should give sellers confidence, as in the event of there being a little more Indian Tea to deal with this season, it is likely to be all required sooner or later.

The following table shows that the exports of tea from India to places otherwise than the United Kingdom are increasing in a steady and fairly satisfactory manner.

Direct Exports of Tea from India (in lbs.) to places outside U. K. for half-year ending 30th June.

	1903.	1902.	1901.	1900.
Australasia ...	1,325,636	869,631	1,595,073	1,105,635
Indian Ports ...	1,553,304	1,317,290	1,695,968	687,441
North America ...	773,215	646,075	749,831	570,588
Turkey ...	482,378	538,075	911,177	459,743
China ...	301,142	246,426	230,009	166,096
Germany ...	141,013	209,877	193,023	203,693
Persia and Arabia ...	233,545	142,121	231,009	78,756
Russia ..	907,483	533,172	83,096	Nil
Egypt ...	28,145	57,437	7,820	25,657
Straits Settlements ...	28,584	23,194	18,638	13,376
Africa ...	59,433	49,537	29,117	21,785
France ...	9,394	7,144	6,236	7,309
Norway ...	Nil.	Nil.	250	Nil.
South America ...	200	1,200	300	Nil.
Austria ...	1,083	1,023	17,016	425
Other Places ...	40,707	5,624	6,054	3,696
Total Lbs. ...	5,885,262	4,647,826	5,774,617	3,344,200

INDIAN.—Supplies have again been moderate and not in excess of requirements, and there has been a continuance of the good general competition noticed last week. Some of the Assam Teas are showing promise of good quality to come in the near future. On the other hand, some third invoices of Dooars Teas are showing a light set-back as regards flavour and quality.

The official wire gives exports from Calcutta and Chittagong to U. K. for the first half of August as 12,830,000 lbs., against 9,690,000 lbs. same period last year; making the total from 1st April to 15th August 43,422,000 lbs., against 39,590,000 lbs. in 1902.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 20,820 pkgs., av. 8.18d. 1902, 25,842 pkgs., av. 7.25d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 74,277 pkgs., av. 7.80d. 1902, 95,321 pkgs., av. 6.96d.

CEYLON.—Judging from the samples representing this week's offerings, it would appear that the bulk of the teas made in the less satisfactory weather prevailing in the island some two or three months back have now passed through the market; the Trade are therefore anticipating improved quality, especially from the Districts situated at a high altitude. Samples to hand by mail showing most recent manufacture help to confirm this opinion.

The teas met with good demand and prices ruled steady; where invoices showed an improvement, a corresponding advance in price was made.

A private telegram from Colombo gives shipments to U. K. for first half of the month as 4,000,000 lbs., against 3,500,000 lbs. in same period of 1902.

Average for week 7.11d., against 6.53d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 657,169 pkgs., av. 7.50d. 1902, 743,904 pkgs., av. 6.70d.

Agents for LEA & PERRINS'

CELEBRATED OILMAN'S STORES.

JAVA.—Javas sold with a steady demand. 22,371 packages sold on Garden Account from 1st June to date realised an average of 6·61d. per lb.

Bank Rate 3 per cent. Exchange on London three months' sight:—  
Calcutta  $1\frac{1}{4}\frac{5}{32}$ . Colombo  $1\frac{1}{4}\frac{3}{16}$ .

### COFFEE.

Messrs. C. J. Leech & Co., in their weekly report on the coffee market, state that Rio receipts show a moderate, but natural, increase, but those at Santos are distinctly smaller than the previous week, although an increase was expected from the 1st instant in consequence of reduced railway freights on the Paulista Line. Although it is altogether too early to attempt to estimate this season's Santos crop, the absence of any increase in the movement to the port during the past fortnight is certainly remarkable, and gives rise to the reflection that after all there may be more foundation for the talk of a crop of not more than seven million bags in Santos than coffee operators, after the deceptions of previous years can at present bring themselves to believe. Mr. Karl Krische estimates the receipts for current month at Rio 550,000 bags, and Santos 1,250,000 bags, but according to last week's movement his estimate for Santos looks improbable.

### CINCHONA.

The auction to be held at Amsterdam on September 3 was to consist of 10,410 bales and 489 cases, weighing altogether 950,856 kilos. The stock in first hands in Amsterdam on August 13 consisted of

2,988 packages Government and 12,798 packages private bark, including the quantity to be offered at the above auction.

### CINCHONA BARK.

Offered 11 packages. Sold 0. *Maracaibo* (2 bales): For these a bid of 3d. per lb. was made and refused. *Calisaya*: Broken quill (9 bales) bought in at 5½d. per lb., a bid of 4¾d. was refused.

### QUININE.

After the slight spurt towards the end of last week, when some 50,000 oz. was sold, the market relapsed again into its former lethargic condition, and no business of importance has been done, there being sellers at 11½d. spot, for second-hand German sulphate in bulk, but on Wednesday 11½d. was accepted for a few thousand ounces.

### CARDAMOMS.

Cardamoms sold at irregular but fairly steady prices, the tendency of *seed* being firmer. There has been a large arrival this week, but the packages are small, and the consignments come to two firms only. The following prices were paid in auction:—Ceylon-Mysore: extra bold pale, well bleached, 2s. to 2s. 2d. per lb.; good bold pale, 1s. 8d. to 1s. 9d.; bold medium pale, 1s. 3d. to 1s. 5d.; small and medium pale, 1s. to 1s. 1d.; brown and split, 9d. to 9½d.; small pale, 9d. to 10d.; peas, 9d. per lb. *Decorticated seed* sold at from 1s. 1d. to 1s. 2d. per lb. Tellicherry and Mangalore were bought in.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, SEPTEMBER 19, 1903.

[No. 37.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 25th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

September 16th.—Weather—Still gloomy and overcast, rain falling daily. Wind S. W., temperature 68. Works—Weeding and digging. Coffee—Healthy, but supplies poor. Health—Poor. Labour—Sufficient. Interesting item—The road to Saklaspur from Sukrawarsanté is nearly impassable, as also the road from Balol to K—hokote. The roads across the Coorg boundary are much superior.

#### THE NEW LAND OF PROMISE.

THE Indian agriculturist knows little, and troubles himself still less, about the agricultural capabilities of other countries than India. The planter in this country worries himself considerably about the rivalry of other producing countries. This is one of the many divergencies of interest and of outlook that distinguish the East from the West. In respect particularly to the Coffee-planter in India we may say that Brazil's rivalry has forced itself upon his notice. Threatening his prosperity, his very livelihood, it has demanded his attention and has secured it. Of over-production there has been none in the coffee industry of India. In that of Brazil there has been much, and there is no sign of a change of policy. Brazil may be said to have swamped the coffee-markets of the world, and the low prices that have resulted from the action have entailed great hardships upon planters in India. It is all very well to assert that Brazilian coffee is being largely sold at a loss; there is no indication of a permanent reduction of output. Whatever may be said

about the dearness of labour in the Republic, enormous areas are still under coffee, and the produce continues to be put upon the market and to prevent any good prospect of a rise in prices. Of late years, too, there has been much talk of the capabilities of Mexico as a coffee-producer. The planter in Mysore, already largely at the mercy of Brazilian competition, has been threatened with fresh rivalry, with rivalry that has been stated to require only time to make it as serious as that of Brazil. In regard to Mexico, however, some reassuring statements may be made, though as to Brazil we can only write with extreme reserve, knowing that, despite assurances and predictions to the contrary, Brazil still continues to supply virtually as much coffee as the world needs—perhaps more.

In the case of Mexico, as in that of Brazil, optimistic and pessimistic writings have to be weighed in the balance of common-sense. Predictions and utterances have to be studied in the light of statistics. In Brazil there have been many pessimistic writers, whose remarks have been hardly periodical trade statistics. In regard to Mexico there has been a wealth of optimism in written reports of what was to come, accompanied by a continuance of statistical statements that prove that these predictions came no nearer to fulfilment. Not very long ago the *Economista Mexicano* stated as a fact undeniable among economists, that the territory of the Republic in its present condition is not capable of producing sufficient to sustain its population. The position, it was stated, is daily becoming more serious as the population increases and the agricultural producing powers of the country diminish. The remedy, we are told, would be irrigation; but this is costly, and unless the Government undertake it little will be accomplished. In regard to Coffee we need have little fear, even if Government do undertake irrigation works on a large scale. One-third of Mexico is composed of the hot lands (*tierras calientes*), and these lands, fertile almost everywhere, are extremely so in certain localities. They are, however, generally unhealthy, and almost unproductive for public alimentation. It is here, certainly, that coffee is grown; but the scale of cultivation is not sufficiently large to cause alarm. Yet the fertility of these districts has been turned to account, not in the way of actual cultivation of coffee in such quantity as to threaten the creation of a second

Brazil, but for the purposes of the Company-promoter and the preyer upon the ignorance and the gullibility of the majority of the public.

Not very long ago, it was stated in a British consular report that in recent years an almost incalculable number of companies had been formed for the acquisition and development of agricultural lands in Mexico. The great majority of these companies were of American origin. So much the more significant is the fact that they have been denounced in a report to his Government by the United States Consul-General in the city of Mexico. Commenting on this, the British Consul-General remarked:—"It is a delicate question, and one does not desire to injure *bonâ fide* undertakings which undoubtedly exist, but I consider it my duty to endorse the United States Consul-General's condemnation of these companies for the development of tropical lands. Most of their plantations are in the States of Vera Cruz, Tabasco, Chipas, in Oaxaca on the Isthmus of Tehuantepec, and in Tamanlipas. Intending investors should always make inquiries of British consular officers in Mexico, as many of these companies which issue beautifully got-up prospectuses are either dangerously speculative if not indeed fraudulent. Their operations are very injurious to general enterprises and damage many excellent commercial undertakings." It is added that one of the great difficulties encountered in developing lands in tropical Mexico is the scarcity of labour. Useful data relating to the agriculture of Mexico are almost impossible of collection. The most recent statistics are five years old. The statistics of exports, however, do not warrant any alarm about the coffee-production of the country, and in this respect Mexico—the new Land of Promise—would appear to be a land of promise only, not fulfilment.

### FRENCH IMPORT DUTY ON COFFEE.

Intimation has been received from Paris that the French Government propose to raise the minimum tariff rate on coffee from 136 francs to 156 francs per 100 kilogrammes with effect from 1st January, 1904. We are not disposed to attach much importance to this, as we doubt if it is correct. The French duty on *Brazilian* coffee is to be increased as above, but this has probably caused a misapprehension in regard to Indian coffee. Still, the matter is one that calls for inquiry.

### COFFEE NOTES.

**Coffee in Hamburg.**—The coffee trade in 1902 again suffered from the effects of over-production, such as would indeed hardly have been regarded as possible a few years ago. Prices were highest in January and lowest in December, and many persons during the first month of the year expected an improvement in business, but were again destined to disappointment when the vast quantities of coffee arriving from Rio de Janeiro and Santos flooded the market. Only one slight recovery took place in quotations after this, when reports reached Hamburg regarding the probable failure of the new Santos crop; but these reports turned out in the end to be much exaggerated. The total imports last year, to this port exceeded those of 1901 by about 40 million lbs. and

as will be seen, amounted altogether to 447 million lbs. (thus showing the great importance to which the Hamburg market has attained during the past decade), *viz.* :—

Year.	Imports. lbs.
1893 ...	254,000,000
1894 ...	240,000,000
1895 ...	265,000,000
1896 ...	282,000,000
1897 ...	372,000,000
1898 ...	400,000,000
1899 ...	318,000,000
1900 ...	379,000,000
1901 ...	409,000,000
1902 ...	447,000,000

The different sorts of coffee, and the respective quantities of each sort imported during each of the last two years, were as follows :—

From	IMPORTS.	
	1901. Bags.	1902. Bags.
Santos ...	1,870,125	2,248,958
Rio de Janeiro ...	419,036	343,855
Bahia ...	88,569	41,532
La Guayra ...	62,946	87,219
Domingo ...	13,224	16,178
Maracaibo and Savanilla...	13,224	5,236
Central America ...	599,570	562,208
Porto Rico ...	2,200	6,100
East Indies ...	13,330	11,115
Africa ...	34,572	38,906
Various other countries ..	227,493	293,299
Total ...	3,344,289	3,654,606
Or ...	409,000,000 lbs.	447,000,000 lbs.
* * *		

**New Coffee Tablet.**—R. C. Anderson, a watchmaker of El Paso, Texas, has invented a coffee tablet. He has been experimenting for some months, and claims that he has a perfect tablet made from the pure coffee berry. No foreign substance is used in the tablet, and the inventor says that he has accomplished something which has baffled chemists for years.

He asserts that by the use of his tablet a month's supply of Mocha and Java coffee can be carried in one's vest pocket, and the aroma and strength of the compound is never lost. He claims, also, that he removes the tannic acid of the berry, which causes nervous people much trouble and is one of the objections raised to coffee-drinking.

A trial of a tablet showed that each makes two cups of fairly strong coffee, or one cup of strong coffee. The process of coffee making is simplified by dropping a tablet into a cup of hot water. A patent has been applied for, and Mr. Anderson expects to net a fortune from it. Others who put like compounds on the market also had great expectations; still, Mr. Anderson may have just hit it right.

\* \* \*

**Cuban Tariff on Coffee.**—The following text of the Cuban tariff on coffee has been received from the United States Minister to Cuba, H. Squires :

"Be it by these presents known, That the Congress has enacted, and I, Tomas Estrada Palma, Constitutional President of the Republic of Cuba, have sanctioned the following law :

"Article 1.—Eighteen dollars [\$16.668, United States] is fixed as the import duty on coffee per 100 kilograms [220.46 pounds] without prejudice to the modification it may be necessary to make when the tariff of the Republic is made.

"Article 2.—Collection of the duties established by this law will begin from the publication of said law in the Official Gazette, but such shipments of coffee as it is proven in due form were shipped prior to the said publication will pay the tariff duties now in force."

**Coffee in the U. S.**—The market has been a trifle wobbly, says the *American Grocer* of 12th ultimo, but its general conditions is unchanged. Over-supply is so much out of proportion to increase in deliveries that low prices are inevitable until some crop disaster comes or consumption catches up to production, which is possible in four or five years, provided the industry is not extended in the meantime.

A temporary spurt on last Friday carried options up 20 points, and stiffened the spot market for Brazil, but prices closed with small change from the previous week, and largely nominal for mild sorts. The sales of mild coffee from July 24 to August 7 include 15,804 bags Maracaibo, with good Cucuta, 7½c.; choice, 10@11c.; 15,979 bags Savanilla, 1,641 bags Central American, 1,684 bags Laguayra, 1,273 bags Mexican, 80 bags Coro, 68 bags Jamaica. Blue Mountain Jamaica, 9@11½c.; best washed Bogota, 12@14c.; Bucaramanga, best, 12@14c.; Guatemala, good to choice, 10@14c.

Few people in Great Britain know that the much-praised French or Parisian coffee, as served in France, principally consists of the cheaper kinds of Brazilian coffee—of which enormous quantities are annually imported into that republic—and a good proportion of chicory. Brazil had for a decade or so preferential treatment for her coffee in France, which, by a recent edict of M. Rouvier, the French Minister of Finance, will be stopped from January 1, 1904. The Chamber of Commerce at Havre, the port through which the bulk of Brazilian and other South American coffees enter France, are greatly incensed against M. Rouvier's action, fearing that it may ultimately lead to a customs war with Brazil. Should there be no agreement between the two countries before January 1, 1904, Brazilian coffee will from that date have to pay a duty of 300 francs per 100 kilos., or about 1s. 0½d. per English pound.

**New Orleans as a Centre for Handling Coffee.**—Special correspondence to the *Tea and Coffee Trade Journal* states:—What is expected to develop the coffee business of New Orleans more than any other one thing is the recently reached determination of the New Orleans Board of Trade to establish here, after September 1, a regular coffee future market. Already the second importing point for coffee in the United States, New Orleans has that in the future which insures for her a continually increasing place of vantage in the handling of that product. The assurance that the isthmian canal will, within a comparatively few years, bring the city into closer connection with the East Indies, the west coast of South America, rendering imperative better transportation facilities to the West Indies and the east coast of South America, and resulting in more rapid and expeditious connection with all parts of the United States, has worked to infuse the local dealers and merchants with confidence in the vast possibilities which lie ahead of the city as a centre for the coffee handling trade of the United States. All this, coupled with the fact that in five years New Orleans has increased her handling of coffee far more in proportion than has New York, has made

the local trade deem it both expedient in view of the future, and advisable with regard to the present, to aid and further the movement to have a future market here established.

Hitherto, while New Orleans has ranked second to New York for a number of years, the Eastern city has been so far in the lead that the southern proportion of the trade has seemed too small to be considered. Now New Orleans seems upon the point of taking a place among the coffee handling ports of the world, that will entitle her word to be taken with some considerable degree of attention.

**Real Coffee and Ylp-Ylp Coffee.**—A Kansas City coffee company with real coffee to sell advertises the fact in the following clever way hitting coffee substitutes:—

"COFF-NUTS—A new substitute for coffee. Made from ground ground-nuts, buttered butter-nuts and selected hips, haws and paw-paws, mixed with crisp, sweet flakes of Takachewa, the modern bran-food. The very latest production of the Insanitarium. Boiled for 2½ hours, it cannot be distinguished from Roastem, Hikahika, Coffeyetta, Ylp-ylp or Library Paste. Makes sick men well, well men sick, and dead men thankful. Why eat real food when there is more money in substitutes? However, if your imagination is inactive and you prefer genuine coffee straight from the tree, drink—coffee!"

**The U. S. Market in Coffee.**—The actual coffee market has shown some movement on the easy terms prevailing, says the *Tea and Coffee Trade Journal* of 18th ultimo, but speculatively prices during the week have had ups and downs with fluctuations of from 10 to 15 points. There has been enough trading to show that the market is stirring. An irregular market is just the thing needed for an improvement in the coffee business. It stimulates buyers and traders are encouraged. An upward tendency should follow, but meantime it is noticed that the option market closed yesterday at prices the same as at the close one week ago, marking no general advance. The bears are still too much in evidence. The Lewisohns re-entered the market last week, and their buying caused advances which were wiped out by the selling of well known bear interests. In the European markets, Havre and Hamburg have maintained advances.

Many firm offers have been received from Brazil, which is receiving and shipping coffee in large quantities. Prices seem too high to attract purchasers here, but inasmuch as large shipments do occur, sellers and buyers evidently have reached an agreement, and probably the buyer did not have the worst of the bargaining. Offers during the week included Rio No. 7 at 41½c., c. & f., Santos Nos. 3 and 4 at 6c., and Rio No. 7 at 4.94c., c. & f. Spot invoice has again declined, and the basis now is 4.78c. for Rio No. 8; 5½c. for Rio No. 7; 5½ to 5½c. for Rio No. 4, and 6c. for Santos No. 4. Good roasting coffees are always at a premium, for they continue scarce, and when found readily command a sale unless the price is too high. Of trash, there is an immense quantity in New York, and it is accumulating, and becoming more and more unsaleable. Invoice trading and jobbing are moderately active.

In mild coffee matters are very slow. Good roasting coffees are always in demand despite the large quantities of milds that are now arriving. Buyers, expecting lower prices are thus held in check. To August 13 from the first of the month 32,731 bags have arrived, including 4,434 bags

Savanilla, 5,401 bags Padang, 452 bags Batavia, and 1,372 bags from Central America. In the course of the week to come some 30,000 bags Savanilla and 17,000 bags Maracaibo are expected to arrive at New York. Good Cucuta is  $7\frac{1}{2}$ c. East India coffees are steady.

\* \* \*

**July Coffee Movement in the U. S.**—The first month of the new coffee year, 1903-04, beginning July 1, is notable for a heavy increase in the world's visible supply; receipts at Rio and Santos the largest for any July on record; heavier deliveries in the United States and Europe than in July, 1902; a very steady spot market.

The following statement shows the July movement in detail:—

Stocks July 1, 1903:	Bags.	Bags.
United States ..	2,461,664	
Europe ..	7,209,009—	9,670,673
Receipts during July:		
United States ..	577,433	
Europe ..	737,035—	1,314,468
Total supply July 1, 1903	...	10,985,141
Less stock August 1, 1903:		
United States ..	2,400,040	
Europe ..	7,245,426—	9,645,466
Deliveries, June, 1903:		
United States ..	639,057	
Europe ..	700,618—	1,339,675
Deliveries, July, 1902	...	1,211,088
Increase over July, 1902	...	128,587

The visible supply of the world, August 1, was 12,370,466 bags, against 11,900,173 bags July 1; 11,590,007 bags August 1, 1902, showing an increase in August of 470,293 bags, and 780,459 bags more than in August, 1902.

Transactions on the Coffee Exchange were 342,750 bags, with 3.60 cents the lowest price for July and August deliveries; highest, 4.70 cents for May.

The spot price of No. 7 Rio fluctuated between  $5\frac{1}{2}$ @ $5\frac{1}{4}$  cents, as the official quotation, but actually the lower grades commanded a premium of  $\frac{1}{4}$ @ $\frac{1}{2}$ c. or more, as to grade, over the official quotation.

The total deliveries in August in the United States were 639,057 bags, of which 54,186 bags were of Brazil sorts, 134,871 bags all other kinds.

The total receipts during July at Rio were 502,000 bags; at Santos, 921,000 bags; both ports, 1,423,000 bags, against 1,091,000 bags same time in 1902; 1,413,000 bags in 1901. During July, 1901 and 1902, 9 per cent. of the total crop was received in July. If the same proportion of the crop was received this year it indicates total receipts of nearly 16,000,000 bags, or the biggest yield on record. Coffee must rule low in price this year.

### TEA NOTES.

**The Russian Tea Duty.**—THE AMOUNT OF THE DUTY. The Russian authorities are, says the *Times of Ceylon* of the 10th instant, raising the tea duty about 5 per cent. at their European ports and land frontier; and, if the announcement had said nothing more, it would be easy to contend that all teas were to be treated alike, and that the object sought to be attained was additional traffic for the Siberian Railway. Besides the blow inflicted on the London trade, however, the local Russian interpretation of Reuter's message is that China tea

will be admitted on the lower tariff—at Odessa, for example—on Consular certificates; and this we cannot in the least reconcile with the most-favoured-nation clause which is still in existence between Russia and Great Britain, their commercial treaty not having been denounced. Mr. Thomas North Christie, as the emissary of the Planters' Association of Ceylon, 10 years ago, was able to interest the Colonial and the Foreign Offices in the fact that rates in favour of China tea were in existence at Russia's Asiatic border. With London houses materially affected the question will on the present occasion, be promptly raised; and we look forward to much more transpiring at an early date.

In Ceylon money the existing Russian duty on tea is Rs.47 $\frac{1}{4}$  per pood (36 lbs.), that is Rs.1.31 cents per lb. A rouble is equal to Rs.1.50 of Ceylon money, and, as the duty has been increased  $1\frac{1}{2}$  roubles (three shillings) on 36 lbs., it has been increased by  $6\frac{1}{4}$  cents per lb.—exactly a penny.

It may tempt exultation to be assured that the turn-over in the local market will be increased; and the alteration, which is apparently to be imposed at once, may adversely affect London prices for a short time only; but the political consideration that Russia is not justified in what she is doing weighs even more with us that the selling of some additional million lbs. of tea in Colombo; and the same will be the feeling, we trust, in Calcutta.

\* \* \*

A Circular issued by the Indian Tea Cess Committee states that from the 1st to the 31st August the Green Tea Bounty was paid on 525,157 pounds of tea, at the rate of half-an-anna per pound.

\* \* \*

**Calcutta Tea Market.**—Reuter's London telegram reached Calcutta on September 11th quoting the market there easier for common and medium grades. This report coupled with the fact of the offerings at the auctions being the largest brought forward this season, was no doubt responsible for the easiness noticeable in the common grades here, and such teas mark a decline of one to two pie, but operators were keen to purchase at the decline and a very small quantity only was withdrawn. The demand for other grades was good, buyers for all markets appearing satisfied to continue securing their requirements at the same rates as previously, and no alteration can be quoted. Darjeelings were well competed for and two invoices, viz., Mim and Seeyok, realised the very satisfactory averages of 14-9 and 1-2, respectively. Dusts continue to be taken freely for the Russian demand and prices paid for that market are such as to induce many concerns to offer those grades on this market whilst sending the bulk of their produce to London. At the auction 25,763 packages were offered and 24,985 sold.

\* \* \*

**London Tea Sales.**—Wiring to Colombo on the 10th instant Messrs. Gow, Wilson & Stanton reported a generally steady market, pure teas dearer, teas for price easier. Fair-liquoring Ceylon Pekoe Souchong was quoted 6 $\frac{1}{4}$ d.; average for the week 7 $\frac{1}{4}$ d. Reuter reported:—Generally slight advance. The quality of recent arrivals has been better. Offered 29,000 packages; sold 28,000 packages. Pekoe Souchong 6d. Average 7 $\frac{1}{4}$ d.

\* \* \*

**Some Specimens of Russian Tea.**—The *Times of Ceylon* remarks:—Our readers are already familiar with the name

of Mr. K. C. Popoff, the well-known Russian who has for a long time now experimented in the cultivation of tea in the Caucasus. Already he has spent £600,000 and devoted the best years of his life to this work, and it is therefore about time that his labours bore fruit. By perseverance he has produced an excellent Russian tea, and hopes to put about 60,000 lbs. on the Russian market by next year. Although it would not be correct to say that Russian tea is at present an appreciable rival to Ceylon tea in Russia, yet, with the immense advantages which the home-grown tea possesses over that imported, it is not impossible that within the next 25 years conditions may have changed very considerably. For instance, while Ceylon tea has to pay a heavy duty before it can enter Russia, the tea grown in the Caucasus is duty free, and the cost of transport is slight. As an indication of what Mr. Popoff has already achieved, we may mention that by the post yesterday there arrived from his estates specimens of Russian tea which had been grown from Assam and China jât trees. It included brick tea, pill tea, and the ordinary loose tea. Mr. Tchokoff and other tea men who have examined the specimens speak very highly about the tea. It is said to be equal in liquor to the best Ceylon tea, and far superior to a specimen of the very best tea produced in China. It is now three years since Mr. Tchokoff tested in Colombo the last samples of Russian tea submitted to him by Mr. Popoff, and the improvement is most marked, he says. The "pill" tea is of inferior quality, and is composed of dust; but it finds a ready market in Russia, where it can be obtained at about 7½ cents a lb., for it must be remembered that it does not have to pay duty. Mr. Popoff's labels show the Russian colours barred as a background and, in the foreground, an eagle which, be it observed, is fiercely attacking the China dragon—symbolical of China tea.

\* \* \*

**Tea in Hamburg.**—The importation and consumption of Indian and Ceylon teas experienced a further increase in 1902, owing to the growing popularity of these sorts which was due no doubt to their good quality and careful preparation for the market. The reduction in the tea import duties fixed by the new German Tariff, viz., about £1 4s. 6d. instead of £4 18s. per 100 kilos. (or 220 lbs. avoirdupois.) will probably largely contribute towards increasing the consumption of tea in Germany, and, it may be hoped, in particular of Indian and Ceylon teas.

\* \* \*

**Scented Teas.**—HOW THEY ARE FLAVOURED. We have three descriptions of scented teas, says the *American Grocer*. They are known as Scented Caper, Scented Orange Pekoe, and Chulan Powchong. The two former kinds are consumed almost entirely in England, the latter is only used in America. The Scented Caper is round in shape, the same as gunpowder, but in colour is black. It is totally different from Oolong, Green Japan, or Congou, in flavour. The flavour is similar to that of the jessamine flower. This tea is grown near Canton. After the tea is rolled into shape and fired, and before it is allowed to cool, it is put into flat baskets, about three or four inches deep. The flower of the Chulan plant is placed in similar baskets. These baskets are then piled one upon another, each basket containing the tea being between two in which the Chulan flowers are placed. The aroma of the Chulan flower is similar to that of the jessamine. While the tea is cooling it absorbs the aroma of the Chulan flowers to such an extent that the odour remains

for a long time. Scented Caper is not pleasant to the taste; it has a raw, pungent flavour; its only merit is in its odour. In England, where it is chiefly sold, it is never consumed by itself, it is used there by the trade in making their mixtures; one pound to about 15 of the unscented teas is the quantity generally used. A little of the odour of the Chulan flower, like that of the jessamine, is pleasant; too much of it is repulsive.

Scented Orange Pekoe is flavoured with the same Chulan flower in the same way, but in shape it is totally different; it is made into a long, very well twisted leaf, and is black in colour. This tea in taste is like the Scented Caper, and is used in the same way by the English dealers in making up their mixtures. There is a small sale for it in America, where it is used, as it is in England, for mixing purposes. The Scented Orange Pekoe that we get from Foochow is much finer than that which is produced near Canton. The finest Foochow kinds have a very handsome appearance; the leaf is glossy black, exceedingly well twisted, and is even in colour and size. A package of this tea left open will fill a small room with its odour. A little of this tea will go a great way in a mixture, and not more than one pound of it to 15 or 20 pounds of other teas should be used.

Chulan Powchongs were first imported to America about 1838. When first imported they were very much better than those now received. The leaf was of a blackish colour, resembling the Oolong leaf, which, in fact, it was. Later it had a motley brownish colour. The leaf has very little twist in it; on the contrary, it has a ragged appearance. Chulan Powchongs are flavoured with the Chulan flowers, but they are not made with the same care which distinguishes Orange Pekoes or Scented Capers. The bud of the Chulan plant is mixed in with the tea. This bud is about three times the size of a pin's head, and is of a yellowish colour. The proportion used is about one pound of the bud to 20 of the tea. From 1838 to about 1848 the quality of the leaf used in making Chulan Powchong was very good, and great care was taken in its curing. The cup quality was good, having fair strength and flowery flavour. At that period those teas were worth from 50 to 60 cents at wholesale, and were retailed at \$1.00 per pound. These teas have deteriorated very much in quality, so much so that at the present time they rank with the commonest kinds. All teas packed in China in papers are called "Powchongs."

\* \* \*

**The U. S. Tea Market.**—A depressed sentiment is, says the *Tea and Coffee Trade Journal* of 11th ultimo, beginning to assert itself in the tea market because of the continuance of the quiet conditions in the trade, when there should be some activity, at least the promise of activity. This exasperatingly is not forthcoming, and study of conditions in the country is bringing out more and more the fact that importers and wholesalers have permitted only too well, over-buying by their customers. In other words, the interior is well supplied with tea and disinclined to come out to buy more in the face of the higher values that have accrued on the new season's teas. There is some inquiry, but no purchasing, except for imperative needs, nor does the circumstance that the market, speaking generally, has declined two cents, induce satisfactory attention, the opinion of buyers being that prices still rule too high in view of the conditions that obtain in the somewhat restricted demand and the expanded supply. A conservative Front street tea-man, prominent

in the trade and usually accurate in his forecasts, said last week :

"The market is going on one leg and that a lame leg, and it is going to proceed that way for the rest of the year. Retailers have been too well stocked, it has been found, and they cannot be induced to come out although tea has recently gone down two cents. So conditions are not prophetic of great activity. For Japan there may be said to be no market at all. There is an excessive supply of green tea in all quarters, and most of it is coming here. Although the net importations into the United States in the last season were about 104,000,000 pounds, the quantity that it has been arranged to import this season will be even larger, and looks like 110,000,000 pounds at least. Congous alone offer a satisfactory outlook. They are not so abundant this year as formerly, and comparatively few will come to this market. The prices for them remain firm, and only they are in this position. In fact it may be said that Congous alone have saved the market from a bad slump, and it may develop that they will have saved the market entirely."

Seemingly the market is turning in the buyers' favour. In the open, quotations are steady, and in some cases, as in Congous, Indias, and Ceylons, firm. The new teas are as yet not very abundant, but such as are here have not met with the welcome they expected, and it remains to be seen how the immense quantity to come will fare. If the holders of the new teas will not become too early discouraged, they may be able to maintain a confident tone in the market and fairly sustain prices. In our opinion the cat has not yet jumped, although there are indications which way she is making up her mind to jump. Primal markets are firm.

**The Tea Trade of Japan for 1902.**—The amount of tea exported last year was 43,242,644 lbs., 738,052 lbs. less than in the year previous. On the other hand, this was valued at £1,070,244, as against £903,876 that of the tea exported in 1901. As, however, the crop was poor, and the duties on tea in the United States were to be taken off from January, 1903, the demand was great, the object of the merchants being to get their supplies across to America before the beginning of this year. This accounts, to a certain extent, for the difference in value between the export in the two years.—*Japan Times*, August 15th.

**Indian Tea.**—Messrs. Caritt Moran & Co.'s Fortnightly Market Report, dated Calcutta, 10th September, says:—Offerings during the fortnight have been moderate, totalling 41,796 packages. The character of supplies has been more or less plainish with the exception of a fair proportion of offerings from Darjeeling. In Assams a marked falling-off has been noticeable. The market has continued good, the sales having passed off with much spirit, and tea generally has met brisk competition; prices can be quoted steady to firm difference in quality alone being responsible for any fluctuation; common grades have moved up a point or so, and fine tea has continued to bring full rates. The Assam Company's offerings have totalled 279 packages of good average quality, they have sold readily at good prices. 1,500 packages of green tea have changed hands; for these kinds the market closes somewhat weaker. Since the season started, the feature of the market, more especially during recent sales, has been the persistently extensive operations on outside market's account, and the buying power in these

interests has never before been so unmistakably evident, or asserted itself so prominently as has lately been seen. The market has dealt with a series of sales in which quality has shown much variation, but it is nevertheless generally admitted that the trade could have comfortably absorbed an appreciably larger quantity without any adverse effect on values resulting from heavier offerings; this strength of demand is, to some extent, shown in a keen auction room, and an unusually close discernment of quality, any slight tendency to improvement, which in many cases goes no further than "preference," being reflected in a quotably appreciated price. With the acquiring of Russia, our latest, strongest and most consistent customer, showing, as she already does this season, a very substantial increase in her purchases on this market, together with a steady addition to our new outlets, it would appear prudent to feed these demands more liberally; the policy of simultaneously encouraging fresh markets and relieving pressure in London is perhaps the soundest and safest measure for further improving and strengthening the industry. Russia is one could probably take 15 to 20 millions off this market if she had a less restricted field of operations. The following details are interesting in connection with the foregoing: up to the sale of 19th June the offerings in Calcutta totalled 31,300 packages, of these only 9,700 packages have so far re-appeared in the Mincing Lane sales up to the 21st August, as follows:—Darjeeling—Offered in Calcutta, 6,380 packages; re-offered in London, 2,020 packages. Dooars and Terai—Offered in Calcutta, 7,500 packages; re-offered in London, 1,400 packages. Assam—Offered in Calcutta, 3,000 packages; re-offered in London, 1,240 packages. Cachar and Sylhet—Offered in Calcutta, 14,400 packages; re-offered in London, 5,000 packages.

**The Threatened Retaliation.**—The information sent from St. Petersburg to the Paris correspondent of the *Times*, as announced on the 31st ultimo, was right in one important particular, and probably in another equally important, says the *Times of Ceylon*. The Russian authorities are raising the tea duty about 5 per cent. at their European ports and land frontier; and, if the announcement had said nothing more, it would be easy to contend that all teas were to be treated alike, and that the object sought to be attained was additional traffic for the Siberian railway. Besides the blow inflicted on the London trade, however, the local Russian interpretation of Reuter's message is that China tea will be admitted on the lower tariff—at Odessa, for example—on Consular certificates; and this we cannot in the least reconcile with the most-favoured-nation clause which is still in existence between Russia and Great Britain, their commercial treaty not having been denounced. Mr. Thomas North Christie, as the emissary of the Planters' Association of Ceylon, ten years ago was able to interest the Colonial and the Foreign Offices in the fact that rates in favour of China tea were in existence at Russia's Asiatic border. With London houses materially affected the question will, on the present occasion, be promptly raised; and we look forward to much more transpiring at an early date. Whether the P. A. General Committee will discuss the subject to-morrow, on the larger or on any other side, remains to be seen.

In Ceylon money the existing Russian duty on tea is 47½ rupees per pood (36 lbs.), that is Rs.1·31 cents per lb. A rouble is equal to Rs.1·50 of Ceylon money, and, as the

duty has been increased  $1\frac{1}{2}$  roubles (three shillings) on 36 lbs., it has been increased by  $6\frac{1}{4}$  cents per lb.—exactly a penny. . . . It may tempt exultation to be assured that the turn-over in the local market will be increased; and the alteration, which is apparently to be imposed at once, may adversely affect London prices for a short time only; but the political consideration that Russia is not justified in what she is doing weighs even more with us that the selling of some additional million lbs. of tea in Colombo; and the same will be the feeling, we trust, in Calcutta.

\* \* \*

**Japan vs. Ceylon Teas.**—The *Kobé Herald* of June 19, says that since the opening of the tea season this year the market for common grades of tea has been very quiet and buyers have been few. This state of affairs is due to the fact that considerable quantity of green tea in imitation of Japan tea has been shipped from Ceylon to the United States and Canada, and it is being sold at lower rates than the genuine Japan tea, with a view to ousting the latter from the market. The production of green tea in India last year was only 6,000,000 pounds; this year it is estimated at between 12,000,000 and 15,000,000 pounds, while it is intended to increase that quantity to 40,000,000 pounds, if possible. It is impossible for Japan tea to compete with Indian green tea in point of price, so that it is expected, says the *Herald*, that the commoner brands of Japan tea may be entirely deleted from the United States and Canadian markets in the course of three or four years.

\* \* \*

**Ceylon Tea.**—Speaking at the half-yearly meeting of the Ceylon Chamber of Commerce on the 1st instant, the Hon'ble Mr. STANLEY BOIS, the Chairman, said:—It is satisfactory to note with regard to our main staple, tea, the increase in our exports to America. With regard to Russia there is no increase, but we are holding our own. Disquieting rumours are now on foot that increased duties may be imposed and this may check the business, but in view of the fact that the absence of any expansion as far as I can gather is, to a great extent, due to better prices we get for our lower grades of tea locally, in which direction Calcutta can underquote, gives us no cause for alarm. You will observe under the head of tea cess we have had the pleasure of registering the success that has attended the policy of the Thirty Committee in continuing to support the green tea industry by means of the payment of a bonus; and I think we are greatly indebted to the Thirty Committee for the consistent way in which they have adhered in this policy, which has resulted in the increased figures quoted in our report; from which it will be seen that for the first half of 1903 we exported  $5\frac{1}{2}$  millions of green tea as against  $2\frac{1}{2}$  millions in the first half of 1902. This expansion is due, to a very large extent, to our change of policy, whereby every endeavour has been made to suit our green teas to the markets which we are principally desirous to capture and not to endeavour to force our black upon an unwilling market. A great number of teas have been sent from here in a finished condition, which also marks a change in our policy. I think we may now congratulate ourselves on the green tea industry being well on its legs, and at no distant time able to stand alone. In this connection it would be wrong to withhold from Mr. William Mackenzie some tribute of gratitude for the services he has rendered to us in the past, by the consistent manner in which he has advocated the necessity of making green teas for the American market, such as America required,

rather than that we should continue merely to advertise our black teas. Events have shown, I think, that he was quite right, and that our green tea trade, which was undertaken under the pressure of low prices for black teas bids fair to extend much more than even we now can fully estimate.

Mr. G. B. LEECHMAN dwelt upon the satisfactory condition of the present outlook, and said he looked forward not perhaps to an extraordinary, but yet to a moderately prosperous future as regards the tea industry. The green tea trade, which had commenced in a time of stress, though strongly urged by Mr. William Mackenzie and others, had increased to a large extent, and was destined to have a marked effect upon the future of our staple industry. Mr. Leechman, referring to Mr. Chamberlain's tariff proposals, said that one effect which the question would have would be that the attention of people at home would be drawn to the fact that our tea was taxed 80 or 100 per cent., and it might—he did not say it would—happen that the said tax might not only be reduced to 4d. or 2d., but entirely abolished. On the other hand, there was the unpleasant fact that Russia was likely, in a moment of heated retaliation—perhaps not intentionally—to tax our tea into her country, and this, after we had nursed the industry so assiduously, was not altogether favourable to them.

The Report of the Committee stated:—

**TEA CESS.**—In the Chamber's report at 31st December, 1902, your Committee fully endorsed the policy of the "Thirty Committee" in continuing to support the Green Tea Industry by the payment of a bonus as a means of correspondingly reducing the output of black teas, and they are glad to say this has resulted in an increase of 3,245,474 lbs. green tea manufactured during the first six months of this year, as compared with last, the actual figures being as follows:—

First half of 1902.	First half of 1903.
2,277,357 lbs.	5,522,831 lbs.

This has involved an appropriation of funds far in excess of the revenue of the current year, and it will be remembered that in order to meet the deficit, the proposal made on this side was that the Cess should be temporarily raised to  $\frac{1}{2}$  cent a lb. This, however, was not approved of by those interested in London, although the majority were in favour of continued support being extended to the Green Tea Industry, and the difficulty has accordingly been met by Government coming forward and indicating their readiness to advance the necessary funds on the security of next year's Cess Revenue. A sum of Rs.150,000 allowing of a bonus of 3 cents a pound on a further 5,000,000 lbs., or about the amount required up to the end of the year, has accordingly been thus obtained, and the thanks of those interested are due to His Excellency the Governor for this assistance, which prevents the sudden check to the expansion of the Green Tea Industry that otherwise would, in all probability, have resulted from the sudden stoppage of the bonus about the middle of the year.

**ST. LOUIS EXPOSITION OF 1904.**—It was considered probable at the time of the last report, that if the result of Mr. W. H. Figg's enquiries on the spot proved favourable, the Ceylon Government would be prepared to arrange for the representation of Ceylon in a liberal and adequate manner, and this anticipation has now been realized. It has been decided on the strength of Mr. Figg's recommendations that Ceylon should participate on the lines of its representation at Paris, the cost of which to the Colony was some £15,000, and Government, with the cordial concurrence of the planting community, have paid the Chamber the compliment of selecting your Chairman, Mr. Stanley Bois, as Commissioner for Ceylon to St. Louis. They have also appointed two Assistant Commissioners, Mr. R. Huyshe Eliot and Mr. Paul E. Pieris, C.C.S., as representing the planting and the low-country

Sinhalese interests respectively, who, with the addition of certain official visitors, should do much to interest Americans in the island and promote its trade with the United States.

#### TRADE IN THE FIRST HALF OF 1903.

**TEA EXPORTS.**— . . The total shipment of green tea, according to the returns or Bills of Lading, amounted to 3,675,255 lbs., against 1,414,391 lbs. These figures do not however represent the true position of green tea. The Thirty Committee's figures shew that the bonus has been paid on 5,522,831 lbs., against 2,277,357 lbs. for the same period in 1902, which proves that a large stock is held in Colombo for the purposes of "finishing" and awaiting shipment, in addition to which a certain quantity is lost in the shipping returns, owing to the fact that green teas are not always specified apart from black teas.

**Quality.**—The quality has been about average, except in the month of June, when a considerably less quantity than usual of undesirable tea came forward.

**Prices.**—The average price obtained at the Colombo Sales was :—

1903	...	...	...	37 cents.
1902	...	...	...	33.81 "

Common teas have done well throughout the half-year, and the range of price has been better than previous years. This is the natural result of reduced output of black tea caused not only by shorter crops, but by the large number of low-country estates which have manufactured green tea. Fannings and dust have again risen in price owing to the "brick tea" industry.

GREEN TEA has made steady progress, and is now attaining a permanent position in Canada and America. The greater proportion (probably 75 per cent.) is now shipped in a "faced" or "finished" condition, and this system has undoubtedly been the means of the continued success of Ceylon green tea. Prices have been good throughout and have slowly advanced during the period under review.

\* \* \*

The important commercial changes which have been anticipated, and which are now going on in the Orient, are peculiarly illustrated in the tea operations in Japan, writes the *American Asiatic Journal*. Until the last two years the large importing houses had a monopoly of this business for the United States. To-day it would seem that every wholesale grocery house in the country has its own buyer in Japan. The advantage is questionable, since the price of tea has been stimulated under the extra competition—the difference between, say, 20 and 200 buyers in the market. The regular large importer's profits of 1c. or 2c. advance is comparable against a full 20 per cent. advance to native and shipper under the new conditions, and it is doubtful if the new profit margin of the wholesale grocer is enhanced. The extra competition is assigned as the cause for continued high prices.

\* \* \*

**The U. S. Tea Situation.**—Importers are looking around for a remedy for that tired feeling from which the tea market is suffering, but needless to say, observes the *Merchants' Review* of 14th ultimo, they are not meeting with success. The producers have marked up prices at every opportunity, although the reason has been far to seek, except the familiar reason that they needed the money, and the distributors having been heavily loaded up with supplies when the duty-repeal law went into effect, have not since been compelled to

pay extreme prices, their requirements having been anticipated for some months. The heavy imports during the fiscal year 1903 tell the story pretty clearly.

However, at this season the outlet for tea from importers' hands is expected to be narrow, and a good many holders believe that the replenishment of grocers' stocks will be liberal in the fall.

As a consequence of the plethoric state of the grocer's caddies there seems to be a superabundance of green teas, of which the prices are showing a more reasonable tendency, but Congous, which in recent years have been rather too plentiful for holders' interests, are now working into good shape. They are in only moderate supply and are wanted more often than greens. Their prices are firm, which is more than can be said for greens as a class.

The way the tea market has come around from its activity and buoyancy during the few months preceding the taking effect of the repeal act, reminds students of the history of the trade of the course of the same market in the period immediately preceding and closely following the abolition of the duty in the seventies. Then, however, the changes were more violent and the after damages in the speculative channels more severe. The resemblances could be traced in the early buying movement and advance of values, followed by a long period when repletion caused a dull tone and declining prices. The differences were seen in the milder forms in which the earlier situation was reproduced in the later one.

\* \* \*

**The U. S. Tea Market.**—The market in tea may be described, says the *Tea and Coffee Trade Journal* of 18th ultimo, as under half pressure, with prices remaining steady. Some one describes it as proceeding at present on only one lung in condition, the unclogged one being composed of those dealers who find their stocks low and therefore demanding replenishing, and the other of those who are too well stocked, and who naturally, since prices do not tempt, stay out of the market. Perforce, these must some time or other enter the market, but seemingly they will do so only gradually, and consequently it may be some months before the market in general may be understood as humming with activity. Although some in the trade report slow conditions, not a few speak of experiencing a marked increase of activity, which they ascribe to the rather large arrivals of tea recently, permitting some basis on which to do business on a fairly large scale, and with enthusiasm and confidence.

Speaking generally, teas of good quality and desired are scarce, and command full values, while the lower grades are plentiful and susceptible of concessions. Despite the reported slowness of Japan teas both at New York and Chicago, that tea has advanced another cent in Japan for all grades. Picking is to be stopped September 1, and this, it is thought, will materially influence the final crop, which, however, is estimated as 2,000,000 pounds in excess of the quantity produced and sent out last year. Greens, it is known, will be 5,000,000 pounds more than last year, and in view of this fact, there should follow a decline in the prices of this tea from the unwarranted high figures with which the markets in the East started. Perhaps the huge surplus will not find an exportable demand. London has bought about 2,000 packages of Congous in the New York market, paying therefore 8½ cents. It is not thought that very much more of that grade of tea is remaining in New York. Of course, London's need was

prompted by the firmer prices for the India and Ceylon teas, and because new season Congous are higher. The United States will take 5,000,000 pounds less of this tea this year, and will scarcely feel the pinching, despite the large London purchases hitherto, the importations of the two previous years having been so plentiful. A considerable quantity of Formosas arrived last week, but the better grades, of course, being autumnal pickings, have yet to arrive. All Moyunes that arrived last week have found ready purchasers. India and Ceylon hold firm. Ceylon greens are in good request in Canada, where their cheapness has made them attractive, and almost driven out the Japan teas.

NOTES.

Java Quinine.

The exports of quinine from Java during June amounted to 27 cases, including 20 to Genoa, 6 to Japan, and 1 to Singapore. From January to June the shipments have been :—

	1903.	1902.	1901.	1900.	1899.
Cases ...	546	451	1,037	662	905

Cheap!

Tea is cheap and coffee is cheap now-a-days. Imagine, says the *Merchants' Review* of New York, first-class grocery stores quoting coffee and tea in the window at 14c. for the former (7 lbs. for 90c.) and 30c. for the latter ("good black or mixed")! It is done in this city and the reputation of the dealers is proof that the quality is not to be sneezed at.

In Coffee and Tea.

In case of war in Great Britain it is estimated, says a New York Paper, that the average stocks of teas and coffees in the hands of retailers which are about one month's consumption, and in bond and the hands of wholesalers about five months' consumption, would last much longer than six months in the evident enhanced prices of food generally and consequent reduced purchasing power of the people.

The Marseilles Market.

During 1902 imports into Marseilles included 911 tons Cocoa, as against 1,048 in 1901, and an average of 814 from 1898 to 1901. Coffee imports rose last year to 27,279 tons, as against 21,900 in 1902, and an average of 21,353 tons for the above four years. Pepper, 1,230 tons in 1902; 685 in 1901; 818 average. Tea, 1,497 tons in 1902; 1,278 in 1901; average of the four years 1898—1901, 1,146 tons.

Manures.

A bill to prevent the sale of inferior manures has been drafted by the Minister for Lands for submission to Cabinet. Mr. Taverner informed a deputation at Nhill on Saturday that he hoped the bill would be passed during the coming season. He complained, however, that the farmers had not co-operated with the department as they might have done in trying to secure convictions under the present law.

Shipments of Rubber from Para.

Consul K. K. Kenneday writes from Pará :—The shipments of rubber from the Amazon Valley during the month of May just passed amounted to 2,070 tons, as against 2,083 tons for the same month in 1902. The total export of rubber for this season—July 1, 1902, to May 31, 1903—is 28,110 tons, as against 28,738 tons for the corresponding

period of the previous season. It does not appear likely that the business of this closing month of the season will materially change the relative bearing of these figures. The crop shortage this year, as compared with the year of 1901-02, will therefore be only about 2 per cent., instead of 5 per cent. as estimated January 1.

Cocoa in Hamburg.

The importations of all sorts of cocoa were more extensive in 1902 than in any previous year (except 1899), and were all disposed of for purposes of consumption. In view of this development of the consuming power of continental countries for all kinds of cocoa, the favourable reports of the recent harvest in all cocoa-growing parts of the world were naturally received with satisfaction by persons interested in the cocoa trade of Hamburg.

GENERAL ARTICLES.

PRODUCE AND PLANTING.

Some remarkable statistics, showing the revenue derived from the importation of dutiable articles into the United Kingdom, are contained in the forty-seventh report which the Commissioners of Customs have just presented to the Treasury. The period covered by the report is the year ending March 31 last, and although the figures are nearly three-quarters of a million below the Budget estimate, the Customs revenue is shown to be nearly 11 per cent. higher than in 1901-02. In no one year has so much been raised by Customs duties, and but for abnormal clearances in anticipation

of fiscal changes the receipts would have swollen to a greater amount. The gross returns reach £35,499,723, or £3,414,125 more than in the preceding year, which, in its turn, showed a very large increase over the previous twelve months. In five years the Customs receipts have increased by nearly thirteen and a-half millions. Tea is responsible for £5,975,483, an increase of £182,516, the quantity paying duty being 254,398,837 lbs. Sugar duties fell 30 per cent., the receipts being £4,478,707 against £6,399,228, but this, as before explained, was due to forestalments or post-ponement of clearances in anticipation of changes of duty. The Commissioners think that the normal yield of these duties will be found to be about £5,900,000, on the basis of the present rates. The average consumption of sugar in the United Kingdom for the past five years is 31,150,000 cwt. per annum.

The risk of loss in crop through inability to manufacture as a result of damage to the Tea House by fire has, we hear, been under the serious consideration of more than one tea company's board. The risk is certainly considerable for single estates, and equally so where the different estates of one proprietary are too far apart to render each other any real assistance in manufacture in case of such a catastrophe occurring. We believe that in some instances this risk has been covered by insurance.

Notwithstanding the fact that when the question of renewal came up early in the year, six American, English, and German firms engaged in Yokohama tea trade urged its discountenance, the subsidy to the Central Tea Guild for the purpose of extending the tea market in the United States has been renewed. The subsidy has been paid for six years.

Messrs. Reid, Evans, & Co., of Shanghai, referring to the supply of China green tea, estimate that there will be this season an excess of 30,000 half-chests of Pingsuey tea, 30,000 half-chests of country teas proper, and 20,000 half-chests of Wenchows, S. Packs, and new districts, a total excess of 80,000 half-chests. This would give available for export, say they, to Europe and America some 5,000,000 lbs. of green tea. Allowing that Europe takes 1,000,000 lbs., there remain for America 4,000,000 lbs. more than 1902. This quantity, provided prices were moderate, would not be excessive when the small stocks in many parts of that country and the removal of the 10 per cent. duty is taken into account.

Under the heading "Paradoxes of Diet," a writer in the *St. James's Gazette* says that the peoples that drink most tea and alcohol are the most dominant Powers. Tea is the essential drink of progress. In a single century Australia has made itself, and the Australian beats the rest of the world by drinking  $7\frac{1}{2}$  lbs. of tea in twelve months. The Canadians manage 6 lbs., which is also the quantity that the home-bred John Bull requires to quench his thirst. The American has a preference for coffee which, added to his tea, makes him drink no less than the Britisher. On the other hand, Germany's national depression is distinctly due to her consumption of a mere 2 oz. of tea per head per annum. When the Russian backs up his 1 lb. of tea with more meat he will go ahead, for if tea spells enterprise, beef means strength. Just to test this look at the opposite side. The Spaniard drinks only half-a-pint of tea in a year. No wonder he is depressed and bankrupt.

The position of coffee-growers in Brazil is not unlike that of tea-growers in India and Ceylon. Brazil planters benefit when exchange is low. Foreign office reports show that the appreciation of the currency is undoubtedly one of the chief causes of the impecuniosity of the planter, "who actually receives about half the amount of milréis for his crops as compared with what he was paid three or four years ago, when the milréis was worth from 6d. to 9d."

In the annual reports published by the Colonial Office of the Federated Malay States, it is shown that the rubber industry, which was spoken of so hopefully last year, has justified all that was said of it, and there can be no doubt that the combination of climate and soil in the States pre-eminently adapts them for the cultivation of rubber of the Pará and Rambong kinds. The export of Pará has not yet commenced, and a year or two may elapse

before it does, but in the meantime samples of it realise high prices in England. The scientific name for Rambong is *Ficus elastica*. Cocoanuts continue to flourish in response to an ever-increasing demand, and the success of sugar cultivation has already been proved beyond dispute. A motley crowd of enemies have, however, arisen against the cocoanut palms—to wit, beetles, rats, wild pigs, and porcupines; and a planter of great skill and experience has in consequence been appointed Federal Inspector to deal with these pests. It is predicted that the cocoanut plantations will form one of the safest of the agricultural interests of the States, the most permanent and paying, and the least costly. The area under cocoanuts already exceeds forty thousand acres. The cultivation of Liberian coffee is being gradually abandoned, the ground being planted with Pará instead.

Some time ago some successful attempts were made in Queensland to obtain and prepare rubber, and samples were sent to England and obtained a fair price; but the industry was not energetically worked, says an Australian journal. The sap was obtained by making incisions in the bark of the white mangrove trees, which grow plentifully in the swampy lands along the coast of Central Queensland, and was allowed to run into tins that were fastened on the trees. It was afterwards located in earthenware jars placed in boiling water, and then worked up by hand until the rubber was produced. In this simple crude way very good elastic rubber was made, which brought 4s. per lb. in England, and a guarantee was given by the merchant that any amount of it would be purchased. It is surprising that this trade has not been developed. It requires little capital. A few fossickers with tomahawks and tins, and masks to prevent injury from the sap, an inexpensive boiling apparatus, and cases to export it, and the necessary plant would be provided. There would be no dread of glutting the market. The demand for rubber is ever increasing. England and America now absorb over fifty millions of pounds annually, and fresh uses for it in machinery, roofing, and clothing, and in the arts of life are ever being found. For many years to come this source of indigenous wealth might be worked with advantage.—*H. & C. Mail*.

## INTELLECT IN PLANTS.

I wonder, writes Mr. E. L. Merriman in the *Daily Mail*, whether many people interested in gardening have ever noticed the natural tendency of some weeds to imitate garden flowers, and, like some of the human race, to "ape their betters"?

The many human characteristics of plants are interesting to notice. In weeding a bed of verbenas has any one noticed a little rough green weed, so like them in growth of leaf that he has hesitated to pull it up? This particular weed I do not remember to have found elsewhere. In a bed of carnation cuttings a little tuft of grass will often grow close against them, so like in appearance as easily to deceive a novice, evidently in hopes of being overlooked when weeding time should come by passing itself off as a carnation slip. The red pimpernel will plant itself close to the garden blue pimpernel, no doubt with the same object in view. The wild rose will do the same; and who has not found the wild foxgloves among the noble white garden variety, which they never leave until they have contaminated, and will in time, if permitted to remain near, turn to their own colour, which, beautiful though it may be, still looks better in a field.

**Parvenus of Plant Life.**—"Mares-tail" grass will grow in an asparagus bed, looking at a distance nearly as soft and feathery. Wild Rose-Campion will thrust itself into a clump of the garden kind. "Morning Glory," feeling itself to be quite as beautiful, and infinitely more vigorous, will take the place of and swamp the garden convolvulus, aggravating the gardener; and though being occasionally spared for the sake of its natural beauty when in its first youthful bloom, it is invariably rooted out later on in life. But like a truly vulgar person, it will never take a hint or realise that it is "de trop," and it will return again at the first opportunity. A kind of switch grass will grow in tiny tufts in a spring-onion bed, no doubt for companionship, and will often get itself mistaken for that useful vegetable, hoping to escape the ruthless gardener, who has unwittingly provided it with a soft bed. The wild poppy delights in showing itself in the middle of a bed of Shirley poppies

defying them to outshine its brilliance. Even the modest daisy will quietly plant its compact little round self in a border of garden daisies, with a gentle ambition of trying their companionship for a little while.

Some flowers, however, are so defiantly wild as to refuse to bloom freely among the tamer or more cultivated kinds, such as the heather-bell, the heath, and the "sea-lavender" (if that is its real name), and some others. They may be ranked among the gipsies of flower life.

**Uncongenial Surroundings.**—There are certain plants which will deliberately transplant themselves when disgusted with their surroundings, and creep away for some distance to a more congenial neighbourhood. I once knew a mint bed which flourished until a pigstye was occupied close by, when it soon became blighted and generally illtreated by grubs and flies. It took the remedy into its own hands, and was afterwards found some distance away in a flower bed. The roots will creep long distances, and establish themselves where it best pleases them. We all know how strawberries will tire of their home, always seeking to colonise and to establish the younger branches of their family in fresh quarters, and that they cease to flourish for more than three years in the same place.

There are plants which seem to like living in village communities, and others which will form large colonies of their own, but which nevertheless will not stray near a human town, but will, on the contrary, recede farther and farther away from its atmosphere. Who has ever found the wild lily of the valley close to a town? Primroses and violets and bluebells will venture fairly near, or at least allow a town to creep within a moderate distance of their homes, but most of our prettiest flowers avoid the vicinity of human beings, as also do many of our best ferns.

**The Flattery of Imitation.**—To return to the subject of imitation. I know a lovely wood carpeted with wild lilies of the valley on the borders of which grow patches of wild garlic. So very like are these that the unwary flower hunter will swoop down on them and dig them up eagerly before becoming aware of their vulgar nature. But I have noticed that for some reason they will not venture too near or actually mix with the lily roots, which I have no doubt would in such a case recede from them, they being flowers which prefer a certain amount of privacy, and do not care much for other pretty flowers outside their own family. One seldom sees showy flowers growing among a colony of lilies. It may be that they are jealous of a more brilliant neighbour, but far be it from me to attribute the petty meannesses and sordid motives of our coarser human life to the flowers whose very presence is a rest to human thought.

Trees, again, show their individuality when they deliberately turn their leaves, as many do, when a shower of rain is coming. How often have we been warned of an approaching shower by the sight of the rough underside of the leaves of various trees, which appear anxious to get a bath. We can hear the gentle tapping of the aspen leaves as they congratulate themselves and each other on the prospect of rain. The homely little "shepherd's weather-glass," or red pimpernel, is a true prophet, and will foretell the coming weather. If the day is to be fine it will open wide its eye, even before the sun shines. If dull, it will remain half closed. If wet, it will become tightly closed. It is weatherwise beyond its fellows, perhaps because of the fear that a heavy raindrop would batter its tiny blossom quite of the stem.

**Parasites.**—Again, many creeping plants will use others for support (or even make "stepping-stones of their dead selves"), using any means to gain an end, like those who obtain a position in life through the vigour and knowledge of another, whose life they manage to completely obliterate with their own rank growth and grasping qualities. On seeing a shrub which has succeeded in gaining a substantial growth, after patient years of steady and honest determination, such a creeper will rush at it, make use of its substantial support, and in a short time obliterate it with showy leaves and brilliant, though often poisonous, berries.

There are also harmless parasites which appear to do no injury to their supporters, but these generally live on one which can well afford to nourish them. Such is the oak polypody, which is but an ornament to the oak.

Nettles nearly always appear to denote either the former habitation of man, or of man's work. They will point out where man has built when the fact would otherwise quite escape the observation

of his descendants, perpetuating his memory for many years after he has passed away. Not long ago, when walking through a beautiful lane, with banks formed of rock richly clothed with every variety of shrub, fern, flower and grass, such as grow chiefly in the more distant country parts, away from even a village, I came upon a gap in the hedge which was filled up with rank-growing nettles. On inspection I found the remains of an old crumbled wall, which from the rank appearance of the nettles I had suspected would be there. This is one instance out of many of a similar kind which I have personally noticed.

The above examples, with many others which could be cited, go to show that the plant life has in its own sphere, quite as much character and individuality as has the human life.

## RAMIE (RHEA) CULTIVATION IN CEYLON.

Mr. D. Edwards-Radclyffe, of London, recently sent a circular communication to various Colonial Governors and Agents-General in advocacy of ramie cultivation, in the machinery for treating the fibre of which he is materially interested.

When the letter reached the Ceylon Government it was forwarded on the 26th August to Peradeniya, and the next day Mr. J. C. Willis sent in to the Secretariat the following memorandum:—

There are undoubtedly great possibilities before rhéa, which in many respects is one of the best of all fibres. The difficulties in the way of its expansion are commercial rather than agricultural.

2. Rhea has for many years been grown at Peradeniya in small trial plots, and planters have experimented with it, but, though it grows well, it requires a very regular rainfall and much manure, while the price obtained is unremunerative. It is possible that by the use of degumming machines locally (which has not hitherto been done) a better result might be obtained, but most people here are agreed that there is little prospect of success before the industry in Ceylon at present.

3. The chief commercial obstacles to the success of rhéa are the facts that the great existing fibre industries of cotton, wool, jute, etc., are opposed to it, and that the mercerised cotton now so common competes with rhéa on its own ground, giving a similar silky lustre to the goods made of it.

4. I do not think that under present conditions it is worth the while of Government to do more than keep a plot of rhéa going at Peradeniya in case of a demand springing up, but later on it might be worth while to import machinery and try it on a large scale at the experiment station.

The Colonial Secretary replied to Mr. Edwards-Radclyffe on the above lines, in the name of H. E. the Governor, omitting the last paragraph.

## THE RUSSIAN TEA DUTY.

### INCREASE ANNOUNCED BY REUTER.

#### LOCAL VIEWS AND INFORMATION.

Both the Russian tea firms in Colombo received cablegrams from Russia this morning instructing them to ship no more tea *viâ* Odessa—which being on the Black Sea comes within the scope of the increased duty announced by Reuter to-day—but to send all their tea *viâ* Dalny. Formerly tea has been shipped in about equal quantities by Odessa and Dalny. The new duty means the death-blow to the London trade in teas for Russia and, practically to the extent that London suffers Ceylon should benefit, according to Russian merchants here. Last year about 20 million of Ceylon and Indian teas were shipped from London to Russia; and from Ceylon and India direct twelve millions and about five millions respectively. Even in the ordinary course of things more than twelve million lbs. of Ceylon tea would have been shipped direct from Ceylon to Russia this year; but with the London market closed the quantity so exported must be largely increased. As regards China, we are informed that, if China tea is shipped to Odessa, it will be necessary for the shippers to get a Russian Consular certificate, saying, where it comes from; otherwise China tea also will have to pay the extra duty. Our informant was unable to explain the position as affected by the most-favoured-nation clause.

#### SOME FURTHER PARTICULARS.

The most prominent point to be remembered in connection with the increased duty on tea imported into Russia by the European

Frontier is, the Russian tea merchants assert, the immense advantage which will accrue to Ceylon! One of them says he will guarantee that 40,000,000 lbs. of Ceylon and Indian tea will have been despatched to Russia through Dalny by the end of 1903, and all will come from Colombo or Calcutta! Incidentally it may be mentioned that the proposal which the *Times of Ceylon* has long advocated, that more tea should be sold in Colombo than has been the case, will be carried into effect in a somewhat unexpected manner. This is the way it has been put to our representative to-day, with the further comment that it should be welcome news to the planters.

From Dalny the tea for Russia will be conveyed over the new Siberian railway, which will benefit to this extent; and, although this point may have weighed with the Russian Government when the question of the increase of the duty on tea was under consideration, yet we have it on good authority that the increase is retaliatory pure and simple.

It might be expected that the closing of the Black Sea and the Baltic Ports to Ceylon and Indian tea would adversely affect the steamers which convey the tea thither. But while there will be a loss there will also be a gain. It is quite true that Russian steamers—including those of the Russian Volunteer Fleet—will not have a paying freight as far as tea is concerned on their way from the Far East to St. Petersburg; but, on the other hand, they will benefit by carrying a greatly increased quantity of Ceylon tea to Dalny, so that the account will at least be balanced. It is possible that larger cargoes of copperah will be carried by the Russian steamers to Russia in the place of tea. Mr. T. O. Tchokoff will shortly be proceeding to Russia to discuss the desirability of sending vessels of the Russian Volunteer Fleet to Calcutta during the next tea season there; for the market there has been growing steadily in importance, and he thinks there would be plenty of tea for steamers to carry to Dalny.

An important fact to remember, in discussing the question of tea for Russia, is that Ceylon tea is an absolute necessity in that country. One hears much about China tea, but Russians will not now have this weak production unless it is blended with the stronger Ceylon tea, which not only adds flavour to it, but gives it keeping qualities in which China tea alone is notoriously deficient.

One the whole, therefore, it will be seen that Ceylon has little to complain about now that Russia has raised the duty on tea so as to bar all business in tea with London.—*Times of Ceylon*, Sept. 10.

## THE GOVERNMENT ENTOMOLOGIST.

Pending the establishment of the permanent headquarters of the Imperial Agricultural Department, it has been decided that the Government Entomologist, Mr. H. Maxwell Lefroy, should be stationed at Surat, Bombay Presidency. This Officer is to gather information in connection with the insects that are injurious to field and garden crops in India, with a view to suggesting simple means, whereby the insects may be destroyed and their ravages checked. There is no lack of scope for this Officer's researches, if those who are engaged in agriculture or who are in touch with cultivators will inform him whenever insects are found to be destructive. We print below the circular describing how specimens should be sent, and detailing the information required by Mr. Lefroy. Before any useful work can be accomplished in the way of remedies, it is necessary to know what are the insects which prove destructive to Indian crops, and we may then hope that the work of this office may make itself felt and prove of value to the community.

### DIRECTIONS FOR SENDING INSECT SPECIMENS.

Whenever possible, a plentiful supply of both living and preserved insects should be sent, in all stages.

Living specimens should be sent under, as far as possible, natural conditions, with a supply of food and some provision for air if the journey will occupy more than 24 hours. If the insect lives in the ground it may be sent in slightly moist earth. Every care should be taken in packing, so that the insects cannot be crushed or injured by any shaking of the contents of the package.

*Preserved Specimens.*—All soft-bodied insects, such as caterpillars, may be preserved in weak spirits or whiskey. Such are best forwarded in a small bottle, but they may also be soaked in spirit for two days and sent in blotting paper soaked in spirit, in a tight box or tin.

Hard insects, such as beetles, may be wrapped in soft paper. They should not be pinned, and should be so packed as not to roll about. In case of long distances, the insects should be dried first, as they are likely to mould, or else naphthaline or blotting paper soaked in carbolic may be placed in the package with them. Butterflies and moths can be readily killed by pinching them below the insertion of the wings. Their wings should then be folded back over the body and the insect placed flat in a small envelope or fold of paper.

Insects should never be packed in contact with cotton wool. Paper should be placed between the insects and the cotton wool. Scale insects, aphidæ, and other small insects, are most readily sent on their food plant in small boxes or tins.

A good supply of specimens should be sent, as in many cases a few of each sex have to be forwarded to the Indian Museum and to Europe for identification. When specimens are simply to be identified, they should be sent directly to the Indian Museum, Calcutta. When specimens are sent with a request for information, it is desirable to give as many particulars as possible concerning their occurrence, etc.; this is *absolutely necessary* where it is desired to obtain recommendations as to dealing with crop pests.

It is desirable to send specimens by the quickest method available, as an extra day in transit may kill all the living insects; parcels arrive more speedily if unregistered, and it is always desirable to inform this office how the specimens are sent, so that their delivery from the Post Office here may be expedited.

## BENGAL CINCHONA PLANTATION.

### ANNUAL REPORT.

The following extracts from the Annual Report on the Government Cinchona Plantation and Factory in Bengal for the year 1902-03 are published in the *Calcutta Gazette* :—

*Weather and General.*—The rainfall during the year was much above the normal: 171.46 inches as against an average of 122.62 for the preceding 28 years. The heaviest fall occurred on 27th September, 1902, when 14.7 inches were measured. Although the total was so much greater than during the year 1901-02 when only 92.69 inches fell, and exceeded the fall registered in any of the preceding 28 years, there was little damage done by landslides on the plantation. Munsong, the new extension in the Dumsong forest, shared in the excessive rainfall, there 106.54 inches fell, as against 88.42 in 1901-02. The heaviest fall at Munsong, 8.83 inches, also occurred on 27th September, 1902.

*Plantation and Crop.*—The number of plants put out during the year was 458,927. These included 402,343 *Ledgeriana*, 26,459 *Succirubra*, 29,360 Hybrid No. I, and 765 Hybrid No. II. The area planted at the headquarters plantation (Mungpoo and Sittong) was 91.06 acres; here 160,967 *Ledgeriana* plants, all the *Succirubra* and all the Hybrid No. I plants were put out. At Munsong 89.1 acres were planted with 241,376 *Ledgeriana* and all the Hybrid No. II plants. The nursery stock of seedlings on 31st March, 1903, was 155,328. The stock included 8,000 more Hybrid No. I, 2,500 more *Succirubra*, and 123,386 more *Ledgeriana*, but 58 fewer Hybrid No. II seedlings than were in the lines on 31st March, 1903, indicating that about 134,000 more plants had to be put out after 1st April, 1903, than was the case at the same date in the preceding year. The delayed planting season which these figures indicate was due to the severe and continued drought that began in October, 1902, and had not broken at the close of the year under review. The total number of living trees of all kinds in the permanent plantations on 31st March, 1903, was 3,015,600. Of these 1,977,315 were at Mungpoo (including Rungbee and Labdah) and 208,331 were at Sittong. At Munsong, in the Dumsong forest, there were 829,954. The trees included 2,308,656 *Ledgeriana*, 256,711 *Succirubra*, 2,130 *Officinalis*, 439,903 Hybrid No. I, and 8,200 Hybrid No. II. The increase, as compared with 31st March, 1902, was 252,314. Planting at Munsong, notwithstanding the unusual drought, has been more successful than during 1901-02. The unfavourable planting conditions have, however, prevented the complete fulfilment of the year's programme prior to 31st March, 1903, since only 89.1 acres out of 100 acres prepared for planting had been put at the close of the year. This will, of course, be recorded as completed in the opening months of 1903-04. But the dryness of the planting season has made it further impossible to overtake entirely the filling up of the vacancies due

to the casualties explained in the last annual report. After a close personal examination of the extensions and careful discussion with the Deputy Superintendent of this subject in all its bearings, we are agreed that, in the interests of the extension, the programme of work for 1903-04 must be modified slightly. Instead of attempting to put out the full extension of 100 acres for that year, it will be necessary to be contented with a smaller area and devote the seedlings which otherwise would have filled the complete extension to the replacement of the 1901-02 vacancies. The factor which renders this decision essential is the labour one; this, as regards Munsong, is not capable of temporary modification.

During the year 600 maunds of bone meal at the rate of 10 maunds per acre were applied to other sixty acres of four-year old cinchona. The application of this manure is now beginning to show its effects on the plants previously so treated, their foliage being decidedly more abundant and healthy looking; their stock of fresh surface-feeding roots more plentiful; and their growth, except in trees already diseased, more vigorous. The results are such as to amply justify an increase in future of the quantity of bone-manure applied, and an extension of the acreage annually so treated. The method of deep trenching and more intensive cultivation systematically adopted during the past few years is now showing its full effects in a diminished mortality among the young cinchonas and a marked decrease in the amount of canker present in the extensions, and great credit is due to the Deputy Superintendent, Mr. Pantling, for the care and energy with which he has carried out this improved method of cultivation. Early planting, in years when it can be carried out, appears entitled to credit for a share in this improvement. Unfortunately, however, early planting is not always possible, and has its own special risks which are, however, on the whole, well worth incurring. Grafting experiments have been continued by Mr. Green, Nursery Assistant, with hopeful results.

The crop taken from the plantation during the year has been 235,605 lbs. of dry bark. From Mungpoo the quantity taken was 209,219 lbs., from Sittong, 25,781 lbs.; 605 lbs. were also taken from thinnings at Monsong. The crop has been composed of 140,669 lbs. Ledgeriana, 12,580 lbs. Succirubra, and 82,356 lbs. Hybrid No. I. The whole of the bark thus harvested has been made over as usual to the Quinologist.

*Factory and Outturn.*—Work in the factory has gone on throughout the year without accident or delay. The systematic examination of the arrangement and method of working in connection with the separation of quinine has now been completed and the renewals and additions to factory plant mark the close, for the present, of this stage of inquiry and improvement, for carrying out which great credit is due to Mr. R. Pantling, Deputy Superintendent of the Plantation. Considerable advance has been made with the next stage of the inquiry which will incidentally involve a re-casting of the methods adopted for the preparation of cinchona febrifuge. The raw material worked up during the year included 392,250 lbs. of Ledgeriana, Hybrid No. I, and Officinalis bark, which provided 11,927½ lbs. sulphate of quinine, the average yield being 3.04 per cent, the residual alkaloids left over in the process, accounted for during the year, amounted to 3,516 lbs. In addition to the foregoing quantity of bark, 84,800 lbs. of mixed Succirubra and Hybrid bark, to which 3,036 lbs. of residual alkaloids were added, yielded 4,342 lbs. of cinchona febrifuge. The total outturn of manufactured products for the year has thus been 16,275 lbs. 4 oz., an increase as compared with the previous year of 2,840 lbs. 8 oz. This increased quantity included 1,916 lbs. 8 oz. of sulphate of quinine and 924 lbs. of cinchona febrifuge.

*General Charges.*—The charges debitable against the department as a whole have amounted to Rs.21,604 as against Rs.25,632. These charges include pay of clerical and menial establishment, Rs.4,962; postal and telegraph charges, Rs.507; advertising manufactured articles, Rs.680; and taxes (road and public works cesses), Rs.1,475. They include, besides, the expenditure incurred in adding to factory plant and appliances; the charges under this heading amounted to Rs.3,908. Besides the above, Rs.1,000 were expended in constructing a new road to the Sonada station of the Darjeeling-Himalayan Railway.

*Plantation Charges.*—The charges debitable against the plantation have been Rs.85,285 as against Rs.73,126 for 1901-02. The increased expenditure has been mainly on labour utilized in more effective and thorough cultivation. Against this outlay has to be placed the harvest, 235,605 lbs. of dry bark obtained during the year.

*Factory Charges.*—The expenditure incurred in connection with the factory was Rs.86,429. Of this sum Rs.38,000 represents the purchase money and Rs.1,557 the cost of carriage to the factory of 84,301 lbs. 12 oz. of cinchona bark acquired from private growers; the actual working expenses of the factory for the year were therefore Rs.46,871, being Rs.39,903 incurred in the manufacture of sulphate of quinine and Rs.6,968 for the manufacture of cinchona febrifuge. In order to produce 11,927 lbs. 4 oz. of sulphate of quinine, 205,348 lbs. of Ledgeriana bark, 46,368 lbs. of Hybrid No. I bark, and 70,576 lbs. 8 oz. of Officinalis bark from the stock held on April 1st, 1902, were used. The value of this bark was Rs.46,602. In addition 69,957 lbs. 8 oz. of Officinalis bark purchased during the year for Rs.31,918 were employed. The total value of bark used was thus Rs.78,520. Of the residual alkaloids left as a bye-product in the manufacture of quinine 3,036 lbs. treated along with 84,800 lbs. of Succirubra and Hybrid No. I bark provided 4,342 lbs. of cinchona febrifuge. The value of the bark used was Rs.7,047; of the residual alkaloids, Rs.2,877.

*Issues of Manufactured Articles.*—The issues of sulphate of quinine for the year amounted to 10,950 lbs. 5 oz., an increase of 1,157 lbs. 2 oz., as compared with 1901-02. There was an increased demand for 800 lbs. on the part of medical depôts, for 523 lbs. 2 oz., in connection with pice-packet system, and for 46 lbs. on the part of the Inspector-General of Jails, Bengal, but a decrease of 213 lbs. 10½ oz. on the part of Government dispensaries. The issues of cinchona febrifuge for the year amounted to 4,505 lbs. 12 oz., an increase of 835 lbs. 8 oz., as compared with 1901-02. There was an increase in the demand on the part of the public generally of 329 lbs., the Principal Veterinary Surgeon, South Africa, received 500 lbs., as compared with 300 lbs. in the preceding year.

*Receipts.*—The receipts for the year have amounted to Rs.2,11,784 as compared with Rs.1,91,922 for the preceding year. Cash receipts have amounted to Rs.81,438 and include, besides the receipts for manufactured articles (quinine, Rs.47,088 and cinchona febrifuge, Rs.32,441) the sum of Rs.1,799 as receipts for crude products (bark, Rs.269 seed, Rs.190 and residual alkaloids, Rs.1,340), and the sum of Rs.108 as receipts for miscellaneous articles (empty soda-drums, old gunny-bags, etc). The book credits for the year amounted to Rs.1,30,345, and have included Rs.36,670 for issues in connection with the pice-packet system, with an additional credit as regards Bengal, reported by the Accountant-General, Bengal, of Rs.6,403; Rs.85,783 for issues to medical depôts; Rs.400 for issues to the Inspector-General of Civil Hospitals, Bengal; Rs.2,452 for issues to the Inspector-General of Jails, Bengal; Rs.5,000 for issues to the Principal Veterinary Surgeon, Cape town; and Rs.90 for issues to the Colonial Secretary, Sierra Leone. The outstandings representing cash issues made during the last few days of the financial year, the transactions in connection with which were not completed on 31st March, 1903, amounted to Rs.5,709. It has been necessary, under the advice of the Government Solicitor, to write off as a bad debt Rs.24 of the outstandings on 31st March, 1902; the remainder of the outstandings at that date were recovered in due course.

*Stock Account.*—The manufactured articles in stock on 31st March, 1902, consisted of 3,924 lbs. 14 oz. of sulphate of quinine and 2,377 lbs. of cinchona febrifuge; their respective values were: quinine Rs.59,023 and febrifuge Rs.23,770, these sums representing the average price at which stock of similar quality was sold during the year. Raw material and unmanufactured products included 230 lbs. of residual (amorphous) alkaloids in stock at Calcutta, valued at Rs.218 and 1,238,903 lbs. 15 oz. of dry cinchona bark, valued at Rs.2,32,527. The value of stores in stock was Rs.1,989, consisting of oils Rs.1,071, chemicals Rs.577; sundries (charcoal for purification), Rs. 340.

*Balance-Sheet.*—\* \* \* \* As directed by the Government of India the stocks of bark, quinine, and febrifuge are valued at the average price at which stock of similar quality was sold during the year. This involves an enhancement of the stocks held at the close of the year by Rs.1,20,771; at the same time, as directed by the Government of India, non-recurrent general charges, which amounted for the year to Rs.4,908, are excluded from the debit side of this account. The balance on this account is thus Rs.1,74,088. Excluding this enhancement in the value of the stock, which is due mainly to a different method of calculation, and allowing for the non-recurrent charges, the net surplus for the year amounts to Rs.48,408.

*Sale of Quinine at Post Offices.*—The quantity of quinine issued to the Jail Department during 1901-03 was 2,529 lbs., being 518 lbs. in excess of the supply during 1901-02, but still nearly 1,000 lbs. below the quantity issued for this purpose during 1900-01. This falling-off proves, on inquiry, to be due to the diminished prevalence of malaria in the Lower Provinces and Assam.

*Miscellaneous.*—(a) *Fuel Plantation*—Fifteen acres of the Khasia oak plantation were coppiced during the year. The yield was 27,603 maunds or 1,840 maunds per acre; of this, 24,103 maunds consist of oak fellings or 1,606 maunds per acre of firewood of the highest quality. The eight acres coppiced during the previous year have produced a healthy growth, and all vacancies have been filled up. (b) *Land Rent*—The revenue collected from settlers within the cinchona reserves for grazing and land rent amounted to Rs.3,429, being Rs.117 less than the previous year's revenue. This sum was, according to custom, paid into the treasury at Darjeeling, no credit being taken for it in the accounts of the Cinchona Department.

## DISTRICT ASSOCIATIONS.

### SHEVAROY.

Proceedings of the Annual General Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, at Yercaud, on Monday, the 7th September, 1903, at 1 p.m. **PRESENT:**—Messrs. C. Dickins, E. Dickins, J. C. Large, C. G. Lechler, W. J. Lechler, H. W. Leeming, Limouzin, S. M. Pritchard, C. Rahm, W. Rahm, F. Short. Mr. R. Gompertz, *Honorary Secretary*.

1. Notice calling the Meeting was taken as read.

2. Honorary Secretary explained that in the notice he had called this Meeting the "Quarterly" instead of the "Annual General" Meeting; and that he had only remembered that this was the Annual General Meeting this morning. In consequence of this oversight, he had not written the usual report, nor prepared the Annual Statement of Accounts, which should have been laid before this Meeting. He begged to apologize for the mistake; but as the accounts, though not tabulated and abstracted, had been brought up to date, there was no reason why the Meeting should not be proceeded with.

3. Read and passed accounts up to the 31st August, 1903, showing a balance in hand, on that date, of Rs.339-6-10. Honorary Secretary stated that he had also in stock 10 Bamboo pass, and six Coffee pass-books, of the value of Rs.65-8-0, and Stamps worth Rs.5-5-6 which would bring the total balance up to Rs.410-4-4 on the 31st ultimo.

4. Read letter from the Collector forwarding a list of alterations proposed by the Tahsildar in the Rules framed under the Coffee-Stealing Prevention Act, and enquiring whether we recommend their adoption.

*Resolved*—That the alteration of the date for submission of Form B to the 10th April is approved

ii. That it would be well to enter the name of the village to which the Estate belongs

iii. That we see no objection to the introduction of the headings proposed by the Tahsildar, if they be printed on the forms supplied by Government to planters.

5. Read letter of 16th ultimo from the Tahsildar asking for a number of Statistics about Coffee.

*Resolved*—That Honorary Secretary be requested to reply that he has not the necessary data, and is unable to furnish the information required.

6. Read proceedings of the Board of Revenue, No. 2607. of the 4th August, 1903, stating that a sum of Rs.50,000 had been sanctioned for expenditure, during the current year, on the Yercaud Ghaut Feeder Roads.—Recorded with satisfaction.

7. Read Secretary's Circular, No. 51/03, of 22nd ultimo, stating that the Government of Mysore have sanctioned a payment of Rs.5,000 towards the expenses of the St Louis Exhibition.—Recorded with satisfaction.

8. Read Secretary's Circular, No. 55/03, saying that the Government of Madras had been pleased to contribute Rs.5,000 towards

the U. P. A. S. I. expenses at the St. Louis Exhibition.—Recorded with satisfaction.

9. *Resolved*—That, as the Brazil Mission had fallen through, the Rs.100 voted for it from the funds of the Association should not be drawn.

10. Proposed by Mr. C. G. Lechler; seconded by Mr. C. Rahm—That, as the Brazil Mission has fallen through, the Rs.120 subscribed towards the expenses of the Brazil delegate, be handed over to the Coffee Committee, viz., Messrs. Hodgson, Harris, Martin, and King-Church, on the understanding that it is not to be expended on the expenses of the St. Louis Exhibition, but is to aid in satisfying the demand for South Indian Coffee, which it is hoped will be created by it, after the Exhibition is over.

*Amendment.* Proposed by Mr. Large; seconded by Mr. Pritchard—That the Rs.120 be handed over to the U. P. A. S. I., as a contribution to the St. Louis Exhibition, without any restrictions.

The amendment was put to the Meeting and lost.

The original proposition was then put to the Meeting and carried by 9 to 3.

11. Mr. Gompertz having stated that, as mentioned in the notice calling the Meeting, he could no longer serve either as Chairman and Honorary Secretary, or on the Committee, for private reasons, the election of Office-bearers was then proceeded with, with the result that Mr. C. G. Lechler was elected Chairman and Honorary Secretary. That gentleman having declined the honor, owing to press of work, and for other reasons, Mr. B. Cayley was unanimously elected in his stead, with the following Committee: Rev. M. Andersen, Mr. C. Dickins, Mr. J. C. Large, Mr. C. G. Lechler, Mr. W. J. Lechler, Mr. C. Rahm, and Mr. W. Rahm.

A number of letters were read and recorded, and the Papers, Books, and Periodicals received since the last Meeting were laid upon the table.

ROBT. GOMPERTZ,

*Chairman and Honorary Secretary, S. P. A.*

*N.B.*—The following, which was not recorded on the Minutes of the Proceedings, is now added at the special request of Mr. J. C. Large:

"Before the close of the Meeting, Mr. Large expressed, in a few words, the appreciation with which the members regarded the long and arduous services of Mr. Gompertz during the last six years in which he has been their Honorary Secretary, and the great regret they felt in losing his valuable services. A very hearty vote of thanks was proposed, and carried by acclamation by all present."

ROBT. GOMPERTZ,

*Late Chairman and Honorary Secretary, S. P. A.*

## WYNAAD.

Proceedings of an Extraordinary General Meeting, called at the request of Messrs. Behr, Day, Mackinlay, Taylor, and Waddington; and held at the Meppadi Club on September 11th, 1903. **PRESENT:**—Messrs. Armstrong, Behr, Day, Mackinlay, Nicolls, Taylor, Trollope. Mr. B. Malcolm, *Honorary Secretary*.

*Visitor:* Mr. Gillatt.

Mr. Waddington *in the Chair*.

1. *Roads.*—The Honorary Secretary drew attention to the correspondence in the *Madras Mail* re the "Wynaad Roads" ending with the Malabar District Board Engineer's letter of September 4th; and the following Resolution was unanimously passed:

*Resolved*—With reference to the statements made by the District Board Engineer, that this Association is of opinion that the work done on the Meppadi Chundale section of the Nilgiri-Calicut road, and of the metal collected on it, fully merits the descriptions given by Messrs. G. Romilly and B. Malcolm in their respective letters to which the District Board Engineer refers; and this Association confirms their statements after a personal inspection of the road made by 5 of the members present.

The Association regrets that in spite of its protest to the District Board of Malabar, the metal referred to has been passed; and is of opinion that the use of metal of this description, for the expenditure incurred, is distinctly a waste of money. Also that

it does not require an expert to judge of the quality of metal of this description, a sample of which was laid on the table and a proportion of which was broken by hand by the members present.

Furthermore the Association would point out that the road is not being broken up before the new metal is laid and it consequently cannot consolidate properly. That the Culvert near the Meppadi Toll-Gate is still blocked, though attention was called to its state some considerable time ago.

Finally that the Local Member of the District Board be asked to do all in his power to bring this matter before the District Board.

A vote of thanks to the Chair terminated the proceedings.

(Signed) H. WADDINGTON,  
Chairman.  
( „ ) BERNARD MALCOLM,  
Honorary Secretary.

## MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated August 28th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ...	217,321	302,521	27,457
1902-1903 ...	247,839	341,026	23,275

30,417 pkgs. INDIAN } Total 65,545 packages were offered in public auction  
31,158 „ CEYLON } this week.  
3,970 „ JAVA }

During the next few months Indian Tea will be arriving in quantities in excess of concurrent requirements, and it is to be

hoped that Growers will see their way to regulate supplies so that the quantities put up for auction will not be dependent on the vagaries of ships' arrivals as they appeared to be at the early part of last season. It will be remembered that in two consecutive weeks in the month of October, the amount of Indian Tea brought to auction varied from 39,000 packages in one week to over 54,000 the next. It is desirable to equalise supplies as much as possible and spread them more in accordance with requirements, as buyers would then feel greater confidence in holding stocks.

INDIAN.—The supplies have again contained some good liquoring teas from Assam and some of the Darjeeling Teas have also showed an improvement. The market has exhibited a steady tone and prices for some useful liquoring parcels from 7d. to 9d. have shown a hardening tendency.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 25,583 pkgs., av. 8·39d. 1902, 28,172 pkgs., av. 6·94d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 99,860 pkgs., av. 7·97d. 1902, 123,493 pkgs., av. 6·88d.

CEYLON.—These have been in rather larger supply but have been readily taken by buyers at rates previously current. In a few cases, prices for useful medium teas were helped by the competition of export orders.

Average for week 7·07d., against 6·48d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 686,411 pkgs., av. 7·46d. 1902, 773,451 pkgs., av. 6·70d.

JAVA.—A fairly large quantity was catalogued, sixteen estates being represented in the auction. Amongst these were some useful liquoring teas, and an invoice from the "Goalpara" estate commanded full prices. Since 1st June 22,578 packages of Java Tea sold on Garden Account realised an average of 6·61d. per lb.

Bank Rate 3 per cent. Exchange on London three months' sight:—  
Calcutta 1/4<sup>5</sup>/<sub>32</sub>. Colombo 1/4<sup>3</sup>/<sub>16</sub>.

## CINCHONA.

The auction to be held at Amsterdam on September 3 will consist of 10,410 bales and 489 cases of Java bark weighing 950,856 kilos. The above quantity contains 44,726 kilos. or 1,560,000 oz. sulphate of quinine. The manufacturing bark contains an average of 5.06 per cent. of q.s. against 4.89 per cent. for the July auction, and an average of 5.51 per cent. for the previous ten auctions held at Amsterdam in 1902. The above supply includes 648,000 kilos. of Ledgeriana, 150,000 kilos. Succirubra, 148,000 kilos. hybrid, and 4,000 kilos. officinalis.

## QUININE.

This article is firmer, and business done. B. & S. and/or Brunswick on the spot at 11½d. to 11¼d., and March delivery at 1s. per oz. After a very quiet week the market closed firmer to-day, with small sales at 11½d. spot, 11½d. for December, and 1s. for March.

## CARDAMOMS.

In consequence of the arrivals of large quantities to be offered at the next drug auctions, there has very little business been done by exporters this week.

## VANILLA.

At auction on Wednesday 542 tins 7 cases mostly Seychelles were offered, of which about 300 tins sold at steady prices for good short, about 6d. lower for long and short medium; common brown and foxy sold at previous prices. Seychelles, etc., 7 to 9 inches, sold at 10s. to 13s.; 6 to 7 inches, 8s. to 10s.; good to fine chocolate, 4½ to 6 inches, 7s. to 8s.; common dry brown and foxy, 4s. 6d. to 6s. 6d.; fair, 5 to 6 inches, 5s. 9d. to 6s. 6d.; 6 to 7 inches, 6s. to 7s. 9d.; and 7 to 7½ inches, 8s. to 9s. per lb.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, SEPTEMBER 26, 1903.

[No. 38.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 2nd proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

### CROP EXPERIMENTS.

#### HOW NOT TO MAKE THEM.

WE have repeatedly accused Governments in India of neglecting the application of Science to Agriculture. More or less directly, replies have reached us to the effect that there is a "Department of Agriculture" here, another there, and so on. This is all very well, but it is not what we have been advocating. A so-called Department of Agriculture is not necessarily an efficient department; and the general rule is that Departments of Agriculture have, during a great many years, been weak in respect to scientific officers. They have been especially weak when they should have been strongest—at the top. One result is that much has been essayed under the name of "research" or "experiment" that can only be regarded as reckless and wilful waste of public money and of the time of men totally unfitted for the work that they have undertaken. Madras could furnish us with many cases in point; and in Madras the Department of Land Records and Agriculture is still far behind the need of the day. It happens, however, that a more convenient instance is furnished by the Report on the Season and Crops of Assam for the year 1902-03. This is a blue-book. It bears the signature of "J. C. Henniker, Esq., I.C.S., Director, Department of Land Records and Agriculture, Assam." From page to page it contains lessons in the art of how not to conduct crop experiments, and reveals the seriousness of the defects that arise from placing an agricultural department under the care of someone who is obviously not an agricultural scientist or specialist.

In this report we read that a certain statement in the appendix "shows the average outturn of crops for the year as indicated by the crop experiments made in each district during the year 1902-03. The figures in the statement are not exact arithmetical averages of the yields obtained by experimenting officers. The method adopted consisted in discriminating between experiments made by superior officers and those by officers of low rank, and in selecting the figure about which the largest number of individual yields cluster as the average outturn for the year. The results of such crop experiments as deserve consideration are compared . . . with the outturn accepted as normal for each district." Who decides as to the merits of experiments, we are not informed; but we will give a few samples of the kind of record that is entered in the report. Under the head of Cachar it is observed:—"Twenty-three experiments were made in *sail* during the year 1902-03. Eight of these were made by sub-Deputy Collectors, *the rest by police officers of subordinate rank*. They give an outturn of 1,070 lbs. per acre, which is 70 lbs. more than the accepted standard of the district. This would indicate the crop to be 107 per cent. of the normal. The Deputy Commissioner's estimate is 125 per cent. Possibly, the normal figure requires revision. It needs watching in succeeding years." Again:—"In *aus*, seven experiments (*all by police officers of inferior rank*) were made, and they indicate an average outturn of 860 lbs. per acre, against the normal outturn of 800 lbs. per acre. The crop was a good one in this district, and as the experiments were made only by inferior officers, who, *for some unexplained reason*, always produce low results, I accept 125 per cent., which has been returned by the Deputy Commissioner." Yet again in Sylhet:—"Twenty experiments were made in *sail*, and of these, *two only were made by gazetted officers*" . . . "In *aus*, eleven experiments were made, *all by officers of inferior rank*. The figure derived therefrom is 918 lbs. per acre, against the normal outturn of 800 lbs. This would show the crop to have been about 15 per cent. above the normal. The Deputy Com-

missioner has reported the crop to be 85 per cent." It is no exaggeration to state that we have quoted but a few out of many instances that are available in the report before us. We could go on citing them *ad nauseam*. The italics given above are our own. To us they suggest that the Director has an idea that might be colloquially expressed thus: "Any fool can conduct crop experiments." Government money has been wasted, valuable time has been lost, in order to get a record of experiments which, on the face of things, are worthless. If subordinate police officers and all sorts of gentry such as are known in Assam as "kanungos" and "mandals" are employed to conduct crop experiments, there is sufficient evidence available to condemn the local Department of Agriculture as incompetent and unworthy of its name.

The lot of the police official in Assam would appear to be an extremely happy one. His whole duty does not lie in the prevention and the detection of crime and the maintenance of public order. He is *par excellence* the crop experimenter. His the humble hand that tills the soil, that raises experimental crops, that notes down results for the guidance or misguidance of one of the Heaven-born! The absurdity of the system—it obviously is an established system—is too manifest to call for very much comment; and we can but express the hope that the report under notice will "catch" Lord CURZON's eye. A course such as that pursued in Assam is calculated to bring Scientific Agriculture into ridicule. What we want is that planters and agriculturists should be taught how to do things, not how *not* to do them. Dr. LEHMANN, Agricultural Chemist to the Government of Mysore, has given valuable hints to planters as to how to conduct crop experiments. He has addressed Mysore cultivators to similar effect. We have not learnt yet, however, that he has invoked the aid of the Mysore Police as experimentalists or demonstrators. But then he is a trained scientist. We enter an energetic protest against the method of "experiments" followed in Assam, though it serves our purpose so far as to give considerable additional weight to the remonstrances we have frequently expressed and to our exhortations to Government in India that what Agriculture needs is aid in the matter of the application of science and scientific methods to its needs.

COFFEE NOTES.

If coffee consumption increases in the next five years at the rate it has in the last five years, it will have attained the figure of 22,000,000 bags in 1908.

Chicago imported, directly, in July, 100,200 pounds of coffee, paying therefor \$11,201, or 11½ cents a pound.

The Haitian export duty on coffee pickings has been fixed at \$2 (\$1·96 United States) per 100 pounds. The law will cease to be operative on September 30 next, when coffee pickings will again become subject to the regular coffee export duty of \$3 (\$2·80 United States) per 100 pounds.

The Dutch East Indian crop is reported to be late this year. Government sales will be held at Batavia as follows:—

October 9	...	24,000 piculs.
November 11	...	25,000 "
December 4	...	24,000 "
Do. 30	...	25,000 "

Drouths in Brazil.—Reports of drouths in Brazil are more or less frequent and some cables say that they threaten to become serious. Rains, however, are reported in Rio Claro, which is in the central part of São Paulo.

The Associacao Commercial, of Sao Paulo, has received estimates from 94 out of 124 districts regarding the current coffee crop in that state, and altogether it is calculated at 7,000,000 bags, against 8,350,000 bags of the season of 1902-03, 10,148,000 bags of that of 1901-02, and 7,988,000 bags of that of 1900-01. Most of the replies are based on tax receipts for the fiscal year, July 1, 1902, to June 30, 1903.

Shipments of Porto Rico Coffee to U. S.—The total shipments of coffee from Porto Rico to the United States in the 12 months ending June 30 last amounted to 6,314,686 lbs. In the corresponding period of the preceding year the quantity was only 227,560 lbs. Its value was \$27,031 while that of 1903 was \$718,531.

In June last Porto Rico exported 1,102,724 pounds of coffee, at a total value of \$117,693. Of that quantity the largest recipient was France, which took 443,199 pounds; Spain was the next best market with 424,791 pounds; Cuba received 55,341 pounds, Austria-Hungary, 48,607 pounds; Germany, 30,416 pounds, and 370 pounds were shipped to Italy. The United States in the last 12 months has taken 7,000,000 lbs. of this coffee.

The S. Paulo Railway has been asked by the Secretary of Agriculture of Brazil to cut rates to satisfy the demands of coffee-planters.

**The U. S. Coffee Market.**—Coffee, in the absence of new features and any developments and because of the Summer lassitude, continues in a dull way, says the *Tea and Coffee Trade Journal* of 25th ultimo. Brazil receipts are fairly full and promise to attain to the high figure of 1,800,000 bags estimated for the month of August, and may go beyond that figure. The Santos receipts are now running in excess of the August receipts of the 1901-02 bumper crop. And this in the face of the frosts of last Summer, which were said to have damaged the crop then growing 20 per cent! Firm offers from Brazil have been too high for buyers here, and have, therefore, met with scant attention. Bourbon Santos No. 3 has been offered at 6c. c. & f., and refused. Spot invoice coffee drags at unchanged quotations which are 4½c. for Rio No. 8, 5½c. for Rio No. 7, 5½ to 5½c. for Rio No. 4, and 5½ to 6c. for Santos No. 4. Good roasting coffees are no more plentiful than heretofore and command a premium. A slow run of orders is reported by the jobbing trade.

In the option market prices are where they were one week ago. In a moderate way there has been some trading, chiefly induced by the nearness for September deliveries. There has been fairly heavy switching into the distant months. Hamburg and Havre are on a higher basis and this fact has served to strengthen the market somewhat, justifying the fluctuations and inviting attention of interests disposed to try the market for a flyer. Rumours of unfavourable weather in Brazil have been current, but traders are callous to such reports now-a-days. Similar lack of credence greets other reports which tell of proposals to organize the Brazil planters into an effective trust.

In mild coffees the increasing supplies have brought out rather free offerings, but buyers are backward in purchasing. The market is therefore quiet and easier. Good Cucuta has declined to 7 to 7½c. East India coffees are quiet and steady.

**Differences in Actual and Exchange Coffee.**—Regarding why any desired grade of coffee cannot be bought on a basis of the Coffee Exchange prices, about which there is much confusion especially outside of the coffee trade circles, the following explanation has been offered to the *New York Journal of Commerce*:

It is because the price on the Exchange is governed by the value of the grades most in supply and the least wanted. At present a buyer on the Exchange would probably receive Rio coffee grading about No. 2, which at the difference between grades, would cost 2½ cents a pound above No. 7. The standard on which the contract is based, with August at 3·60, the coffee delivered would cost the receiver 6·10c. per pound, net cash. Every grade from standard No. 4 and

below commands a premium above the exchange option prices. The grades most difficult to secure are standards No. 6, 7, and 8. To put this clearly, below is given the present market prices of the different grades in New York for 1,000-bag invoices, and the cost to the buyer if he could select and receive the corresponding grade on the Coffee Exchange, showing that the only grades that could be delivered at near invoice values are Nos. 1, 2, and 3:

Exchange standard— No. 1	Invoice prices.		Exchange value to receiver net cash.
	Rio.	Santos.	
2	6½	7	6·60c. per lb.
3	6½	6½	6·10c. "
4	5½	5½	5·60c. "
5	5½	5½	5·10c. "
6	5½	5½	4·60c. "
7	5½	5½	4·10c. "
8	4½	5	3·60c. "
9	4½	4½	3·10c. "
			2·60c. "

The standard on which transactions on the Coffee Exchange is "low ordinary No. 7." There are nine standards on which all deliveries are graded, having various values either above or below standard No 7. They are as follows:

Exchange standard—		Valued 3c. per lb. above No. 7	
No. 1	...	2½c.	"
2	...	2c.	"
3	...	1½c.	"
4	...	1c.	"
5	...	½c.	"
6	...		"
7	...	Basis of all contracts.	
8	...	Valued ½c. per lb. below No. 7	
9	...	1c.	"

Another discrepancy in prices that brokers appear to be having some difficulty in explaining to the trade is their inability to fill orders for interior buyers at ruling quotations for the various grades of Brazil coffee. The explanation is that buyers usually want coffees showing either attractive grocery style or good roasting qualities; these selections are in comparatively small supply, especially grades Nos. 8 to 4, and command premiums of from ¼c. to ½c. per pound from the quotations for ordinary grades of coffee, hence the apparent discrepancy.

**Coffee in San Francisco.**—The market has been extremely quiet and at present writing continues dull and heavy, dealers being little disposed to buy in excess of temporary requirements. Stocks in importers' hands are large, but as arrivals for the season are practically over, will decrease rapidly from

now on. Strictly superior grades of washed coffees are exhausted, fair to prime are still in good supply, but not more. The assortment is overloaded with ash-damaged and non-descripts, mainly Guatemalas. Large quantities of mild coffees are now coming forward to New York from Venezuela and U. S. of Colombia, and heavy receipts from those quarters are expected for some months to come. Quotations in New York for these have declined sharply of late, and has direct bearing upon the product of Central America.

The position of Brazilians has weakened a trifle during the past month, both as to spot coffee and futures, and is generally regarded as not promising any improvement under existing conditions and crop prospects as now estimated. At the close, however, futures improved 5 to 15 points under heavy speculative buying of the distant positions. Spot coffee unchanged. Receipts at the ports of Brazil so far are slightly in excess of last year's.

\* \* \*

**Guatemala Coffee.**—With reference to a notice which appeared in the "Board of Trade Journal" for October 3, 1901, relative to the duty on cleaned coffee exported from Guatemala, the Board of Trade have now received information, through the Foreign Office, to the effect that the operation of the duty in question—six paper dollars (equal about 1s. 3d. at the present rate of exchange) per quintal—has been extended until further notice. A proportionate rate of duty is leviable upon the export of coffee in the husk.

\* \* \*

**Coffee from the Congo.**—A writer in a Continental contemporary waxes enthusiastic over the merits of coffee grown in the Congo. In his opinion it does not suffer in comparison with American coffee. "The sun that shines on the Congo is the same," he says, "as that which warms the Brazilian plantations; the two countries lie on the same equator; the temperature is identical; and the Belgians who superintend the Congo coffee plantations are superior to the Brazilian planters. Then why should not Congo coffee in the near future take its stand among the finest growths in the world?" Such little things as soil and generations of experience in the cultivation of coffee do not seem to count. However, the original wild Congo species have been improved by intelligent culture, and to-day there are a large number of plants in bearing in both Upper and Lower Congo, particularly in the zone of the Stanley Falls. The following figures will show the growth in the number of coffee trees during the seven years 1895 to 1901:—1895, 61,518; 1896, 241,446; 1897, 494,069; 1898, 1,167,259; 1899, 2,021,178; 1900, 2,364,334; 1901, 2,631,183. The plantations are composed principally of Liberian kinds, though some species from Arabia and Guadeloupe may be seen there. The State is engaged in the culture of native sorts, the greater part of which produce a coffee of good quality. The work is entrusted to the natives, who perform their duties well. They live in a sort of little camp attached to the plantations, which is rendered bright by the multi-coloured garments and strange ornaments of the women and children. But picturesque as is the scene the camp offers, it is nothing when compared with the animation which prevails in the plantations when the time comes to gather the harvest. Quickly, and with uniform movements, the workers pick the coffee berries, until a heap of huge dimensions is formed. The berries are then carried to the "lavoirs." These are large oblong vessels, made of brick, through which passes a constant stream of

running water. The workers seize the sacks, hold them over the water, open the mouth, and an avalanche of berries falls into the vessels. The earth is loosened and sinks to the bottom, whilst the berries, being lighter, rise to the surface, and float thereon until, borne by the current of water to the end of the vessel, they fall like a red and shining cascade upon a wire grating. When the berries are dry they are passed between large rollers, which break the blackish husk and release the precious berries without bruising them. It now only remains to put the coffee in 66-kilog. bags, and it is ready for despatch.

\* \* \*

**Mocha Coffee.**—During the past few years, says United States Consul Wm. Masterson, Aden, Arabia, I have often heard the assertion made and have seen it in the newspapers in our country, that there was no such article as Mocha coffee, that the term is purely a fiction, and that what was once known as Mocha coffee is so mixed with other coffees that there is no longer a real Mocha.

In order to help correct such an impression and to do the coffee merchants of this place and the importers in our country an act of justice, I wish to say that there is such an article to-day in the American market as Mocha coffee; that this coffee is of the same kind and from the same place as the noted Mocha coffee of several generations ago, and that the growers and handlers of this coffee are as particular in regard to its quality and purity as they ever were.

At different times merchants have tried to ship coffee from other countries to this place and forward it from here as genuine Mocha, but the city authorities have always suppressed such traffic and have otherwise assisted the merchants in keeping up the standard and good name of this coffee.

Knowing of the carefulness with which the coffee interests are managed and the Government's protection over it, I am of the opinion that if by the time the consumer gets his Mocha coffee it is not pure, the mixing has been done after it leaves Aden.

A letter from E. D. Inward, Esq., Secretary of the Aden Chamber of Commerce, tells of the more recent steps that have been taken to protect the Mocha coffee interests, as follows:

An order—No. 36—dated the Aden Residency, April 13, was issued to the effect that all coffee or coffee husks other than Mocha should be placed in the Port Trust godowns (warehouses) at Maala and the keys kept by the Trustees; but as this proved too expensive for some of the smaller coffee merchants here, who could not profitably afford to pay the godowns rent charged by the Port Trust, further representations were made to the Political Resident by this Chamber with the result that a more recent order has been issued and is now in force, to the effect that all outside coffees must be stored in merchants' own godowns at Maala and the keys kept by the Port Trust officials. The above order obviates all possibility of fraudulent mixing, and you will be conferring a great benefit on the Aden coffee traders if you make this information as public as possible in the United States. A control has always been kept over foreign coffees here.

\* \* \*

In 1902 Greece imported 935 tons of Coffee, against 844 in 1901. Of the former quantity, 443 tons was from Austria-Hungary, 156 tons from France, and 336 tons from other countries.

TEA NOTES.

**London Tea Market.**—A London wire of the 14th says :—Messrs. Ewart & McCaughey's tea report states that at the auction sales 42,968 packages were offered. The prices for common to medium grades being uncertain, a good deal was taken out. Fine grades again met with attention, good Pekoe Souchongs selling especially well. Broken Pekoes with cup quality were also in strong enquiry. Common Pekoe Souchongs were quoted at about 5½d. Messrs. Gow, Wilson & Stanton's report, dated the 17th instant, states that heavy supplies are depressing the market, which for fine teas generally is easier, and the market for teas for price is also easier. The average price of Assam and Indian teas sold on garden account this week is 9½d. and 7¾d. respectively. A rise in prices was scarcely expected; but Messrs. Gow, Wilson & Stanton's cable of 17th to Colombo reports an advance of ½d. in the week's average for Ceylon teas. Indian tea shows a fall of ¼d. Of Ceylons 23,000 packages were offered and 21,000 sold; average 7¾d.; of Indians 37,000 were sold out of 49,000 offered; average 7¾d. It must be remembered that some very fine Assams have been offered of late, but perhaps the proportion of these has fallen off. The general tone of the market appears to have been steady to firm, except as regards common to medium descriptions, which were dull. According to a London cablegram, Messrs. Ewart and McCaughey's Tea Report, dated the 21st instant, says that at the auctions 33,153 packages were offered, with little changes since last week. Plain ordinary kinds were again inclined to come down. Some Assams which just failed to show any character took a lot of selling. Some Broken Pekoes among Dooars at 6½d. although poor, certainly begin to look very cheap. The commonest kinds were quoted at 5¾d. and deliveries of good exports diminished somewhat. Offerings at public sales will be regulated henceforth.

\* \* \*

**Tea in San Francisco.**—Tea at the port of San Francisco during July, 1903 :

	Pounds.
From China ... ..	562,340
From British East Indies ... ..	58,963
Japan ... ..	949,657
Total ...	1,570,960

\* \* \*

**Calcutta Tea Sales.**—The quantity of tea brought forward at the sale on 19th instant makes the total disposed off to date 302,216 packages as compared with 282,683 to 19th September last year.

Demand was again good and general, and any stand-out teas, which however were only in small supply, were well competed for and realised full rates. Darjeelings were also in request, and an invoice from the Pandam Estate changed hands at the handsome average of Re.1-1-3 per pound.

As was rather anticipated common leaf grades were somewhat weaker, showing a further decline of 1 to 2 pies. Medium broken kinds appeared to be in less request and were easier to buy, but there was no quotable decline. Fannings and dusts buyers kept those classes fully firm at about last week's rates. Bombay buyers continued to compete keenly for the neat leaf Pekoes and Pekoe Souchongs, and those descriptions may be quoted as rather dearer.

Advices from the growing districts are generally rather better, the cry of a month ago that "weather was wet, cold and generally unfavourable to growth" now giving way to more encouraging reports. Manufacture is in most cases well ahead of that to the same period last season, though not to such an extent at present as to indicate that the final outturn will be an unwieldy one.

The sale this week was to be held on Thursday on account of the Durga Poojah Holidays, no further one taking place until Friday, 9th October, after which date the usual weekly auctions will be resumed.

\* \* \*

**Green Tea Dust into Black.**—There will soon be patented, says the *Times of Ceylon*, a process by which green tea dust can be changed into black, and sold at a favourable price owing to the demand for black dust for brick tea; but before the patent for the process is obtained, the question of priority of discovery must be settled, for there is more than one claimant in the field. For some months past it has been known to a few that Mr. Kelway Bamber, Government Chemist, had perfected an invention by which the result referred to can be obtained. In fact, the black dust which he obtained by his process from green tea dust has been tested and reported upon by brokers; but the specifications upon which the patent rights would be based have not been sent in until to-day.

Mr. William Hall, Manager of the Galaha Tea Factory, has also come into the field. For the last ten days he has carried out experiments, with the result that he now declares that he can turn green tea dust and fannings into black dust. Samples of this latter were submitted to two well-known brokers. It was not stated to them how the dust had been produced. They were simply asked to report. One broker valued the dust at 35 cents per lb.; the other at 37 cents per lb.; so that this shows an increase of at least 23 cents over the price which would have been obtained for the same dust had it not been treated by Mr. Hall's process. Mr. Hall informed our representative that he was taking steps to-day to see whether a patent could be obtained for his process. So that it will be seen the inventor who first presents his specifications to the proper authorities will be the one who will secure the patent.

There seems to be an impression that the Russians, who are the principal purchasers of black dust, may not be keen to pay the price for dust obtained from green tea which they paid for the original black tea dust; but competition is so keen that if the new dust possesses the qualities claimed for it, there seems to be no reason why they should not take kindly to it and pay what it is intrinsically worth. The brokers can hardly distinguish the difference between black tea dust obtained from green tea dust, and the original black tea dust; and in every respect their qualities are similar. None of the new dust has yet been placed on the market, but there is no doubt, if 35 cents a lb. can be obtained for it, that it will very much strengthen the production of green tea to the benefit of all tea manufacturers.

REDUCTION IN WITHERING SPACE.

Another discovery which Mr. Hall claims to have made, but which has nothing to do with the foregoing, is concerned with black tea. By it he can reduce the withering space in a factory by 33 per cent. besides improving the quality, that is adding to its pungency. There will thus be a saving of

time, which to the planter is very important. More than that, he claims that the cost will be  $\frac{1}{8}$  cent per lb. cheaper, or  $12\frac{1}{2}$  cents per 100 lbs. But above all is the fact that the market price of tea manufactured under the new process will be enhanced. Mr. Hall would not describe his processes, but that in regard to dust is said to be similar to Mr. Bamber's.

**The U. S. Tea Market.**—Holders continue in control of tea, and it therefore remains their market, says the *Tea and Coffee Trade Journal* of 25th ultimo. At the same time, in the face of current prices, buyers are not inclined to come out to any large extent, and the market is consequently quiet and steady. Holders are sure that buyers must eventually have tea, and answer all inquiries with a stiff upper lip, but buyers knowing somewhat of the excess of supplies abroad, defer giving orders for a month or so. It is said that opportunities to obtain some choice teas have been lost in this way, and they may not present themselves again. However, the buyer falls back on his stock in store and waits, and in the eyes of the jobber only increasing the general barrenness.

There is some trading in narrow bounds. What teas are coming in are in the main the imports of small houses; the larger ones appear to be in no hurry to bring in their purchases. Abroad the markets remain firm excepting the Formosa market, which in the last week has eased off one cent. This is not true however, for the choice grades, which remain firm. The same fact is true of all teas of this grade. Low grades are inclined to heaviness throughout. Foochows are especially heavy. There is no call for this tea here and so none in the East. For the present time they may be regarded a dead article. In Japan the market has not yet improved. Picking will be stopped September 1. Congous remain steady. India and Ceylons are firm, especially for the choicer grades, which are if anything firming up. In some parts of the country, especially in New England, more stir is reported. Portions of Canada also report a greater activity.

**The Indian Green Tea Bonus.**—During August, bounty at half-an-anna per pound has been paid on 525,157 lbs. of green tea by the Indian Tea Cess Committee. The bounty has been paid on 661,775 lbs. from the beginning of the season to the 31st of August.

**Colombo Tea Sale.**—At the public sale of tea at Colombo on the 16th instant, 12,461 packages = 1,001,946 lbs. were offered, of which 9,304 packages = 747,333 lbs. were sold. The market was firm for thick, useful kinds, and common to medium Pekoes met with good competition at advancing rates. Other kinds were irregular with a tendency to weakness. Low-country teas were somewhat poor in quality. Green teas were in better demand.

**Green Tea.**—Judging by the rate at which the claims on the bonus are still coming in, the year should see nearly 11 million lbs. of Ceylon green tea manufactured—an increase of 250 per cent. over 1902.

**Tea in China.**—Messrs. Welch, Lewis & Co.'s Circular of 21st August states:—

Our last printed Tea Market advices were dated 7th August.

**BLACK TEAS.**—A fair business has been done in Common Congou at Tls.  $13\frac{1}{2}$ – $14\frac{1}{2}$  per picul for shipment to London. Good Common Congou is in small stock and fetching Tls.  $15\frac{1}{2}$ –16 per picul. Teas equal to the U. S. A. Government Standard cannot be purchased under Tls.  $16\frac{1}{2}$ –17 per picul.

**GREEN TEAS.**—During the interval the demand for Choice Country Teas has continued and the market has been cleared of stock at fully previous rates. A fair business has been done in Medium to Good quality Teas at about the same prices as were ruling last year, viz., Tls. 37–40 per picul, but buying is not general. A small business has been done in Common Country Teas at Tls. 32–34 per picul.

*Local Packs, Wenchows, and Fychows* are in small demand at Tls. 26–28 per picul owing to their very bad cup quality this year, and also the heavy percentage of dust left in the Young Hysons.

*Pingsueys.*—The market is at a standstill, the stock of Good-liquoring Tea is small and Teamen are holding out for prices about Tls. 2-3 above buyers' ideas. The balance of the stock on this market is rather common and not desirable.

*Hysons.*—During the interval a strong demand has sprung up for Good Teas, and as this quality Tea is in small stock, the market has advanced at least Tls. 3-4 per picul.

*Sou Mees and Fong Mees* of good quality remain firm although buyers for Batoum are quiet just now. The Stock is small of really Good Teas. Medium quality Teas are slightly weaker although no quotable change is noticeable.

Latest Telegraphic advices from London and New York state that in both markets buyers are holding off and lower prices may be looked for in both markets for Green Tea.

**A Green Tea Packing Factory.**—Messrs. Darley, Butler & Co. of Colombo, are having a new building erected at the back of their offices. It is to serve as a factory for the preparation and packing of green tea with the patent tea machinery which the firm have introduced. The building will be completed by the end of the year, and it will be fully equipped and ready for use in January.

**Indian and Ceylon Exports.**—The following figures of tea exports taken from the Calcutta Customs daily entries and received periodically from Chittagong are issued by the Indian Tea Association:—Quantity of tea entered for export to United Kingdom for the first half of September, 1903: Calcutta, 10,066,327 lbs.; Chittagong, 1,677,588 lbs. Quantity entered during the corresponding period last year: Calcutta, 9,259,841 lbs.; Chittagong, 1,694,100 lbs. Total from 1st April, 1903, to 15th September, 1903: Calcutta, 56,048,436 lbs.; Chittagong, 11,262,374 lbs. Total 67,310,810 lbs. Total from 1st April, 1902, to 15th September, 1902, 61,258,163 lbs.

The export of Ceylon tea to September 14th is 6,067,272 lbs. less to Great Britain than last year, and to other places it is 584,986 lbs. less. Reckoning green tea the total deficit is 2,834,439 lbs.

**Toasting of Tea.**—New crop tea is better than old crop tea. Fresh toasted tea is better than tea that has been toasted a long time. And when it is new crop and fresh toasted, it is then at its best.

In order to be able to give their trade the very best there is, Hills Bros., San Francisco, have installed in their building a tea-toasting plant, says the San Francisco Retail Grocers'

Advocate. They have an automatic electric tea-toasting machine that is the very latest, and the very best of its kind. This machine will enable them to take their new crop teas of all grades, toast them in San Francisco, and send them to their customers at their very best.

Tea-toasting is somewhat of the nature of coffee-roasting in the developing of the essential oils. Oxidization occurs in a similar manner, hence the great value of fresh teas.

When teas are toasted in San Francisco, immediately before shipment, they go to the trade in their very best possible condition and freshness. This applies to all grades of tea, but is, of course, more beneficial to teas of higher grade.

### NOTES.

#### Java Cinchona.

The shipments from Java for the whole of August were 1,100,000 Dutch lbs., as against 1,818,000 Dutch lbs. for the same time last year.

#### Kermanshah.

The British consular agent in his report on the trade of this port for, 1902-03 gives imports of Tea from India as worth £39,919, and imports of Coffee, all from Arabia and Turkey, at only £524. Bazaar prices of Tea are said to range from 14 to 22 krans per man, which is equivalent to a minimum of about 9d. and a maximum of about 14d. per English pound.

#### Madras Coffee-stealing Prevention Act.

It is proposed to make an amendment in the Madras Coffee-stealing Prevention Act, VIII. of 1878; whereby its date of submission of Statement B will be altered from 1st March to 1st April. The amendment will be taken into consideration on or after 1st November, 1903. Any objections or suggestions that may be received by the Government of Madras from any person with respect to the proposed amendment before the above date will receive due consideration.

#### "El Dorado" in Rubber.

The U. S. Consul at Pará reports that never before has Brazil shown so much enthusiasm in the india-rubber trade, and never before have so many men been employed in the business. Thousands of labourers are pouring into the forests of the interior, and thousands more are expected to follow. New rubber fields will, it is said, be opened and old ones worked with improved methods and larger forces. As an example of this, the Consul quotes the case of one of the largest rubber producers on the Madeira, who recently informed him that he would take out this year four times as much rubber as ever before.

#### An Experimental Agricultural Station.

It is now exactly sixty years since the late Sir J. B. Lawes established at his own expense the famous Rothamsted station for the carrying out of experiments in agriculture. During his lifetime he made himself entirely responsible for the cost of its maintenance. The good that he has done lives after him, not because a grateful nation, inspired by a wise and far-sighted Board of Agriculture, provided the funds, but because the founder left a sum of

£100,000 in trust for the purpose. It is, however, a sign of the times that Lord Onslow, with a company of scientists, such as Sir Michael Foster, Professor Armstrong, and Professor Tilden, has recently paid a visit to Rothamsted at the invitation of the Committee of the Trust. There they saw a field in which experiments on four-course rotation have been continued without a break for the last fifty-six years. The field is divided into three plots, the first of which has never been manured, the second has had mineral manure, and the third mineral and nitrogenous manures mixed. These plots are again sub-divided into four parts, each of which is subjected to different treatment. Mangels have been growing in another field for nearly thirty years. In the forty sections of this field different manures have been tried, and it is needless to add that the results have been all recorded. The most famous field of all is the Broadbalk field, in which for sixty years wheat has been grown, and that without any manure at all. The annual yield of this field for half-a-century has been thirteen bushels per acre. This is a record which even the States, with their vast tracts of almost virgin soil, cannot rival. Other fields are devoted to the study of the growth of leguminous plants, to barley, and to grasses of every kind. But large as £100,000 looks, it is not large enough to cover the expenses of all the subjects that are calling out for investigation. As a type, we may mention the best foods for the fattening of stock. It is to be hoped that the visit of Lord Onslow will be followed by something more substantial than the very great interest he must have felt at this fine instance of private generosity and enterprise.

### GENERAL ARTICLES.

#### CEYLON TEA ESTATES AND VANISHING INSECTIVOROUS BIRDS.

##### A USEFUL LIST FOR COMPARISON.

The discussion recently started with regard to our up-country estates and bird life has, says the *Times of Ceylon*, so far, not resulted in sufficient proof being forthcoming to show whether insectivorous birds have increased or decreased with the conversion of forest and jungle into plantations. What are required are facts about birds which inhabited the planting districts in the early days of coffee, their life and habits, so that observant planters might express definite views on the vexed question as to whether birds have increased or decreased up-country in recent years. The list given below, prepared from the history of the birds of Ceylon by Captain Vincent Legge, the great ornithologist, whose observations were made in the seventies, supplies the information which is now wanted, and up-country readers might preserve the list for reference. Only insectivorous birds resident all the year through in the planting districts have been included. True migrants, which come over from Asia during the North-East Monsoon, as also partial migrants—birds resident in the low-country but which ascend the hills during the dry season—have been excluded and will be dealt with later if found necessary. The black bulbul, orange minivet, Ceylonese jay, jungle fowl, and spur fowl, which are found up to certain elevations, and are enumerated below, appear in the upper ranges, up to 8,000 ft., as soon as the calm weather of the North-East Monsoon has set in in November. Short notes on the habits, food, and nidification, where mentioned, with elevations, are appended. It is not possible to give particulars of colouration of the birds for purposes of identification, as it would take up too much space. The size of birds, with length of tail, is given, so that observant planters, noting these and the habits of the birds, should have little difficulty in recognising specimens. The birds have accordingly, in this article, been divided into three groups—large, medium sized, and small birds.

The figures given are, first, length of bird with tail; and, second, length of tail.

LARGE BIRDS: LENGTH FROM 28 IN. TO 10 IN.

Commencing with large birds we have a list of 14, and of this number 11 are described as wild forest birds. One, the ashy-headed babbler, includes, it will be noted, bugs among its food:—

CEYLON JUNGLE-FOWL (*Gallus Lafayetii*).—28 in.; 13 in. Peculiar to Ceylon. Resident up to about 5,000 ft. Frequents various situations. Feeds on insects, grubs, seeds. Nests on the ground; throughout the year.

CEYLON JAY (*Cissa ornata*).—18.5 in.; 10.7 in. Peculiar to Ceylon. Upper ranges down to below 4,000 ft. Shy bird. Affects tall trees. Feeds on lizards, and large beetles, also fruit. Nests in tall trees and saplings; cool season.

COMMON COUCAL (*Centropus rufipennis*).—17.5 in.; 9.5 in. Up to 4,500 ft. Inhabits every situation except gloomy forests. Feeds on beetles, slugs, scorpions, centipedes, lizards, sometimes small snakes, and pilfers nests. Nests in thick woods in low trees; May-September.

DARK-BACKED SIRKEER (*Taccocua Leschenaulti*).—15.5 in.; 9 in. Up to 4,000 ft. Shy bird. Frequents tangled thickets and bushy patna tracts. Feeds on grasshoppers, mantidæ and other insects, lizards occasionally. Breeds June-July.

CEYLON CRESTED DRONGO (*Dicranurus lophorhinus*).—14.1 in.; 7.6 in. Peculiar to Ceylon. High and low elevations. Inhabits forests. Feeds on insects.

CEYLON SPUR-FOWL (*Galloperdix bicalcarata*).—13.8 in.; 4 in. Peculiar to Ceylon. Up to 5,000 ft. Very shy. Effects most entire concealment in forest. Feeds on insects, seeds, etc. Nests on the ground; April-August.

RED WOODPECKER (*Brachypternus Ceylonus*).—11.75 in.; 4 in. Peculiar to Ceylon. Very abundant. Up to 4,000 ft. Frequents forest and jungle. Feeds on ants and insects. Nests in holes in trees.

LAYARD'S WOODPECKER (*Chrysocolaptes Stricklandi*).—11.8 in.; 3.4 in. Peculiar to Ceylon. Widely distributed. All elevations. Affects heavy jungle and forest. Feeds chiefly on ants. Nests in holes in trees; January—.

JUNGLE NIGHTJAR (*Caprimulgus atripennis*).—11 in.; 5.3 in. Fairly common. Up to 3,500 ft. Inhabits forest, scrub, etc. Feeds on beetles, winged termites, etc. Nests on the ground.

STRIATED GREEN WOODPECKER (*Gecinus striolatus*).—10.9 in.; 3.8 in. Quite a hill bird. Up to 4,500 ft. Retiring, shy disposition. Frequents stunted patna trees and ravines. Feeds almost entirely on black ants.

RUFous BABBLER (*Malacocercus rufescens*).—10.8 in.; 4.6 in. Peculiar to Ceylon. From great altitudes to low-country. Frequents thickets, bamboo-scrub, low jungle, and timber forests. Feeds on beetles and other insects. Nests in bushes, shrubs, or brambles; March-July.

BLACK BULBUL (*Hypsipetes Ganeesa*).—10.5 in.; 4.3 in. Very high and low elevations. Frequents forest, jungly ravines, steep woods and mot places where there are large trees. Feeds on insects, fruits, and seeds. Nests in trees at a considerable height.

DRONGO CUCKOO (*Surniculus lugubris*).—10 in.; 5.7 in. Up to 4,000 ft. Frequents forest, low jungle and patnas dotted with isolated trees. Feeds on caterpillars, beetles, also seeds. Breeds early part of year.

ASHY-HEADED BABBLER (*Garrulax cinereifrons*).—10 in.; 4.3 in. Peculiar to Ceylon. Up to 3,500 ft. Frequents gloom of forests, thick underwood and dense bamboo-thickets. Feeds on caterpillars, bugs (*Hemiptera*) and coleopterous insects. Breeds April-July.

KELAART'S NIGHTJAR (*Caprimulgus Kelaarti*).—10 in.; 5 in. Upper ranges. Affects stony patnas, and open forest glades. Feeds on insects. Nests on the ground; March-April.

MEDIUM SIZED BIRDS: LENGTH FROM 9.75 IN. TO 6 IN.

Of medium sized birds it will be noted that there are 28 species, and of this number about 10 affect all situations, including gardens, while an equal number are wild and shy forest birds. Over half-a-dozen species it will be seen are patna birds.

INDIAN CRESTED SWIFT (*Dendrochelidon coronatus*).—9.75 in.; 5.3 in. Up to 6,000 ft. Frequents open hill sides and jungle clearings. Feeds on insects.

CEYLON BLACKBIRD (*Turdus kinnisi*).—9.7 in.; 3.8 in. Loftiest regions down to 2,500 ft. Frequents thick undergrowth, copses,

gardens in Nuwara Eliya. Feeds on berries, but is highly insectivorous. Nests in niches of tree trunks, stumps, low forked branches; April-June.

BROWN-NECKED SPINE TAIL (*Chætura gigantea*).—9.5 in.; 2.7 in. Up to over 6,000 ft. Swiftest bird in existence. Wanders over whole island in the course of a day. Feeds on insects. Nests in inaccessible precipices.

CEYLONESE FROG-MOUTH (*Batrachostomus moniliger*).—9.4 in.; 4.7 in. Up to 5,600 ft. Strictly nocturnal. Inhabits in most recesses of jungle and dense thickets. Feeds considerably on beetles.

COMMON BABBLER (*Malacocercus Striatus*).—9.2 in.; 4 in. Up to 5,000 ft. Frequents patna, low scrub and bungalow grounds. Feeds entirely on insects. Nests in bushes, shrubs, or brambles; March-July.

SOUTHERN YELLOW-NAPED WOODPECKER (*Chrysophlegma xanthoderus*).—9.2 in.; 5.5 in. Up to 4,000 ft. Affects edges of forest, interior of jungle, wooded ravines, and low thickets. Feeds on coleopterous insects and ant.

COMMON INDIAN NIGHTJAR (*Caprimulgus Asiaticus*).—9.1 in.; 4.2 in. Up to 4,000 ft. Affects scrubby waste land and open-wooded country. Feeds on beetles and moths. Nests on the ground.

SPOTTED THRUSH (*Turdus spiloptera*).—8.7 in.; 3.2 in. Peculiar to Ceylon. Up to 4,000 ft. Shy, retiring. Frequents jungle, undergrowth in forests, bamboo thickets. Feeds on pupae, coleoptera, and other insects. Nests in saplings, among roots of trees, on banks or little eminences; first half of the year.

MAGPIE ROBIN (*Copsychus saularis*).—8.5 in.; 3.5 in. Up to 5,500 ft. Frequents gardens. Feeds on insects. Nests in holes in walls, under roofs, hollow stumps, etc.

ALPINE SWIFT (*Cypselus melba*).—8.5 in.; 3.5 in. Upper ranges, but wanders all over the island in the course of a day. Immense powers of flight. Feeds on insects. Nests in mountain ranges; April-May.

BLIGH'S WHISTLING THRUSH (*Myiophonus Blighi*).—8.5 in.; 3.5 in. Peculiar to Ceylon. Rare hill bird. From little over 4,000 ft. to 3,000 ft. Very shy. Affects vicinity of mountain stream; keeps entirely to shade of thick forest. Feeds on various insects, coleoptera, etc.

MADRAS BULBUL (*Pycnonotus haemorrhous*).—8 in.; 3.2 in. Common. Up to 5,900 ft. Affects edges of forest, open scrubby land, and gardens. Feeds on insects, also fruits and seeds. Nests in low bushes.

FOREST BULBUL (*Criniger ictericus*).—8 in.; 3.3 in. Widely diffused. Up to 4,000 ft. Frequents forests. Feeds on insects, also fruits. Nests in forest saplings.

BLACK-HEADED CUCKOO SHRIKE (*Lalage Sykesi*).—7.75 in.; 3 in. Up to 3,000 ft. and somewhat higher. Frequents tall trees in open forests and gardens. Feeds on caterpillars and other soft insects. Nests in trees.

ORANGE MINVET (*Pericrocotus flammeus*).—7.75 in.; 3.6 in. Up to 4,600 ft. Numerous. Affects lofty trees in forests, and patna woods. Feeds on small butterflies and various winged insects.

WHITE-FRONTED FANTAIL (*Rhipidura albifrontata*).—7.1 in.; 3.4 in. High and low elevations. Frequents groves of trees, and isolated trees on patnas. Feeds on insects. Nests in small trees; early part of the year.

BLACK-BILLED BABBLER (*Pyctorhis nasalis*).—7 in.; 3.5 in. Peculiar to Ceylon. Widely distributed. Up to 5,800 ft. Frequents swampy fern-brakes, patnas covered with mana grass, lantana, and thick cover. Feeds on small coleoptera and various minute insects. Nests in shrubs and tufts of mana grass without any attempt at concealment; May.

WHISTLING QUAKER-THRUSH (*Pellorneum fuscicapillum*).—6.8 in.; 2.6 in. Peculiar to Ceylon. Widely distributed. Up to 5,500 ft. Very shy and retiring. Frequents forest, low jungle, scrub, and brushwood. Feeds on large beetles and insects. Nests in brambles, etc.

CEYLON SWALLOW (*Hirundo hyperythra*).—6.8 in.; 3.3 in. Peculiar to Ceylon. Up to 4,000 ft. Frequents towns, villages, open country, estate stores and bungalows. Feeds on insects. Nests in outhouses, under culverts and bridges; March-June.

MALABAR GREEN BULBUL (*Phyllornis Malabaricus*).—7.5 in.; 2.7 in. Up to above 4,000 ft. Frequents tops of trees, and patna woods. Feeds on insects and fruit, chiefly the former.

GREEN BULBUL (*Phyllornis Jerdoni*).—7.5 in.; 2.8 in. Very common. Up to 3,500 ft. and slightly higher. Frequents open situations. Feeds on insects and occasionally seeds.

ASHY WOOD-SWALLOW (*Artamus fuscus*).—7.4 in.; 2.3 in. Widely distributed. Up to 5,000 ft. Frequents open hill-sides and patnas dotted with trees. Feeds largely on beetles, also other insects. Nests in holes in trees; February-March.

PALLISER'S ANT THRUSH (*Elaphrornis Palliseri*).—6.75 in.; 2.7 in. Peculiar to Ceylon. Above 5,000 ft. Inhabits dense thickets in thick jungle. Feeds on ants and minute insects, and small seeds to some extent. Nests in dense bushes; March-April.

BLACK-HEADED BULBUL (*Rubigula melanictera*).—6.5 in.; 2.6 in. Peculiar to Ceylon. Up to 5,000 ft. Frequents forest, low jungle, and deserted grounds. Feeds on insects, snails, minute ammonites, also seeds. Nests in forks of low trees, bushes, and even on dead stumps; April-September.

BLACK ROBIN (*Thamnobia fulicata*).—6.4 in.; 2.5 in. High and low elevations. Frequents the vicinity of human dwellings, stony patnas, and bare hill-sides. Feeds on flies and other insects. Nests in banks along foot-paths, under shelter of rocks; in bungalow roofs, etc.; March-June.

ROBUST WREN-WARBLER (*Drymæca valida*).—6.4 in.; 2.8 in. Peculiar to Ceylon. Common. Up to 3,000 ft. and somewhat higher. Frequents brambly wastes, open scrub, and deserted forest clearings. Feeds on insects.

CEYLONESE AZURE FLY-CATCHER (*Hypothymis Ceylonensis*).—6.2 in.; 2.75 in. Peculiar to Ceylon. Up to 3,000 ft. Affects forest, shady jungle, detached woods and bamboo thickets. Feeds on small flies and insects. Nests in saplings and shrubs.

JERDON'S WREN-WARBLER (*Drymæca Jerdoni*).—6 in.; 2.6 in. Up to 4,000 ft. Frequents fern-brakes, sides of over-grown ditches and long grass. Sneaking disposition. Feeds on various small coleoptera and other minute insects.

SMALL BIRDS: LENGTH FROM 5.9 IN. TO 2.3 IN.

Of the list of 20 small birds it will be noted that about half the number are described as frequenting all situations including estates, and about five are wild forest birds:—

BLUE REDBREAST (*Siphia Tickelliae*).—5.9 in.; 2.6 in. Up to 4,000 ft. Frequents forest and jungle. Feeds on insects. Breeds May-June.

WHITE-THROATED WREN-BABBLER (*Dumetia albigularis*).—5.7 in.; 2.2 in. Tolerably common. Up to 5,600 ft. Frequents bushy patnas, low scrub, detached woods. Feeds on larvæ of various winged insects and minute coleoptera. Nests in low bushes; March-July.

INDIAN SWIFT (*Cypselus affinis*).—5.5 in.; 1.8 in. Up to 7,000 ft. Frequents estates and other open situations. Feeds on flies and other insects. Nests in verandahs of outhouses, beneath bridges and culverts, overhanging rocks, or caves; March-July.

LITTLE PIED SHRIKE (*Hemipus picatus*).—5.4 in.; 2.3 in. High and low elevations. Tame disposition. Frequents tall trees near edge of forest and heavy jungle. Feeds on insects.

WHITE-BROWED WREN-WARBLER (*Drymæca insularis*).—5.4 in.; 2.5 in. Widely distributed. Up to 5,000 ft. Frequents long grass and tussocky wastes, and hill patnas. Feeds on small caterpillars, minute insects, etc. Nests in long grass; May-June, and October-November.

BUNGALOW SWALLOW (*Hirundo Javanica*).—5 in.; 1.8 in. Above 6,000 ft. Frequents estate bungalows, etc. Feeds on insects. Nests in verandahs of bungalows and outbuildings on estates and eaves of native houses; April-June.

ASHY WREN-WARBLER (*Prinia socialis*).—5 in.; 1.8 in. Widely distributed. Up to 5,500 ft. Lives permanently in mana grass on patnas. Feeds on insects and occasionally small seeds. Nests in mana grass; May-July.

INDIAN TAILOR-BIRD (*Orthotomus sutorius*).—5 in.; 2.5 in. Widely distributed. Up to mountain ranges. Frequents estates, gardens, thick jungle, and forest. Feeds on larvæ and insects. Nests in low bushes and small trees; late in the year.

LONG-TAILED ROBIN (*Cittocincla macrura*).—11.3 in.; 7 in. Up to 4,000 ft. Frequents forest and jungle. Feeds on small beetles, ants, flies, etc.

PIGMY WOODPECKER (*Yungipicus gymnoptthalmos*).—4.9 in.; 1.3 in. Tolerably plentiful. Up to about 3,000 ft. Frequents uppermost branches of trees at edges of estates, or patnas. Feeds on worms, and grubs in rotten wood. Nests in holes in trees.

INDIAN SWIFTLET (*Collocalia francicæ*).—4.8 in.; 1.9 in. Up to 6,500 ft. Affects crags and rocky hills. Wanders great distances. Feeds on gnats, mosquitos and other small flies. Nests in caves in the hills and mountains; March-June.

COMMON WHITE-EYE (*Zosterops palpebrosa*).—4.4 in.; 1.6 in. Very numerous, up to about 3,500 ft. Frequents woods, forests, and gardens. Feeds on insects but mostly fruits and buds. Nests in small trees and bushes; June-August.

LOTEN'S SUN-BIRD (*Cinnyris Lotenius*).—4.3 in.; tail 1.2 in.; bill 1.8 in. Various elevations up-country. Frequents compounds, etc. Sips honey from flowers also feeds on insects. Nests frequently in lime or orange trees.

HILL BUSH-CHAT (*Pratincola bicolor*).—6.2 in.; 2.4 in. Upper mountains down to 3,500 ft. Frequents plains, gardens round Nuwara Eliya, patnas, and bare and rocky localities. Feeds on insects and larvæ of various kinds. Nests in holes in banks or old walls; April-June.

CEYLONESE BLUE FLYCATCHER (*Stoparola sordida*).—6.2 in.; 2.5 in. Peculiar to Ceylon. Mountain ranges down to somewhat under 2,000 ft. Frequents outskirts of forests, edges of clearings, borders of mountain streams, and sides of roads and paths. Feeds on insects. Nests in holes in trees or stumps; April-May.

GREY-BACKED TITMOUS (*Parus atriceps*).—5.8 in.; 2.6 in. Numerous. Highest ranges down to 3,000 ft. Frequents forest, jungle, patna woods, and estates. Feeds on insects, also buds. Nests in holes in trees; March-July.

GREY-HEADED FLYCATCHER (*Culicicapa Ceylonensis*).—5.2 in.; 2.2 in. Hill bird. Top of highest ranges down to 1,900 ft. Frequents a variety of situations. Feeds on insects.

CEYLONESE WHITE-EYE (*Zosterops Ceylonensis*).—4.7 in.; 1.75 in. Peculiar to Ceylon. Very abundant. Ranges down to 2,500 ft. Frequents all situations. Feeds on insects, also leaf buds. Nests in bushes, also coffee; March-May.

THICK-BILLED FLOWERPECKER (*Piprisoma agile*).—4 in.; 1.1 in. Scattered sparingly. Up to 3,000 ft. Feeds on spiders and small insects. Breeds early part of the year.

COMMON GRASS-WARBLER (*Cisticola cursitans*).—2.3 in.; 1.6 in. Widely distributed. Up to high elevations. Frequents patnas and grass lands. Feeds on small insects, caterpillars, beetles, and little snails. Nests in thick grass; May-July, November-December.

#### BIRDS AT DIFFERENT ELEVATIONS.

The above list is comprised of 63 birds, and their distribution at the different elevations, as can be seen from the particulars given, will be as follows:—

At 3,000 ft.—58 bids.	At 5,000 ft.—37 bids.
" 3,500 "—55 "	" 5,500 "—31 "
" 4,000 "—51 "	" 5,800 "—26 "
" 4,500 "—38 "	Above "—25 "

#### BIRDS NOT INCLUDED IN THE ABOVE LIST.

The following birds have not been included in the table given above as the elevations at which they are found are not mentioned. Some of them are quite familiar in the up-country districts:—

CEYLONESE TROGON (*Harpactes fasciatus*).—11.2 in.; 6 in. Found throughout the coffee districts. Inhabits gloomy recesses in forest and jungle. Feeds on coleopterous insects, bugs, moths, etc. Breeds May—.

CEYLONESE WHITE-BELLIED DRONGO (*Buchanga leucopygialis*).—9.9 in.; 5.1 in. Found on slopes of Kandyan hills, Pussellawa, Kotmale, and Badulla. Frequents estates and other open places. Feeds on beetles, bugs, winged termites, and other insects. Nests in large trees at a considerable height; March-May.

CHESTNUT-HEADED BEE-EATER (*Merosia Swinhoei*).—8.6 in.; 3.3 in. Sparingly dispersed. Found in the Kandyan Province and Uva. Frequents the vicinity of rivers in deep valleys, and high trees on steep ravines. Feeds on insects. Nests in holes in banks.

LITTLE MINVET (*Pericrocotus peregrinus*).—6 in.; 2.7 in. Found in most of the coffee districts. Frequents a variety of open situations. Feeds on various larvæ and small insects.

#### PATNA BURNING AND ITS EFFECTS.

Looking through the above list of birds it will be seen that a fairly large number frequent patnas, of which about a dozen species nest in patna grass, low bushes, and brambles, while half that number nest on the ground. It will therefore be seen that those birds must suffer considerably when patnas are set on fire. It will also be seen that several species nest in banks and other exposed places on estates. As regards the food of the different species, it ranges from ants to small snails and large beetles, lizards and small birds occasionally, and mosquitos to moths and butterflies. Bugs (*Hemiptera*), which are generally not a favourite with birds, seem to be eaten by three species.

## TEA AND COFFEE AT NEW YORK IN JULY.

Following are Reports of the New York Custom House on Tea and Coffee imported and exported at the Port during July last:—

IMPORTS OF TEA.			
From Yokohama	...	468,342	pounds.
" Kobe	...	363,100	"
" Hankow	...	291,776	"
" Foochow	...	62,359	"
" Amoy	...	319,691	"
" Hong Kong	...	2,985	"
" Ceylon	...	197,011	"
" England	...	194,909	"
" Shanghai	...	350,196	"
" Tamsui	...	30,000	"
" Calcutta	...	80	"
" Nova Scotia	...	7,028	"
" Turkey	...	200	"
" Germany	...	11	"

EXPORTS OF TEA.			
To England	...	91,000	pounds.
" Bermuda	...	42	"
" Mexico	...	200	"
" British West Indies	...	65	"
" Danish West Indies	...	112	"
" Cuba	...	250	"
" San Domingo	...	25	"
" Argentine	...	1,265	"
" Colombia	...	100	"
" Peru	...	140	"
" Venezuela	...	10	"
" China	...	46,912	"

IMPORTS OF COFFEE.			
From Germany	...	26,490	pounds.
" Netherlands	...	67,044	"
" England	...	107,255	"
" Costa Rica	...	65,997	"
" Guatemala	...	570,790	"
" Honduras	...	18,761	"
" Nicaragua	...	19,175	"
" Salvador	...	27,010	"
" Mexico	...	1,111,000	"
" British West Indies	...	17,470	"
" San Domingo	...	26,209	"
" Brazil	...	45,001,563	"
" Colombia	...	6,924,560	"
" Venezuela	...	6,371,142	"
" Aden	...	118,464	"
" British East Indies	...	338,335	"
" Dutch East Indies	...	184,714	"
" Turkey	...	147,746	"
" Ecuador	...	89	"
" Hayti	...	34,660	"
" Liberia	...	1,939	"

EXPORTS OF COFFEE.			
To Germany	...	19,993	pounds.
" Italy	...	59,589	"
" Cuba	...	992,092	"
" Danish West Indies	...	646	"
" Norway	...	9,050	"
" Turkey	...	1,308	"
" Bermuda	...	1,450	"
" Australia	...	22,580	"
" British Guiana	...	28,310	"

## PRODUCE AND PLANTING.

[In an article in the *Monthly Review* on "The Fiscal Controversy," Sir Michael Hicks-Beach writes as a "Unionist who believes that the proper object of a Customs Tariff is to raise revenue."] In his article Sir Michael presses the point that we should be compelled to give a similar preference to the other colonies by taxing the foreign foodstuffs with which they compete. He then asks what the people of the United Kingdom would gain, or lose, by this policy, and he makes the following reference to the tea duty question: "Mr. Chamberlain has suggested that any loss to the poor from this cause might be made good by remissions of taxation on tea, sugar, and tobacco. The suggestion that the remission of existing duties would

be a gain is in itself an admission that the imposition of new duties would be a burthen; but tobacco may be dismissed at once; for a large part of the population, specially women and children, are non-smokers, and all must eat. But if India and the Crown Colonies are to be included in colonial preference—and this could hardly be refused—some duty on tea and sugar must be retained. The sugar duty might, it is true, be repealed for five years, owing to the provisions against colonial preference in the Brussels Convention. But at the end of that time the West Indies might be trusted to demand a duty on foreign sugar, just as the Indian and Ceylon planters would demand it at once on foreign tea. Their tea, on equal terms, has already gone far to drive foreign tea out of our market; so that any preference would probably enable them, by raising their prices, to deprive consumers here of no small part of the benefit of any reduction of taxation." This is a polite way of saying to the consumer, "Don't have anything to do with preference schemes. If Indian and Ceylon growers, for instance, were to have it all their own way in the tea market you would have to pay fancy prices for your teas."

We recently recorded the views of Mr. Larkin, of "Salada" fame, on the subject of Formosa Oolong and the demand for this class of tea on the American continent. The flavour of these teas is considered by some experts to be artificial, and if this be so there is no reason why India and Ceylon planters should not successfully compete for the supply of this class of tea. A visit to Formosa by a tea maker with an inquiring mind would prove useful, and no doubt this suggestion will receive the attention of the Tea Association, if it has not done so ere this. If tea-drinkers on the American continent will have teas with the flavour of Formosa Oolong, Indian and Ceylon tea-growers must either supply them or lose a market which takes nearly twenty million of pounds of tea. We know that some people are of opinion that these differences of flavour cannot be produced by curing alone, but this remains to be seen. Anyway, the market is worth the expenditure of some time and trouble, and we shall be surprised if Indian and Ceylon planters do not make a bold bid for it.

It has been suggested, and will probably be carried out, that in the exhibition of the Ceylon product at St. Louis the tea should be marketable, not fancy. Further, that they should be taken out of a regular break, and the box sent should be a miniature box of the same pattern of chest as the break. The invoice number and the date it was packed, as well as the estate mark, are to be marked on the box; so that this tea may be compared with the tea sold at the public market. If some such scheme is carried out it is believed that it will go far to remove the prejudice attached to the keeping qualities of Ceylon teas.—*H. & C. Mail.*

## DISTRICT ASSOCIATIONS.

## PLANTERS' ASSOCIATION OF CEYLON.

## MINUTES OF FRIDAY'S MEETING.

Extracts from minutes of proceedings of a Meeting of the Committee of the Planters' Association of Ceylon, held at the Victoria Commemoration Buildings, Kandy, on Friday, 11th September, 1903, at 3 p.m.

## CEYLON GOVERNMENT RAILWAY.—WEIGHT AND QUALITY OF TEA CHESTS TENDERED.

Read letter from the General Manager, Ceylon Government Railway, drawing attention to the weight and quality of tea chests sent to the railway for transmission by train, and asking that the question might be considered by the Planters' Association. *Resolved*:—"That copy of the letter be circulated to the various District Associations for information and guidance."

## PRIZE ESSAYS ON PRUNING OF TEA IN CEYLON.

Submitted correspondence.

Intimated that the judges have not yet completed their labours.

## RUBBISHY TEAS IN COLOMBO HARBOUR.

Intimated that the report on the matter was still under consideration of the Chamber of Commerce.

CARDAMOM COMMITTEE.

At the request of the Cardamom Committee, submitted the following *résumé* of replies received from various Consuls in China, Japan, and the Far East, in reference to the demand of cardamoms in these localities.

Read letter from His Majesty's Consul at Foochow stating that, from enquiries made, he gathered there is little demand for cardamoms in Foochow; the supply appears to be drawn from Annam.

Read letter from His Majesty's Consul at Pakhos, stating that there is not much prospect for opening a market for cardamoms in the smaller Treaty Ports, and that, as the Consulate at Samshui has been closed, he replies to the enquiry that no foreign cardamoms are imported to Samshui.

Read letter from His Majesty's Consul at Canton, mentioning that the present supply of cardamoms is chiefly from Southern India, Ceylon, and the Dutch Colonies, and sending specimens of the various grades imported.

Read letter from His Majesty's Consul at Tainan, stating that the demand for cardamoms in South Formosa is very small, the average annual import only amounting to about 10 lbs., and the import is entirely in the hands of Chinese merchants, the supply coming from China.

Read letter from His Majesty's Consul at Nagasaki stating that cardamoms are not mentioned in the Customs Return for any port in Japan; if any imports exist it is in such small quantities that it is placed under miscellaneous drugs, and the local Chamber of Commerce knows nothing of it.

Letter from His Majesty's Consul at Klungchow, Hainan, stating that the product is entirely used in manufacture of medicines imported indirectly through the large Chinese dealers in Hong-Kong. The amount annually imported is very small, being valued on the average at only about £140.

Letter from His Majesty's Consul at Kobe stating that there is no market for cardamoms in Kobe. The local chemists keep a few seeds in stock, which they obtain from London.

Letter from His Majesty's Consul at Chingkiang stating that the market is very limited, and it is entirely supplied from Shanghai.

Letter from His Majesty's Consul at Hakodate stating that there is no prospect of opening up a business of cardamoms there, the total value of drugs imported direct during last year being barely £10.

Letter from His Majesty's Consul at Wenchow stating that there is no demand for cardamoms.

Letter from His Majesty's Consul at Wuhu stating that cardamoms are imported from India and the Straits Settlements to the extent of about 1,000 lbs. per annum, while an inferior variety comes annually to the extent of about 7,000 lbs. largely from Siam.

The trade is entirely in the hands of native druggists, who obtain their supplies in small quantities from Shanghai.

Letter from the Commercial Attaché to His Majesty's Legation at Shanghai stating that the trade is entirely in Chinese hands and that he understands the supplies are drawn from Cochin-China, India, Java, and Siam. The average annual import of cardamoms into Shanghai during the last five years has been superior 240 piculs, inferior 1,543 piculs, cardamom husks 145 piculs; they are retailed at dollars 1.50 per Chinese ounce, and dollars 0.80 second quality.

Letter from His Majesty's Consul at Tamsui, North Formosa, stating that there is no very great demand for the commodity. During 1902 1,407 lbs., valued at gold yen 386.95, say £40, were imported and for the first half of the current year 695 lbs., worth gold yen 215.30, or about £22-10-0. All the cardamoms came to fill small orders from China *via* Hong-Kong to the order of Chinese merchants who retailed the article as a drug.

Intimated that samples of cardamoms had also been forwarded to Zanzibar.

SPECIAL LEGISLATION RE CACAO STEALING: CACAO THEFTS COMMISSION.

Intimated that no progress had yet to be reported in the matter. *Resolved*:—"That pending special legislation Government be asked to invite the Government Agents in the various cacao districts to use special influence in getting the headmen and police to try to check robberies and sales of cacao in the open thoroughfares, during the coming crop. The Committee would point out the success attending the personal efforts of Government Agents last year in the Matalé district."

MACHINE FOR DRYING CACAO SEEDS.

Read letter from the Secretary, Ceylon Chamber of Commerce, drawing attention to a new machine for drying cacao seeds, from which it would seem that, with this machine, the solar and artificial heat is combined, thus drying the seeds in greater numbers and in much less time. *Resolved*:—"That a copy of the letter be sent to the Kandy Districts, Kurunegala, Matalé and Badulla Associations."

SPECIAL LEGISLATION FOR CACAO DISEASE. PLANT SANITATION ORDINANCE NO. 5 OF 1901—PROHIBITION OF THE IMPORTATION INTO CEYLON OF PEPPER PLANTS FROM INDIA. PROPOSED REGULATIONS FOR THE PREVENTION OF CACAO DISEASE.

Read letter from Government forwarding accompanying copy of a regulation which it is proposed to promulgate under Section 3 of Ordinance 5 of 1891, together with copies of the forms to be used in connection therewith and inquiring whether the Planters' Association has any suggestions to offer in the matter. *Resolved*:—"That the correspondence be referred to the Cacao Committee of the Planters' Association; (2) that copies of the correspondence be forwarded to the District Associations interested."

Read letter from the Honorary Secretary, Batticaloa Association, transmitting copy of the following Resolutions regarding beetle pests on cocoanut palm:—"That in view of the serious increase in damage to cocoanut trees by beetle pests, *viz.* (1) *Oryetes Rhinoceros*, commonly known as the Black Beetle; (2) *Rhynchophorus ferrugineus*, or Red Beetle, the Honorary Secretary be requested to write to the Parent Association, asking it to take up seriously the question of the need of an Ordinance being passed similar to that of the Federated Malay States, enacted in 1898, an enactment for the protection of cocoanut trees from the ravages of certain beetles."

*Resolved*:—"That copy of the Resolution received from the Batticaloa Association be submitted to the Government Entomologist and to the Government Agents of the different Provinces with a request for information as to the advisability and practicableness of an Ordinance such as that suggested against the ravages of beetles on cocoanuts."

Submitted regulations made by the Governor with the advice of the Executive Council under Section 3 of the Insects Pests and Quarantine Ordinance.

Read letter from Government intimating that, on the recommendation of the Director of the Royal Botanic Gardens, Regulations under the Ordinance No. 5 of 1901 had been passed prohibiting the importation into Ceylon of pepper plants from India where a disease of this plant has recently been causing serious damage and loss to cultivators of pepper.

Submitted copy of the Regulation published in the Ceylon Government Gazette, No. 592 of July 17, 1903.

TEA PESTS—SPREAD OF "SHOT-HOLE BORERS."

Read correspondence with Government on the subject of the spread of shot-hole borer pest in tea.

Read letter from Mr. Chas. Gibbon.

Read letter from the Honorary Secretary, Dolospage and Yakdessa Association, transmitting copy of the following Resolution:—"That the views of this Association are in accordance with those of the Kandy Committee as contained in the Resolution recently passed."

Read letter from the Honorary Secretary, Dimbula Association, transmitting the following Resolutions:—"That the Parent Association Minute and Resolutions dated 18th July, 1903, as to the desirability of Legislation with regard to the sale of tea-plants from affected estates, be supported. (2) That the Dimbula Planters' Association have much pleasure in supporting the hearty vote of thanks accorded to Mr. E. E. Green."

Read letter from the Honorary Secretary, Passara Association, transmitting the following Resolution:—"That this Association is in favour of some simple legislation by Government on the lines suggested by Mr. Green to prevent the distribution of shot-hole borer and other tea pests."

Read letter from the Honorary Secretary, Kelani Valley Association, stating that so far no notification that the pests exist in the district has been received.

Read letter from the Honorary Secretary, Maturata Association, transmitting the following Resolution:—"That the Resolution as to legislation with regard to the sale of tea-plants from affected estates be supported."

Read letter from the Rangalla Association stating that the Rangalla Association was in favour of legislation, but so far the district was free of the pest.

Read correspondence with the Chairman, Badulla Association, in reference to any literature dealing with the pest, in which the Government Entomologist mentioned "that a circular on the shot-hole borer is being prepared in the department of the Royal Botanic Gardens, Peradeniya, but waits completion for certain data expected in response to questions circulated through the District Associations," meanwhile adding that the following works deal with the pest:—(1) "Indian Museum Notes," Vol. iv, p. 57, plate V, fig. 2; (2) "Pests and Blights of the Tea-Plant," G. Watt, pages 192-4; (3) "Pests and Blights of the Tea-Plant," 2nd edition, Watt & Mann, page 174-6, and plate 4, fig. 2.

Read letter from the Honorary Secretary, Knuckles, Kellabokka & Panwila Association, stating that this Association approve of legislation on the lines laid down.

*Resolved*:—"That the Planters' Association of Ceylon is now of opinion that the majority of the District Associations are in favour of legislation on the lines indicated by the Government Entomologist (Mr. Green), and that Government be asked to legislate accordingly against the spread of the 'shot-hole borer' pest in tea."

#### ST. LOUIS EXHIBITION, 1904.

Read letter from the Secretary, Ceylon Committee, World's Fair, St. Louis, asking that arrangements may be made that all tea exhibits be furnished in chests of uniform size and shape, containing a uniform number of packets of the different grades, any shortage being made up with packing materials if necessary. The object in view is the facilitation of the packing for shipments.

Read letter from the Honorary Secretary, Uda-Pussellawa Association, forwarding the following Resolution regarding the class and marking of tea to be sent to St. Louis Exhibition:—"That teas sent to the St. Louis Exhibition shall be marketable teas. They should be taken out of a regular break and the box sent shall be a miniature box of the same pattern of chest as the break, with date of packing, invoice number, as well as the usual estate-mark; teas could then be packed at any time, and thus remove the general stigma as to the keeping qualities of Ceylon teas. Further, if fancy teas are sent, they should be so marked."

#### EXHIBITS FOR THE ST. LOUIS EXHIBITION, 1904.

*Resolved*:—"That the District Associations be asked to select an estate or estates, according to size of district, to make commercial teas, black or green, of three grades, two 5-lb. boxes of each grade, with copy of invoice for the St. Louis Exhibition. That the Kandy Districts, Kurunegala, and Matalé Associations be asked to collect samples of Ceylon cacao. That the selection of cardamoms be left to the Cardamom Committee. That the Kalutara, Kandy, Kurunegala, and Matalé Associations be asked to collect samples of rubber. That the Kandy Districts, Matalé, and Kurunegala Associations be asked to collect samples of the following produce:—Pepper, Nutmegs, Cloves, Mace, Croton Oil, Vanilla."

#### OFFICIAL ESTIMATE OF TEA CROP FOR 1904

Considered the question of the official estimate of the tea crop for 1904. *Resolved*:—" (1) That an official estimate of the tea crop of Ceylon be compiled by the Planters' Association from the 1st January to the 31st December, 1904." (2) That District Associations be asked to compile such estimates for their district, and furnish them to the Secretary, Planters' Association of Ceylon, by the 30th November, or as soon thereafter as possible. (3) That district estimators be requested to obtain their estimates from acreages as far as possible, the statistics received to be considered confidential, not to be published by the estimators, and the total District acreages need only be given. Such returns should, in the opinion of the Committee, be—(a) Total acreage in tea, (b) acreage in bearing, (c) total estate crop (excluding bought leaf), (d) estimate of green tea to be made (being part of c), (e) estimate of native leaf (not included in c), (f) acreage of tea-land abandoned during the past year. District estimators are kindly requested to check the figures received so as to correct the possibility of the total under (c) being also included in (c). (4) That forms be issued separately to each Superintendent to be returned by him in a closed cover. That the foregoing Resolutions be forwarded to the Honorary Secretaries of the various District Associations with a request that they will kindly take immediate steps to furnish the Committee with the desired data. (5) That a Special Committee be appointed to consider the returns received in due course from

District Associations, and to report to the Committee before the end of December, 1903. (6) That the following members be asked to serve Hon'ble Mr. Edward Rosling, Messrs. W. D. Gibbon, T. C. Huxley, the Chairman, Planters' Association of Ceylon, the Secretary, Planters' Association of Ceylon; and that the Ceylon Chamber of Commerce be invited to nominate two members of the Chamber to confer with the Special Committee of the Planters' Association, especially as regards the probable distribution of the crop."

#### PRESERVATION OF BIRD LIFE ON TEA ESTATES.

Submitted correspondence with the various district Associations on the subject of the comparative absence of bird life in tea districts in Ceylon, and the probable connection between that circumstance and the present prevalence of caterpillars and other pests on the bushes.

Read letters from the Honorary Secretary, Rakwana Association, intimating "That this Association heartily support Messrs. George Stuart & Co.'s suggestions for the preservation of bird life on estates, but agree with their correspondents who condemn the growing of lantana, is being subject to the attack of bug which infects adjoining vegetation."

Read letter from the Honorary Secretary, Dimbula Association, forwarding the following Resolution:—"That as the matter of preservation of bird life on tea estates was receiving full attention in the local papers it was unnecessary to discuss it at this Meeting."

Read letters from the Honorary Secretaries, Badulla, Matalé, Knuckles, Kellabokka and Panwila, Kelani Valley, Passara, Kurunegala, Balangoda, Maturata, and Hewaheta Associations stating that the matter will be considered at Meetings

### THE CEYLON THIRTY COMMITTEE.

Extracts from minutes of proceedings of a Meeting of the Thirty Committee appointed to administer the proceeds of the export duty on tea levied under Ordinances No. 4 of 1894 and No. 13 of 1902 for increasing the consumption of Ceylon tea in foreign lands, held at the Victoria Commemoration Buildings, Kandy, on Saturday, the 12th September, 1903, at 7-30 a.m.

*PRESENT*:—Messrs. A. C. Kingsford (*Chairman*), A. Philip (*Secretary*), Hon'ble Mr. J. N. Campbell, Hon'ble Mr. W. Henry Figg, Hon'ble Mr. Edward Rosling, Messrs. W. Cecil Braybrooke, R. Hyshe Eliot, Edgar Turner, Joseph C. Dunbar, T. C. Huxley, Frank S. Vowler, Walter J. Smith, H. O. Hoseason, E. D. Harrison, John J. Robinson, J. B. Coles, W. D. Gibbon, R. Morison, James Westland, W. D. Bosanquet, R. A. Galton, Robert Davidson, and George Croll. Twenty-three members.

#### LOAN FROM GOVERNMENT OF Rs.1,50,000.

Read letter to Government annexing copy of the following Resolution:—"That on the exhaustion of the present 4 cents (probably in August) bonus, a bonus of 3 cents per lb. will be paid on all tea certified by 31st December, 1903, up to a further 5 million lbs," and asking that the sanction of His Excellency the Governor in Executive Council may be formally intimated for the said appropriation of Rs.1,50,000, as desired and determined by the Thirty Committee.

Read letter from Government, dated 8th September, 1903, intimating that the Governor in Executive Council had been pleased to approve of the appropriation of Rs.1,50,000 proposed.

Intimated that a further sum of Rs.20,000 applied for had been received, being the third instalment on account of the loan of Rs.1,50,000, sanctioned by his Excellency the Governor.

#### CEYLON GREEN TEAS GRANT, 1903.

Submitted memos showing payments made as at 15th and 31st July and 15th and 31st August, 1903, and also comparative statement showing number of lbs. during 1902 and 1903 respectively up to 30th June of each year.

Intimated that payment having been made on 7 million lbs. green tea at 4 cents per lb., payment is now being made on a further 5 million lbs. at 3 cents per lb. on all green tea certified to 31st December, 1903.

#### WORLD'S FAIR, ST. LOUIS, U. S. A., IN 1904.

Read and considered correspondence with Mr. Wm. Mackenzie.

Read letters from Government stating that His Excellency the Governor had decided that Mr. R. Huyshe Eliot, Assistant Commissioner for Ceylon at the World's Fair, should be paid salary at the rate of £700 per annum, and that he should be reimbursed actual steamer and rail fares from Ceylon to St. Louis and back; further noting that a sum of £2,000 sterling had been voted from the Thirty Committee's funds towards the expenses of the representation of Ceylon at the World's Fair.

Read letter from the Board of Lady Managers sending an expression of thanks for the case of tea, which would be much appreciated.

Submitted letters from Mr. Gordon Field.

Read letter from the Indian Tea Association, Calcutta, suggesting union of Indian and Ceylon interests at the World's Fair, St. Louis, U. S. A. *Resolved*:—"That in reply it be stated that the Thirty Committee cannot recommend the Government to join with the Indian Tea Association at the St. Louis Exhibition, 1904, as final arrangements are now made, but that the Thirty Committee would be glad to co-operate or to hear the views of the Indian Tea Association regarding pushing tea on the Continent of Europe and elsewhere."

CEYLON TEA IN SOUTH AFRICA.

Read letter from the Secretary, Indian Tea Cess Committee, Calcutta, in reference to the question of extending the sale of British-grown teas in South Africa, and enquiring whether the Thirty Committee would consider favourably a scheme for joint working between Ceylon and India. *Resolved*:—"That pending information as to the respective quantities of China, Indian, and Ceylon teas imported into South Africa, consideration of the matter be deferred."

INDIAN TEA ASSOCIATION.

The following is extracted from the abstract of the proceedings of a Meeting of the General Committee held on the 15th instant, at which there were present: Mr. H. C. Begg (*Chairman*), Mr. T. McMorran (*Vice-Chairman*), Messrs. Geo. A. Ormiston, Lockhart, Smith, R. R. Toynbee, T. Traill, and W. Warrington.

Read letter of 28th August from the Secretary, Indian Tea Association, London.

The principal subject dealt with in the letter was—

BLACK TEA FOR THE LONDON MARKET.

This matter was referred to in the proceedings of the last Meeting where it was stated that the Committee were awaiting the receipt of a telegram communicating the details of the scheme. This telegram had been received and was to the effect that details had been arranged on the basis of dividing the estimated crop into weekly offerings extending to 30th June, 1904.

The letter stated that a circular was being issued, pointing out that material advantage was gained last year by the action of the Regulating Committee, and expressing a hope that additional support would be received this year.

After a lengthy discussion it was decided to issue a circular to members of the Association stating what the London Committee proposed to do, and recommending them not to hasten the despatch of teas from the gardens as offerings were to be spread over the season until June, 1904. It was also decided to ask members of the Association if they would be prepared to support a proposal which had been made to regulate Calcutta sales and extend the auctions to 31st March.

ST. LOUIS EXPOSITION.

In the proceedings of the last Meeting it was stated that the Committee were awaiting a reply from the Thirty Committee, Ceylon, regarding the proposal for an amalgamation of the Ceylon and Indian exhibits at the St. Louis Exposition.

A reply had since been received by telegram and was to the effect that the Thirty Committee regretted they were unable to recommend the Ceylon Government to join the Indian Tea Association in the representation at St. Louis, final arrangements having already been completed.

It was now decided to telegraph the result to the Committee of the Indian Tea Association, London, and request them to proceed with their arrangements for the Indian exhibit. It was also to be stated that a sum of £10,000 was practically assured.

MORE DESTRUCTIVE THAN WAR.

Ignorance of the cause and nature of human ailments, and of what best to do when attacked by sickness, is responsible for greater loss of life, and infinitely more prolonged misery, than the most desolating war that was ever waged. Wars break out, rage fiercely, subside, and there is peace once more in the land; but everywhere and always there is a proportion of the people who are sick and ailing; who cannot properly sustain their part in the competition of life, and whose time is passed in suffering pain, from which they perceive no way of escape except by death.

In all ages the wisest and noblest of mankind have exerted their mental power to the utmost to avert, so far as may be, the suffering and wastage of humanity, and they have been rewarded by a large measure of success. The evils we deplore, great as they undoubtedly still are, have been enormously diminished by their efforts. Many modes of treatment formerly in high repute have been proved by modern science to be positively detrimental to patients, while remedies have been discovered of such wonderful efficacy that the cures they work would have been accounted miracles in a darker and more superstitious age. The foremost place among these disease-dispelling life-savers must be given to Mother Seigel's Curative Syrup. For thirty-five years that great remedy has been doing its humane work in all parts of the world. No other medicine is so much esteemed, nor likely to be while people voluntarily write of it in terms such as those employed by Mr. Isaac T. Sihiya, of Engun-jini, Sneezewood, P.O., Griqualand East, Cape Colony, who, in a letter dated 10th June, 1903, says: "I am convinced that but for Mother Seigel's Curative Syrup I should not be alive to-day. Some years ago I had a bad fall from my horse, and sustained a great shock. I lay for a long time on the ground helpless, and when assistance arrived it was found that I had severely sprained my spine. After a while I recovered somewhat, and was not greatly troubled by my accident until after I entered upon my present duties as Forest Guard for this district. The work at that time was very hard, the people being unruly and giving much trouble. I had to be on horseback the greater part of every day, and very soon my back began to trouble me again. My kidneys were affected and caused me dreadful pain. Many times I was obliged to dismount from my horse and walk, leading the animal behind me; for I was not in a position to give up my work. A doctor whom I consulted informed me that one of my kidneys had been displaced, and was otherwise injuriously affected. For three years I suffered in this way, and none of the medicines I tried benefited me in the least. But one day a friend gave me a little book to read, and advised me to try the medicine described therein, which proved to be no other than Mother Seigel's Curative Syrup. I followed his advice, and to that fact owe the good health I now enjoy. I am confident that I could not have continued much longer to endure the terrible anguish with which I was afflicted before resorting to Seigel's Syrup."

Testimony such as this must convince even the most sceptical; yet let it not be forgotten that Seigel's Syrup is the unrivalled remedy for indigestion and of the numerous complaints which arise from that malady. "As regards my family," writes Mr. C. F. Morsner, of French Hoek, Paarl Division, Cape Colony, 15th June, 1903, "we keep Seigel's Syrup as our house doctor. It cured me of liver complaint. I have recommended it to numerous people, and always with satisfactory results."

Humanitarians look forward to a time when suffering shall be reduced to its lowest possible limit the goal alike of the best politicians and physicians.

MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated September 4th, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1903-1904	256,814	330,738	29,930
1902-1903	285,486	368,578	24,935
39,493 pkgs. INDIAN	Total 70,183 packages were offered in public auction this week.		
28,217 " CEYLON			
2,473 " JAVA			

The report of the Director-General of Statistics gives the total acreage under tea in India at the end of 1902 as 525,252 with a production of 188,589,261 lbs., against an acreage of 524,767 and production of 191,302,773 lbs. in 1901. It also states that only 4,464,762 lbs. were retained for local consumption, besides 3,480,716 lbs. imported from other countries.

The report of the Indian Tea Markets Expansion Commission just issued shows that in two years they have sold 3,687,767 pice packets and 950,313 cups, the total quantity disposed of in the 24 months being 552,323 lbs. An area has been covered of over 2,500 villages and towns.

**INDIAN.**—In spite of a rather heavy auction demand was strong, all kinds selling very steadily, while anything with attractive quality realized full prices. A small invoice of fine Darjeeling Tea from "Jungpunnah" brought an average of 3/1½. Exports to U. K. from Calcutta and Chittagong second half August 12,100,000 lbs., against 10,690,000 lbs.; from 1st April 55,522,000 lbs., against 50,280,000 in 1902. Averages:—"Dooteriah," 2/4½; "Margarets Hope" and "Turzum," 1/6¼; "Balasun," 1/5½; "Bordubi" and "Behora," 1/3½.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 34,110 pkgs., av. 8/14d. 1902, 30,551 pkgs., av. 7/56d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 133,970 pkgs., av. 8/00d. 1902, 154,044 pkgs., av. 7/12d.

**CEYLON.**—The auction passed with good general competition, medium teas being if anything a trifle dearer, while better class descriptions sold well, last week's rates being maintained for commonest grades. Quality is now beginning to show signs of improvement. Exports to U. K. for August 6,500,000 lbs., against 7,250,000 lbs. same month 1902; total from 1st January 69,000,000 lbs., against 75,500,000; Estimate for September 6½ to 7 million lbs., against 6¾ million lbs. 1902.

Average for week 7/26d., against 6/52d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 712,641 pkgs., av. 7/46d. 1902, 800,081 pkgs., av. 6/69d.

**JAVAS**—Sold very steadily at full prices, all kinds meeting with good attention. Since 1st June 24,991 packages on Garden Account realised an average of 6/61d. per lb.

### COFFEE.

Messrs. G. Dauring & Zoon's Monthly Market Report, dated Rotterdam, August 31st, 1903, states:—Contrary to expectations, markets wore a hardening tendency; the trade has been purchasing with less reserve and ultimately values are ½ct. to 1ct. better.

Next Trading Company's sale will be held September 8th.

The Java crop is particularly late this year and arrivals continued moderate during the month under review. Importers met the market freely, and values were in sellers' favour, especially so for fine grades high grown, which realized fancy rates. Medium descriptions also Liberian, without any change in value.

Second hand dealings do not call for any remark and consisted chiefly of old pale Santos coffee at prices based on terminal values, consequently considerably cheaper than cost and freight quotations, preventing business in that line.

Arrivals in our market were unimportant, only 27,200 bags Java and 57,100 bags Santos. Deliveries of the latter amount to 70,400 bags, reducing our stock by 13,300 bags.

Terminal business was slow, without any change in value during the first part of the month. The trade has been using the moderate terme standard for purchases of old filières, which together with an advance in cost and freight, lead to an improvement of ¾cts., quotations being 15½cts. per September, 15½cts. per December, 15¾cts. per March, and 16cts. per May. Dealings amount to 83,000 bags or 580,500 bags since 1st January. August contracts 7,000 bags, tenders 6,000 bags.

Business was much interfered with by the advance, which Santos holders asked and succeeded in carrying through.

Two causes were put forward to legitimate higher values.

1°. Drought, prejudicial to the coming crop.

2°. Lower estimates of the present crop.

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

## CURES

**RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,**

And all Aches and Pains usually treated by outward application.

**IT HAS NO EQUAL ON EARTH AS A PAIN  
RELIEVER.**

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

As far as injury by drought is concerned, it is too early yet to have a decisive influence upon next crop, besides rainfall is reported since, beneficial to the September blossom. As to the second argument: lower crop estimates, the trade, after three years' experience, well knows what crop estimates mean and refuses to go by anything but receipts, although too early to be taken as a criterion. Nevertheless these reports were quite to the purpose, forcing values up from 3,600*réis* to 4,100*réis*, not a trifling affair indeed and sufficient to encourage owners not to neglect their fazendas. This year again large receipts are counterbalanced by unfavourable crop and weather reports, by which it was possible to sell a large quantity cost and freight at far better prices than would have been obtainable otherwise, the benefit being entirely on the Brazilian side. Public opinion at present favours the idea of reducing estimates of the present Santos crop, not exceeding the previous one, whilst Rio is reported smaller than anticipated, both crops combined not to exceed about 12 million bags.

Shipments from Santos have been—

(July 1st to June 30th.)	1902-03.	1901-02.	1900-01.
	Bags.	Bags.	Bags.
To Hamburg and Bremen	2,101,100	2,134,700	1,702,900
„ Havre	1,232,300	1,934,900	681,300
„ Rotterdam	867,000	1,187,400	967,000

Total	8,542,400	9,731,900	7,821,500

The usual increase in stocks has set in in July, European stocks being 1,350 tons more and visible supply 31,370 tons more.

PEPPER.

Messrs. G. Duuring & Zoon, report:—Trade demand has been extremely poor and local business has come to a standstill. Lampong pepper is not considered cheap compared to other descriptions. Stocks at the end of July were slightly more, 7,500 bags in Europe and 3,100 bags in the United States. Shipments from Singapore and Penang were heavy during the first half of the month, particularly to the United States. These features had an adverse influence on the speculative market, resulting in realisation per December and March. Quotations are  $\frac{3}{4}$ ct. down for near and  $1\frac{1}{4}$ cts. for distant positions and the report has vanished,  $32\frac{3}{4}$ cts. being the universal quotation for all positions except March  $32\frac{3}{4}$ cts. Dealings amounted to 27,200 bags or 202,600 bags since 1st January. August contracts 1,800 bags and tenders 1,400 bags.

# PLANTING

# OPINION.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, OCTOBER 3, 1903.

[No. 39.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 9th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

September 28th.—*Weather*—Rain still with us. *Wind* S.-W. Days warm. *Works*—Handling, weeding. *Coffee*—very vigorous. *Supplies*—might be better. *Health*—Good. *Labour*—Plenty.

#### Coorg.

POLLI BETTA, 29th September.—*Weather*—It has been unusually wet throughout September. This has been bad for coffee. Leaf-disease is showing up badly in stiff soils. *Interesting item*—The Government Entomologist has been here. He is reported to have said that bug is easily got rid of. *General health*—Plague has now made a lodgment at Gonicopal, and five deaths from this cause have occurred in an estate here. *Labour*—equal to requirements.

#### Kotagiri.

1st October.—*Weather*—No signs of a break from the continual showers as yet. The total rain for September is 8 inches with scarcely a single fine day. This has made the attack of leaf-disease bad and prolonged. *Crop*—Fly-picking commencing. *Tea* has been flushing very well. *Health*—Poor, a good deal of fever. *Labour*—Still rather scarce as locals are at work on their crops, and resident coolies have not come in yet. *Interesting item*—Mr. H. Maxwell Lefroy came here for three days to examine "Green Scale" and "Brown Bug," and hopes to come again next April to treat affected areas by spraying. He also inspected "Mealy Bug" and two Scab pests on young *Castilloa* Rubber trees.

### PLANTERS AND THE LABOUR LAW.

It is amusing, yet also distressing, to observe the attitude that many planters have taken up in respect to the Madras Planters' Labour Act I. of 1903. For a great many years past the planting communities in Southern India have agitated for a Labour Law that should give them satisfactory control over Estate labour. It was the common grievance on the score of the absence of such a law that caused the various District Associations to unite in the formation of a central body, representative of all the planting districts of the South. What was asked for in early stages was an amendment of Act XIII. of 1859. This was found to be impossible. The Planters' Enquiry Committee reported in favour of an additional Act. Such an Act was drafted, the draft was submitted to numerous revisions. Planters fought ably and boldly for certain desired amendments, and in some cases they gained their point. Having secured every concession he could, the "Planting Member" of the Legislative Council of Fort St. George yielded with a good grace to *force majeure*, and seconded the resolution that the Bill, as finally revised and amended, should be passed into law. In doing so, he did not arrive at a settlement of a long-debated question, but merely helped to carry it into a fresh sea of dissensions. Now, the Nilgiri Association has the credit of being the first in British India to ask for the application of the Act to the District it represents; but this credit does not count for much. For months past the Nilgiri planters have wavered, and now, when they have definitely declared a policy, it is only the casting vote of the Chairman that has enabled them to do so. However, the die is cast, and the new Act will no doubt receive a fair trial in the Nilgiri district. This marks an advance, and if other planting districts follow suit, desirable amendments in the Act may not be very far off. Every delay in regard to the application of the Act means a delay also in the eventual amendment of it at points where it is found to be ill-adapted to local requirements and the conditions of Estate labour in the different districts.

It would be well if planters would consider very carefully what they have a prospect of gaining by pursuing a policy of obstruction. They have obtained the best Act that the Government could give them. They have been invited to give it a

trial, and then, if there is anything wrong, to approach the Government with representations based upon the results of experience. Apparently some of them think that they have a choice between Act XIII. of 1859 and Act I. of 1903. By the favour of the Madras Government this is so at the present time; but will it always be so? It is said that Act XIII. of 1859 is in some ways useful to the Government of India; but that is no reason why it should not be withdrawn from the Madras Presidency and the Native States of Mysore, Travancore, and Cochin. After the way in which successive Governments have been worried about reforms in the Labour Law as applicable to planting districts, no blame would attach to the present administrations if they decided to withdraw the alternative Act upon which planters now seem desirous of relying after urging for many years its manifest flaws and deficiencies. Left without Act XIII. of 1859, repudiating Act I. of 1903, where would the planters of any particular district be? If they will reflect upon this, they will probably decide not to drive the Government to extremities. We do not think that the Madras Government have adopted quite the attitude that they should have done; the reflections that have been cast upon planters because of their non-acceptance of an Act which is certainly not on the exact lines that they desired, are largely unfair. Still, planters themselves have not in all cases been so fair as they might have been in their criticisms. Let the past go. The present shows, as the past showed, that the power is in the hands of Government. It is vain to kick against the pricks. By submitting now, planters will at least place themselves in the position to test the capabilities of the new law. If there are defects, they will come to light, and, we have no doubt, be removed. But, if planters decline to give the law the necessary trial, there will be no proof of the existence of defects in it, and, sooner or later, they may find themselves in the position of accepting this Act or having none at all, and of having to negotiate with a Government whose sympathies they have wilfully alienated.

There is not a doubt about one thing. Every district that holds aloof from the new law will be regarded by the Madras Government as refractory. That is how the Government will regard the matter. The Government will continue to hold a weapon with which they can bring the refractory districts to reason. Is it likely that they will long refrain from using this weapon, *viz.* the power to deprive the districts referred to of the very doubtful advantages of Act XIII. of 1859? We think not. That is why we would add our exhortation to those of the present Chairman of the U. P. A. S. I. and the "Planting Member" and strenuously advocate the acceptance of the new Act in every planting district of the Madras Presidency and, with such modifications as can be obtained from Local Administrations, in Mysore, Travancore, Cochin, and Coorg. There is virtually no appeal against the decision of the Government of Madras. The Government of India is known to take a far less sympathetic view of the exigencies of estate labour and the contracts that are necessary to secure it. The Government of Madras hold the key to the position. They say that there is no case against the new law, but, at the same time, they admit that a case may possibly be made out as the result of practical application of this law. The right course for planters to take is as clear as any one could desire. They must give the Act a trial, note down the defects, collate their notes, and in due course, after, say, a year's trial, approach the

Government once more and state the results of practical and fair experience. If this course be taken, we feel convinced that their efforts to secure necessary amendments will not be in vain.

## U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

### REGULATION OF SUPPLIES OF TEA TO THE LONDON MARKET.

The Indian Tea Association, Calcutta, has issued the following circular dated 19th September, 1903: "You will doubtless have noticed from the proceedings of the Meeting of the General Committee of this Association, held on the 1st September, that a movement had been set on foot in London to continue the regulation of offerings of black teas at the London sales. The General Committee are now informed by the Committee of the Indian Tea Association, London, that it has been arranged to spread the offerings over the season until the end of June next. In view of this arrangement the General Committee would recommend members not to hasten the despatch of their teas from the Gardens.

It has been suggested that the regulation of sales should be attempted in Calcutta also, but for a shorter period, say until 31st March next. In this connection I am directed to enquire whether members of this Association are prepared to assent to the proposal."

A reply was solicited before the end of September.

## COFFEE NOTES.

**A Brazilian Coffee Corner.**—A telegram from New York dated August 31 was thus transcribed in London papers:—

The following telegram has been received from Rio de Janeiro: "The 'Jornal do Commercio' announces that a syndicate of Americans is about to purchase the whole stock of coffee at 10,000 réis in Arroba."

The ignorance here displayed will scarcely surprise those of our readers who know how little interest is taken by the general Home Press in the important subject of Coffee cultivation. Of course, what is meant is "10,000 réis per arroba."

\* \* \*

**Say Coffee Will Rise.**—Messrs. J. S. Bache & Co., New York, in their weekly circular, say:—

"We are not disposed to question, however, but what there may be many advances between now and December, and we are inclined to look for a rather more active market. Prices are low, and adverse crop news will prove very tempting to the speculatively-inclined outsider. We do not believe any advance justified that is not based on an actual curtailment in productive capacity; but scalping operations on the long side might not be unwise for the next two or three months. Don't think, however, that it would be good policy to buy a thousand bags or so and store it away with the idea that prices will go up 5c. or 6c. a pound. There is too much coffee for that."

\* \* \*

**The U. S. Coffee Market.**—Actual Coffee has been moderately active at unchanged and steady prices for Brazil

grades, says the *Tea and Coffee Trade Journal* of September 1. The Brazil market itself is ragged and the tendency is to make concessions in the firm offers. Certainly the Brazil coffee is moving. A recent offer to the New York market was 4.94 and 5c. c. & f. in Rio No. 7, which was regarded high. Rio No. 7 at 5.10c. store terms has been refused here. The movement of the present crop continues heavy, averaging 70,000 bags in the daily receipts. The increase in the world's visible supply will probably prove 600,000 bags, bringing the total up to 13,000,000 bags. The reports of drouths have been displaced by those of rains.

In spot invoice there is a quiet market. Quotations are 4 $\frac{7}{8}$ c. for Rio No. 8, 5 $\frac{1}{8}$ c. for Rio No. 7, 5 $\frac{7}{8}$ c. for Rio No. 4, and 5 $\frac{1}{8}$  to 6c. for Santos No. 4. Jobbing business is fairly active. A complaint of jobbers is that wholesale houses are importing coffee heavily on their own account, a change not welcomed by them as tending to narrow their business opportunities. Much such complaint is general in grocery lines. The wholesalers are branching out.

In option coffee the market has been active but mainly in switching September into the distant months. The September liquidation was very large and of course few desired to receive the coffee. Hence the switching which was done at 85 points into March and 100 points into next May, realizing rather profitable margins. Not a little switching was done into November at 20 to 25 points. This month offers fine opportunity in a speculative way. The assumption is that a change in the value of grading of coffee will be ordered next November by the Grading Committee of the Exchange, which

may order a reduction of 25 points from 50 points in the grades and it may not be uniform. The change will be made necessary should the wide divergence between the prices of actual and optional coffee continue. The tendency is to narrow again and the change may not be ordered. In that event some profits may not be realized. In consequence of the cessation of the September liquidation the market again rules flat, and the next move will probably hover around November, in which in the course of the last twelve months there has been enormous trading, insuring very heavy liquidation when the month arrives.

In mild coffee supplies are plentiful and buyers not overzealous to come out. Concessions are possible in the quiet market. Good Cucuta is quoted at 7 to 7 $\frac{1}{2}$ c. East India coffees are quiet.

\* \* \*

**Mt. Pelee Eruption and the Coming Coffee Crop.**—An optimistic London coffee house says:—"Ever since Mount Pelee, climatic conditions have been upset all over the globe to the detriment of good crops in any country, and it is quite possible that Brazil in its turn may have adverse conditions for the new crop." Possible, yes; but probable?

\* \* \*

Exports from Hawaii to the United States in the last twelve months included 1,852,162 pounds of coffee, an increase of 800,000 pounds over the preceding corresponding period.

\* \* \*

The popular price for blended coffee is 25c. (12 $\frac{1}{2}$ d.) per pound, says the *American Grocer*, and it is surprising what fine grades can be had at that price.

\* \* \*

Reports from Jamaica in regard to coffee plantations are very meagre. There is less than 1,000 bags of Jamaica coffee in the New York, says the *American Grocer*. The finest marks bring 12@14c.

\* \* \*

Ordinary grades of mild coffee cannot be sold except at a concession from quoted figures, while choice to fancy grades command full figures, and often beyond quoted prices.

### TEA NOTES.

**Pingsueys, Congous, and Country Teas.**—Messrs. Wisner & Co., writing from Shanghai, on August 1, say that in black teas only a very limited business has been done, and prices have shown little change, closing weak. Good, clean, common tea has dropped two taels per picul on the Hankow market. Stock is 16,391 half-chests. Settlements reported are as follows: Ningchow, taels, 20.50 to 32.00; Oopack, taels, 16.50.

In green teas, country teas, these have continued to come to market freely and early in the interval found buyers at full rates. During the second part of the period under review, the market has been a falling one and buyers cautious. From the highest point prices of "fully good," to "choicest" chops have fallen 4 taels and of "common" to "medium" 3 taels per picul. "Kiukang Packs," "Wenchows," and "Local Packs" have continued to sell at comparatively cheap rates; at the close there is very little inquiry for them.

Shipments to August 1 to the United States have been 4,004,778 pounds black tea against 5,468,691 last year and 5,352,376 pounds green against 4,185,585 last year; to

Canada, 384,532 pounds black against 376,532 pounds last year, and 236,000 pounds green, 102,414 pounds last year.

\* \* \*

**Ceylon Teas for Japan?**—Messrs. Smith, Baker & Co., Yokohama, August 13, say of Japan tea:—

“Judging from the present talk among native tea-men, they seem to take about the same languid interest in the local tea market from now to the end of the season that the habitual ‘fan-tan’ player does after three quarters of the cash in the game has been withdrawn, that is, they seem to know just how it is coming out. They say to-day, for instance, that there will be only seventeen days more picking (the growers having agreed to stop picking September 1) and the narrower the margin of production becomes the more confident they feel of their ability to take care of the present stock and probable addition and in consequence, signs of weakness on the part of holders is nowhere apparent to buyers for export.

“When we explain to them with painful particularity, the inroads Ceylon and India teas are making in the American and Canada trade for cheap Japans they miss the point entirely, and ask childlike and blandly if it is not possible for them to import some of the cheap Ceylons for home consumption in Japan! ‘These Mongolians is improvin’.

“Will an export of 42,000,000 from Japan cover the requirements of America and Canada for this season?”

The exported during the current season to August 11 has been 22,461,148 lbs. of which 5,551,555 lbs. were for New York, *via* Pacific Ocean and 3,480,963 lbs. *via* the Suez Canal; 3,551,963 lbs. for San Francisco, 10,550,863 pounds for Chicago, and 2,228,623 pounds in Canada. The total one year ago at this time was 19,244,527 pounds.

\* \* \*

**Report on Formosa Teas.**—Messrs. Tait & Co's circular, Amoy, July 20, says:—

FORMOSA OOLONGS.—Arrivals to the Tamsui market total some 300,000 half-chests, against at even date last year 265,000 half-chests. During the period under review market has been active, and after receipt of news of the fire on board ss. *Heathford* cargo teas were forced up \$2 to \$3. Fine grades met with good demand, but quality is very indifferent. They have strong water, but lack the true Formosa flavor. Choice grades have all been bought up, and we do not expect to see more from subsequent pickings. Chinese packers are having a very bad season, and all the profits made last year have been lost; but the grower is making good profits. Prices in the country keep very firm. We quote as follows:—Good, \$39 to \$41, duty paid; good to superior, \$46 to \$48, duty paid; superior, \$52 to \$55, duty paid; superior to fine, \$58 to \$63, duty paid; fine, \$68 to \$71, duty paid; finest, \$80 to \$90, duty paid.

Exports to the United States to July 16 were 5,569,034 pounds, against 5,367,721 pounds last year. Arrivals of Tamsui Oolong were 300,000 half-chests, against 275,775 half-chests one year ago, and settlements, 265,000 half-chests, against 255,000 half-chests then.

\* \* \*

**Report on Japan Teas.**—Messrs. M. J. Brandenstein & Co. say of Japan tea:—“Since our last, second crops are being marketed. The market has been weak on lower grades of poor steeping quality, but very firm on good drawing teas. Buying has been anything but active for the time of the

year, due to the undesirable offerings. The fine and good grades have been very scarce. Stylish basket-fired leaf is exceptionally meagre. Quality, on an average, about the same as last season. Style: Teas on offer are on the basis of last year.”

The settlements of Japan tea at Yokohama to July 30, and Kobe to July 28, are as follows:—

Choicest	...	60	3,875	...
Choice	...	55-59	11,147	...
Finest	...	50-54	25,140	...
Fine	...	45-49	44,703	5,159
Good medium	...	41-44	49,850	20,061
Medium	...	36-39	34,790	46,378
Good common	...	32-35	28,382	67,542
Common	...	28-31	29,767	56,204
Sundries	...	27	26,575	22,896
Totals	...	...	254,229	216,240

\* \* \*

Last year the tea from China for European Russia took the old route *via* the Amur, and importers will use the same route this year, although the freight charge *via* Dalny and the Chinese Eastern Railway is lower than by the Amur, and duty need not be paid in advance, while it must be so paid on the Amur. The reason is that insurance companies refuse to take the tea risks across Manchuria.

\* \* \*

Up to the present time South African-grown tea has not been able to find a large market, and whether the public taste can be educated in that direction remains to be seen. It is proposed to help it much in South Africa by tariff preferences, and a new duty of 5 shillings per 100 lbs. *plus* an *ad valorem* on all imported teas is under suggestion. Ceylon and Indias *via* London are chiefly used.

\* \* \*

**Tea-Planting and Tea-Drinking.**—A correspondent writes from Germany to *Commercial Intelligence*:—In view of the satisfactory results of experiments in tea-planting on a small scale in the Cameroons, the Government has decided to go in for planting on a much larger scale. Good varieties from Ceylon and the Himalayan district are to be cultivated. Talking of tea, I find that a good deal of “Russian” tea consumed in Germany is bought in London. There is a prejudice in favour of Russian teas, and the German dealers accommodate themselves to it by putting up Ceylon and Indian teas in wrappers printed with Russian characters. Thus the Teutonic consumer gets a very good article for his money, while, at the same time, his Russian bias is borne in mind. An East Prussian general dealer told me that he did quite “a roaring trade” in Mincing Lane “Russian.” I hope our tea-dealers have noted that the tea duty in the new German tariff stands at 12s. 8½d. instead of £2 10s. 10d. per cwt., and made preparations to work the German market directly the new advantageous rate comes into force.

\* \* \*

Mr. Larkin is indefatigable in his demand for a British-made Oolong tea, says the *Tea and Coffee Trade Journal*, and his zeal in lecturing Mincing Lane and other Indian sources of supply continues unabated, and of course he provokes discussion and the desire on the part of some to attempt to slake his thirst for an Indian Oolong. Mr. Larkin says he needs it in his business, and he threatens really to buy Formosas should his patriotic wishes pass unheeded, and unrealized. On the face of things Mr. Larkins's concern deserves praise and recognition, and eventually, success.

However, the trade on this side of the Atlantic understands that Mr. Larkin does employ Formosas or China Oolongs in his blends, and is inclined to wonder at his ambition. It is inclined to the belief that the Canadian tea-man is a bear on Formosa tea, being a purchaser rather than a grower and therefore wanting tea at least possible cost. A considerable production of India Oolong tea would greatly add to the world's supply of Oolongs, demand for which is limited to not more than 20 million pounds, and prices would necessarily be forced down. While some India tea men think that an India Oolong can be made fully as good as Formosa, the tea trade generally holds that the peculiar excellencies in the Formosa tea is produced by Formosa soil, which cannot be duplicated, and Indian growers have themselves ascertained that a Formosa tea plant when transplanted in Indian soil reverts to the worst China types. However, there is a general agreement that the growing and manufacture of Formosa Oolongs is not thoroughly understood outside of the island. Let the experiments and subsequent events be what they may, it should seem hard to displace the popular and excellent tea, and it would be a pity, events actually producing the tea elsewhere than on the Island of Formosa, to see the Oolong so meet with a fall in prices as to affect the quality produced, and this may well be feared. India and Ceylon tea-men have produced wonderful things in the tea world, and if they want a British Oolong for British men and commerce and can supply it as good as any grown, why, we suppose, it will come about. Meantime, Mr. Larkin's real motive should be understood.

\* \* \*

**The U. S. Tea Market.**—More general trading is reported in tea but very little in a large way, says the *Tea and Coffee Trade Journal* of September 1, buyers continuing disinclined to anticipate wants; prices are steady locally and firm abroad with some instances of advances.

It is now thought that no large business will be done before October. Buyers expect or at least hope for a decline, and will not enter the market except to satisfy immediate wants. From the inquiry that is general it would appear that stocks are getting low, at least in some much-desired teas, and eventually replenishing must ensue. The expectation is that the demand will come in a lump.

While teas of low grade are generally expected to show a decline as the season proceeds, an admission freely made by many importers, firm rates at the present high basis of values is reported as the common expectation for teas of superior grades. They are relatively scarce, and are in strong hands. Moreover, the consuming market is supposed to be more or less barren of them.

Japan teas continue hardening, and, in the course of the week, are up 1 cent for all grades. Picking stops to-day, and while a full crop will be shipped, the barren condition of the market here is expected to take all the tea offered and at the sellers' rates. A pretty battle is on between bulls and bears in this tea, and in the maintenance of price the advantage so far lies with the bulls. Formosas are up a cent, but it is only a recovery. Two weeks ago the sellers in the East experienced a panic because of the lack of buying from this side, and they made concessions which prompted considerable buying, which in turn induced the recovery. The better grades are reported scarce, and should continue to bask in the sunshine of high prices. Congous are steady, and as a drug on the market are being displaced by Foochow for

which there is no sale. The bulk of last year's large importation is still here unsold, together with some of the crop of the preceding season; of the present crop some 100,000 packages remained unsettled in China. The green teas remain steady, and their immediate future is problematical. The supply is plentiful. Indias and Ceylons are firm; the quality has much improved and they are in much less supply, London reporting 2,000,000 pounds of tea in stock at the end of July 1 last less than at any time since July 1, 1900. The missing supplies are thought to have come direct to America and not *via* London as heretofore. Nevertheless, it is well to note that the London market is firm.

Canada reports that in its market it might be anticipated that Japan teas are ranging 15 to 16c. for good; common or medium may be obtainable, the quality probably being a little coarser than last year's. Fine quality of all descriptions now evidently being off the market in Japan, holders there look for a good trade on such when business resumes activity, which is likely now the holiday season is over. "Tea for price" having been the demand for some years past, the flat flavored Ceylon imitation of Japan teas had been in demand; whereas, with the expectation of Japans now reaching 15 to 16c., with fair quality of cup, the desire of consumers will be to obtain Japan teas.

New fannings are very scarce, and the Canada market takes them at 8 to 8½c., while new siftings are quoted 6c. or over, according to quality.

\* \* \*

**American Market as Viewed in Japan.**—Writing from Kobe on August 12, the Japan Tea Exporting Co. says:—

"Our last report was dated July 22. Since then there has been a continued demand for low-grade teas, and some active business has taken place, the result being great scarcity of stock, which naturally caused prices to advance. After the turn of the month, however, all buyers assumed a cautious attitude, holding aloof from operating, except for filling only pressing requirements, and in consequence a somewhat quieter feeling has prevailed on the market.

"Prices have advanced for medium and downward grades by Y1, which is about Y2 higher compared with the prices ruling at the corresponding period last year, while goods of fine and higher grades, owing to the absence of demand, exhibit some weakness, though if compared with the quotation last year, the price is still Y1 higher.

"Small transactions have taken place in Yokohama for the third tea crop, for which prices more favorable than was anticipated are maintained there. It appears that high prices are anticipated, owing to limited arrivals being expected in consequence of a Resolution passed in the Shizuoka districts to suspend the picking of the leaf on and after August 31. On the other hand, on account of unfavorable news which has of late been received regarding the American markets, buyers hesitate to come forward to operate, and the result is the absence of free transactions. It is, however, expected that when larger quantities begin to appear on the market there will be a fair amount of business done. Only a small quantity of Ise third crop tea has arrived in Kobe, and this calls for no special comment.

"Although the demand which has recently increased for the low-grade teas has compelled shipments from the interior, yet the available stock remains small, the consequence being that the market is steadily maintained, goods equal to United States standard, being worth 16 cents delivered in the United

States. As to the report that it has been quoted at 15 cents delivered in the United States, there have never been any transactions at such a price, and it may, therefore be concluded that whoever made the offer on such a basis must have had some special motive for so doing.

"As one or other of the foreign firms continue buying, it is likely that the existing conditions will continue to be maintained, and that prices will not undergo any serious decline."

\* \* \*

**Tea in the United States.**—Inquiry is general as to how much tea is in the United States at the present time, and the following may give a line on the quantity in the country July 1 last:—

In principal Warehouses, January 1	...	90,971,210 lbs.
January Imports	...	9,611,430 "
February "	...	5,831,410 "
March "	...	4,158,527 "
April "	...	1,389,510 "
May "	...	1,933,737 "
June "	...	4,318,489 "
Total	...	118,204,316 "

Exports for six months, 4,000,000 lbs.; net imports, 114,204,316 lbs.; consumption, six months, 42,000,000 lbs.; stocks July 1, 72,000,000 lbs.

Consumption in the United States is put at between 5,000,000 and 7,000,000 lbs. monthly. The imports in July were at least equal to the consumption.

\* \* \*

**London Tea Market.**—Cabling to Colombo on the 24th ultimo Messrs. Gow, Wilson & Stanton reported a dull market, but no change in the average, 7½d. Reuter announced that common qualities were steady and others firm, but also made no change in the average. Of Ceylons, 18,000 packages were sold out of 20,000 offered. There were 43,000 packages Indian Tea offered and 35,000 sold. Average 8d. (¼d. up).

\* \* \*

Receipts of Rio and Santos continue large, and will probably beat the August record of any previous year, says the *American Grocer*.

\* \* \*

Java teas are not included in the Russian increased duty.

\* \* \*

The use of cinnamon as a flavour for tea is not uncommon in Switzerland, according to some writers, the spice being added to the leaf before brewing the tea.

\* \* \*

Green teas in China are known as Sunglos, Moyunes, Hychows, Fychows, Tienkes, Tayshings, Pingsueys, Cantons and country green teas, which varieties are subdivided into gunpowders, imperials, hysons, young hysons, hyson-pekoe, and hyson-skin. Chinese black teas comprise Oolongs, Congous, Souchongs, and scented teas.

\* \* \*

**Advertisement.**—Would it not prove a novel and effective method of advertising tea to introduce the Chinese tea-ball in grocery stores? asks the *Merchants' Review*. It is a small hollow metal ball, divided in the middle and perforated with many minute holes. The halves are filled with dry tea, and then fastened together and suspended from an ornamental chain into a cup of boiling water. After being swung to and fro for a few moments the tea-ball is withdrawn, the water

in the cup having acquired the desired strength and flavour from the tea. As a novelty to be given away the tea-ball might prove a valuable advertisement.

\* \* \*

The *Investors' Guardian* of September 5 concludes a two-page article on Indian tea results in 1902 as follows:—

"The troubles of the Indian and Ceylon planters are not, it would seem, by any means over, and competition from these two sources must be carefully watched. Another matter which will have to receive attention is the deterioration in the older plant, which is reported from Assam and other districts. Then there is the exportation of inferior tea—the stuff which is sold in Mincing Lane for 'exportation only.' The fact that some tea has been rejected in America and shipped to England has led the London correspondent of the *Times of Ceylon* to wittily give tea a threefold division, such as many other things have. This classification is:

First, teas which are fit for the citizens of the United States; second, teas which are not good enough for them, but which are suitable for the inhabitants of the United Kingdom; third, teas which will not do for Britishers, but are good enough for 'foreign devils' as the Chinese have it.

Some consolation for the planters may be found in the fact that Germany has recently reduced the duty on tea from about 5½d. to 1·34d. Some of the Colonial Press cite the States, Australia, and Canada, where there is no tea duty, as examples for the mother-country to follow."

## NOTES.

### Dutch Quinine.

The Amsterdam Quinine-works advanced their prices on September 4 by 1f. for Ed. II. and 1·50f. per kilo. for Ed. III., their quotations being 22f. and 27f. per kilo., respectively.

### Autres Pays Autres Mœurs.

In Turkey they drink the grounds of coffee with the water, and in Japan they often drink the tea, leaves and all, the leaves being reduced to a powder. Paraguayans drink maté tea in the same manner.

### The Frisco Market.

The *Weekly Commercial News* of 27th August reports regarding San Francisco:—Coffees hold fairly steady for choice grades, but lower grades are in abundance and weak. Japan teas also show some slight weakness.

### New York.

Tea and coffee, as sold in some parts of New York, are so much improved in quality of late years that the fact forcibly obtrudes itself upon one's attention. We record it as a tribute to the skill and honesty of the New York grocers.

### German Quinine, etc.

During the six months ending June (the latest figures available) the exports of quinine, quinine-preparations, etc., from Germany were as follows:—

		1901.	1902.	1903.
Kilos.	...	111,800	96,000	74,000
Marks	...	4,696,000	3,456,000	2,664,000

### Java Quinine.

At the tender of Java quinine held at Batavia on September 9, 6,091 kilos. Ed. II. were offered, of which 1,230 kilos. were sold at an average of 17f. 30c., per kilo. (about equal to 6·40 cents Amsterdam unit), against 18f. per kilo. paid at the previous tender. The next tender will take place on October 14.

**Tablets.**

Tablet coffee is now being manufactured. It is practically a distilled product, and the U. S. Government is examining the article with a view to army use. Concentrated tea should be added to the grocer's stock, if the coffee tablet takes with the public, and then there will no longer be excuse for badly-made tea and coffee.

**A Warning.**

Tea and coffee blends have this peculiar characteristic in common, namely, that damaged, mouldy, and ill-flavoured goods cannot be improved by being mixed with sound goods. This is most conspicuous in tea blending. A bad-smelling tea, instead of being helped by mixing with finer leaf, will spoil the good tea without being itself improved.

**India's Tea Production.**

Messrs. Wm. Jas. and Hy. Thompson, in their Report dated September 10, say: "The return relating to the Tea industry in India, of exceptional interest, affords additional strength to the views now widely current as to the future, for it shows that from all India, including Travancore, there are only some 24,000 acres to mature, or at a liberal estimate, say, 12 million lbs. more Tea to deal with, which is equivalent to only one month's consumption in the U. K. Any increase, therefore, above this in the annual yield must be due to exceptionally favourable seasons or a freer system of plucking."

**Russia's Tea Duty.**

In their report dated 10th ultimo Messrs. George White & Co. of London, remarks:—"It is now officially stated that the levy on Ceylon and Indian Teas imported into Russia by the European frontier and the Black Sea is raised from 31 roubles 50 copecks per pood to 33 roubles. This amounts to an increase of fractionally over 1d., per lb. or approximately 1s. 11½d. per lb. altogether, and is fortunately less serious than at first reported. The duty on China Tea remains as before, a stricter supervision to be exercised regarding the origin and place of despatch." It should be added that the duty on Java Tea has also not been raised, and that the new regulation means a preference of 1½d. per lb. to China and Java over British-grown tea.

**Highway Robbery of a Planter.**

A correspondent writes to the *Madras Mail*:—"Mr. A. W. Brodie, a well-known Nilgiri planter, left Coonoor on the morning of Wednesday, the 23rd ultimo, on his way to visit the Waterfall Estate on the Anamalais. He arrived by train at Podanur and left that place in a country cart about 7 P.M. When, within nine miles of Pollachi, he was attacked by a gang of ruffians and was beaten and robbed of everything he had with him. His arm is broken, and he had to walk the whole distance of nine miles, without boots, and streaming with blood. The Assistant Collector at Pollachi (like a good Samaritan) is now kindly looking after him, and he lies in his house in a wounded and bruised condition. All this happened on the well-known road to Pollachi in British Territory. Where were the Police? Is there no safety for life and property on the King's highway? Along this very road His Excellency the Governor will pass next month on his way to visit the Anamalais. It is surely high time that some enquiry should be made, as to the lawlessness of this District, and that this band of ruffians should be hunted down.

**The Clove Supply.**

The Zanzibar clove crop of 1902 was the smallest recorded during the last decade. Picking began early and continued later than usual, yet in some districts, notably in Pemba, a considerable quantity of cloves remained to be gathered at the end of the year. The labour available at harvest time is altogether inadequate, and although every effort is made to remedy this deficiency, a very large proportion of each year's crop remains unpicked. The market price at the beginning of the year stood at about \$3 50c. per frasila for Zanzibar, and \$3 30c. for Pemba cloves, but the demand was not great; from March to the end of September the quotation fluctuated between \$2 93c. and \$3 29c.; during the two following months the prices were steady at from \$3 40c. to \$3 60c. for Zanzibar, and from \$3 20c. to \$3 50c. for Pemba produce, but fell towards the end of December to \$3 30c. and \$3 17c. respectively. The average price throughout the year was about 3½d. per lb. These particulars are given by the Consul, who also quotes statistics showing that of the cloves exported, £136,172 in total value, £69,012 went to British India, £31,495 to Holland, and £16,872 to the United Kingdom. Why not try Clove cultivation in Southern India?

**Java Government Cinchona.**

From the report of the Government cinchona-plantations in Java for the first three months of this year it appears that the rainfall during this period has been abnormally heavy, and the heavy gales, which occurred chiefly in February, caused a considerable amount of damage to the plantations. On the other hand, the trees have suffered little from insect-pests. The continued drought of last year has had a favourable effect on the diseased trees, but it has stimulated the vegetation to such an extent that this may prove to be not entirely without some adverse influence on the harvest. The seedling-plantations promise a rich yield of valuable seed towards the end of the present year. There was no lack of labour during the period under review, and, as a consequence, the cultivation of the soil was commenced in March. At the end of the quarter the total shipments of bark to Tandjong Priok amounted to 190 tons; this includes 90 tons which had been held over from the 1902 harvest in order not to depress the low quotations then ruling. At the end of the quarter the demand for labour from other sides increased greatly; this led to an advance in wages amounting to about 4s. per ton. On March 7 a seed-auction was held, which produced nearly £940. The prices paid included £304 for forty-eight packets of hybrid seed of 25 grams each, and £42 for six packets Succirubra seed of 50 grams each.

**GENERAL ARTICLES.****PRODUCE AND PLANTING.**

The report which gained currency last week that Russia contemplated increasing the duty on British-grown tea has now been confirmed by Reuter. The import duty on Indian and Ceylon teas imported into Russia by the European frontier and the Black Sea is increased from 31 roubles 50 copecks per pood to 33 roubles, the import duty on China teas remaining unchanged at the former figure. The reasons for this increase appear to be a wish to check the growing trade in Indian tea, the imports of which into Russia have, we believe, reached 20 million pounds annually, and is as yet in its infancy, and to encourage the import of China tea by the Trans-Siberian Railway. It may also be a little piece of retaliation

for India's countervailing duties on bounty-fed sugar. Russian buyers are in evidence both in Colombo and Calcutta, and have for years selected the best tea they can get, particularly Darjeeling growth, to satisfy the demand for good tea in their own country, so that any vexatious increase in the duty will be a serious matter, both in their own interest and in that of the tea-producing countries of India and Ceylon.

Mr. George Seton's table of the working of the representative Indian tea companies has been referred to in many of the papers, and, as a rule, the comments based on it have been favourable to the outlook for Indian tea. "The Critic" is an exception, for while admitting that the table indicates very gratifying progress on the part of the Indian tea industry, it declines to draw entire comfort from the present situation. It says that the improvement will have to be carried very much farther before a large part of the capital now employed in the industry can be remunerative. It points out the danger of another glut of tea, unless consumption continues to expand considerably, and winds up with the remark that even the best of the companies' shares at current prices would involve considerable risks. This may be regarded as a pessimistic view of the position, but tea-growers will be wise if they accept and act on, as far as they can, any warnings on the subject of over-production. In this connection we notice the *Overland Times* of Ceylon has the following: "In the first half of this month Northern India has shipped to London over 3,000,000 lbs. of tea more than in the corresponding fortnight of 1902 and 2,000,000 lbs. more than in 1901. The tea has been going forward with a rush since last month. Providence may be kinder this year than we have any right to expect; but the prospect is a fall in Indian prices later on. We can only continue to advocate short supplies from Ceylon, with a correspondingly high quality."

In a long review of Mr. Seton's table the *Grocer* says: "The Indian tea companies raising the heaviest quantities of tea during 1902-03 were the Consolidated Tea and Lands Company (the largest of all) with 11,436,700 lbs.; next the Assam Frontier, the Assam, the Dooars, Nedeem, the Imperial, the Jokai (Assam), and Empire of India yielding from 3,380,000 lbs. to 3,999,000 lbs.; and the Doom Dooma, Chargola, Brahmaputra, and Amalgamated Estates with crops from 2,004,420 lbs. to 2,607,550 lbs. Companies raising amounts between 1,018,400 lbs. and 1,957,280 lbs. tea in the season were the Allynugger, the Jetinga Valley, the Jhanzie, the Sephinjuri Bheel, the Majuli, the Baraora, the Moabund, the Chubwa, the East India and Ceylon, the Singlo, the Jorehaut, and the Lungla (Sylhet). Others which grew crops differing in size from 778,800 lbs. to 963,810 lbs. tea were the Eastern Assam, the Rajmai, the Attaree Khat, the Lankapara, the Derby, the British Indian, and the Doloo; whilst the companies producing the lightest growths of tea were the Longai Valley, the Makum, the Meenglas, the Chandpore, the Darjeeling, the Indian of Cachar, the Lebong, the Hunwal, the Dejo, the Moran, the Scottish Assam, the British Assam, the Darjeeling Consolidated, and the Balijan, varying by small degrees from 685,980 lbs. down to 360,170 lbs. tea as their entire outturn for the past season. In paying dividend one company takes credit for a 20 per cent. rate and another for 15 per cent. Five companies paid 10 per cent., two were good for 9 per cent., three for 8 per cent., one paid  $7\frac{1}{2}$  per cent., one 7 per cent., four 6 per cent., three 4 to 5 per cent., and ten had to be content with  $2\frac{1}{2}$  to  $3\frac{1}{2}$  per cent. A solitary instance was afforded where only a  $1\frac{1}{2}$  per cent. rate was declared, and there were thirteen tea companies which failed to pay anything in the shape of a dividend for the whole year's working of their industries."

The trade of India with Chinese and Russian Turkestan passes mainly through Leh (Zadakh) in Kashmir. Leh is not a central market, but merely a village which chance and geographical position have made a convenient spot for registration. In 1901-02 the total trade between India and Central Asia amounted to £151,000, or 24 per cent. more than in 1900-01. The relatively small export of tea *via* Leh is partly Indian tea from native gardens round Palampur, partly China tea brought in increasing quantities from Bombay. Indian tea seems unlikely to succeed in Central Asian and Tibetan markets unless an article more closely resembling Chinese brick tea can be supplied.

In a book entitled "Tea Hints for Retailers," by John H. Blake, Denver, Colo., the author is of opinion that the China teas will be retired from the markets of the world through the overwhelming and superior commercial methods of their rivals, which the Chinese innately are unable to take up. The tea-growing experiments in South Carolina are referred to and approved by the author, who would go so far as to assist it with proper tariff consideration, which, as he thinks, would assuredly bring into bloom a valuable American industry and at the same time compel, so far as demand compelled it, the use of a superior tea from abroad, low grades being prevented from coming in on account of the additional tax.

This is the way they puff Japan tea in Chicago. It appears in a small monthly called *Gude Thynges*. "Tea time. The new Japan crop of 1903 has just come in. Is there anything about tea that is romantic to you? Anything away up the Omar Khayyam scale, with odors of pomegranates in Arabian Nights gardens? Yes? We thought so, but—our tea, our new Japan tea of this season's harvesting. May we brew a sermonette about tea—our tea? It won't be uninteresting. It's in, our new, fresh Japan tea. Now tea, though a dried leaf, may almost be said to be a dried flower. The dried flower, exposed to the air, must give back to the sun its subtle aroma. So the dried leaf, so tea. Fresh tea, then, has properties that vanish in the open. So they who buy tea in small quantities from our great chests and cannisters cannot know tea in its fullest value. But there is a way to do this. Buy tea in original packages of 5, 10, 20, 50, and 100 pounds. Then you have tea direct from the Japanese garden to the Chicago teapot, and with a saving of 5 cents or more a pound. In tea, as in other things, the choice is at the tiptop. The tip of the plant and its two or three nearest leaves furnish the world's perfect tea. Down the branch are other larger and tougher leaves, from which comes tea of inferior delicacy. Blend some or all of these leaves and you have all known market varieties. We are great importers, as you know. We do not take what comes; we direct what shall come. Our Japan tea, just in, fired on porcelain plates, was first picked from gardens of our own selection, and came to us by fast mail steamers. The crop for high-class Japan teas ran about 33 per cent. short this year."

The *Journal of the Society of Arts* prints some extracts from a lecture delivered at the University Extension Meeting at Oxford on August 3 by Professor Raphael Meldola, F.R.S., on the relations between scientific research and chemical industry. Referring to the coal tar colour industry, the lecturer says:—The coal tar colour industry arose, in the first place, from an observation made by Dr. W. H. Perkin in 1856, in the course of a research having for its object the synthesis of quinine. He did not succeed in producing the alkaloid, but he noticed that aniline, when oxidised, gave a colouring matter, which he manufactured and introduced under the name of "mauve," and so laid the foundations of an industry which has developed to its present colossal dimensions. The art of the dyer and calico-printer has been absolutely revolutionised by the introduction of the synthetical colouring matters prepared from coal tar. Of these, more than 500 are now available—each one a distinct and definite chemical compound with characteristic colour; each one with properties rendering it suitable for application to particular classes of fabrics. Every range of colour, including the deepest black, can be imparted, and every degree of brilliancy or dulness, of fastness to light, to washing and bleaching agents, etc., can be realised as required. The natural dye-stuffs, such as madder, which supplied alizarin for Turkey red; the cochineal insect, which furnished a red dye; the lichens and dyewoods, which were used by the old-time dyers, have been displaced, or are on the way to displacement, by the tar products. The most important of all the natural colouring matters, indigo, is, as you know, among the latest of the achievements of industrial synthetical chemistry, and a great industry worth some £3,000,000 annually to our Indian Empire is threatened with extermination by the German manufacturers. Not a month passes without the introduction of new colouring matters, and so enterprising are the German colour makers that their pattern books are issued with full directions in various languages, and trained chemists in their service will give personal instructions to our dyers in the application of new and unfamiliar colouring matters.—*H. & C. Mail.*

## A RUBBER PEST.

Interfering with Nature is always apt to upset matters, as folk found to their cost in the introduction of the rabbit and thistle to Australia. When a new animal or plant is transferred to an alien country few can tell what its destiny may be. It may either encounter such a host of enemies as to be driven out of existence, or conditions may be so favourable to its development that instead of being a boon to the introducer it becomes a curse to everybody.

New enterprises, and more particularly new planting enterprises, have to be very carefully watched. They may give a decided increase of food to some insect pest or other which will in time adapt itself to its new surroundings and bring disaster in its train. In the July number of the "Agricultural Bulletin of the Straits and Federated Malay States" just to hand, we find a record of an insect enemy of Pará rubber having been discovered by Mr. Tunnicliffe, at Port Dickson. This pest is a small boring beetle which attacks the bark of the tree causing it (the bark) to dry up and die. From Mr. Tunnicliffe's account, however, the beetle appears to have brought about its own destruction, for he says, "Hundreds of them are sticking on to the tree in their small holes, those that are dead having killed themselves by boring into the tree, from which a very little latex formed and coagulated, holding them in their self-made holes."

Mr. H. N. Ridley, to whom specimens of the beetles were sent, gives the following very valuable advice:—"But though this beetle has I think merely attacked the dead portion of the tree, it is not at all advisable to neglect it. There have been known more than one case of wood boring beetles, living normally, on dead wood, having gradually adapting themselves to attack living trees, and effected vast damage. It is just this set of insects that I should expect to be the greatest enemies of Pará rubber under cultivation, and just these that we must specially watch and guard against. Fortunately it is easy enough to destroy all rotten wood (*especially that of the trees themselves*) lying about the plantations, so as to leave boring beetles no breeding ground. To leave a dead Pará tree lying about among living ones is nearly as bad as to leave a corpse to decay in a town." Mr. Ridley is of opinion that the beetles are of the genus *Platypus*, of the tribe *Bostrychidae*.—*Penang Gazette*.

## COFFEE'S GOOD POINTS.

The foregoing caption is not quite fair to the great staple of Brazil, says the *Merchants' Review*, for it assumes that coffee has its bad points, but notwithstanding all the assaults upon its good name by the cereal coffee men, we have yet to discover that coffee-drinking has any drawbacks for the average man or woman, when indulged in with the same moderation that all wholesome eatables and drinkables demand if they are to be properly valued.

It is true that here and there can be found a person who cannot drink coffee without suffering from sick headache or other sign of disturbed digestion, just as people can be found to whom strawberries are a poison or milk a cause of troublesome gastric disturbance, but these departures from the normal should not be counted against coffee any more than the others should be counted against strawberries and milk.

According to the advertisements of the most active cereal rival of the coffee bean, the latter is responsible for many of the ills to which flesh is heir. This is preposterous, and doubtless the grocers, as a class, are well aware that it is so, nevertheless they may be glad to be provided with a few facts gathered from experience, which they may use against the valuable arguments of the cereal coffee men, whenever their customers approach the subject of the wholesomeness of coffee, in conversation with the grocers.

It is, however, rather late in the day to come to the defence of a food-drink which in the seventeenth century was eulogized in this fashion: "It much quickens the spirits and makes the heart lightsome, suppresseth the fumes exceedingly, and therefore is good against headache, prevents cough and consumption, and is excellent for the cure of gout, dropsy, scurvy, hypochondria, and the like." The writer of that old-time advertisement came nearer to hitting the mark than the moderns who decry the merits of coffee, although he probably claimed too much when he gave the beverage credit for preventing consumption, but in regard to curing gout he was not far astray, for present-day writers of repute

assert that coffee made strong and black is a specific for many forms of gout as well as chronic rheumatism, if a quantity of pure black pepper has been added to the coffee, a teaspoonful to the pint. Care must be exercised afterwards that the free perspiration induced does not invite the taking of cold. The dose should be taken before going to bed. The same remedy is good for breaking up colds.

Coffee is stimulating and exhilarating, but, unlike alcohol, leaves no depressing after effects. It is a valuable disinfectant and deodorizer. It will remove the foul odor of decomposing meat, if the latter is suspended in a room into which the vapour of roasting coffee escapes. Naturally coffee is useful where infectious and epidemic disease prevails.

People who have tried the practice say that miasmatic and malarial complaints are prevented by drinking a cup of hot coffee just before venturing into the morning air. In cases of torpidity of the liver coffee is beneficial. Anti-bilious and a good remedy for constipation, coffee would probably become the mortal foe of a good many patent medicines if its medicinal virtues were generally known.

It is well known that coffee is useful in nausea and violent retching, as well as in cases of extreme drunkenness. As a substitute for the beer, ale or spirits to which heavy drinkers have become accustomed, there is nothing better than a cup of good, strong, freshly-made coffee, especially when administered without milk or sugar. In typhoid and endemic fevers many physicians regard coffee as almost a specific. In fever and ague, when taken with lemon juice, it is said to be very useful.

It was Liebig who found that coffee contained many of the elements which stimulate the flow of bile and make it laxative and diuretic. Curiously enough, in its natural state coffee thrives best in those regions where malarial and bilious diseases abound—a wise provision of nature.

Infusions of raw coffee beans in cold water, taken on an empty stomach, after rising in the morning, have been found to be a sovereign cure for renal and hepatic colic, diabetes and other liver and kidney complaints.

Coffee soothes the tired brain and nerves and stimulates to renewed mental exertion, but it is only when used to excess that it causes sleeplessness.

Coffee contains essential principles of nutrition far beyond its stimulating or exhilarating properties, and is therefore an economical addition to the meals at which it is used, more particularly when it is drunk in the Turkish fashion, grounds and liquor together. It is chiefly useful, however, as an accessory to other food, aiding in the digestion and assimilation of the latter. It checks the too rapid consumption of nitrogenous material in the system, and thus economizes food and the vital force needed to convert the food into energy. Coffee has been called the intellectual beverage.

## AN INTERESTING CHAT WITH MR. P. C. LARKIN.

Mr. P. C. Larkin, of the "Salada" Tea Company, returned on the *Cedric* recently, after a four months' trip to Europe. Mr. Larkin, who was accompanied by his family, spent the time in Italy, France, Germany, and England. When asked if he had anything to say about tea that would prove of interest to our readers, he replied, says the *American Grocer* of 19th ultimo:—

"I do not know that I have, unless it would be interesting to them to know that anyone visiting Paris or the south of France cannot help but be struck with the progress Ceylon and India tea is making in the affections of the tea-drinkers there. In all the first-class hotels in Paris they have on their menu cards, 'Ceylon Tea,' as prominently displayed as in the Waldorf or Holland House in New York. Then one sees it in the grocery shop windows, and evidently, therefore, the teas of Ceylon and India are making the same progress there that they are in America.

"Since I have been away I hear that the importation of Ceylon and India green tea to America was larger for the first five months of this year than for the whole year of 1902, thus showing how rapidly these teas are displacing Japans and Young Hysons. The green teas of Ceylon and India are bound, by intrinsic merit, to eventually displace all China and Japan green tea, just as Ceylon and India black teas will displace all other black teas, because they are better cup quality. They have done so in England—the

greatest tea-drinking country in the world—they have done so in Canada, and they are doing so in the United States.

"The Ceylon and India tea-planters intend having a very magnificent exhibit at the St. Louis World's Fair. This will help to bring Ceylon and India teas more prominently before the tea-drinkers of America, and when they are once tasted that settles the question—the tea-drinkers will have no other. Our own particular brand, 'Salada' tea, has made wonderful progress during the first seven months of this year against the corresponding seven months of last. At our Toronto office we had a 27 per cent. increase after being in business there for over eleven years. Our Montreal branch had 26 per cent. increase; Buffalo branch, 35 per cent. increase; Detroit branch 73 per cent. increase; Pittsburg branch, 91 per cent. increase, and New York branch, 95 per cent. increase over the same seven months of 1902.

"In the city of Boston alone, where we have been pushing our tea for the last six years, our increase for the first seven months of this year over the same months of last year was 72 per cent."

Mr. Larkin read these figures from a letter that he had just received. Mr. Larkin says that it was a good "home-coming" for him, and that the moral of it all seemed to be that he was an incubus on the business, and should stay away altogether. (The *American Grocer* cannot agree with him on this point.)

This is the largest increase in any seven months that the "Salada" Tea Company have ever had. During the present year the "Salada" Tea Company opened a branch in Chicago, another in Cleveland, and are now doing business through all the Southern States and as far west as Minneapolis and St. Paul. This is the firm that first took hold of Ceylon and India teas, eleven years ago, and they have built up a most wonderful tea business in America. They are one of the largest advertisers of teas in the United States and Canada, and, at the bottom of it all, they claim that the quality of the tea they give the consumer is unequalled by any other firm in the world. During eleven years it has been a constantly increasing business, until to-day they are handling close on five million pounds of tea annually. They do not handle one pound of Japan or China teas, believing, as they say, that these teas have nothing before them but a constantly decreasing demand, until China and Japan teas disappear altogether, as they have in other countries, before the delicious teas of Ceylon and India.

### NATIONAL TEA UNION (LIMITED).

The Annual Meeting of Shareholders of the National Tea Union (Limited) was held at the Mitre Hotel, Manchester, on Tuesday, September 1st. The Meeting was not open to reporters, but our Manchester correspondent writes:—From inquiries I have made I am enabled to give an outline of the proceedings. Mr. James Duckworth, J.P., the Chairman of the Board, presided, and was supported by his co-Directors, Messrs. R. C. Burgis, J.P. (Leamington), Oates Rushton, J.P. (Wigan), and Alderman J. Williams (London). There was a large attendance of Shareholders, and the Directors submitted the following report:—

The Directors herewith present statement of accounts for the year ending June 30, 1903, the most trying period in the annals of the Company. The turnover for the first three months, viz., July 1 to September 30, 1902, was the smallest in the Company's record, but since that date the sales have steadily increased, and a considerable saving in the working expenses has been effected. As a result of the Resolution passed at our last Annual Meeting, calling for a change in management, your Directors called in Mr. Addleshaw (Messrs. Addleshaw, Warburton & Co), Solicitor, of Manchester, who recommended a separate audit of the books by an independent firm of accountants. Upon their advice the Directors have taken the actual market value of their tea estates investments, made a provision for bad and doubtful debts, together with 10 per cent. off plant and fixtures, totalling a loss, less *contra*, of £4,816 13s. 9d. The Directors are happy to state that the cash at Bank amounts to about £6,500, and no trade liabilities. This indicates your strong position as buyers on the market. The stock is clean and well bought. Every facility will be given at the Meeting, to be held on September 11, to discuss the position of the Company as to its past and future; the shareholders have it in their power to make the Company a great success. In conclusion, we would point out that your Directors know exactly the position of the Company—knowledge that has only been arrived at by great cost, care, and anxiety. Mr. Oates Rushton retires by rotation as Director, and, being eligible, offers himself for re-election. The auditors appointed at the last Annual Meeting having resigned, the Directors called in the services of Messrs. Cooper & Cooper, of Manchester, who offer themselves for election at your hands.

On the motion of the Chairman, seconded by Mr. John Harper (Manchester), the report and balance-sheet were unanimously adopted. Full explanations were given by the Directors as to the late investigation of the Union's affairs, and the Directors expressed themselves as being decidedly of opinion that the new auditors, Messrs. Cooper & Cooper, had reduced everything in the balance-sheet to strictly present value, so that they had every hope and confidence of working the Company successfully in the future. The Meeting expressed itself as in full sympathy with the Directors, and quite satisfied that the Union was now placed on a sound basis. It was resolved in future to hold the Meetings of shareholders half-yearly instead of yearly, so that the next balance-sheet will be made up to December 31 this year. Mr. Oates Rushton was re-elected a Director, and Messrs. Cooper & Cooper, chartered accountants, Manchester and London, were re-appointed auditors.

### U. S. IMPORTS OF COCOA.

The imports of cocoa reached a high level during the last fiscal year, says the *American Grocer*. The total reached 63,351,924 pounds of crude cocoa and cocoa shells, in addition to which there were imported 1,004,766 pounds of prepared or manufactured cocoa. The following statement shows the imports, exports, and net imports for 1903:—

	Pounds.
Imports of crude cocoa	63,351,924
Exports of crude cocoa	3,208,554
Net imports, 1903	60,143,370
Net imports, 1902	48,785,688
Net gain over 1902	11,357,682

Since 1898 the imports of cocoa have more than doubled, a fact which is highly significant of what free raw materials does for the extension of American manufactures. The trade in cocoa and its manufactures has doubled in five years, a still more significant fact when viewed in connection with the consumption of duty-paid tea, which from 1898—1903, averaged a trifle over one pound *per capita* per annum, a decrease from 1.40 pounds for the period 1892—97.

It is evident that cocoa is taking a much higher place among food products than it ever before occupied; and deservedly so. It is, as its name, *Theobroma Cocoa*, implies, "food of the gods." In its manufacture the excess of oil contained in the raw leaves is extracted, thus making powdered cocoa easily digested by the most delicate. Such eminent authority as Mrs. Ellen H. Richards (Massachusetts School of Technology) says: "The flavour of the cocoa bean seems to be almost universally liked, and the use of the various preparations made from it is constantly increasing. From the sweet chocolate with which the traveller now provides himself in all journeys in which the supply of food is doubtful, either in quality or quantity, to delicate colouring and flavouring of cakes and ices, nearly all kinds of culinary preparations have benefited by the abundance of this favourite substance."

### DISTRICT ASSOCIATIONS.

#### SOUTH MYSORE.

A Special General Meeting of the South Mysore Planters' Association was held at Saklasapur on September 7th. PRESENT:—Messrs. Harris (*President*), G. Anderson, C.I.E., J. G. Crawford, W. L. Crawford, de Salis, Galiffie, Gowans, H. M. Playfair, Lamb, C. Luke, L. F. Luke, Robinson, T. Anderson, Dennis, Pittock, Taylor, F. Norton (*Honorary Secretary*), Wetherall (*Honorary Member*).

Visitors: Dr. Lehmann, Dr. Butler, Mr. Barber, Mr. Woodbridge, and members of the South Mysore Native Planters' Association.

Mr. Harris opened the proceedings by welcoming Dr. Lehmann, Dr. Butler, and Mr. Barber to the District, and for attending the Meeting, and in conclusion inquired if any of them would desire to address the Meeting.

Dr. Lehmann very kindly intimated that it would be preferable if they joined in any discussion which might take place, so that information that was specially required might be more readily

afforded. The President, after consultation, called on Mr. Graham Anderson to open the discussion on Fungoid Pests.

Mr. Anderson commenced by most cordially endorsing what the President had stated relative to the high appreciation of the members of the Association of the distinguished compliment which had been conferred on Southern Mysore by Munzerabad being included in the tour of scientific inquiry, and dwelt on the fact that in the visit of the eminent scientists present, the members of the Association had a preliminary experience of the immense practical benefits which will certainly accrue after His Excellency the Viceroy's plans for forming a Bureau of Scientific Advice have been fully matured. He drew attention to the confirmed opinion of all practical workers that the future success of agricultural and horticultural operations very greatly depended on scientific assistance and by way of illustration briefly touched with much diffidence on some of the difficulties connected with the Fungoid pests of Shade trees and of Coffee. He laid great stress on the importance of making a clear distinction between those forest trees which, after having been felled, are known to start the disease called "Stump rot" and those which are the victims to the subterranean fungus which travels from tree to tree by means of its rhizomorphs, or by the roots in contact. If the botanical names of those trees which are known to start the primary growth of the destructive fungus are ascertained, much practical assistance will have been afforded.

A note of warning has recently been sounded in regard to *Ficus Mysorensis* and other excellent shade trees and it would be a great pity if attention was diverted from their propagation. Some of the *Ficus* tribe are epiphytic and having killed the tree upon which they originally grew suffer as victims from the fungus developed in the decaying stump.

Recent observations have clearly shown that many excellent shadders for Coffee similarly are victims to the fungus, but long experience has failed to prove that the pest ever originates or starts from the decay of their stumps after felling.

In regard to *Hemileia vastatrix*, while admitting the danger of applying unsuitable manures to Coffee trees and dwelling on the importance of ascertaining those most desirable for special or general use, he drew attention to the necessity for scientific advice and the danger of relying on what some of the original investigators had laid down, notably for example what DeBary had stated, relative to other fungoid pests, that "in the experiments he had made he never observed an individual or unhealthy predisposition of the nourishing plant; on the contrary that the more the plant was healthy, the more the mould prospered."

Dr. Butler in a most lucid and comprehensive manner afforded much valuable practical advice and concluded by pointing out the benefits derivable from hybridization and the production of immense varieties of cultivated plants.

Dr. Lehmann followed with valuable remarks on the careful selection of seed and the benefits calculated to result from systematically-conducted experiments with suitable fertilizers.

An interesting discussion then took place on Stump rot and its causes. Mr. C. Luke inquired at what age Silver oaks had been attacked in Assam, and Dr. Butler said he had seen trees from five and six years attacked and causing immense damage. Mr. Taylor suggested that the character of the soil might have something to do with the spread of the rot, but Dr. Butler could not definitely state that was so. Mr. J. Crawford said that it was not necessary for a tree to be cut down to cause stump rot, for he had seen equally disastrous results from trees that had been blown over.

Mr. W. L. Crawford gave some interesting details on the hybridizing of coffee: and the poor results attained: the produce having been very poorly reported on by the Home brokers, but he would be very glad to distribute seeds, after what had fallen from such high scientific authority, with a view to continuing the experiments. He also gave information as to the effects of leaf-disease in nurseries from imported seeds.

Mr. Barber said,—Reference having been made to the experiments in hybridizing coffee, I would like to say a few words, since there seems to be some misconception regarding the laws regulating their characters.

Planters seem to think that when they have obtained a hybrid their work is done, and if it proves a failure, as it is certain to do, they disgustedly drop the thing.

Really they have only taken the first step in a long and arduous business.

I can explain with a reference to the sugarcane seedlings in Barbados. There, of the 60,000 seedlings raised every year, only one or two are finally considered worthy of extended trials. The vast bulk are regularly and ruthlessly destroyed. The obtaining of coffee seedlings is a much easier thing, but it is necessary that the great majority should be similarly destroyed.

The reason for this is perhaps the following: It is a rule with hybrids that there is very marked tendency in their offspring to vary. Even when two parents with definite characters have been carefully chosen (almost an impossibility with sugarcane) the offspring vary enormously, there being among other characters a very strong tendency to throw back to an ancestral type. Now in cultivated plants the ancestral type is a "wild" one and therefore it is reasonable to expect what really happens frequently that the offspring are, to a great extent, quite unfit for cultivation.

The first step with hybrids then is to rigorously thin out all that do not appear well worth going on with. The ones so selected will have certain characters presumably such as it is desired to fix: vigour, freedom from disease, character of bean and so on. Those that are chosen to go on with should be crossed among themselves or even bred in and in, that is prevented from crossing with any other plants. The useful characters are by this means intensified. When once a useful type is obtained it must be "fixed" and the in and in breeding is intensified. It takes comparatively few generations to fix the type, but meanwhile it is important to keep the plants carefully protected from the pollen of neighbouring plants.

It is therefore a pity that the many hybrids and their offspring which we see scattered over coffee estates at present should be considered the final product when they merely represent the first and chiefly useless results.

For the experiments to succeed it is essential that they should be conducted on a large scale and that the experiments should be conducted continuously with a very definite object in view. Once this object is defined, the result is usually only a matter of time. It is possible within fairly large limits to obtain almost any result and this is for the very reason that there is such an enormous variation at the start that almost any tendency can be spotted and fixed. Thus it is that fruit and flowers of almost any form and colour can be obtained, within certain limits which hold for the particular plant being experimented with.

The work is long and tedious and cannot be done by any one planter. But by the help of all and a suitable combination of energy there is no reason why equally good results may not be obtained with coffee as with the many other plants such as potatoes, sugarcane, beetroot, etc., which have been so immensely improved in this way. Each plant has its own peculiarities and will have to be treated accordingly. And with coffee there will have to be a certain amount of continuous hard work and close scientific attention.

The following Resolution was put to the Meeting and carried unanimously:—

"That in view of the remarks of Dr. Lehmann, Dr. Butler, and Mr. Barber with reference to the hybridization and selection of coffee that the United Planters' Association be asked to ventilate a proposal amongst District Associations for planters to establish an experimental farm in a suitable locality in South India and to ask the various Governments if they would be willing to place the services of their scientists, from time to time, at the disposal of the managers of the farm, and to afford all the assistance possible should the scheme prove practicable."

Mr. Harris proposed and Mr. Graham Anderson seconded a cordial vote of thanks to Dr. Lehmann, Dr. Butler, and Mr. Barber for their attendance and practical advice, which was carried unanimously.

Mr. Norton then read his Report as follows:—GENTLEMEN,—Mr. J. Crawford, who was originally elected to attend the Annual Meeting of the U. P. A. S. I., being unavoidably unable to go to Bangalore, I was asked to go in his place. I beg to present my report of a very interesting Meeting and trust that I carried out your instructions to your satisfaction. You have no doubt all read in the papers all that occurred, so beyond explaining one or two of the most salient points I need not detain you for any length. Two questions stood out more prominently than others, and those were the Labour Laws and the Quality of Coffee. The Labour Law was most comprehensively and ably explained in Committee by Messrs. Ackworth, Romilly, and Hodgson, and finally

so lucidly summed up by Mr. Harris, that we were able to adopt a unanimous vote of thanks to the Madras Government for their endeavours to meet the requirements of the Planting community. At one time it was feared that so happy a result might not be attained, as several delegates were instructed to vote against the Bill, but such new lights were thrown on it during its discussion in Committee that those delegates were able to change their attitude in regard to it, and to record their votes for the Resolution. The result has shewn that it is inadvisable to tie a representative's hands too strictly, but to allow him a certain amount of latitude and discretion. In connection with this Bill, Mr. Harris, Mr. Scot-Skirving and myself waited on the Dewan, and we were assured by him, that as the Bill affects us planters chiefly it would not be introduced into Mysore unless we asked for it, and that our suggestions and views, when it was introduced, would receive most careful and considerate attention. I am happy to say that in this matter we were able to act conjointly with the N. M. P. A. We had a most valuable and interesting lecture from Dr. Lehmann, on the Quality of Coffee, who is conducting experiments which will undoubtedly prove of most vital importance to our industry when he has had time to complete them. Dr. Lehmann once more emphasized the importance of guaranteed fertilizers, and he considered that the remedy laid in our own hands. By refusing to accept any but guaranteed manures agents will be bound to supply them. All District Secretaries were instructed to impress on the members of their Associations the necessity of insisting on receiving and being supplied with guaranteed analyses. I had the pleasure of reading a paper on the Quality of Coffee which was received with interest and attention, and its importance was recognized by a unanimous Resolution instructing the Secretary to write to all Curing Agents asking for their co-operation. It is a matter which is assuming graver proportions every year. Mr. Cameron gave us a most interesting lecture on auxiliary products, and I recommend members to place themselves in communication with him with a view to the introduction of bye-products. In Dr. Lehmann and Mr. Cameron we have sympathetic and willing friends to help us with sound and practical advice. The Hon'ble Mr. Ackworth, in an eloquent speech, moved three Resolutions with regard to Differential Duties which I had the pleasure of seconding.

It was resolved to support the St. Louis Exhibition and Rs.10,000 was voted from the U. P. A. Funds to be supplemented by contributions from District Associations, and Secretaries of District Associations were instructed to impress on their members that if through this medium they create a demand for East Indian Coffee in America, they must be prepared to support it. Mr. Harris, Mr. Scot-Skirving and myself were accorded an audience with H. H. the Maharajah of Mysore to whom our aims and objects were explained, and were listened to with sympathetic attention. This sympathy, I am pleased to inform you, has taken the practical shape of a donation of Rs.5,000 to the Fund; and I have just heard that the Madras Government have made a similar grant; to both the thanks of this Association are due. I am very sorry to report that the Coffee Cess scheme was abandoned for this year, for I am more than ever sure, from what fell from delegates, that there is a market for our coffee at our very doors, and if it is captured by tea-planters, we shall only have ourselves to blame. Though I was directed to support, which I did, the sending of a delegate to Brazil, it was decided, through want of funds, that we should apply through the Foreign Office and its Consuls for the information that we require. The voting powers of the Executive Committee have been altered, so that votes go by subscriptions, and I am glad to say that it was not found necessary to alter the constitution of the U. P. A. S. I. Mr. Hodgson was elected Planting Member in the place of Hon'ble Mr. Ackworth whose resignation takes effect next July, and I trust that this Association will record their appreciation of his unstinted services on behalf of the Planting community. Mr. Romilly was elected Chairman for the ensuing year and Mr. Scot-Skirving, Vice-Chairman. In conclusion, I have to thank you for having nominated me as your representative to the last U. P. A. Meeting.

Mr. W. L. Crawford was elected delegate to the forthcoming Dasserah Assembly.

Mr. Harris in summing up again alluded to the presence of the visitors and congratulated members on such a good attendance, and sincerely trusted that the remarks that they had listened to would bear fruit in the near future. He begged to emphasize what had

fallen from the Honorary Secretary in regard to the St. Louis Exhibition, and that members must be prepared to support any demand they may create.

Several members expressed their willingness to contribute. A vote of thanks to the President then closed the proceedings.

#### To the Honorary Secretary.

Three men of science latterly came up here from the East—  
One dabbled much in stinks and smells, one was a botanist,  
The other captured little bugs, an Entomologist.

The chemist came to study soils, to analyse manures.

The botanist for leaf-disease; with scientific lures.

He hoped to stop the spread of it and manufacture cures.

And finally the insect-man, there were no flies on him,

He came to study borer; and to gratify a whim,

To put one in his microscope and tear it limb from limb.

I haven't time to tell you the adventures that befell;

The chemist found a "Putgah" tree and analysed the smell:

He then went off to bed and guessed he wasn't feeling well.

The botanist was missing since his early morning tea,

So gangs went out to look for him; beneath a toddy-tree

They found him stretched upon the ground and breathing heavily.

The buggy-man perambulated slowly through the land

And saw a "cumbly-hulla," which he didn't understand,

So thoughtfully and tenderly he took it in his hand!

And so these men of science thought they'd leave the "Land of Mist."

They started off, the chemist, cryptogrammic botanist,

And in a bullock-coach behind the Entomologist.—J. B. R.

#### Mr. Norton's Speech on the Labour Law at the U. P. A. Meeting.

MR. CHAIRMAN AND GENTLEMEN.—I am sure we are all pleased at the satisfactory nature of this Resolution which has received the almost unanimous support of the delegates here. I don't think that we need to convince one another that this is a good Bill, but that we should try to bring round to our opinion our brother-planters who still hold a contrary one: and to that end I make these remarks. Had I been living in British India I should have welcomed this Bill (and with some modifications which we hope to get introduced into it; always bearing in mind that the principle must not be touched, and because the labour conditions in Mysore vary from those in other districts I am sure it can be made acceptable to us). It seems to be lost sight of that law-making is a science, which like all sciences, is a progressive one, and has no finality; I therefore do not consider this Bill as final, as after experience it will doubtless be amended, for until it has been put in force, you cannot know how it will work, and cannot approach Government with suggested amendments for its improvement. In my opinion this Bill is a great improvement on Act XIII., and is itself in its enactment or final stage a very great improvement on the Bill as it was first introduced into the Legislative Council; and thus shows a progressive step. I do not say it is a perfect Bill, but I believe it can be made nearly so if it gets a fair trial. I know that whenever a new Bill is passed there will always be a large body of malcontents, but laws are made to remove grievances or to allay discontent. Though I am sure there is a large body at home who disapprove of the new Irish Bill, I am equally convinced that the great majority of Englishmen will welcome it, even at some personal self-sacrifice, if it will remove a grievance and allay the discontent of centuries. As this applies to a nation, so does it to us as a smaller body. We have for forty years been calling on Government to find a remedy for a great grievance. Our agitation has gone through several phases until it has culminated in this Bill. If we do not accept it we proclaim our grievance a mock one, and our continued agitation an imposture; and when approaching Government on any other subject, possibly of vital importance to our industries, we can but blame ourselves if they look upon our petitions with disfavour and suspicion; and another real grievance may be shelved for even a longer period than the repeal of Act XIII. We shall have brought it on ourselves. For over forty years this Act XIII. has had the vials of our wrath poured upon its head in no unmeasured strain of vituperation and in many languages. Every succeeding year has only discovered new defects and blemishes but now, at the parting of the ways, they have suddenly found out virtues and charms hitherto hidden from our scrutiny. They say Act XIII. has all their heart and their affections and that they are being violently separated against their

will and wishes. The Act might aptly retort "Tis all very well to dissemble your love, but why did you kick me downstairs." I think we may say "farewell" to a Bill which has been replaced by a much better one. Sir, most of the criticism has been directed against XII. respecting inspection of lines, etc. We are here in accord, but a very large body resent official interference and have conjured up a bug-bear from which they do not seem to be able to relieve themselves. I believe these clauses will work either smoothly or with friction just as each manager works them. The man who is continually in Court seeking redress will most likely bring on himself those very evils which he dreads. I know of no law where large bodies of labourers are employed, whose health and comfort are not specially provided for by legislation. Take mines and factories. But instances might be multiplied. Inspectors are always appointed to look after the employed, and if we would look upon the visitor as an "Inspector" and not as an official, I am sure the difficulties could be got over. I do not know by what right we should claim exemption from a law which is always introduced where Capital and Labour are concerned. A letter was recently published (unfortunately anonymously) by a planter informing us that the same coolies returned to his estate year after year, and therefore he did not require this new Bill. Instead of being an argument against the Bill, I consider it the strongest argument in favour of it, for this planter has absolutely nothing to fear from the official inspection of his lines, which would sink into a mere formality, and I am convinced that the great majority, if not all planters, are in the same happy position, for we may take it for granted that coolies would not return year after year to the same estates if they were not well looked after. Government are only enacting or embodying in the Bill and giving it the force of law what nearly every one of us have done from motives of self-interest. Referring to letters in the papers, I think it is to be regretted that instead of rushing into print, the opponents of this Bill have not attended and stated their objections to it, for after the comprehensive way in which the matter has been gone into, they might have had their views changed, as has already most happily occurred at this Meeting. I never realized until I came here, though I followed the course of the Bill closely, the enormous difficulties that the Planting Member had to contend with, and the conflicting interests he had to reconcile, and this Bill, which I believe will bring us the relief we have so long desired, will remain a lasting monument to his tact and ability. I have much pleasure in recording my vote in favour of the Resolution.

### WYNAAD.

Proceedings of a General Meeting held at the Meppadi Club on September 23rd. **PRESENT**:—Messrs. Armstrong, Behr, Day, Mackinlay, J. R. Malcolm, Nicolls, Powell Jnr., Taylor, Trollope, Waddington, West, and B. Malcolm, *Honorary Secretary*. *Honorary Member*: Mr. Tireman. *Visitor*: Mr. Gillatt. Mr. Trollope in the Chair.

1. Proceedings of last General Meeting and Extraordinary General Meeting taken as read.

2. **Election of New Member**.—Proposed by the Chairman and seconded by Mr. Nicolls, that Mr. O. Richelman be elected a member of the Association.—*Carried unanimously*.

3. (a) **Roads**.—Read letter of September 21, 1903, to President, District Board, enclosing copy of the Resolution passed at the Extraordinary General Meeting re the Chundale-Choladi Road.

(b) **Yellera Mulla Road**.—*Resolved*, that the Association address the Government of Madras with the request that a grant be made from Provincial funds to metal this road.

4. **U. P. A. S. I.**—(a) Read the Delegate's report of the Bangalore Meeting. Proposed by Mr. Waddington, seconded by Mr. Day and carried unanimously, that a vote of thanks be passed to Mr. Romilly for his services as Delegate.

(b) **St. Louis Exhibition**.—The Honorary Secretary was instructed to write for information as to exhibits.

5. **Tea Cess**.—*Resolved*, that the Association address the I. T. A. for information as to whether the Nett, Gross, and Tare weights have to be shown on Tea chests shipped from Calcutta; and, if it is found that such is not the case, that the Head of the Customs be addressed

with a view of getting the vexatious order, as regards tea shipped from Calicut, removed.

### 6. Labour Law.

(a) **Voting power of the Association**.—Mr. Nicolls gave notice that at the next Meeting of the Association he would bring up the question of Voting power in so far as the votes for or against the Labour Law were concerned.

(b) Proposed by Mr. B. Malcolm and seconded by Mr. Day, that this Association does not see its way to giving any opinion as to the acceptance or rejection of the New Act until it has seen the Rules and Regulations; and that a copy of this Resolution be sent to the Collector of Malabar and to the U. P. A. S. I.

Amendment by Mr. Waddington, seconded by Mr. Behr—that Mr. Malcolm's proposition be postponed for consideration until the next Meeting.

The amendment was put to the vote and lost.

The proposition was then put to the vote and carried by 7 to 3—2 not voting.

7. **Next Meeting**.—The next Meeting of the Association was fixed for Wednesday, October 21st.

Papers on table—Planting Opinion; Indian Planting & Gardening; I. T. A. Circulars; U. P. A. S. I. Circulars.

A vote of thanks to the Chair terminated the proceedings.

(Signed) A. TROLLOPE,  
*Chairman.*  
( „ ) BERNARD MALCOLM,  
*Honorary Secretary.*

## THE NILGIRI PLANTERS' ASSOCIATION.

### A GENERAL MEETING.

(From the *Madras Mail*.)

OOTACAMUND, 23rd September.—A General Meeting of Nilgiri Planters' Association was held at the Armoury this afternoon. A general invitation to all Nilgiri planters to attend the Meeting was issued, for the purpose of discussing the new Madras Planters' Labour Act. Mr. T. Stanes was voted to the Chair, and there were also present Messrs. F. M. Cockburn, L. C. Liebenrood, L. M. Achard, A. K. W. Downing, E. G. Windle, A. M. Groves, S. Bell, W. Deane, H. P. Hodgson, T. Brown, N. Gray, L. W. Gray, A. F. VansAgnew, A. R. Pigott W. Barton Wright, A. Allen, W. Rhodes James, E. F. Minchin, J. Mackenzie, and the Honorary Secretary Mr. C. H. Brock. The following Honorary Members were also present: Mr. C. M. Mullaly, Collector of the Nilgiris, Mr. G. Romilly, and Mr. W. H. Hamilton, the District Police Officer.

### U. P. A. S. I. DELEGATE'S REPORT.

The first business on the agenda was the Report of the delegate to the U. P. A. S. I. Meeting at Bangalore.

Mr. H. P. HODGSON presented a Report, of which I make the following summary:—The *Madras Mail* kindly accorded us considerable space in the columns of its daily issue, and those interested were thus enabled to follow the proceedings which took place in General Meeting. It will be unnecessary for me, therefore, to go into the details of every subject of discussion. But there are one or two of the most important which I feel you would like me to touch upon, and perhaps the most important of these is the Madras Labour Act.

A whole day was given to the discussion of this Act in Committee. Several District Associations had instructed their delegates to vote against the Act, but after hearing the discussion I am glad to say that the final Resolution, when put in General Meeting, was carried unanimously. The Resolution reads:—

"That this Association tenders its most cordial thanks to the Government for their endeavours to meet the requirements of the planting industries as embodied in Act I. of 1903, and while regretting that it is made to apply to all forms of contract and all conditions of labour and that Act XIII. has not been allowed to run concurrently with it, accepts it as likely to prove of benefit to several of the planting Districts of South India, and will endeavour

to induce its members to give the Act a trial in their respective Districts."

You will see that the Resolution, while tendering to the Government of Madras our thanks, which are their due, for having endeavoured to meet our oft-repeated requests for protective legislation for our labour contracts, does not commit any District to its acceptance, and gives only a qualified approval of the Act. At the same time, in the light of the discussion that took place, the majority of the delegates were convinced that it is desirable to give the Act a trial, and agreed to induce their respective Districts to do so. The discussion of the Labour Act is down on the agenda paper to-day, and I will say more on this subject when it comes up.

The St. Louis Exhibition was considered a subject of the highest importance to both tea and coffee-planters, as an opportunity for advertising and pushing their products in a country having a large demand for both. Tea-planters both in Northern and Southern India have fully realised this and are taking active steps for the proper representation of their product. I can only express a hope that coffee-planters will do the same. The opportunity will be given them and it remains with them to accept or neglect it. The U. P. A. S. I. has given a grant of Rs.10,000 and the Madras and Mysore Governments have each kindly assisted us with grants of Rs.5,000, and we hope to get grants in aid from other Districts. But, gentlemen, let me impress upon you here that if you desire to secure any real and permanent advantage in the market which this Exhibition opens up to you, you must bestir yourselves and arrange for supplies of coffee to meet the demand which we hope will arise after the Exhibition. You are having a big advertisement provided and paid for, opportunity will be given to thousands of people who have never tasted pure East Indian Coffee to do so, and if it is really as superior to most other coffees as we believe it to be, there must be a demand for it, which, if carefully met and fostered, may lead to a new and extensive market in which it is reasonable to expect better prices may be obtained than by dumping down our crops in the overstocked markets of London, to fetch such prices as they choose to give us.

A Committee, consisting of Messrs. Harris, Martin, King Church and myself was appointed to arrange details for pushing coffee in the United States after the closing of the St. Louis Exhibition. This Committee is about to issue a circular to ascertain what support planters will accord to the proposal and everything must depend on the result of the appeal. For you will realise that without the means the Committee is powerless.

The delegate to Brazil had to be abandoned for the present, from want of funds. The Secretary was, however, instructed to communicate with the Government of India with a view to eliciting their good offices towards obtaining through the Secretary of State for Foreign Affairs and His Majesty's Consuls in Brazil as much information as possible regarding the condition of the coffee industry in that country.

Mr. LIEBENROOD proposed a vote of thanks to Mr. Hodgson for his Report, and this was passed unanimously.

The SECRETARY announced that Mr. Hodgson had given Rs.100 to increase the Association's subscription to the U. P. A. S. I. from Rs.250, as was decided at the last Meeting, to Rs.350.

#### THE PLANTERS' LABOUR ACT.

##### DISCUSSION.

The matter opened with a question to Mr. H. P. Hodgson as to whether the new Act had been applied to any District.

Mr. HODGSON said he thought not in British India, but that Travancore had asked for it. He further stated, in answer to a question as to whether there was any objection to the Nilgiris refusing the Act, that the planters had asked for an Act and that 32 planters from this District had attended and given evidence at the Enquiry Committee that sat some years ago. These planters stated that they were losing money and asked for legislation. Government had taken up the matter, and after a great deal of trouble had given them an Act which they now refused to adopt. If they did that, he thought the charge of inconsistency might be fairly laid against them. The evidence before the Committee of Enquiry was given eight years ago, and it was true that conditions might have changed since then. It might be easier to get labour now than it was then, but this state of affairs was, he was certain, only temporary, and they would have difficulties again. Ceylon was in great need of more labour and was sending its agents to recruit from the same Districts from which Nilgiri planters drew their labour supply. The time would come again when there

would be a demand for labour in excess of the supply. He thought the Act was a good Act, and when they came to put it into operation he felt sure they would find they had over-estimated its difficulties.

The objection was then raised that Government would inspect estate accounts, but Mr. Hodgson said this applied only to check rolls. He did not think planters would have to keep any more accounts than they did now.

Mr. ACHARD said that a return of births and deaths was asked for, but was told that this was the law now, and that if he neglected to furnish Government with the returns of births and deaths he laid himself open to a penalty.

Mr. ACHARD said he had seen the Act working in Ceylon; it was most unsatisfactory there.

Mr. HODGSON said the Ceylon Labour Ordinance was a very different thing to the Labour Act. He added that he must say he thought it would be wise to give the Act a trial. Planters could apply for its withdrawal if it was found that it did not work well. There was another thing to be considered. There was every possibility of Act XIII. being withdrawn altogether, and if that occurred and they did not adopt the new Act, they would find themselves without any law at all. The Government of India had absolutely declined to amend Act XIII.; they said it was not applicable to the purpose to which it was put, and the Nilgiri planters had said the same thing. It was true that they had not all asked for a new Act, but such of them as had not approved had never thought fit to favour Government with their views. That was the unfortunate thing about planting affairs, men were in many cases most indifferent. They waited until an Act had been passed and accepted by the Planting Member on behalf of them, and then objected to it.

Mr. RHODES JAMES, referring to the withdrawal of Act XIII., said he preferred the problematic disadvantage of being some day left without an Act to the actual and certain disadvantage of adopting the new law.

Mr. ROMILLY said that personally, though he knew the Act would not be the best for his local labour, he did not think it would cause any very great inconvenience. It seemed to him very illogical to oppose any trial of the Act because they were afraid of it.

Mr. ACHARD said they did not want the Act; it was iniquitous and absurd.

Mr. HODGSON asked in what way.

Mr. ACHARD said it gave the Government Apothecary power to come to the planters' lines. He would be sure to condemn them and they would have to spend a large amount in building pucca lines, when the coolies would not live in them. It was well known that coolies preferred tatty lines to pucca.

Mr. HODGSON asked why Mr. Achard assumed the Apothecary, as he had called him, would be sent to find fault. The speaker did not think that that would be the case at all. The Enquiry Committee were satisfied with planters' arrangements for housing their labour, and why should not the local authority be so? There was the Collector to appeal to. He thought Mr. Achard's fears were absolutely groundless. In his opinion the coolies were well looked after now, why should not Government take the same view?

Another objection was raised that the planter, under the new Act, had to pay 2 annas a day to feed a coolie who was sick. There would be a great many sick coolies after the adoption of the Act.

Mr. C. H. BROCK, the Honorary Secretary, said the planter had his remedy. He could send the man off the estate and planters must remember that they received just double that amount when a coolie stayed away from his work when he was not sick. He spoke strongly on the delay there had been in bringing these objections forward. If they had been pointed out before the Bill was passed it might have been amended. Planters did not send them in, though the Bill was before everybody for two years.

Mr. RHODES JAMES said planters thought when the Act was to be amended that these objections would be removed and that planters would be fairly represented.

Mr. C. H. BROCK said it was impossible for one man to represent everybody. The conditions in the Districts varied in the greatest possible degree, and how could a member meet objections to a law working under conditions of which he was ignorant. If the planters themselves were silent who could speak for them?

Mr. BELL admitted that they might have been lax and was sorry planters had not been more attentive to this matter. All the same

he must vote against the adoption of the new Act; it would be a most irritating law. He could not see that they required a new Act.

Mr. HODGSON: Suppose Act XIII. is taken away?

Mr. BELL: Let Government give another.

Mr. BROCK said that Government had practically decided to repeal Act XIII.; was it not better that they should adopt the new Act now, while there was no labour difficulty.

Mr. BELL said it might be necessary to have the Act but they did not want it now. They wished to see first how it worked in other Districts.

Mr. HODGSON said that they all seemed to think that because there was a new law the cooly and maistry would at once become possessed of remarkable intelligence and use the Act to their own advantage against the planter. In his experience it did not matter what law they were working under. He felt certain there would be no difficulty, the cooly and maistry would jog along just as they did before.

Mr. BELL said they would find that their maistries had not taken the coolies before a Magistrate and the contracts would not be legal.

Mr. HODGSON said as a matter of fact they did not think of their maistries enough. These men lost money now which they would not under the Act.

Mr. GRAY said his estate was 22 miles from Ootacamund, and the coolies who were recruited would have to be brought in there to sign their contracts.

Mr. BROCK pointed out that the Act provided for the appointment of other persons than Magistrates by the local Government to witness the signing of the contracts. The difficulty might be met that way.

It was suggested that as the provisions of the Act could be made to apply to certain local areas only, some parts of the District should accept it while others left it alone. The conditions of the District were very varied.

Mr. ROMILLY asked if it was not better to find out the weak points in the Act by actual practice, than to discuss them round the table. Then they could get them amended or the Act withdrawn. The question was whether they were going to give the Act a trial or be inconsistent and refuse it. If they tried the Act they would maintain their reputation for knowing what they wanted and Government might help them again.

Mr. RHODES JAMES said they did not see what advantage the Act would be to them.

Mr. ROMILLY said under the present law the maistry lost money.

Mr. BELL said they did not want the Act and asked why it should be pressed upon them.

Mr. HODGSON said this District had asked for an Act through its Representative and through the witnesses before the Enquiry Committee.

Mr. RHODES JAMES: We asked for an Act, not this Act.

Mr. HODGSON said it would be best to try the Act and find out where it hurt and then get it amended or withdrawn. They would have the support of the Planting Member. He could not understand the absolute opposition there was to it. It was not a bad Act. If it did require certain amendments, it was impossible to get these done until the Act had been tried.

Mr. WINDLE said he had been as consistently against the new Act as anybody. He had taken the trouble to write to the Planting Member and point out various objections, most of which were met, but some, which he considered serious, were not. However, on carefully reviewing the situation, he was in favour of the introduction of the Act. He employed more local than imported labour, so his decision had not been influenced by personal considerations. There was the possibility of Act XIII. being withdrawn and for that and other reasons the Act should be tried.

Mr. HODGSON said personally he did not care which Act they had, but they must not be inconsistent. The new Act could be withdrawn or amended.

The CHAIRMAN said that seemed to be an uncertainty and it was this that made people hesitate before trying it.

Mr. BROCK said they had the word of Government that it would be withdrawn if it worked badly.

The CHAIRMAN said he had heard that the opposite was the case.

Mr. RHODES JAMES said the trouble was to find out how long it would take to withdraw the Act.

Mr. BROCK said if they tried the Act Government would help them, but if they refused there would be no more assistance to expect from Government. Personally he did not want the Act,

but he thought that the only way they could put themselves politically straight was to try it.

Mr. RHODES JAMES proposed and Mr. Archard seconded a Resolution that the planters begged to decline the Act.

Mr. WINDLE, as an amendment, proposed that Government be asked to introduce the Act for a year.

Voting on the amendment and Resolution were exactly even and the Chairman gave his casting vote in favour of the amendment.

Mr. RHODES JAMES proposed that as the majority was so small the matter stand over.

Mr. HODGSON said this was an extraordinary suggestion after a vote had been taken and Mr. Rhodes James had lost.

Mr. RHODES JAMES said he proposed this because the notices calling the Meeting had not been sent out in time.

Mr. BROCK explained that the notices were sent in time, but by the fault of the Post Office some of them had not been delivered.

Mr. HODGSON said they had had level voting that day, but it would not have been so a fortnight ago. The more men thought of it the more they were in favour of giving it a trial.

The rest of the business of the Meeting was purely formal.

The Meeting recorded an emphatic protest against the proposal to cut down the sholas on the Dodabetta slopes for the extension of the Government cinchona plantations.

### THE ANAMALAI PLANTERS' ASSOCIATION.

Minutes of a General Meeting of the Anamalai Planters' Association, held at Paralai, on the 8th September, 1903.

PRESENT:—Messrs. P. W. E. Watts (in the Chair), G. L. Duncan, E. Walsh, C. R. T. Congreve, O. A. Bannatine, J. R. Vincent, and G. A. Marsh, *Honorary Secretary*.

Read notice calling the Meeting.

The Minutes of the last General Meeting were read and confirmed. Minutes of the Committee Meeting of the 25th July were read by the Chairman and confirmed.

Read Resolutions carried by the U. P. A. S. I. at their Annual Meeting. A cordial vote of thanks to our delegate, Mr. H. P. Hodgson, for his services at the U. P. A. S. I., was proposed by Mr. Bannatine, seconded by Mr. Walsh, and carried unanimously.

Read letter regarding freight for Coffee on the Southern Mahratta Railway, which was recorded.

Read letter on Christmas Island, regarding Phosphates from the Secretary of the U. P. A. S. I.—*Recorded*.

Read letter from the Secretary, U. P. A. S. I., regarding subscriptions to the U. P. A. S. I. for 1903-04. The Honorary Secretary was instructed to remit the annual subscription as soon as possible.

Read letter to the Collector with reference to the Coffee-stealing Act.—*Recorded*.

Read letter to the Postmaster-General regarding the way the Local Post Office receipts are credited, and his answer to the same.

The Meeting then discussed at length, in Committee, the St. Louis Exposition and correspondence regarding joining forces with the Travancore Hills Cardamom Planters' Association, and the Honorary Secretary was instructed to correspond further with the Travancore Hills Planters' Association on the subject.

The rough draft prepared by the Committee of the Address to be presented to His Excellency the Governor was approved and passed.

Mr. Marsh's proposition regarding Liquor shop. The proposal was postponed, pending such time as further information could be got from the authorities.

Mr. Marsh's proposition regarding Local Post Office was withdrawn; exception being taken by one of the members as to the right of the Association taking the matter up.

Laid on the table:—

Minute, Cash, and Copy Books.

Proceedings of the U. P. A. S. I. for 1902 and 1903.

*Planting Opinion*.

Draft Address to His Excellency the Governor and general correspondence.

With a vote of thanks to the Chair, the proceedings terminated.

It had been intended to present a formal Address to the Governor, but His Excellency having intimated that he does not

wish to receive any Addresses on this tour, the points stated below are to be represented to him informally at the Monica Bungalow on the 13th of October next.

The practical completion of the Ghaut Road and its re-opening after the damage done by the unprecedented storm of December ast.

The progress made in production. Exclusive of the Waverly and Waterfall Estates, in the season 1900-01, some  $1\frac{3}{4}$  tons of coffee were sent off; in 1901-02,  $10\frac{1}{2}$  tons; and last season 1902-03, 74 tons were harvested. The crops now on the trees are estimated at 136 tons with every prospect of a steady increase in the future.

Cardamom crops for the last two seasons are: 1901-02, 1,300 lbs.; for 1902-03, 18,515 lbs.; and the crop now coming forward is estimated at 34,500 lbs.

Tea has not yet been manufactured, but a large Factory is now in course of erection on Monica Estate. This season's crop is estimated at 50,000 lbs., and the following crop at 150,000 lbs.

Cinchona and Rubber show promising growths.

A revision of leases on the following points:—

(1) **Prohibition of Free Trade in Timber from Leased Land.**—By Section 4 the lessee is prohibited from sending any timber beyond the Annamalai Forest limits, except on payment of a heavy seignorage, and Section 3 seems intended to prevent the cutting of any trees, except for the purposes of clearing for cultivation or buildings. Section 9 prohibits the cutting of any trees, in the lessee's unopened land, of a certain class, named in Schedule 4. Most of these trees are deciduous and do not exist in our forests, but the omission from the Schedule of *Artocarpus Hirsuta* and *Calophyllum Elatum*, is asked for, if not the withdrawal of the Schedule. Permission to cut and trade freely in timber from planters' own lands, would involve the withdrawal of Section 14 which gives Government rights over trees in the "excepted" list. It is considered that the permission now asked for would lead to a very appreciable ghaut traffic, and assist planters also by giving return loads to carts bringing up grain when crop is not available.

(2) **Minor Forest Produce.**—Section 5 prohibits lessee from trading in articles of minor Forest Produce from his own land. It is desired that the right in these articles may be vested in the lessee, as is usual elsewhere.

(3) **Plantation Products.**—It is suggested that Rubber be included, and that Cardamoms, as already stipulated, be also added.

(4) **Rents.**—The question of remission of assessment has been taken up by the United Planters' Association and will, no doubt, come before His Excellency in due course.

It is true that the terms of the leases, as they now stand, were agreed to by the lessees when they entered into possession, but neither lessees nor lessor could then foresee the present straits of the Planting industry.

(5) In the reply to a former petition, His Excellency agreed that the construction of branch roads was necessary, though it might not be possible to provide money for that purpose as fast as we could wish. Planters fully recognize this, and propose that a branch Bandy Road be taken from Paralai through Puthutotam, Castlecroft, and Upper Stanmore, joining up with the present Government Bandy Road at Monica; (2) that this road be linked up by a bridle-path to where the present Sirakundru Road now ends; (3) that the Kaliandipandal bridle-path be widened into a Bandy Road. They would point out that these roads, if cut, would serve some 1,980 acres of cultivated land which, at present, cannot use the Government Bandy Road.

They express a strong desire that the excellent Ghaut Road now made may not be handed over to the District Board, but continue to be kept up by the P. W. D. The handing over of the road was originally contemplated in G. O., Revenue, dated 28th September, 1896, but planters believe they are correct in stating that the District Board is without funds, which would enable it to do any sort of justice to the upkeep necessary, and a failure would replace them in the old position of depending entirely on cooly and bullock transport, whilst the expenditure in making the Ghaut Road would have been in vain. Moreover, in paragraph 2 of Resolution, Forest, No. 466-A, dated 3rd October, 1896, it is evident that Government intended immediate construction of the road, and recognized that "the opening out of the tract" depended greatly upon this construction. Planters who have worked for over six years without the assistance of that road think they may fairly ask that a sufficient provision may be made for its upkeep or that it may remain in the hands of the P. W. D.

## MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated September 11th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ... ..	296,485	359,769	31,580
1902-1903 ... ..	330,801	395,070	27,473

39,672 pkgs. INDIAN } Total 70,353 packages were offered in public auction  
29,031 " CEYLON } this week.  
1,650 " JAVA }

The following telegram sent from St. Petersburg through Reuter's Agency is of some importance to those interested in the production of Indian and Ceylon tea,—“A Government ordinance is published, increasing the import duty on Ceylon and Indian teas imported into Russia by the European Frontier and the Black Sea from 31 roubles 50 copecks per pood to 33 roubles. The import duty on China teas is not changed, but fresh regulations are enforced for the purpose of certifying the origin and place of despatch.”

This means that a preference of  $1\frac{1}{16}$ d. per lb. is given to China over British-grown tea.

INDIAN.—There was a fairly good demand for all except the poorer liquoring descriptions which were inclined to favour buyers, though not to the extent of as much as  $\frac{1}{4}$ d. per lb. There were strong buyers for a few of the finest invoices, Darjeeling and Assam benefiting by this enquiry. The following averages are worthy of note:—“Amal. T. Est. Dooteriah,”  $1\frac{7}{8}$ ; “Rungmook,”  $1\frac{1}{5}$ ; “Amal. T. Est. Lattakoojan,”  $1\frac{3}{8}$ ; “Badulipar,” “Cedars,” and “Turzum,”  $1\frac{1}{2}$ .

Week's av. of New Season's Tea sold on Garden Acct. 1903, 35,141 pkgs., av. 7.89d. 1902, 36,830 pkgs., av. 7.58d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 169,111 pkgs., av. 7.98d. 1902, 190,814 pkgs., av. 7.12d.

*Comparative prices of Indian tea in London.*

	1903.	1902.	1901.	1900.
Dust. (Fair ordinary, dark liquor)	5 $\frac{1}{4}$ d.	3 $\frac{1}{4}$ d.	3d.	4 $\frac{1}{4}$ d.
Fannings. (Red to brown, strong rough liquor)	5 $\frac{1}{2}$ d.	3 $\frac{1}{2}$ d.	3 $\frac{1}{4}$ d.	5d.
Broken Tea. (Brownish to Blackish, strong liquor)	6 $\frac{1}{2}$ d.	5d.	5 $\frac{1}{2}$ d.	6d.
Pek. Soug. (Blackish greyish, useful liquor)	6 $\frac{1}{2}$ d.	5 $\frac{1}{2}$ d.	5 $\frac{1}{2}$ d.	6 $\frac{1}{4}$ d.
Pekoe. (Greyish to Blackish, some tip, useful liquor)	6 $\frac{3}{4}$ d.	6d.	7d.	7 $\frac{1}{4}$ d.
Pek. Soug. (Blackish greyish, inferior liquor)	5 $\frac{3}{4}$ d.	4 $\frac{1}{4}$ d.	4 $\frac{1}{4}$ d.	5d.
Pekoe. (Blackish, greyish, some tip, inferior liquor)	6d.	4 $\frac{1}{2}$ d.	4 $\frac{3}{4}$ d.	5 $\frac{1}{2}$ d.

CEYLON.—There was fair competition, and it was due to a further slight improvement in quality that quotations in many cases were on a fractionally improved basis.

Average for week 7.31d., against 6.46d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 740,039 pkgs., av. 7.46d. 1902, 826,288 pkgs., av. 6.68d.

*Comparative prices of Ceylon tea in London.*

	1903.	1902.	1901.	1900.
Pekoe Soug. (Ordinary leaf, fair liquor)	6 $\frac{1}{4}$ d.	5 $\frac{1}{4}$ d.	5 $\frac{1}{2}$ d.	6d.
Pekoe. (Ordinary leaf, little twist, fair liquor)	6 $\frac{1}{2}$ d.	5 $\frac{3}{4}$ d.	6 $\frac{1}{2}$ d.	6 $\frac{1}{2}$ d.
Pekoe Soug. (Rather bold leaf, indifferent liquor)	6d.	4 $\frac{1}{4}$ d.	4 $\frac{3}{4}$ d.	5d.
Pekoe. (Somewhat bold leaf, indifferent liquor)	6 $\frac{1}{4}$ d.	4 $\frac{1}{2}$ d.	5 $\frac{1}{4}$ d.	5 $\frac{1}{2}$ d.

JAVAS met with a fair demand though in the case of some of the poorer liquoring parcels prices ruled rather in buyers' favour, though no actual decline can be quoted. “Goalpara” estate was again represented by a good liquoring invoice. Since 1st June 26,622 packages on Garden Account realised an average of 6.60d. per lb.

Bank Rate 4 per cent. Exchange on London three months' sight:—Calcutta  $1\frac{1}{4}\frac{5}{8}$ . Colombo  $1\frac{1}{4}\frac{1}{8}$ .

## COFFEE.

The Coffee market for landed parcels is still but indifferently furnished with supplies, and only the following are the totals of the quantities offered in public sale this week—viz., 8 casks 1,370 bags East India Plantation, 3,850 bags Costa Rica and Guatemala, 2,300 bags Columbian and New Granada, 1,580 bags Salvador, 844 bags Vera Paz, 403 bags Morana, 400 bags Mexican, and 300 bags

other sorts. These met a steady demand, and were nearly all cleared off at firm to again rather higher prices for the bright coloury kinds, such as blue Costa Rica from 74s. 6d. to 89s., with very fine Maragogipe (Salvador) as high as 116s. per cwt. There were besides 1,700 bags washed Dumont Santos, which went at 30s. 6d. to 40s. for small and medium, up to 47s. for bold, and 2,250 bags Unwashed ditto at from 23s. 6d. to 35s. 6d., quay terms. The market for Futures has mostly had a dull tone, and though easier terms have been ruling, business has been much curtailed, late quotations for good Santos for September to July delivery being 25s. 3d. to 27s. 7½d. The deliveries of Java coffee in Holland by the Dutch Trading Company during August were limited to 6,100 bags, against 5,870 bags last year, and 4,100 bags in 1901; thus making a total for the past eight months 101,750 bags, in contrast with 75,500 bags in 1902, and 86,300 bags in the year before that. The next public sale by the above-named company will be held on Tuesday next, when 24,400 bags Java coffee will be offered, and the price fixed for good ordinary quality is 26 cents, being about the same as was established at the previous auction in June.

Messrs. C. J. Leech & Co. write:—"The arrangement of the September account has proceeded actively this week, holders mostly reporting to distant months, notwithstanding the high premiums; for confidence in a recovery from the present very low prices is gaining ground, encouraged by the belief that the current Santos crop is a moderate one. Last week's cables, reporting drought in Santos, have been followed this week by somewhat conflicting cables announcing rains. For instance, on Tuesday, Mr. Karl Kriche: 'Santos cables general rains.' On Wednesday, Messrs. Nauman, Gepp & Co., Limited, Santos: 'Raining some parts; prospects September flowering improved.' Messrs. Barbosa & Co., Sao Paulo: 'Light rains in two districts, but too late to do any good.' Messrs. Boetel & Co., Santos: 'Current Santos crop, 7,000,000; prospects unfavourable.' Messrs. Prado, Chaves & Co., Sao Paulo: 'Drought continues: only local storms:

receipts will moderate;' and, again, yesterday, from the same source: 'Weather continues unfavourable.' After opening firm on Monday markets have since been somewhat easier. Receipts have run very large again this week; but, as it is the earliest crop on record, this is not surprising, and to attempt to estimate the yield on the movement to date is impossible. For example, receipts in Santos to date are but little inferior to the record season of 1901-02, which yielded 1,166,000 bags, whilst, on the other hand, they are but slightly larger than in season 1899-1900, which gave only 5,704,000 bags. On the ruling price basis everything unfavourable appears to have been discounted, and the chapter of accidents should favour the bull, as we are at a level which, at last may be described as incompressible. At the present time there is no large individual holding of coffee, such as proved a menace two to two-and-a-half years ago; but the multitude of small holding looms in the aggregate so large that the huge visible supply does not weigh and the tone is hopeful. Rio receipts this week 141,000 bags, against 119,000 bags last year and 137,000 bags in 1901. Santos receipts 325,000 bags, against 295,000 bags last year and 345,000 bags in 1901. The market in Santos has continued firm, and considerably over 'terme' parity. We quote good average 27s. 3d. to 26s. 6d. c. & f., as compared with 32s. 3s. c. & f. a year ago. Compared with last week, we note the following changes: London futures partially 1½d. lower, Havre ¼f. decline, and Hamburg ¼pf. to ...pf. decline. New York unchanged for all months up to and including December, but 10 points lower for January to July, 1904."

#### TEA IN NEW YORK.

Demand continues small, and it begins to look as though holders would have to meet the wholesale grocers half-way before relieving themselves of important quantities of leaf. Low-grade tea has felt some demand, some country greens and Pingsueys changing hands near the close. The primary market for Formosas is easier, say a

# CONQUERS PAIN

cent a pound lower, but with this exception the producing points seem to be steady in their views as to prices. Foochow is very little wanted and are easy. Upon the whole the lower grades are in the poorest position as regards strength of tane.

**INDIAN TEA.**—Increased quantities have been brought to auction, comprising 39,490 pkgs., which met a good demand at full rates. With larger arrivals from India it becomes necessary for importers to regulate the weekly supplies more in accordance with the requirements of buyers, and to avoid the printing in any one week of an excessive quantity that the trade are unable to absorb, and whereby prices are adversely affected. All good medium teas continue to meet with attention. Good Broken Pekoes are in strong demand. Some of the Assam estates show very attractive quality, but this varies considerably as a few Darjeeling and Assam invoices already show a falling-off in character. High figures are wanted for the best Darjeelings. A choice invoice from the Jungpunnah estate, Darjeeling, brought long prices, two breaks of Pekoe going at 2s. 8d. and 2s. 11½d., and four of Broken Pekoe at 2s. 0¼d., 3s. 4d., 3s. 4½d., and 4s. 1d. respectively. Dooars, Cachars, and Sylhets are about up to their recent standard. Finest Broken Orange Pekoes realised from 2s. 0¼d. to 2s. 7d., fine 1s. 6½d. to 1s. 10¾d., useful lines 1s. 1d. to 1s. 5½d.; finest Broken Pekoes 1s. 6d. to 1s. 8d., finest 1s. 10½d. to 1s. 11½d. and 2s. 6d., medium to good 10d. to 1s. 3½d.; fine to finest Orange Pekoes 1s. 7¼d. to 1s. 10½d. and 2s. 5d., fine Pekoes 1s. 4d. to 1s. 6d., finest 2s., with numerous Pekoes and Orange Pekoes from 11d. to 1s. 5¼d. Finest Pekoe fannings made 1s. 2½d. to 1s. 4¼d., fine 10¾d. to 1s. 1d., common to good 5¼d. to 9¼d. Finest Pekoe Souchongs brought 10½d. to 1s. 0½d., fine 9d. to 9½d. Supplies consisted of a larger proportion of common tea than recently. Common leaf was in good request at firm rates, Pekoes selling from 6½d. to 7d., and Pekoe Souchongs 6d. to 6½d. A few inferior Pekoes were sold at 6d., and Pekoe Souchongs at 5¼d., but leaf Tea under 6½d. was scarce. Broken Pekoe Souchongs ruled at 5¾d. to 9d., and broken Tea at 5½d. to 9¼d.

### COCOA.

A sudden revival of demand has been experienced for this article since our last report, and the light public sales have gone off with a lively competition at an irregular advance of 1s. to 3s. per cwt.

—viz., 392 bags Trinidad, dark at 59s. 6s., good red at 61s. 6d. to 63s., and fine at 68s.; 711 bags Grenada, pale at 51s. to 53s. 6d., good common to fair red at 54s. to 57s. 6d., good and fine at 58s. to 60s. 6d.; 85 bags fermented Jamaica at 53s.; 4 bags Dominica at 56s. 6d.; 10 bags St. Vincent at 54s. to 55s. 6d.; one lot fiery red 61s.; 20 bags Demerara, pale at 55s., red at 64s.; and 545 bags Ceylon, low at 41s. 6d., native at 46s. to 47s. 6d., small and middling at 53s. to 59s., fair bold at 63s. to 66s., and fine red at 69s. 6d. to 71s. 6d. per cwt. About 500 bags Guayaquil, African, etc., were held firmly and withdrawn. Privately, also, there has been more doing at rates corresponding to those above quoted, with some comm Dominican at 51s., and good African at 54s.

### CINCHONA.

At the Amsterdam auctions of Cinchona on September 3 10,899 packages were offered (weighing 950,856 kilos.), compared with 6,979 packages offered at the auctions on July 23. Of the above quantity 10,739 packages were sold, at an average unit of 9.90c. per ½ kilo., as against 6.55c. per ½ kilo. paid at the previous auction. The approximate quantities of quinine purchased by the principal buyers were as follows: The English and American factories, 12,046 kilos.; Brunswick factory, 7,650 kilos.; the Manheim and Amsterdam factories, 8,628 kilos.; the Frankfort-on-Main and Stuttgart factories, 5,203 kilos.; and various buyers, 10,680 kilos. The prices paid for the manufacturing-bark ranged from 5c. to 71½c. per per ½ kilo., and for the druggists' bark from 10¼c. to 54c. per ½ kilo. The unit show an advance of 5 per cent., practically everything being sold.

### QUININE.

As a result of the 5-per-cent. advance in the unit at the Amsterdam bark-sale, makers advanced their prices 1d. per oz., best German brands in bulk being now quoted at 1s. 1d. Howards have also advanced their prices to 1s. 2d., and for 1,000 oz. lots of 1-oz. vials they now quote 1s. 4d. Whiffen's brand has also advanced to 1s. 1d. Salts of quinine are also higher. In second hands there was more activity at the close of last week, some 50,000 oz. of German bulk selling on the spot at 11½d. to 11¾d., and December delivery at 11¾d. to 1s. This week, however, the market has been inactive, with sellers at 11¾d., spot, and December at 1s.

# OPINION.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, OCTOBER 10, 1903.

[No. 40.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 16th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*Weather*—Very strong and wet, the rainfall is much beyond the average. *Works*—Handling and weeding. *Coffee*—healthy and late supplies good, early supplies have suffered from the wet. *Health*—Good. *Labour*—Plenty.

#### Coorg.

*POLLI BETTA, 7th September.*—*Weather*—It is still continuing over-cast and rainy. Amounts gauged now average about 15 cents a day. It is to be hoped it is now going to clear up. *Plant diseases*—Leaf-disease is extending with this wet, but it is not very general as yet, and, on the whole, coffee is looking well. *Works*—Attention is being mostly concentrated on weeding, but some handling is being done. *General health*—Fair. *Labour*—Sufficient.

### SALES OF COFFEE IN INDIA.

IN our U. P. A. S. I. section to-day we place before our readers the latest statistics available in respect to Imports and Exports of Coffee and Tea. Commenting upon the figures relating to coffee, we may remark that those that tell of imports cannot be accepted as complete. So far as they deal with raw coffee they probably are nearly so, but the importation of tinned coffee must amount to a very considerable value. In many cases, it is only too probable, the coffee is shipped along with other goods, even in the same cases with other goods, and entered in Custom House returns as

“oilmanstores.” The leading firms of retailers might be able to throw light upon this point, but it would be impossible to arrive at anything like a trustworthy estimate of the quantity imported on account of “bazaar” dealers. There appears to us to be a strong probability that a very large proportion of any Brazilian Coffee that passes into consumption in India reaches the country in the form of ground and tinned powder; and this is just the branch of trade in regard to which statistics must be accepted as affording very little information. It appears, however, that over one million pounds of Coffee are imported, chiefly from the Straits Settlements and Austria-Hungary. Supplies from the latter port are unquestionably of Brazilian origin. These supplies come mostly to Bombay and Burma, but Bombay re-ships about one-third of its imports—chiefly to Persia, Arabia, and Mauritius. Burma is, to a small extent, a coffee-producing country. It has, in times past, drawn upon this Presidency and Mysore and Coorg for supplies. Yet what it imports from foreign countries—probably chiefly from the Straits Settlements—passes into consumption in the Province itself and is not re-shipped. To this extent, therefore, Coffee from the Federated Malay States and, possibly, from Java, must be regarded as ousting Indian Coffee in a measure from an Indian market.

It is very desirable that planters in this country should know the extent to which their Coffee is undersold in India by Brazilian or other imported Coffees. Just at this point statistics fail us. The primary reason for this is that, in a commercial sense, there is no local market for Coffee in India. There are no Indian quotations of price. Each planter knows what rate he can obtain on the estate for such coffee as he sells locally, but such sales are not recorded in official publications. They must indeed be regarded as more or less of a retail character, though some may run to large figures, and the total of such transactions must certainly be important. It is most probable that Brazilian competition is also almost entirely of a retail character. Oilmanstore dealers import to meet their own requirements, there is no public market (wholesale), and the volume of business thus transacted can but be guessed at, as there are no data upon which to base estimates even as reliable as those that are annually forthcoming in respect to Brazilian Coffee Crops. Then as to the price paid for importations of this kind, the

Director-General of Statistics to the Government of India can say but little, and that little is of no practical value. What he does say amounts to this : that, so far as the figures of quantity and declared value in the import and export trade may give an indication of the relative rates of Indian and foreign coffees, the values divided by their respective quantities give an average rate which is in the case of :

Imported coffee ... 4 annas per pound.  
Indian coffee exported ... 7 " "

It is quite obvious that these figures are entirely unreliable; yet, at the same time, we have to bear in mind that even the actual value of the Indian Coffee exported from this country would afford but little clue to that of such Indian Coffee as is sold in India for local consumption. Generally speaking, the former comprises the superior qualities produced; the latter, the inferior qualities, including garblings and what might be fairly termed refuse.

In spite of the unreliability of the figures furnished we would lay stress upon one or two points that they appear to indicate. In the first place, we have the solid fact that imports from foreign countries, as recorded in Custom House returns, show an increase of half-a-million pounds (over 60 per cent.,) as between 1901-02 and 1902-03. More than one-half of this increase represents Brazilian Coffee (as statistics relating to imports from Austria-Hungary show). The Straits Settlements account for another two-fifths. As re-exports show but a trifling increase, these figures mean that to the extent of 500,000 lbs. Indian Coffee has been undersold in India by foreign coffee during a single year, in excess of the underselling of the year immediately preceding. This appears to us to be a very serious matter. The figures are not very large, but they are too large, and the rate of increase is alarming. The first thing that strikes us is the desirability of instituting the most searching inquiries possible as to the importations of coffee, quality, price, etc. The next, the question of the possibility of establishing in this country what it now lacks, *viz.* a local Coffee market. That the difficulties in the way of establishing such a market are immense, we are fully aware; but it is essential that hard-pressed planters in this country should do everything that lies in their power to protect their "Home" interests while they are essaying to develop their interests abroad. That this matter should receive the earnest attention of all who are concerned in the Indian Coffee industry, appears to us to admit of no doubt whatever.

## BRITISH BOARD OF TRADE RETURNS.

AUGUST 1903.

**Cocoa (raw).**—There was only a moderate supply in the United Kingdom last month, but the deliveries were good, and the stock came to be on a parity with that in 1902.

In the first eight months.		1903.	1902.	1901.
Imports	lbs.	39,040,769	42,750,254	41,220,816
Home consumption	"	28,267,850	32,762,075	29,659,620
Exports	"	8,117,581	9,146,807	7,313,047

# U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The undernoted statistics have been kindly furnished by the Director-General of Statistics to the Government of India in reply to a report made by the Secretary, U. P. A. S. I.

It will doubtless be remembered that similar statistics relating to earlier years were published in *Planting Opinion* some months ago.

That they deserve and will repay earnest study will doubtless be admitted by all readers who give them, another first place, even casual attention.

COFFEE NOTES.

**The U. S. Coffee Market.**—The market has been quiet in coffee for both actual and optional, says the *Tea and Coffee Trade Journal* of 8th ultimo. In prices there are no changes worthy of note. The Brazil market is on a parity with that locally and offers and sales include 3,000 bags Rio Nos. 5 to 8 at 5c. c. & f., 1,000 bags Rio No. 7 at 4.90c. c. & f., and 1,000 bags Rio Nos. 3 to 7, averaging No. 5, at 5.40c. do. Rio No. 6 at 5.15c. c. & f., and Bourbon Santos No. 2, 6½c. c. & f. The market has been steady, and this had its effect here, prices

being maintained for spot invoices at  $4\frac{7}{8}$ c. for Rio No. 8,  $5\frac{1}{8}$ c. for Rio No. 7,  $5\frac{1}{2}$  to  $5\frac{3}{4}$ c. for Rio No. 4, and  $5\frac{7}{8}$ c. to 6c. for Santos No. 4. Distribution has been moderate and jobbing likewise.

In the option market the heavy September liquidation has been followed by a restful quiet. The next movement will concern itself with November, which is a month of much interest at present, and in which there has been large trading. In it will be determined whether the values of the Brazil grades shall be changed, and there has been much speculation on the doubt. The matter is still indefinite, but the tendency is for a narrowing of the differences existing between the lower and higher grades of coffee. The latter is more abundant. Much will depend on the class of coffee that will be shipped meantime from Brazil to the United States. Meantime some attention is being given to reports that the Santos crop will be rather small. Abundant rains are reported for the growing crop.

A moderate business is being done in mild coffee. Supplies are abundant but not in the better grades, which readily find buyers at steady prices. Good Cucuta is 7 to  $7\frac{1}{2}$  cents. East India coffees are quiet.

Messrs. Karl Krische & Co., Santos, estimate the receipts of coffee at Santos during September at 1,200,000 bags, and at Rio 525,000, a total of 1,725,000, compared with 1,714,000 in September last year and 2,246,000 in September, 1901.

New York retailers are striving to make reputations by selling a fancy blend at 25c. per pound. Some of them are notably fine in cup quality. There is also a large trade in a blend retailing at 35c. or three pounds for a dollar; exquisite in cup attraction, having full body and rich, mellow flavour.

**Coffee Futures at New Orleans.**—Preparations for establishing the coffee future market upon the floor of the New Orleans Board of Trade. Trade have not progressed so rapidly as was at first expected, owing, it is said, to the thorough manner in which the Special Committee in charge of the matter is performing its work. The rules and regulations to govern the system and method of the department will probably not be ready much before September 15, and the market itself will hardly be in running condition before September 20.

**Coffee in the U. S.**—Market weak, says the *American Grocer* of 2nd ultimo, except on specially desirable lots of mild sorts. While the quotations for Brazil sorts are on the basis of  $5\frac{1}{8}$ c., and Maracaibo  $7\frac{1}{4}$ @ $7\frac{1}{2}$ c., for good Cucuta, it is difficult to make sales at quotations, except where an invoice is fully up to or above grade. The country is consuming more coffee than ever before, and the American people are getting better value in roasted coffee, and this is increasing consumption and establishing coffee as a popular beverage in sections where it had a light foothold a few years ago.

The Costa Rica coffee crop of 1901-02 was a reduced one, 236,037 bags, as against 320,934 bags of the previous crop, or 26.45 per cent. less. On the other hand, the average price realised abroad was considerably better than that in 1901; but, although this was an encouragement to the planters, there has been no increase in the area planted, and the export of coffee is likely to remain at between 250,000 and 300,000

bags per annum. The export to the United Kingdom has amounted to 73 per cent. of the whole crop, as against 66 per cent. in 1901. The area under banana cultivation continues to increase rapidly, over 2,500 acres of new plantations having been made last year.

**Adulterated Feed.**—The Journal of Commerce of New York says that "dealers in feed in this city are much concerned over the growth of a systematic plan that has been in operation for more than a year of adulterating feed with peanut shells and coffee hulls. Peanut shell bran costs about \$9.00 per ton in New York and ground coffee hulls cost about \$6.00 to \$7.00 per ton, and up to 40 per cent. of which can be mixed with mill bran and pass muster. While peanut bran has about 6 to 7 per cent. protein and about  $2\frac{1}{2}$  per cent. fat, coffee hulls have only about 2 per cent. fat and no protein at all, and are said to be poisonous also. A State law makes it a criminal offence to sell adulterated feed unless the package containing it is branded or tagged with an analysis of the contents. Yet some dealers buy feed of mills with their brands on the bags, adulterate it as above and sell it in the original packages at a less price than they paid the mills, as the mill price is \$18 and the adulterated mixture costs only \$13 per ton." Retailers who handle feed need to be careful as to the source of their supply.

Verily, says the *Merchants' Review*, this is the "silly season," when sensational but baseless despatches appear in the newspapers and when strange theories are thrown out by deliberative bodies with a view to startling the public and focussing the popular attention upon obscure personalities. Thus we read that the Journal do Commercio of Rio de Janeiro has announced that a syndicate of American capitalists is about to purchase the whole stock of Brazilian coffee at the price of ten thousand réis an arroba. This belongs to the "important if true" category of current news. We should be sorry for the members of that syndicate if they invested any hard cash in the scheme. It is probable that there is much more coffee in Brazil than even the trade statistics reveal, and just as soon as foreigners came forward to relieve the market in the manner described by the Brazilian paper, just so soon would the Brazilian coffee-planters redouble their exertions to turn out as much coffee as possible.

It is now promulgated that coffee is dangerous to Governments, and were less of it drunk there would be so many revolutions less, especially in South America. An Ohio medical journal learnedly says: "In South America, where coffee is used to an alarming extent in some of the republics, it finally brings about a physical agitation in which it is quite impossible for the victim to sit still, or lie still, except when sleeping. Some have gone so far as to attribute the national unrest of the South American republics to their excessive use of coffee. It has become a saying that it is a quiet day, indeed, when there is no new insurrection in South America. It may be that these characteristics are in reality due to the immoderate use of coffee." Unfortunately for the argument, observes the *Tea and Coffee Trade Journal*, the South American republics, despite that they almost entirely supply the world with coffee, use themselves relatively little of it. Perhaps in taxing coffee the Governments are planning more wisely than they know. And to think on what volcanoes the United States, Holland, and Sweden live, Governments that

have up to the present been so stable, this using more than ten pounds of coffee per inhabitant per year! But this is not all and we quote further this conclusion of the same authority: "If the average citizen of Great Britain uses only three-fourths of a pound of coffee in a year, while the average citizen of the United States uses over twelve pounds, shall we not in some measure attribute the hurry-scurry of our cities, as well as the slowness and conservativeness of British cities, in part at least to this difference in the consumption of coffee?" Now, then, if the average Englishman does not know what ails his enterprise in contrast with the Yankee he need be no longer ignorant in view of this revelation. London in the last year increased the consumption of coffee 100 per cent., and perhaps it at last has met with the elixir of life, the possession of which is so much envied in the American. More Yankee invasion, indeed! But apart from all this, what nonsense is written and said of coffee just to fill vacuums.

\* \* \*

In these days of the malignment of coffee by sordid sources, it is pleasant to give wider publicity to a tribute by Gelett Burgess. We gratefully reproduce this by him: "Nothing we drink is quite so dark as black coffee. See how the liquid in the cup forms a little concave mirror, in which is reflected the light over the table! By tipping the cup, or agitating it slightly, the image of the light dances in and out of wonderful Arabesque patterns, filling the circle with queer designs like Japanese mons. They flash in changing shapes, one melting into another with the rapidity of lightning, a fascinating network of zigzag lines. So, too, for one sensitive to a certain sort of coffee intoxication, there is a mental Arabesque of quaint thoughts that is stirred into life by the stimulus of the beverage. Coffee occasionally has the curious effect of magnifying common things, and of making slight moods and incidents picturesque. And so, in its own curious way, does black coffee at times induce abnormal mental states, finer and more elusive than the intoxication of alcohol, more nearly resembling the restless exaltation of physical fatigue."

\* \* \*

An American firm of retail grocers print the following eulogium of dry-roast coffee:—

"A prominent Western coffee roaster recently ridiculed, in a published article, the idea that any one 'would be so foolish as to roast coffees absolutely dry, or without the addition of water.'

"He made no pretense that his own coffees were dry-roast.

"But Acker coffees have been absolutely dry-roast for 22 years.

"It may have been 'foolish' for us, during these 22 years, to give our customers 16 ounces pure coffee to the pound in place of the usual combination of coffee and water, but the development of the most critical coffee trade in this country partly atones for the loss of the additional profit.

"But 'dry-roast' is a pretty title to juggle with.

"Many adopt our title, but continue to pour on the usual proportion of water."

We have referred to this subject before, says the *Merchants' Review*. Possibly the dry-roast process is superior to the wet, but where does the superiority lie? Not in the excessive weight of the beans that have been brought into contact with water while in the roaster, for unless the water is used to excess the intense heat turns it into vapour, which quickly escapes into the air. It is claimed that roasting is made safer by the use of small quantities of water, as it extinguishes the sparks that sometimes occur in the cylinder.

Total stock in United States September 1, 2,547,936 bags against 2,467,352 bags September 1, 1902. Brazil stock in the United States September 5, in store and afloat, 2,498,231 bags against 2,980,524 bags at the same time last year. Other than Brazilian, 428,703 bags against 405,120 bags last year.

Brazil coffee in New York September 5, 1,929,164 bags. Stock in other coffees September 1, 343,496; in San Francisco, 75,441 bags and in New Orleans, 9,766 bags. Visible supply in the world of all coffees, September 1, 13,148,200 bags.

Brazil stock in Baltimore, August 29, 56,164 bags; in New Orleans, 151,998 bags.

Warehouse deliveries since September 1, 1903. New York, 38,962; Baltimore, 1,470; New Orleans, 716. Total, 41,141.

Receipts at	1903-04.	1902-03.
Rio, July 1 to September 3	1,157,000	1,011,000
Santos, July 1 to September 1	2,222,000	2,008,000
Total ...	3,379,000	3,019,000

**Mat Coffee in Warehouse.**—The stock of mat coffee in New York warehouse September 1—

	September 1 1903	1902
	Mats.	Mats.
Padang ...	75,385	55,527
Praeger ...	1,000	300
Malang and Buitenzorg	2,000	2,000
Palemb'g and private growth	56,529	58,000
Macassar and Bonthyne	19,000	16,375
Total ...	153,914	132,202

Deliveries during August, 1903, 7,122 mats, of which 4,125 mats were Padang. Deliveries during August, 1902, were 10,524 mats, of which 7,737 mats were Padang.

### TEA NOTES.

**The U. S. Tea Market.**—A broadening in the demand is reported in the tea market, which consequently is steadier and therefore healthier in tone, says the *Tea and Coffee Trade Journal* of 8th ultimo. It is thought that two-thirds of the buying market is now disposed to come into the market, and presently will do so. Meantime pending this expected activity and during its probable Autumn course, prices should hold steady for the more desired grades of teas, such as Japans, the greens, Congous, Indias, and Ceylons. A booming market should not be looked for. The boom of last year has had its untoward effect in putting too large supplies in consuming hands, and an even larger importation has been arranged for during the current season. We began July 1 with at least 72,000,000 pounds of tea in the land, 36,000,000 pounds more than was needed for current supplies, and on top of this 110,000,000 pounds are to come in. Meantime the fairly high prices are not stimulating any additional tea-drinking on the part of the country. It should seem that tea must fall in price, but it is to be remembered that the incoming supplies are in strong hands, and holders, while finding it impossible to advance prices, in all probability will be able to maintain those at present ruling, or nearly so. They have been able so far to prevent any marked decline, which set in two months ago and which makes present prices look less, as they indeed are, but further they have not lowered themselves.

\* \* \*

**London Tea Market.**—A London wire to the *Englishman*, dated September 28th, says:—Messrs. Ewart MacCaughy & Co., Ltd., report that at this week's sale 37,521 packages were offered. Assams, as a whole, sold well; some Pekoes were rather uncertain, ranging to 9d.; teas for price were

little changed; clean from 7d. common Pekoe Souchongs remain about 5½d., and a few were quoted at 5½d. Altogether a steady market, with plenty of buying.

According to a London cablegram, Messrs. Gow, Wilson & Stanton's report, dated the 1st instant, says that the Tea market generally shows a slight decline. The market for medium-liquoring Pekoes and Broken Pekoes shows a fractional advance. The market for teas for price is easier. The average price of Indian and Assam tea sold on garden account is 9¼d. and 7½d. respectively. According to a London cablegram, Messrs. Ewart and McCaughey's Tea Report, dated the 5th instant, says that 36,302 packages were offered for sale at auctions and passed with a fair spirit at late rates. Assams, on the whole, sold well, although sometimes it was rather difficult to get on with Pekoes between 7d. and 9d. Common kinds were steady at 5¾d. with a few at 5½d. quotations where the quality showed a falling-off.

Messrs. Gow, Wilson & Stanton's cablegram of the 1st instant to the Colombo papers announces a rise of ¼d. in the average of Ceylon Tea. Buyers, it is said, are operating very cautiously. Fine teas are generally dearer; teas for price, easier. C. P. Souchong 6¼d.; average 7½d. Reuter confirms the average as 7½d.—against 6½d. for the corresponding week of last year—and adds the remarkable fact that all the 13,000 packages catalogued were sold. India put up 45,000 packages, of which only 38,000 sold, with a drop of ½d., which brings the Indian average down to 7½d. The stocks in London on the 1st instant were:—

Ceylon: 22,400,000 lbs.—down 2,500,000 lbs. in the month.

Indian: 38,300,000 lbs.—up 9,700,000 lbs. in the month.

\* \* \*

Direct exports of tea from India for half-year ending June 30 to North America were: 1903, 773,215 lbs.; 1902, 646,075 lbs.; 1901, 749,831 lbs.

\* \* \*

The Kangra Valley tea-planters seem to have had a bad time on the whole this year. A short time back we had occasion to remark on the want of rain in that district; now it appears that the Valley has had more rain than it wanted. They had ten days' very hard weather last month and heavy snow fell on the upper ranges on the 10th and 11th. The effect on the crops generally has been good but we understand that there is still a great deficiency in the tea crop which it is now too late to have any hope of making up.

\* \* \*

**Ceylon Tea Shipments.**—The following is the Ceylon Chamber of Commerce official tea telegram to London on October 1st:—

September shipments	...	...	...	5½ millions.
October estimate	...	...	...	7 "

The September estimate was 6½ to 7 millions. The shipments for August and September last year were 7,467,514 lbs., and 6,702,973 lbs. respectively; and for October they were 6,628,444 lbs.

\* \* \*

The wonderful manner in which India and Ceylon teas have been forced down the throat of the world testifies in an unmistakable manner to the masterfulness and skill of the companies exploiting the British colonial tea industry, for there is no gainsaying the superior delicacy and flavour of the Chinese teas. So says the *Merchants' Review* of New York.

Messrs. W. J. & H. Thompson, in their report, September 17, say: The new Russian duty, which has already come into force, has had no adverse effect as yet on the demand for shipment—export orders have been more plentiful, strengthening the rates for medium and good teas—while common grades for home consumption have dropped in price, with an active demand at lower quotations.

\* \* \*

**China Tea.**—According to the Annual Report of the Imperial Maritime Customs of China, the grand total of the exports of tea for the year 1902 was 1,519,211 piculs or 202,455,881 pounds, against 1,157,211 piculs or 154,256,226 pounds in 1901, a substantial increase which is likewise exceptional, for the importations from China, excluding the year 1898, when 1,930,795 piculs were exported, have been continually decreasing since the year 1895. In the last ten years the highest figures reached were 1,865,680 piculs (1895). Exports were lowest in 1901. The following are the details of distribution: Of Congous, 506,885 piculs were exported in 1902, of which 114,364 piculs went to the United States direct, 77,065 to Great Britain, and nearly all of the remaining to Russia. Hong Kong is represented with 42,078 piculs. Of Oolongs, 77,906 piculs were exported, of which the United States got direct 52,751 piculs. Souchongs were sent direct to the United States to the extent of only 8 piculs. They went in the main to the continent of Europe, Russia excepted, the total being represented by 18,867 piculs. The grand total was 26,072 piculs. The exports of scented capers were 10,055 piculs, almost entirely distributed from Hong Kong. The entire export of black tea amounted to 687,228 piculs or 101,615,490 pounds, of which 168,501 piculs or 22,461,183 pounds were sent direct to the United States.

Of green tea the total export was 253,757 piculs or 33,936,808 pounds, of which 126,196 piculs or 15,821,927 pounds were sent to the United States direct, and 64,377 piculs to Russia. To the United States were sent 23,052 piculs of young hyson, 13,142 piculs of hyson, 951 of imperial, and 89,088 piculs of gunpowder. Russia took large quantities of the better grades, excelling the United States. The figures were 16,536 piculs young hyson and 41,677 piculs of hyson. Russia received almost the entire output of brick tea, being sent 477,597 piculs of black and 86,932 piculs of green. Russia also practically got the entire production of tablets—7,156 piculs. Japan by direct export received only 1 picul of green tea, but was allowed to have 7,061 piculs of black tea. On the other hand, India took only 877 piculs of black tea direct, but ordered 10,984 piculs of green tea, which, on the whole, is no small bit of heresy for that country to perpetrate. The Philippine Islands figure in the list with only 177 piculs. Russia leads all other countries as China's best tea customer. The grand total sent direct to that country was 882,893 piculs or 117,689,636 pounds, but second is the United States, with, however, only 294,697 piculs or 39,283,110 pounds, and third is Great Britain, with 116,317 piculs, and next Hong Kong with 77,425 piculs.

\* \* \*

Sir Thomas Lipton's presence here is so splendid an advertisement for Ceylon teas that other makes as well as his own are profiting by it, says the *Merchants' Review*. But Sir Thomas did not challenge in order to get an advertisement. He challenged because he was a "dead-game sport," and his manly sportsmanship and fine genial manners have endeared

him to the American heart. Anything of ours except the cup is his for the asking. He has given us medicines to make us love him, as Falstaff says, and we are almost sorry that he cannot take the cup back with him.

\* \* \*

Packet tea is growing in favour, says the *American Grocer*. The persistent work and judicious advertising of the British packers is having its effect in an increasing demand. The demonstration counter has played no small part in stimulating demand.

\* \* \*

Before the British Association at Southport recently Lieutenant-Colonel C. C. Manifold, of the Indian Medical Service, read a paper on recent explorations in China. In the course of this he said, that from Ta-Chen-lu the party followed the great tea road between Thibet and China, so called because of the great traffic in tea carried between Lhassa and Ya-chou. Millions of pounds' weight of coarse tea sweepings go into Thibet from Western China, and the lecturer pointed out that if free commercial relations could be established with Thibet there was no doubt that the better and cheaper Indian tea would capture this market.

\* \* \*

The following telegram with reference to the tea crop in the various districts has been despatched by the General Committee of the Indian Tea Association at Calcutta to the Committee of the Association in London:—Assam and Cachar—Outturn last month about normal; immediate prospects fair; weather generally too cold for the time of the year and is checking leaf. Sylhet, Dooars, Terai, and Darjeeling—Outturn last month about normal; immediate prospects fair; weather moderate.

\* \* \*

The following figures of tea exports taken from the Calcutta Customs daily entries and received periodically from Chittagong are issued by the Indian Tea Association:—Quantity of tea entered for export to United Kingdom for the second half of September 1903, Calcutta, 9,109,216 lbs.; Chittagong, 1,698,701 lbs.; quantity entered during the corresponding period last year, Calcutta 11,612,406 lbs.; Chittagong 1,782,000 lbs.; total from 1st April, 1903, to 30th September, 1903, Calcutta 65,157,652 lbs.; Chittagong 12,961,075 lbs.; total 78,118,727 lbs.; total from 1st April, 1902, to 30th September, 1902, 74,652,569 lbs.

\* \* \*

The prospects of the tea industry in the Darjeeling district continue favourable. Last year the season terminated very abruptly, but there is every appearance of climatic conditions being such as to enable more than a normal output to be manufactured this year.

\* \* \*

**A "Boom" in Ceylon Tea in Paris.**—The *Paris Journal* recently published a long editorial on the enterprise of the Tea Planters' Company in Paris in giving an insurance policy for one month against death by accident to purchasers of  $\frac{1}{4}$ ,  $\frac{1}{2}$ , and 1-lb. packets of tea. The new departure was announced while public opinion was still much agitated by the catastrophe on the Paris underground electric railway; and it gave the Company and Ceylon tea a splendid advertisement. The *Journal* is now to distribute 25,000 lbs. of Ceylon tea, done up in  $\frac{1}{8}$ -lb. packets, as prizes to readers of the paper.

Messrs. Ch. & A. Boehringer, of Colombo, state for the satisfaction of Ceylon planters that refuse tea (red leaf, etc.) is shipped by them to the Continent only, and there it has to be mixed with lime before the Customs will allow its passing free of duty. They ask—"Would it not be advisable if the Planters' Association induced the Customs in London to denaturalise all refuse or rejected teas to prevent their going into consumption?"

\* \* \*

**Tea for Australia.**—REJECTED SHIPMENTS RETURNING. Last year's incident connected with the rejection of Ceylon tea at Melbourne Customs, and the controversy which followed, will still be fresh in the memory of our readers. By the Australian law, all tea that did not conform to the standard was liable to be destroyed. The standard—a somewhat rigid one—was that no insoluble matter should be contained in the tea, and that all the properties of tea should be there. Now it happens that in the Ceylon dust shipped to Australia there has been a certain amount of grit, which was insoluble, did not come into liquor, and nothing could be drawn out of it. It did not at all affect the quality of the tea. The presence of the grit was apparently enough for the Australian analyst, and he condemned the tea. The question was carried to law and decided against the tea merchant by the Supreme Court.

The Customs authorities did not exercise the option of destroying the tea. Presumably this was in response to the vigorous protests made, it being explained from Colombo that the tea was perfectly sound and in great demand here. The tea was stored in warehouses at the expense of those who sent the tea from Ceylon, and it is now coming back in dribblets. For instance, ten and a-half chests of tea were brought back by the O.-P. ss. *Orient* yesterday, and in the manifests of the last few mail steamers from Australia a quantity of tea was included. This tea, it should be remembered, was condemned two years ago.

Mr. A. H. Ayden, of Messrs. Whittall & Co., informed our representative that he had heard by the mail before last that the question of the re-shipment of rejected tea from Australia to Ceylon was being considered, but, as far as he knew, nothing had been settled either way. The Commonwealth is at present undergoing a change of Government, and it may be that the tea which recently arrived here has been allowed to pass owing to a temporary relaxation of the rules during the political changes.

Those who sent the dust from Ceylon two years ago will be only too glad to have it returned. When it left Ceylon it was worth anything from 16—18 cents a lb.; now it will fetch in any market but the Australian anything up to 30 cents a lb. Mr. Ayden showed two specimens of dust, with unavoidable grit in them, which were worth over 30 cents each a lb.; but, if this tea was sent to Australia, it would not be passed.

From another source we learn that rejected tea has been returned to three or four firms in the Fort. Messrs. Forbes and Walker have had a quantity to sell. It was put on the market, but has not yet been sold. Mr. Drury said it was good dust, but, owing to the length of time it had been kept in Australia, it had got very flat. The great point to remember, however, he said, was that dust to-day fetched a much better price than it did when this tea was rejected.—*Times of Ceylon*.

On inquiry at the Customs our contemporary learnt that, if the tea rejected in Australia and returned to Colombo can be proved to be Ceylon tea, no duty will be levied; otherwise it would have to be charged the 25 cents import duty.

## NOTES.

**Rubber in Costa Rica.** The export of rubber grows less year by year owing to the careless way in which the trees are bled.

**Cacao in Costa Rica.** The export of cacao is increasing as the new plantations come into bearing. The value exported in 1902 is £4,943, as com-

pared with £1,866 in 1901; and the local demand, which is considerable, is entirely met by the home-grown article.

**India-Rubber in Peru.** In accordance with the provisions of a law promulgated in December last, it is left to the discretion of the Government to extend the time for which concessions have already been granted, or which may hereafter be granted, to india-rubber companies. The extension may be for any period not exceeding 40 years.

**Tannin.** Tannin is found in the coffee bean, but only one-quarter as much as tea yields. Weight for weight, coffee gives less theine than tea, but as more coffee than tea is used to make the beverage a cup of coffee usually contains as much theine as a cup of tea, "Theine" is the stimulating principle of both tea and coffee, but, although chemically identical, this element in coffee is known as caffeine while in tea it is called theine.

**Russian Trade with Seistan.** The Armenian journal, *Surandak*, states that M. Sobansky, Director of the Bank of Meshed, on April 27 last (o.s.) sent to Nusretabad, chief town of Seistan, a caravan of 12 tons of Russian goods, consisting of petroleum, sugar, tea, calico, and other cotton goods. These goods safely reached their destination, in spite of great difficulties, and were promptly sold at very advantageous prices.

**Blending.** There are, says a New York paper, as many possible combinations in blending coffees as in the game of chess, and perhaps the perfect blend of blends is yet to be discovered. Think of the rewards for the lucky grocer who discovers the best way of mixing the best coffees to make the best blend at a popular price. Tea blending is equally as fascinating, owing to the same chances that new discoveries may be made. There is one great drawback in blending, however, and that is the variation in coffee and tea flavours from season to season. Sometimes the variation is so slight as to be imperceptible to ordinary drinkers.

**The Calcutta Botanical Gardens.** In the Report of the Calcutta Royal Botanical Gardens, Major D. Prain, M.B., I.M.S., says:—The out-door work for the year 1902-03 was almost exclusively with regard to economic plants—particularly fibre-bearing plants including *rhéa*, *agaves*, *furcræas*, and Indian hemp and Indian yams. Samples of *ipecacuanha* have been submitted for medical examination. Arrangements are being made for the propagation of *Ixora coccinea*, a substitute for the foregoing drug, and for the introduction of finer kinds of American pines. The Japanese bamboo, *matakè*, was also introduced this year. The herbarium and library work are progressing favourably, as also work at the Lloyd Botanical Gardens.

**Balata in Dutch Guiana.** The Balata industry was more prosperous during 1902 than it has been for several years past, the amount brought to town being 321 tons, against 237 tons in 1901 and 208 tons in 1900. This does not, however, represent the actual yield, as a very considerable amount was lost in transit from the bush to Paramaribo; most of this was, fortunately for the colony, insured. It is difficult to say how much was lost in this way, but within six months claims were made against a single

Insurance Company for about £7,500, the value—insured—of some 90 tons lost in the rivers by the upsetting of the boats in which it was being transported; no lives were lost. It is understood that the Insurance Company in question has decided not to take any further risks of this sort.

#### Tahiti Vanilla.

Vanilla is now no longer a lucrative production in Tahiti, as the present low prices scarcely pay to cultivate the vine, inoculate the flower, and prepare the pod for shipment. This much we gather from the British Consul at Tahiti, who tells us that the native is turning his attention to copra, as its preparation is more simple and suitable to his indolent disposition. It may eventually take the place of vanilla should that article cease at any time to be an important export from Tahiti. The Consul gives an interesting table, showing the exports of vanilla from Tahiti from 1893 and 1897 to 1902, also showing the values and average price per lb. Last year the average price was 2s. 11d., and the exports 324,340 lbs., valued at 47,417l., or 120,603 lbs. more than in the preceding year.

#### Cocoa in Dutch Guiana.

Cocoa is the most important industry of this colony, but the year 1902 was most unfavourable, the total crop being only 2,187 tons against 3,004 tons in 1901. There is very little doubt, says the British Consul, that this state of things might be much improved by higher and more scientific cultivation. Recognising this, the Government propose to establish an experimental station: but much might be done on the part of the individual planters, by manuring, more thorough pruning, and when planting new areas or when supplying old fields, by using only plants raised from seed imported from other countries, *e.g.*, Trinidad or one of the other West Indian Islands. The destruction of diseased pods and branches, by fire or otherwise, is almost entirely neglected, these are often left lying on the ground after gathering or pruning, and are, in all probability, the means of reproducing and spreading the disease, "Kroloto," which has already done so much harm to the plantations and to the colony generally.

#### Scientific Aid.

The *I. P. G.* offers a suggestion worthy of consideration by all concerned and interested:—"We are most anxious to secure the custom of Germany and the United States for our teas. What is one of the best ways to set about attaining our object? Why, we should say, enlist the active and practical assistance of German analytical and agricultural chemists and American inventors by offering substantial prizes for new discoveries, which will improve the quality of our teas to such an extent as will raise them to the pitch of perfection. When it is made worth the while of the gentlemen above mentioned, to actively engage in the work of improving Indian teas, the mere fact of their having taken up the subject in right earnest, will be a better advertisement for us, than any number of worthless advertisements in small provincial papers. Will the Indian Tea Association and the Tea Cess Committee consider the matter? We feel assured that the adoption of our suggestion will bring grist to the mill. It is only by offering really handsome honoraria that we shall be able to enlist the services of the best talent of Europe and America in furthering our best interests. In rewarding we shall be rewarded a hundredfold."

## GENERAL ARTICLES.

## ALOES IN CEYLON.

Application having been made by Mr. R. M. Eckert, of Sunnycroft Estate, Veyangoda, to the Government Agent of the North-Central Province, for the lease of land lot No. 7456 in preliminary plan No. 2398, containing in extent 661 acres and 3 roods, bounded on the north by Pannakkawalakele, south by Thonygalakele, west by Pusiyankulamawewa Ismattekele, and east by Galkadawala village, Hinnemukalana, and Karambewa village, situated in the village Pussiyankulama of Nuwaragam korale in the Nuwaragam-palata of the Nuwarakalawiya District, for the purpose of experimental cultivation which, if found to be successful, may lead to the opening up for cultivation of a large area of unirrigable jungle land hitherto lying waste, it is hereby notified under regulation No. 52 of land sale regulations, published in *Gazette* dated 20th February, 1903, that the said land will be leased to the said applicant for five years under the following conditions, unless within six weeks from the date of this notice valid reasons to the contrary are adduced:—

1. The land to be taken over by the lessee in blocks of at least 100 acres each every year, such blocks being defined by the Government Agent by arrangement with the lessee.
2. The lease of the entire land to be completed within five years and to be terminated in the fifth year.
3. The rent for the blocks taken over to be Re.1 per acre per annum, payable each year in advance.
4. At the expiry of the lease, right of pre-emption at Rs.10 per acre to be allowed to the lessee.
5. No timber above 2 feet in circumference to be felled, and any valuable timber under that size felled to be paid for at Government rates.
6. Aloes only to be cultivated on the land leased.
7. The land to be forfeited to, and vest in, the Crown, if at any time such land or any building thereon be applied, without the written consent of the Governor, to other purposes than those specified in the grant or lease, or if, within a reasonable time, the necessary steps have not been taken to apply the land to the purposes for which it was granted.
8. No permanent buildings to be erected on the land without the written consent of the Government Agent.—*Ceylon Gazette*.

## PRODUCE AND PLANTING.

While the Consuls at the Treaty Ports of China inform us that the awakening of the Chinese tea-grower to the needs of foreign markets is as far off as ever, there are a few prophets on this side who are still hopeful. Not long since one of these made it known that, "With a sufficient capital, which would be reproductive, I would undertake to double the present trade in China tea in a few years, to the great benefit of the Chinese, and also to the health and temperance of tea-drinkers who would consume China tea if they could get it." But, he added, no doubt with regret, "meanwhile the trade persists in ignoring it." This may be very obstinate policy on the part of "the trade," but they evidently have good reason for this wayward course. Teas from India and Ceylon have secured such a firm hold on the trade and on consumers that without the expenditure of a large sum of money it is not quite clear how the China tea trade is to be successfully rehabilitated, notwithstanding that those interested are never tired of telling us "that the day will come," etc.

If we may judge by a recent circular from Messrs. Smith, Baker & Co., of Yokohama, the Japanese tea-man is not quite awake to the competition of Indian and Ceylon growers. The firm mentioned say: "Judging from the present talk among native tea-men, they seem to take about the same languid interest in the local tea market from now to the end of the season that the habitual 'fan-tan' player does after three-quarters of the cash in the game has been withdrawn, that is, they seem to know just how it is coming out. They say to-day, for instance, that there will be only seventeen days more picking (the growers having agreed to stop picking September 1), and the narrower the margin of production becomes the more confident they feel of their ability to take care of the present stock and probable addition, and, in consequence, signs of weakness on the part of holders are nowhere apparent to buyers for export. When we explain to them with painful particularity the inroads

Ceylon and India teas are making in the American and Canada trade for cheap Japans they miss the point entirely, and ask childlike and blandly if it is not possible for them to import some of the cheap Ceylons for home consumption in Japan! 'These Mongolians is improvin'.' Will an export of 42,000,000 lbs. from Japan cover the requirements of America and Canada for this season?" Tea exported during the current season to August 11 has been 22,461,148 lbs., of which 5,551,555 lbs. were for New York, *viâ* Pacific Ocean, and 3,480,963 lbs. *viâ* the Suez Canal; 3,551,963 lbs. for San Francisco, 10,550,863 lbs. for Chicago, and 2,228,623 lbs. in Canada. The total one year ago at this time was 19,244,527 lbs.

Amongst the pamphlets recently issued by the Cobden Club, intended to illustrate the charm of the good old Protectionist days, is one on the humours of Protection by Lord Welby. Referring to coffee, the writer says: "Let us take first the case of coffee. In those days the coffee duty was 6d. per lb. on colonial coffee, 1s. 3d. per lb. on foreign coffee, and an intermediate duty of 9d. if the coffee came from the Cape of Good Hope or from east of the Cape. The result of the working of these duties was that it actually paid the importers of foreign coffee from Hamburg and the Continent to send the coffee to the Cape of Good Hope and bring it back again, in order to land it here at the intermediate duty of 9d. It was reckoned that the cost of that junketing journey was 1½d. per lb., which, added to the intermediate duty of 9d., still left a profit of 4½d. per lb. as compared with the foreign duty. Thus the law made it profitable to send coffee several thousands of miles across the sea, subject to the loss of interest on the money invested, and to the charges for freight and insurance, in order to bring it back and sell it in London. It should have been to sell it in Bedlam."

Although Americans are large consumers of coffee some of their dietetic authorities do their best to discourage coffee-drinking. An Ohio medical journal says: "In South America, where coffee is used to an alarming extent in some of the republics, it finally brings about a physical agitation in which it is quite impossible for the victim to sit still, or lie still, except when sleeping. Some have gone so far as to attribute the national unrest of the South American republics to their excessive use of coffee. It has become a saying that it is a quiet day, indeed, when there is no new insurrection in South America. It may be that these characteristics are in reality due to the immoderate use of coffee." The *Tea and Coffee Trade Journal* points out that, "Unfortunately for the argument, the South American republics, despite that they almost entirely supply the world with coffee, use themselves relatively little of it."—*H. & C. Mail*.

## TEA PESTS.

A Meeting of the Pussellawa Planters' Association was held at the Gampola Hotel on Saturday afternoon, the 26th ultimo. From a report of proceedings in the *Times of Ceylon* we extract the following:—

## SHOT-HOLE BORER—AN IMPORTANT REPORT.

The CHAIRMAN: Before the receipt of the first letter from Mr. Green we had already appointed a Sub-Committee on the subject. It met on several occasions and prepared a report which they will be glad to submit to you now, for your approval or otherwise:—

Report of the Sub-Committee appointed by the Pussellawa Planters' Association to collect statistics as to the existence, spread, and best means to combat pests and blights affecting tea in this district. The attached circular was sent out to some sixty estates representing approximately 25,000 acres, ranging in elevation from 1,500 to 4,500 feet and with a rainfall averaging from 90 to 180. Answers to the circular were received from forty-five estates with a total of 19,000 acres. Seven estates, about 3,000 acres, are said by the residents to be not now affected by shot-hole borer, though small areas have at times been attacked. The elevation of these seven estates ranges from 3,000 to 4,500, rainfall 120—180. Thirty-eight estates, about 16,000 acres, elevation from 1,500 to 4,000 feet, rainfall 90 to 150, report as being affected by this pest, and from the information collected it may be said that a large proportion of this area is severely affected by shot-hole borer. It is eminently satisfactory that this Committee can say in reply to the circular as regards all other pests and blights than shot-hole borer this

district is singularly free. In no case has opinion been expressed that any other pests or blight has ever done serious damage or remained long in evidence. It is an interesting fact within the knowledge of this Committee that the shot-hole borer is spreading in a southerly direction, its first appearance being nearly always on the northern boundary of the estate. The conclusion this Committee has inevitably arrived at with regard to the shot-hole borer is that it is the most serious pest that has yet been known to attack tea over any extended area. The affected areas have undoubtedly rapidly increased during the last two years and drastic and systematic measures are absolutely necessary to keep it in any sort of check. Weighing the evidence afforded by the responders to their circular this Committee considers that the present inroad of the borer necessitates the destruction of all prunings over affected areas and would go so far as to recommend legislation to make this compulsory. On this point the Committee was divided, three to two being in favour of legislation. Fully alive, therefore, to the extremely destructive nature of this insidious pest the Committee is of opinion that the whole time of an expert should be given to the complete study of it, and that this want might be met by appointing a trained assistant to work under the Government entomologist, whose time is at present divided amongst the study of numerous other entomological questions.

The CHAIRMAN: That, gentlemen, is the report which the Sub-Committee have drawn up with great labour, and I trust it will meet with your approval. (Hear, hear.) On one or two points there may be a difference of opinion. We consider the present inroad of the pest necessitates the destruction of all prunings over all infected areas. That may meet with opposition or debate.

Mr. MACGREGOR: Mr. Chairman and gentlemen, I am one of those opposed to legislation in connection with making it compulsory to bury prunings or burn them. I think it would be a great mistake. If you went so far as that you would have to legislate for the time you ought to prune your tea. If you let your tea run on for two or three years without pruning, it becomes a regular harbour for the borer. I think it ought to be left to the discretion of the superintendent, agents, or proprietors, to say whether they have shot-hole borer. It is then to their advantage to bury or burn their prunings; but to make it compulsory is a thing I strongly object to.

Mr. LUCAS seconded what Mr. MacGregor had said.

The HONORARY SECRETARY: Before we go on with borer there is a Resolution to be considered, sent to us by the Committee in Kandy, about legislation as regards the sale of tea-plants in infected districts.

Mr. MACGREGOR: Everyone has your support there.

The HONORARY SECRETARY pointed out that they had objected to this at first, and what he wanted to know was that they changed their minds? The Kandy Committee supported legislation.

Mr. SHELTON AGAR: How about sending plants from one infected district to another?

The CHAIRMAN: It is sought to prohibit that, and I think it is desirable. Does anyone oppose this Resolution?

Mr. SHELTON AGAR: Would you say "except in the case of one infected estate to another"?

#### SPEECH BY THE GOVERNMENT ENTOMOLOGIST.

Mr. E. Green, the Government Entomologist, made an interesting speech on the subject of Shot-Hole Borer. He explained at the outset that he had brought no specimens of the pest with him, nor had he come to deliver a set speech on the subject, but more to give them any information he could of practical importance. "I want to say," he went on, "that without minimising the importance of the pest—I think it is a very serious one and requires careful watching—I think it is a pity a scare should be the outcome of it. I do not think it is a pest likely to jeopardise the tea industry in any way. It means a considerable amount of loss of crop, no doubt, but I think you may put aside the idea which some people have got into their heads that it is going to wipe out the tea. From what I have seen of it—and I have known it now for 13 or 14 years—it appeared in the Nawalapitiya district first, as appears from one of the first reports and I have not heard of any large dying-out of tea. I have not any reliable reports as to the death of a single tree that can really be put down to the Shot-Hole Borer itself."

#### DESTRUCTION OF PRUNINGS.

At the same time I should like to point out that to keep it in check I consider the destruction of prunings is one of the important

points to remember—not the only important point, because there are several things which should be attended to. I think it is a mistake to allow the tea to run too long without pruning. If you allow it to do so the plant gets full of the borer and weakens its stamina. It will not recover in the same way and necessitates heavier pruning. I have not had any experience of the district down here, but judging from what I have seen I should put the length of the interval here between prunings from 15 to 18 months according to elevation, as a safe time to allow tea to run. I have been told by several people that that would mean a loss of the tea, yet I have been told that many people round here do prune at comparatively short intervals. Is it the custom down here to prune at such short intervals?

Mr. BLISS: Yes, about 15 to 18 months.

Mr. GREEN: Then again I think there is no doubt it will necessitate more liberal cultivation than has been the custom in a good many places if you are going to keep the tea up to its present state of bearing; but beyond that I am of opinion that if in a place like this you destroy your prunings and prune at fairly frequent intervals and keep the tea in good heart, it will be able to fight its own battles. I have frequently found in vigorous tea that the tendency of the plant is to deposit fresh wood over the hole made by the borer, and these holes are blocked up, there being neither entrance nor exit. You see the galleries in the middle, and you find the holes have been blocked up by a new growth of wood which has isolated the galleries altogether. On that account I deprecate the excessive punishing of tea in places where the borer has been at any time. In a case like this I think the idea of going below the borer is hopeless. It is not very easy for everybody to tell whether they are going below the living or the old gallery, and you may be doing a lot of unnecessary damage to the tea. I think that ordinary pruning according to the merits of the bush is what I should recommend in a place like this, and careful cultivation of the tea to keep it in full vigour. There has been a good deal of talk about chena being full of shot-hole borer. I found the borer in a certain number of plants, but I have also, I suppose, had any number of other things sent to me as shot-hole borer which proved to be quite a different thing, altogether. It is perhaps difficult for you to understand. There are probably about 100 different beetles in Ceylon, all closely allied to the shot-hole borer and only distinguished under the microscope, as a matter of fact.

#### FALSE ALARMS.

A gentleman sent me the other day some dead Albizzia branches. I found the beetle was completely distinct and had evidently got into the thing when it was dead. I told him so, but he was very sceptical and said it must be the shot-hole borer. I have had a second lot from him in which there were several distinct species—all different, and not one was shot-hole borer. It is rather difficult for a layman to say for certain whether it is shot-hole borer or not. It is a class of beetles, the greater number of which go for dead wood; the furniture beetles which bore into chairs and rafters; but only a comparatively small number of them attack living wood. Other species do so, but mostly confine themselves to a few trees. I think I have found the shot-hole borer in guava, and in grevillea of course, and in annato, and I have seen it in living albizzia branches but not to the extent it is to be found in tea. In many places a large number of vagrant beetles fly about and try to worry their way into any tree. It is a moot question where the borer came from. It is probably indigenous and must have originated in some tree, but in its original condition it was probably very much more limited than it is now. Many pests when they get a large extended area of cultivation without any break in it, like tea, and where they can find a continual branch to breed in, alter their habits very considerably and are able to increase and multiply to a greater extent than they did in their original home. I don't know whether there are any particular points that any gentlemen would like elucidated.

#### A DISCUSSION.

The CHAIRMAN: Do you find shot-hole borer in tea only?

Mr. GREEN: It occurs in grevillea, in guava, and in annato.

The CHAIRMAN: In dead tea?

Mr. GREEN: I found one species in living tea, and several in dead tea. The beetle goes generally for dead wood. I suppose you have all acquainted yourselves with the way the borer gets into the tea bush. It goes into the knot hole and each one of

these little infections is quite distinct from the next one, not running up and down the stumps. When it gets into one hole the parent beetle lays its eggs in a circular gallery and the parent vacates that hole and probably goes off and makes a series of channels in another knot. There is always an interval between the several infections up the stump. In pruning with a view of getting below the borer it is quite a chance whether you will not—by cutting between two knots—be under the impression that you have got below it, when it is still there. You cannot be absolutely certain about it.

The CHAIRMAN: Does it work up or down as a rule?

Mr. GREEN: It does not go up and down, but begins in the red wood. Mr. Green also explained that it generally attacked plants 4 or 5 years old and nearly always in the red wood first.

Mr. SKELTON-AGAR: When the tree is pruned, how long does it take the beetle to vacate the prunings?

Mr. GREEN: If the prunings lie on the ground what happens is this: After a certain time there will be a certain amount of eggs and a certain number of young grubs. The grubs that are less than three-quarters grown will die. Those three-quarters grown and above will mature and come out of these prunings in time. They take a certain time to do so. Burning of course is the most perfect way of getting rid of the borer, especially as you can burn straight away off the bush. But there is always this in burying—I am not averse to burying if there is proper burying—but if you only scrape a hole and pile your prunings, in and then place a little earth on to the prunings, all this is waste of time. The way to bury is to dig large holes at the time you prune, throw the prunings straight in, and cover them with earth well beaten in and stamped down.

The CHAIRMAN: Would three or four inches be sufficient?

Mr. GREEN: I should say six to nine inches. In reply to further questions Mr. Green explained that the female beetle was impregnated in the gallery and after laying her eggs flew away and entered another stump and made her gallery. The male beetle never leaves the stump.

The Chairman thanked Mr. Green very much for his kindness in giving them that explanation. At any rate he had filled them with hope. He (the Chairman) thought things were very much worse.

Mr. GREEN: I don't wish to minimise the seriousness of shot-hole borer; but my opinion is that it is not a pest which will endanger the tea industry in any way.

Mr. Green's proposal was unanimously approved.

As regards the Committee's report, the discussion on which had been interrupted, Mr. MACGREGOR proposed and Mr. MURRAY seconded:—"That the paragraph with regard to legislation for the compulsory destruction of all plants be deleted from the report."

This was agreed to on a show of hands, by 13 against 11.

The report, with this alteration, was then adopted.

Mr. Green's speech on the shot-hole borer question, with the subsequent discussion (fully reported in our Sunday edition) followed.

A vote of thanks to the Chairman, proposed by Mr. E. M. HAY, closed the proceedings.

## TEA REFUSE.

### ITS PREPARATION FOR THE MARKET.

It seems a somewhat peculiar coincidence that one of the first dryers that was introduced into the tea districts should have been the outcome of a chance visit by a tea proprietor to a foundry near London. He had gone to see some coffee damaged by sea water manipulated, so that only an expert could tell by infusion that it had ever been injured, and the fact became revealed that almost every kind of damaged produce could be treated by washing out the salt, and re-drying at a high temperature in a hot air chamber. Tea was there present waiting its turn to be manipulated, and pass into consumption. This took place some 25 years ago or more, but the same business is probably still carried on, and we have no doubt that much of the tea, which is rejected by the Customs as unfit for human consumption but is allowed to be landed free of duty for the manufacture of Thein or Caffeine, finds its way into those cleansers' hands, and is subsequently sold. We regret to notice, too, from the home papers that the largest quantity rejected hails from India, and is increasing, last year's rejections marked 1,500 against 900 in 1902, and it is quite time that something was

done to stop such stuff being foisted on the public. The process consists of an immersion in water, and an immediate removal into a hot drying atmosphere sufficient to recock it and thoroughly expel all moisture. It cannot be said that low-class tea would be injured by such a process, except in strength of cup. In fact, it would be cleansed of all impurities, but what we wish to point out is the great inducement for manipulating and passing into consumption teas of this class; for teas passed as unfit for consumption get in free of duty for so-called chemical purposes.

It has been intimated to the Governments of Bombay and Bengal by the Government of India that "refuse tea," exported from the country, is to be exempted from Customs duty. The decision was come to after deliberation with the Tea Cess Committee.—*Capital*.

## RUBBER RESOURCES OF RHODESIA.

The British South Africa Co., holding a royal charter for the administration of the various territories of Rhodesia, have favoured the *India Rubber World* with some details regarding the existence of India-rubber in that region, and the nature and extent of its exploitation to date. Attention will be given first to a report by Colonel Colin Harding, C.M.G., on the rubber industry in North-Western Rhodesia—a region bounded on the west by Portuguese Africa (whence come the Benguela rubbers) and on the north by the Katanga district of the Congo Free State, also a rubber-producing area. It is natural, therefore, that rubber should be found in this part of Rhodesia. Colonel Harding reports the following native species:—

(1) *Landolphia florida*.—Found generally in this territory between 12° and 14° S. latitude; abundant in the marshy and verdant spots, from  $\frac{1}{2}$  to 1 $\frac{1}{2}$  inches in diameter and 20 to 60 yards in length, extending around the forest trees and forming an almost impenetrable thicket. The natives select the larger portions of the vines, leaving the smaller branches, which, in another year, would have attained maturity, to rot on the ground. The latex does not flow from the bark, so that the native method of extraction would appear to be the only practicable one. The vine is cut into lengths of 3 or 4 feet, which are carried into the kraal and soaked for 48 hours, and then hammered or pounded to remove the bark from the stems. The resulting mass is then boiled continually for three or four days, to remove as much as possible of the woody fibre of the bark, after which the rubber, while still warm, is rolled into sticks 6 inches long (*matalas*) and hung up to dry, being made later into *ch-totes*, ready for the periodical visits of traders, who send it out to the Atlantic coast.

(2) *Kiekxia (Funtumia) elastica*.—Found generally in the same districts; latex is obtained by tapping the trees, and the product is better than from the vines, besides being prepared with more freedom from dirt. The rubber is sometimes mixed with inferior sorts to help their sales. Colonel Harding had little personal knowledge of this species, however.

(3) *Carpodinus lunceolatus* ("root rubber")—"Although admittedly it is of inferior quality, still it is a rubber that thrives in the soil where no other root could exist, and will with an ordinary amount of care in collecting it, eventually prove a valuable asset." Abundant north of 15° S. latitude. The root of the *Carpodinus* so nearly resembles a length of *Landolphia* vine that only an expert can distinguish them. The *Carpodinus* plant rises only 6 to 10 inches above the surface, while the roots are found about 4 inches below, and, spreading evenly and uniformly, cover a great deal of ground. "At present the plant is so plentiful that in rubber districts the natives collect only the larger roots, leaving the smaller exposed and perishing under a tropical sun. The surface, after the natives have collected their rubber, resembles an orchard or meadow which has been upturned by a grub-seeking hog." The process of preparing rubber from these roots is the same as from the *Landolphia* vines.

Another report is by Dr. Blair Wilson, Civil Commissioner, in regard to the Mweru district of North-Eastern Rhodesia, which lies east of the Congo Free State, between 8° 30' and 9° 30' S. latitude. Here are reported several species of *Landolphia* vines, no rubber trees being found. All the species are not of equal value, some yielding rubber scantily and of inferior quality. Rubber has long been used by the natives for playing balls, drumsticks, and the like, and until a foreign demand was developed, the

vines were not injured in extracting the latex. Then the vines began to be destroyed, until now "the trade in rubber is now practically finished in the Mweru district." Whereas there were in 1899, twenty white rubber traders there, bartering goods for rubber, a large quantity of which was exported, only one trader went through the district in 1902, bringing back very little. Besides, much rubber at one time was smuggled into the district from the Congo Free State, but that has now been stopped by the authorities of the latter. The *Landolphia* vines here grew to a diameter of 4 inches. The natives not only cut all the vines, large and small, but dug up the roots, until nothing remained. The Mweru natives seem to have had but one method of preparing rubber: "The juice is collected by the hand as it flows from the cuts and is then rubbed on the body and limbs; the heat of the body and the spreading out thus in a thin layer facilitate evaporation, for the juice quickly coagulates enough to be scraped off and rolled up in the form of a ball, in which state it is always met with; by this method the maximum of purity is obtained."

To recur to North Western Rhodesia, the official report of the administrator for 1901-02 (recently printed) reports a rich rubber district in the Bakaonde country, 100 by 75 miles in ex-rubber trees of two species, but no *Carpodinus*, so far as he knows. The rubber, prepared in small balls, is of good quality. Very destructive methods prevail, including the tearing up of the roots of *Landolphia*. Many white traders are at work in the district, and large areas are reported in which the rubber has been exterminated. The administration will try, however, to put a stop to these abuses. This district, by the way, is on the eastern border of North-Western Rhodesia, while that reported on above by Colonel Harding is on the western border.

Measures of preservation of rubber have been adopted in North-Eastern Rhodesia, the administrator of which reports having proclaimed a rubber reserve in the Kafue district (immediately north of the Zambesi river), in which the work of rubber gathering will be regulated. During the year ended March 31, 1902, there were 125,998 pounds of rubber exported from North-Eastern Rhodesia, valued at 1s. 6d. per pound, or £9,449 17s. No statistics exist for North-Western Rhodesia.

### FROM THE STATES.

The *Tea and Coffee Trade Journal* of 8th ultimo remarks:—We have before commented upon the opinion in the trade, last notably voiced in the Annual Report of the New York Chamber of Commerce, that a mistake was made in permitting the repeal of the late duty on tea by the Federal Government. The opinion, we gather, is a growing one, and is now becoming a matter of keen regret in what may be styled the original importing houses. Something has happened which was not generally expected at the time the repeal was agitated, and this something is the entrance into the primary market of very many of the smaller wholesale houses, who now purchase their tea direct in the East to the loss of the importing jobber, whose business is proportionately diminished. During the time when the duty was in effect, it was no small labour to import tea; the customs regulations were complicated and not easily understood, and besides, considerable cash capital was necessary in the transaction. The smaller house was not disposed to trouble itself with these complications, and so it made its purchases from the experienced importing houses. These themselves were not in love with the duty. It for one thing required about 100 per cent. more capital than otherwise necessary, and the tangled stocks were a bother, to say nothing of the exasperation of never knowing whether they were long or short. So that when there was a special demand on the part of the houses further removed from importing directly their needs, they were disposed to join with enthusiasm to cause the repeal of the obnoxious duty. But it appears since to have developed among the smaller dealers that it would be nice to be direct importers of their teas, and not finding any longer the customs regulations as an obstacle, they embarked on their own account; then, moreover, it seemed reasonable and right to dispense with the middleman, the importing jobber, so much the more profit being earned. But changes bring about changes, usually not looked for; and all the trade now knows that the addition of so many new interests as buyers in the primary markets has induced a competition for tea in them to the great enhancement

of prices. As affairs now stand, the Orientals have got the best of it, and are getting rich at the expense of those who expected to reap larger profits because of their nearness to the source of supply, and of course also of those who were there originally. In other words, the market, which heretofore was in strong hands, is now not controlled by the buyers. All this has made interesting dancing, and we are paying the piper liberally. It may be assumed that present conditions will prevail, so far as importation directly by houses with less capital is concerned. It is in the air with wholesale houses, and they must do it, we suppose. Coffee importing houses report the same thing. We can give no other advice than that the buyers must come together and reach an understanding. Theirs is the final pronouncement as to whether they shall buy or not, and according to their wishes so shall be the results. We have but to instance the Formosa market, where for a short while recently buyers abstained from buying, and presently a panic ensued among the sellers, and the tea began to march downward, declining in a very short while 1 per cent. a pound. But the buyers rushed in pell-mell, and the market went up, recovering all it lost, and became firm. We do not advocate any return to the duty; but since this is a consuming country, and therefore demands tea at its cheapest cost, some *modus operandi* must be devised so that we be not fleeced with our eyes wide open. Let us remember—United we stand, divided we fall.

### THE LANGUAGE DIFFICULTY.

The most fruitful source of contention between individuals is failure to comprehend each other's meaning. Such error arises, more often than not, from different individuals attaching different meanings to the same word. And this being true of people employing their common language in domestic negotiation, how vastly greater is the danger of misunderstanding between people ignorant of each other's language! Interpretation and translation are not exact sciences. A political dispatch written in one language may be rendered in another, so as to soften it, or make it appear more stringent, at the will of the interpreter; and that, too, without any indefensible departure from the original. Some years ago, there was almost a rupture between the United States and France, owing to an American minister, imperfectly acquainted with the French language, attaching a dictatorial meaning to the very innocent word *demandeur*.

Nations are more widely divided by difference of language than by colour of skin, rivers, mountain chains, or even oceans. The Englishman and the Australian, born at opposite points of the world, converse like brothers, while a Chinaman of Swatow and a Chinaman of Canton, natives of the same country and both supposed to speak Chinese, find it convenient to talk together in a barbarous sort of English which they acquire from British and American sailors at their ports, so greatly does the Chinese language differ in various parts of the Celestial Empire.

Some of the world's greatest thinkers hold the opinion that a time must surely come when there will be but one language spoken throughout the world. They base their belief upon the obvious facts that every year transit becomes cheaper and more rapid, and education more diffused and of a higher standard. Trade, by bringing all nations together, and uniting their interests, is another great factor that must not be lost sight of. Enter a good drug store in any country you please, and ask, by its English name, for a bottle of Mother Seigel's Curative Syrup, and it is a thousand to one but you will be immediately supplied with what you desire, so universally is that great remedy known and esteemed. Writing 9th June, 1903, Mr. J. McJohnns, F.C., of Vogel Vlei, Mossel Bay Division, Cape Colony, says: "A few weeks ago a coloured man came into my store who appeared a mere skeleton, and complained of pain in his chest and lungs. He asked my opinion, and I recommended him to try Mother Seigel's Curative Syrup and a Seigel Plaster. He accepted my advice and the result was astonishing. The man is now perfectly well, and gratefully acknowledges the cause of his good health."

Another letter, dated 17th June, 1903, from Mrs. W. Smith, of Graham's Town, Cape Colony, is equally satisfactory. Mrs. Smith says: "Three years ago I was much troubled by pains in the head, which were so severe at times as to cause me to vomit and badly affect my eyesight. To add to my misery, my teeth

would frequently ache for days and nights continuously, until I thought I must go mad. Yellow patches appeared on my chest and back, caused, I was told, by an affection of the liver. I obtained medicine from several physicians, but without experiencing the slightest relief. I had abandoned all hope of being cured when a doctor advised me to try Mother Seigel's Curative Syrup. After taking a few doses of that remedy, there was a change for the better. I continued to take the Syrup for a time and was soon completely cured. All of my ailments have disappeared and I now enjoy the best of health."

The remedy of which Mr. McJohnns and Mrs. Smith speak so highly is the standard medicine of the sixteen principal countries of the world; but there is no nation by which it is not known and esteemed, and no language in which its use has not been commented upon with gratitude.

### MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated September 18th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1903-1904 ...	346,462	383,198	33,655
1902-1903 ...	375,250	420,134	27,473
49,976 pkgs. INDIAN	Total 75,480 packages were offered in public auction this week.		
23,429 " CEYLON			
2,075 " JAVA			

From market movements during the past week it is evident that the Trade are not disposed to heavily stock tea at rates recently current, and the result of offering some 50,000 packages of Indian Tea has been that the market has shown weakness with a fractionally lower level of price. The position does not warrant any heavy fall, as if there should be an increase of some few million lbs. in the Indian crop, the same is likely to be counterbalanced by the increase which is taking place in the consumption and the shortage

in the supplies lately received from Ceylon. Therefore there appears to be no occasion for Importers to unduly force matters.

INDIAN.—The market showed weakness, and a large proportion of the supplies had to be bought in for want of adequate support. Low priced and medium teas show about  $\frac{1}{4}$ d. per lb. decline on the week, but quality was partly responsible for this movement. Some of the better liquoring Assam Teas also showed a fractional fall in value.

The official wire gives exports from Calcutta and Chittagong to U. K. for the first half of September as 11,740,000 lbs. against 10,950,000 lbs. for the same period last year, making the total exported to U. K. from 1st April to 15th September 67,262,000 lbs., against 61,230,000 lbs. last season.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 41,273 pkgs., av. 7·69d. 1902, 38,780 pkgs., av. 7·18d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 210,384 pkgs., av. 7·93d. 1902, 229,654 pkgs., av. 7·13d.

CEYLON.—These kinds remain unchanged; the average price obtained for the week's supplies shows a fractional improvement, but this is due to the rather better quality of the offerings.

Private advice from Ceylon gives shipments to U. K. for first half of September as 2,250,000 lbs., against 3,500,000 lbs. for same period last year.

Average for week 7·34d., against 6·34d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 762,563 pkgs., av. 7·45d. 1902, 850,975 pkgs., av. 6·67d.

JAVA.—In some cases prices mark a fractional decline on rates ruling last week; at the decline however the teas met with a satisfactory demand. Since 1st June 28,491 packages on Garden Account realised an average of 6·59d. per lb.

### COFFEE.

The public sale of Java Coffee by the Dutch Trading Company at Rotterdam on September 8th passed off well, when 24,400 bags of that description offered found ready buyers at better prices, establishing a rise of 1 cent on the valuations, and making the quotation for good ordinary quality 27 cents, instead of 26 cents as at the auction near the end of June. At the September sale by the above Company in 1902 the price of "good ordinary" Java was 37½ cents,

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

### CURES

**RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,**

And all Aches and Pains usually treated by outward application.

**IT HAS NO EQUAL ON EARTH AS A PAIN RELIEVER.**

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

or 10 cents higher than now, as compared with 35 cents in 1901 and 1900, and 26 cents at the same period of 1899. Here the demand from both the home trade and exporters continues good, and the limited quantities of fancy coffees put up by auction since our last report have been cleared off at very firm to enhanced rates for finest orts as under:—40 pkgs. Plantation Ceylon, small from 30s. to 45s. 6d., low grey at 55s., middling blue at 79s. 6d to 85s. 6d.; and superior 90s. 6d. to 96s.; 980 bags small to good middling East India from 35s. 6d. to 76s.; 3,360 bags Costa Rica and Guatemala, pickings and small at 21s. 6d. to 32s., good to fine fine ordinary at 35s. 6d. to 43s. 6d, low middling and middling at 46s. to 59s. 6d., good middling to bold bluish coloury at 62s 6d. to 72s. and 77s., with bright blue from 82s. 6d. to 96s., and Peaberry from 43s. 6d. to 65s., and up to 82s.; 3,000 bags Columbian and New Granada, pale and greyish at 28s. to 34s. 6d. and 43s., greenish at 44s. to 57s.; 900 bags Peruvian, fine ordinary to middling at 38s. to 47s., peaberry at 50s., 141 bags Vera Paz at 34s. for common; 236 pkgs. Jamaica at current rates; 1,310 bags Salvador, small to middling at 35s. 6d. to 48s. 6d., good middling to 50s., peaberry at 52s. to 67s.; 400 bags Mexican, good middling at 53s. to 53s. 6d., bold at 65s. to 73s.; 2,880 bags Unwashed Dumont Santos, small (foxy) and medium at 27s. 6d. to 31s. 6d., peaberry at 35s.; and 2,076 bags Washed ditto grey and coloury at 30s. 6d to 39s., with bold at 38s. 6d. to 46s. per cwt. Futures have again experienced many fluctuations, but taken altogether they have not been of unusual importance, and good Santos deliverable between September and July has been taken at 25s 9d. to 28s. 6d., which is 6d. to 1s. per cwt. above last Friday's quotations. Stocks of coffee in the chief ports of Europe on the 1st instant were still very excessive, amounting to 431,600 tons, against 380,000 tons in 1902, and 240,000 tons in 1901.

Messrs. George White & Co., in their Report, September 17, say: Latest arrivals have not maintained the standard of quality reached in the earlier shipments, and this, combined with the comparatively large offerings, has caused a weaker tone. . . . With regard to prospects of supply, recent cablegrams point to modified anticipations on the other side of anything approaching an excessive crop. On the comparatively high level prevailing for the ordinary consuming qualities since the season opened, the assumption is that operators for home and foreign markets, in expectation of a somewhat lower basis following freer supplies, have more or less confined their purchases to immediate requirements and that some concession in price will lead to a good general business and increased offtake. The following extract from a noted trade journal with reference to the finer descriptions is of interest:—"The liberal demand for these grades points to the fact that the consumption is well maintained, notwithstanding the free advertising of teas of inferior qualities, which clearly proves that the consumer is willing to pay a reasonable price for good tea. It only requires an earnest effort on the part of the retailers to bring them prominently under the notice of their customers to

ensure a much larger sale, instead of clinging to the opinion that the public will only pay the price for practically the commonest teas."

### CINCHONA.

At the London auction on Tuesday the small supply of 1,009 packages (containing about 105,000 oz. quinine) was offered, of which the greater part sold at an advance of 10 per cent., the average unit being 1½d., against 1¼d. last sale.

The following table shows the quantity of bark offered and sold:

		Packages Offered.	Packages Sold.
South American cinchona	...	297	297
East Indian cinchona	...	594	497
African cinchona	...	66	45
Ceylon cinchona	...	52	18
		1,009	857

The following were the approximate quantities of bark purchased by the principal buyers:

		Lbs.
The American and Italian factories	...	48,433
The Mannheim and Amsterdam factories	...	36,595
The Imperial Quinine factory	...	33,970
The Frankfort-on-Main and Stuttgart factories	...	17,485
Messrs. Howards & Sons	...	15,820
The Brunswick factory	...	2,939

Total quantity sold	...	155,242
Bought in or withdrawn	...	31,807

Total quantity offered and sold ... 187,049

The prices paid were as follows:

AFRICAN.—Dull red quill, 5½d. to 5¼d.; and red quillings, 4¼d. per lb.

SOUTH AMERICAN.—Bolivian cultivated Calisaya quills, 5½d. to 5¼d.; Colombian, small dusty chips, 6¼d.; and twigs, 2d.

EAST INDIAN.—Officialis, natural stem chips and shavings, 2¾d. to 6d.; renewed, 3¾d.; broken quill, 5¾d.; root, 5½d. to 6½d.; and branch, 4¾d.; Red stem chips and shavings, 2¾d. to 3½d.; branch, 1½d. to 1¼d.; Ledgeriana, natural stem chips, 3½d. per lb.

The half-monthly shipments from Java for September amount to 566,000 Amsterdam lbs., against 180,000 Amsterdam lbs. in 1902, and 601,000 Amsterdam lbs. in 1901. In the drug-auction 32 serons fair sound Loxa quill brought from 10½d. to 10¾d., and a bale of dark, thin, flat Calisaya sold at 1s. 7d. per lb. Seven bales of bright flat damaged Cartagena were limited at 5½d., and 10 serons from Paita sold at from 8¾d. to 9d. per lb.

### QUININE.

Consequent upon the advance in the London bark-sale there has been a rather firmer tendency in quinine in second hands, a small

Agents for LEA & PERRINS'

WORCESTERSHIRE SAUCE.

GROSSE

& BLACKWELL'S LTD.

CELEBRATED OILMAN'S STORES.

business having been done at from 11 $\frac{3}{4}$ d. to 11 $\frac{7}{8}$ d. for good German sulphate in bulk, there being few sellers at these prices, however. On Wednesday December delivery sold at 1s., and March at 1s. 0 $\frac{1}{4}$ d.

### CARDAMOMS.

Almost every broker offered cardamoms to-day, the total supply aggregating 583 packages. There was a fair demand, and as importers and dealers appeared anxious to sell, rather lower prices were accepted. The following prices were paid: Ceylon-Mysore,

fine bold pale, slightly open, 2s. 4d.; good bold pale bleached, 1s. 10d. to 2s.; medium and bold pale, 1s. 7d. to 1s. 8d.; bold medium pale, 1s. 3d. to 1s. 6d.; bold dullish, 1s. 8d.; bold pale split, 1s. 6d. to 1s. 9d.; small good pale, 1s. 2d. to 1s. 3d.; medium and small, 11d. to 1s. 1d.; small and medium dull, 10d. to 11d.; small yellowish, 9d.; dull specky splits, 9d.; peas, 8d. to 9d.; brown, split, and pickings, 8d. to 8 $\frac{1}{2}$ d. Two packages small to medium lean native wild sold at 8 $\frac{1}{2}$ d. per lb., and medium round pale Mangalore were held at 2s. 4d. per lb.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, OCTOBER 17, 1903.

[No. 41.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 23th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

October 14th.—*Weather*—A nice sunny break on now, wind still from the S.-W., but very little to speak of. *Coffee*—The break is just in time for the supplies which were suffering from want of sun: coffee generally magnificent. *Health*—Good. *Labour*—Abundant. *Interesting item*—Gymkhana at Saklasapur.

#### Coorg.

POLLI BETTA, 14th October.—*Weather*—After the first few days of the current month, the weather has been fine and bright and chilly at nights. Yesterday, there was a smart shower in the evening from the N.-E. *Coffee Diseases*—Coffee has come out wonderfully well from the unusual wet of September. Leaf-disease is confined to bad patches only, and, on the whole, coffee is looking very fine. Weeding, handling and care of supplies are the only works that are in hand. *Labour*—Plentiful. *General health*—Fair. Plague has unfortunately invaded one Estate, another death from that cause having occurred there last week. There had been several previously.

### FOREIGN TEA IN INDIA.

LAST week we wrote about Sales of Coffee in India, basing our remarks upon statistics furnished to the Secretary, U. P. A. S. I., by the Director-General of Statistics. It should, by the way, have been stated in our U. P. A. S. I. section that these statistics were supplied in reply to a request (not a report) made by the Secretary. The Tea figures require to be studied from a different standpoint from that occupied when reviewing the statistics relating to Foreign Coffees, though it would appear that a considerable quantity

of Foreign Tea comes to India *to stay*. Total imports of such Tea by sea amounted in 1902-03 to 3,848,357 lbs., by land to 1,677,424 lbs., making a total of over 5½ million lbs. Exports totalled only 1,660,996 lbs. by sea and 576,860 lbs. by land—total, say, 2½ millions, so that something like 3 million pounds of Foreign Tea would appear to pass into consumption in this country. This is by no means an unimportant quantity; and when it is placed side by side with the figures relating to sales effected by the Indian Tea Markets' Expansion Commission it affords food for reflection. The imports by sea come chiefly to Bombay and from China, though Ceylon supplies over ¾ million pounds. The tea that is imported into Burma by land is, presumably, also China Tea. It would appear, therefore, that India received by sea last year 2,200,000 lbs. of China Tea, and by land, in Burma, over 500,000 lbs. Ceylon contributed 780,000 lbs., the Straits Settlements 491,000 (mostly China tea, no doubt) and Java 267,000. The real significance of these figures can, however, only be realised when it is noted that imports of China Tea and of Java Tea, though not of Ceylon leaf, show a marked increase when 1902-03 figures are compared with those of 1901-02.

It is evident from this that the importation of Foreign Teas into India has increased of late. So, to a smaller extent, have exports of such teas. The balance remaining appears to indicate that there is an increased demand for Foreign Teas in India. Although there are certain importations from the United Kingdom, these do not appear to call for special comment. They do not amount to very much, and it is to be expected that a certain quantity of well known brands or blends should find a market in this country, even though much of the tea should have been originally shipped hence. What appears to demand investigation is the manner in which imports from China (directly and indirectly), from Ceylon, and from Java are disposed of. How is it that Indian Tea has not been able to exclude imported tea of all kinds, except packet or blended teas that have acquired a high reputation in the Home market? Omitting what may be regarded as transshipment or "carrying trade" supplies, there is still an appreciable quantity that is either consumed in this country or used in it for blending purposes. We do not entirely object to the conduct of blending operations in India. On the contrary, it seems probable that such blends may prove useful as "pioneers" in

new markets and in such as are not yet converted to a belief in the pure Indian leaf. But we should certainly like to know exactly how surplus imports are utilised; and we feel that this is a matter that deserves the consideration of the Indian Tea Association.

We compete successfully with China and Java in foreign markets. Can we not hold our own markets against them? Bombay would appear to be the head centre of India's trade in Foreign Teas, and we cannot but think that a close investigation of the conditions and requirements of the Bombay market would well repay the trouble and expense that would be involved. It should be possible also for India to secure the whole of the Burma demand for Tea. A reference to the statistics published in our last issue will show that Burma imports large quantities of Foreign Teas while exporting (as far as can be judged from Custom House returns) very little. It would be instructive to know if this is really the case and, if so, why? Obviously much of the tea taken by Burma comes from the Shan States. What are its characteristics, what is the average price or the range of prices? Is there anything about these teas that precludes successful rivalry on the part of Indian leaf? We would draw the special attention of the Indian Tea Association in Calcutta to the subject of imports of Foreign Teas into Bombay, Bengal and Burma, and exports therefrom, in the hope that an exhaustive investigation may be made, and that one result may be the discovery that India can secure for herself this trade that is now practically going past her, or being done in Foreign Teas within her own limits. Whatever the prospects in foreign markets may be, Indian tea-planters cannot afford to neglect the markets nearer home. It appears sufficiently clear that she is at present acting as 'carrier' in respect of a great deal of Foreign Tea. How much better would it be for her if she could manage to replace these teas by her own, and thus secure the producer's, as well as the carrier's, profit.

#### COFFEE NOTES.

**Mocha Coffee Still Comes.**—Wm. Masterson, discerning consul of the United States at Aden, gives pleasure to the lovers of good coffee by disproving the often-made assertion that genuine Mocha rarely if ever reaches that country. It has been said again and again that what purports to be Mocha from Arabia is nothing more than Brazilian coffee shipped to Aden and thence forwarded to the United States as the real thing, the only difference between it and the honest Brazilian product sent direct being one of price. A coffee connoisseur is not to be deceived by such statement, however, for he knows Mocha when he tastes it.

Mr. Masterson has done justice to the Arabian growers and has restored the confidence of the consumer by a report to the government, in which he states that a good many hundred thousand pounds of real Mocha coffee is sent to this country from Arabia every year, and that the Aden Board of trade takes careful and effective means to protect the brand from every form of adulteration or substitution there. The United States imported 1,091,004,252 pounds of coffee, worth \$70,982,155, in 1892. Of this, 2,688,285 pounds, worth \$377,352, was Mocha. In 1897 the amount of coffee imported from Aden was over 5,000,000 pounds, the imports in two other years being 3,000,000 and 4,000,000 respectively.

The *Singapore Free Press* states that reports from Brazil that have just come to hand are discouraging to planters in Java. The number of coffee trees coming into bearing in Brazil is simply enormous so that, in a year or so, when crops from them flow into the market, a further fall in quotations may be looked for. The demand for coffee is on the increase, but the supply increases too fast to prevent the fall in prices

\* \* \*

That the coffee-planters of the Peninsula have not yet entirely abandoned the Liberian berry for the cultivation of Pará rubber is evidenced, says the *Straits Times*, by the fact that the amount of coffee exported hence during 1902 was 104,000 piculs, as compared with only 80,000 piculs in 1901, an increase of 24,000 piculs, or exactly 30 per cent. The average price received was \$21.88 as compared with \$20.57 in 1901—an advance of 6 per cent.

\* \* \*

**The U. S. Coffee Market.**—NEW YORK, Sept. 5, 1903.—A better tone dominated the market, and prices advanced slightly. Cable advices were received from Karl Krische & Co., Santos, saying that the stocks of coffee at the interior stations were light; this information was interpreted as foreshadowing comparatively small receipts; in fact, the day's pointers of the Santos interior receipts dropped to 33,447 bags, and this had a strengthening influence. Private cable advices were received reporting general rains in São Paulo, but this appeared to have no influence as a market factor. The European markets also were stronger, both Havre and Hamburg reporting advances, they, too, evidently being influenced by the prospects of smaller Santos receipts. The Brazil markets were unchanged and a moderate amount of business was transacted with Rio, the sales reported including 3,000 bags Rio Nos. 5 to 8, at 5c., c. & f.; 1,000 bags Rio No. 7, at 4.90c., c. & f., and 1,000 bags Rio Nos. 3 to 7, averaging No. 5, at 5.40c., do. The spot market for invoices was steady, and sales were made of 3,000 bags Rio No. 7 spot at 5.10c., and 2,000 bags do., to arrive, at 5.10c. Prices quoted were unchanged at 4 $\frac{7}{8}$ c. for Rio No. 8, 5 $\frac{1}{2}$ c. for Rio No. 7, 5 $\frac{1}{2}$ @5 $\frac{3}{4}$ c. for Rio No. 4, and 5 $\frac{7}{8}$ @6c. for Santos No. 4. The distributing business continued moderately active.

Speculation in the market for contracts reached only limited proportions. The opening was at an advance of five points during the day. The market was firmer on receipt of bullish cable advices from Brazil, and the close was steady.

Business in the market for West India growths was active. It was learned that large interests were free buyers, especially of Bogotas for investment account, but that they were buying on a low basis of values.

The tone of the market is firmer, says the *Tea and Coffee Trade Journal* of 15th ultimo, and the trade confident in the suppression of some strong bear influences. Rio and Santos receipts were somewhat smaller than in the same week last year. Demand is broader, jobbers reporting a satisfactory distributing outlet, and dealers buying more liberally. Brazil markets were firmer, and the offers from Rio and Santos were on a higher basis; they included Rio No. 7 undescribed, at 5 $\frac{3}{16}$ c., c. & f., and described at 5 $\frac{1}{2}$ c., c. & f.; Santos No. 4 to 8 at 5 $\frac{3}{4}$ c., c. & f.; and Santos Bourbon Nos. 3 and 4, at 6 $\frac{1}{4}$ c., do. Sales reported were 5,000 bags Rio No 8, described

as flat bean, good roasters, at 5c., c. & f., and 2,500 bags desirable old crop Santos No. 3 sold on sample at 6¼c., c. & f. There were indications of other sales, but particulars were not made public. The spot market for invoices was firmer, with buyers reported showing increased interest. Sales were reported of 1,000 bags Santos No. 2 at 6¾c.; 1,000 bags desirable Rio No. 7, at 5¾c., and 100 bags Rio No. 7 at 5¼c. Prices quoted at the close were 5c. for Rio No. 8; 5¼c. for Rio No. 7; 6 1/16c. for Rio No. 4, and 6¼c. for Santos No. 4.

Some interest has been displayed in the market for contracts.

Mild coffee was firm and good stocks are taken sometimes at an advance; East India firm; Jobbing demand moderate.

\* \* \*

**Haitien Coffee Pickings.**—A law promulgated on the 7th August, fixes the export duty on coffee pickings at \$2 (\$1.96 United States) per 100 pounds. The law went into immediate effect, but will cease to be operative on September 30 next, when coffee pickings will again become subject to the regular coffee export duty of \$3 (\$2.895 United States) per 100 pounds.—Alexander Battiste, Deputy Consul-General at Port Au Prince.

\* \* \*

**To Boom Porto Rico Coffee.**—For the first time in the history of Porto Rico all the coffee growers, at a convention to be held on September 20, were to unite to seek a market in the United States and otherwise further their interests. They are backed by the banks and business men of Porto Rico.

\* \* \*

**Porto Rico Coffee in Europe.**—Washington, D. C., August 14.—During the month of June the export trade of Porto Rico included that of 1,102,724 pounds of coffee, at a total value of \$117,693. Of that quantity the largest recipient was France, who took 443,199 pounds at a total value of \$49,833. Spain was the next best market with 424,791 pounds at \$44,467; while Cuba came a very poor third, receiving 155,341 pounds, for which she paid \$14,392. Austria-Hungary took 48,607 pounds, for which was paid \$5,592, and Germany 30,416 pounds at \$3,379, and 370 pounds at \$30 were shipped to Italy.

\* \* \*

It is proposed, says the *Tea and Coffee Trade Journal*, to inaugurate a propaganda in favour of that much maligned beverage—coffee. Two very potent reasons for such a campaign have developed in the last few years, making it imperative that the importer, broker, jobber, and wholesaler as well as the grower co-operate to improve conditions in the coffee world.

The reasons are: First, the largely increased output of the plantations, particularly in Brazil, which is now largely in excess of consumption. Second, the active advertising campaign of a certain coffee substitute concern, in which coffee is alleged to be responsible for almost all the ills of humanity. This concern, it is said, has appropriated \$1,000,000 to be spent in advertising during the current year, with the result that every daily paper and magazine of this, the greatest coffee-consuming country in the world, is filled with warnings against the use of coffee, and gross misstatements as to its injurious effects. The growers of Central and South America are already looking for some remedy for the ruinous prices

that have prevailed for a year or more. The governments of some of the coffee growing countries are considering measures of relief, but so far have done nothing more than to assist in the publication of a monthly newspaper printed in Spanish, for circulation among the growers. Obviously, what is needed is to curtail the production or increase the consumption. The former is admittedly impracticable, since the growers cannot be expected to destroy bearing trees, and even if some were willing to join in an agreement to destroy part of their trees, it would be impossible to get the majority to carry out such a compact. The remedy lies, then in increasing the consumption. The conditions are very much the same as those confronting the tea trade some years ago, when production so far outstripped consumption, that ruin threatened the growers, and importers and dealers found no profit in handling tea. The East India and Ceylon Governments then levied a small tax on tea, which it spent advertising its merits, and in spreading broadcast in England and Canada, the United States and elsewhere, the proper method of brewing, etc. The results were immediate and satisfactory. The amount annually expended in advertising is said to be more than \$500,000. The need that something of this nature be undertaken in the coffee interests is even more urgent. It is estimated that not half of the coffee-drinking families in the United States know how to brew coffee properly. They should be taught. But perhaps the greatest factor in arresting coffee consumption in the United States is the persistent newspaper advertising of cereal substitute manufacturers, in which coffee is pronounced injurious and poisonous.

Coffee growers, or the governments of coffee-producing countries, and those who import and distribute it, should co-operate to bring the merits of coffee to the attention of the consumer, and to teach him how to prepare it. This might be done by each producing country levying a small export tax, or by all importers agreeing to contribute a fraction of a cent a bag on all importations for this purpose. This might be supplemented by an appropriation by the governments of the coffee-growing countries.

\* \* \*

**Encouragement to Coffee-planters in Mysore.**—We take the following extract from the Address delivered by the Dewan of Mysore at the opening of the Representative Assembly on the 5th instant:—

“The depression in the coffee trade owing to competition from Brazil and other causes has been, it is well known, retarding the growth of that industry throughout India. There has been a large diminution of more than 20,000 acres in the cultivated area of this crop in Mysore, the decrease this year being about 2,500 acres, and it was therefore with great willingness that the Government complied with a request made by the North and South Mysore Planters' Associations for a conference on the subject. Mr. Madhava Rao, C.I.E., who was deputed with instructions as the representative of Government met Mr. Graham Anderson, C.I.E., and other leading planters and conferred with them at Mudgere and Saklespur, the centres of coffee growth, on the present state of their industry. The subjects considered were the registration of titles, levy of a coffee cess, measures for the prevention of adulteration of coffee and a few others. The question of introducing the Coffee-Stealing Act and the Labour Law were also touched upon. The fullest

assurance of sympathy and help on the part of Government has been given to this enterprising body of gentlemen, whose industry has been of so much benefit to this country. Lately, a contribution from the State of Rs.5,000 was sanctioned to enable the Planting Associations to exhibit the local coffee and cardamoms at the Louisiana Purchase Exposition in 1904."

**The August Coffee Movement in the U. S.**—The August movement of coffee is notable, says the *American Grocer*, for heavy receipts at Rio and Santos, they being only 59,000 bags behind the record-breaking crop of 1901-02; increase in the world's visible supply; deliveries in the United States and Europe, 85,511 bags less than in August, 1902; a steady market with fluctuations in spot within  $\frac{1}{2}$ c. per pound.

The following statement shows the August movement in detail:

Stocks August 1, 1903:	Bags.	Bags.
United States ..	2,400,040	
Europe ..	7,245,426—	9,645,466
Receipts during August:		
United States ..	656,900	
Europe ..	649,822—	1,306,722
Total supply August, 1903	...	10,952,188
Less stock September 1, 1903:		
United States ..	2,547,936	
Europe ..	7,186,814—	9,734,750
Deliveries, August, 1903:		
United States ..	509,004	
Europe ..	708,434—	1,217,438
Deliveries, August, 1902	...	1,302,949
Decrease from August, 1902	...	85,511
Deliveries, July, 1903	...	1,339,679
Deliveries, August, 1903	...	1,217,438
Averages per month, 1902-03	...	1,330,541
Total 1902-03	...	15,966,498

The visible supply of the world, September 1, was 13,148,200 bags, against 12,370,466 bags August 1; 12,226,947 bags September 1, 1902, showing an increase in August of 777,734 bags, and 921,253 bags more than in September, 1902.

Transactions on the Coffee Exchange were 802,250 bags, with 3.55 cents the lowest price for August and September deliveries; highest 5.00 cents, for July.

The spot price of No. 7 Rio fluctuated between  $5\frac{1}{8}$  @  $5\frac{1}{4}$  cents, as the official quotation.

The total deliveries in September in the United States were 509,004 bags, of which 411,505 bags were of Brazil sorts, 97,499 bags all other kinds.

The total receipts during August at Rio were 1,101,000 bags; at Santos, 2,071,000 bags; both ports, 3,172,000 bags, against 2,853,000 bags same time in 1902; 3,309,000 bags in 1901.

Conditions continue favourable for very low prices.

**Latest Coffee Tablet.**—Mr. R. C. Anderson, El Paso, Tex, writes in the *Spice Mill*:—My new coffee tablet is not a compound. It is simply coffee in tablet form. In other words, a pound of coffee reduced to three ounces without loss of any of the aromatic oils. The reason others have failed to produce results lies in the fact that they invariably introduced foreign ingredients to solidify, and which invariably ruined the flavor. Samples of my tablet sent to the War Office were examined for army use, and reported on favourably

under date of August 10. My product is subject to a chemical analysis by any and all who wish to test my claims. It will be found to contain nothing but coffee, pure and simple. My tablets are the result of many months of careful study and practise, aided by a steam-tight, self-condensing vessel, patented in 1895. I am enabled to pass ground coffee through a machine, the coffee coming out at the end ready to form into tablets, and this without loss of any of the aroma. I have the matter of separating the elements of the berry and reuniting the same in tablet form under complete control.

## TEA NOTES.

**Ceylon Tea Imports to America.**—It is interesting to know, says the *Times of Ceylon* of 7th instant, that last month for the first time a larger quantity of tea than of any other product was sent from Ceylon to America.

**Colombo Tea Sales.**—The demand at the sale on the 7th instant ran almost entirely on "leaf" teas, and prices for Pekoe and Pekoe Souchongs were firmer all round. Broken Orange Pekoes and Broken Pekoes were neglected, and a smart drop took place in these grades. Dusts have now reached a lower range of price; but were fairly steady at the fall.

Mr. Renton has kindly written to the *Times of Ceylon* to state that Antwerp is the distributing port through which practically the whole of the Ceylon teas for Switzerland (Basel and Zurich), and for Germany south of Frankfort, enters the continent. Mr. Renton states that there is still little or no tea-drinking in Belgium. With regard to the very important subject of the reduced duty in Germany, Mr. Renton says that it is true the reduction has passed the Reichstag, but that it will take effect on the 1st January next is highly improbable. Nothing will be done till the new Commercial Treaties in Germany are arranged, and when that will be no one knows. The Government also will give no warning. The new duty will be gazetted some fine afternoon, and will become law next day. In the meantime the effect on trade is very bad. Retailers and dealers are carrying hardly any stocks—the former practically none. The total quantity of tea cleared for consumption to the end of July was 762,000 lbs. less than at the same date last year. Ceylon is put down as being 3,600 lbs. behind, whereas from British India there is an increase of 113,000 lbs. Now the total export of tea from India to Germany to the end of June, continues our Commissioner, was only 141,013 lbs., and the total export for 1902 was only 608,119 lbs., which makes it impossible almost that 541,640 lbs. should have been cleared for home consumption in the first seven months of the year, and 606,000 lbs. for the whole of 1902. No, some of the importers, annoyed at the success of Ceylon tea, are declaring their imports as Indian. This is a manoeuvre which deserves to be exposed. Regarding latest doings and immediate prospects, Mr. Renton adds:—

We are doing as well as can be expected in France, Italy, and Scandinavia. I was down all over the Saxon Duchies and Thuringia last month, and I am now off to Scandinavia.

**The U. S. Tea Market.**—Mr. A. R. Robertson writes in the *Spice Mill*:—The tea market continued quiet for the past

month; Formosa teas are lower in price for lowest and medium grades. Fine to choice teas are steady, and will apparently remain so, as advices from the East point out that such teas will not be found in third crops, and for other grades the offerings will be poorer in quality.

Oolongs from Foo Chow are slow sellers, with small demand. Congos are attracting more attention, with indications of steadiness, in medium grades. There are some very choice tea offerings, 60 to 70c. being paid. Japans are not active sale, and show little alteration in prices. China greens are a little easy, with some fine liquors offering in Pingsueys.

Ceylon and India blacks have had an increased demand recently at steady prices, while the greens are making remarkable strides in consumption, and some very fine liquors are offering at low prices.

\* \* \*

Sir Alfred Jones, K.C.M.G., stated to a *Daily Mail* representative in Liverpool on September 18 that his experiments in Jamaica had showed excellent prospects of tea-growing on the island. In a short time tea of good blend will be added to the exports of Jamaica. Mr. R. Dawson, an expert, selected the warm, temperate slopes of the Blue Mountains, at an altitude of some 4,000 feet, as being an ideal place for the growth and cultivation of tea. There is ample water-power to work the machinery. From experiments it has been proved that the Chinese varieties grow luxuriantly, but there are still better prospects for the Assam and Ceylon hybrids.

\* \* \*

Buyers and consumers of Japan teas should always keep in mind the difference in these teas that are due to the difference in their treatment as by pan-firing, basket-firing or sun-drying process. The sun-dried teas are generally placed second to the pan-fired leaf, but they drink better as a rule, owing to the thorough fermentation they receive by being dried in the sun before firing. The basket-fired Japans are esteemed for blending purposes. There is one feature common to all Japanese teas, and that is, the delicacy of flavour, which, combined with the light colour of their liquor, makes them deceptive to people not familiar with their qualities, for they actually are stronger and more pungent than many of the Chinese teas.

\* \* \*

Sir Henry Seymour King writes to the editor of the *Overland Mail* :—

The blessed word "Retaliation" is in every month, and many are expecting the creation of a Commercial Paradise by its magic influence, though, sad to relate, some still doubt the opportunity has arisen of converting these doubting Thomases.

The Russian Government, impelled, as some allege, though I do not vouch for the fact, by antipathy to that recent brilliant specimen of constructive statesmanship, the Sugar Convention, has increased the duty on Indian and Ceylon teas from 31 roubles 50 copecks per pood to 33 roubles, thereby differentiating against our tea in favour of China by fractionally over 1d. a pound; fortunately the Indian Government need no popular mandate nor parliamentary approval, and the "big revolver" lies ready to their hand. The imports into India from Russia amount to roughly £2,124,000, of which no less than £2,100,000 is Russian mineral oil; let the Indian Government at once retaliate by imposing a heavy duty on Russian oil until such time as the increased duty on tea is removed or, while they are about it, greatly further reduced from its former oppressive amount. There can, of course, be no doubt about the result.

\*

So shall the great Sword of Retaliation smite the foes of their country, to the joy of all faithful believers and the confusion of all sceptics; all which is much to be desired.

The paper aforesaid comments this :—The reported action of the Russian Government in increasing the duty on Ceylon and Indian teas imported into Russia by the European frontier and the Black Sea from 31 roubles 50 copecks per pood to 33 roubles, while that on China teas is left unaltered, may have some motive other than purely fiscal which is as yet undisclosed. The inference, however, is that it is desired to discriminate against a British product; for it is stated that "fresh regulations are enforced for the purpose of certifying the origin and place of despatch." If Mr. Balfour has the courage of his convictions he may now (as Sir Seymour King suggests in the above letter) put his own doctrines into practice with immediate advantage to India, and prove the value of his new opinions. In India legislation is facile and Simla is within telegraphic reach of the India Office. We see that in 1901-02 out of the total quantity of kerosene oils imported into India (91,467,466 gallons) as much as 84,477,876 gallons, of the value of £2,098,656, are noted in the returns as coming from Russia. Clap on to every gallon of Russian oil a spanking duty and you have an object-lesson in Mr. Balfour's principles which ought to impress the electorate in this country. Do it by a Bill run through in a day at a special meeting of the Viceroy's Legislative Council and you give Russia an object-lesson in her own methods applied to herself. It is surely not conceivable that fresh converts like Mr. Balfour and the Duke of Devonshire should throw away this excellent opportunity of demonstrating the efficiency of their new principles.

\* \* \*

**London Tea Sales.**—In their cable of 8th instant to the Colombo papers Messrs. Gow, Wilson & Stanton report a generally steady market, prices harder. Fair liquoring Ceylon Pekoe Souchong 6½d.; average for the week 7¼d. (½d. up). Reuter wires that common qualities secured full rates, and fine qualities were in demand at full prices. Of 18,000 packages offered 17,000 sold. India offered 40,000 packages and 31,000 sold. Dealers and blenders doubtless understand now that the Ceylon supply to London this year will be several millions short.

According to a London cablegram, Messrs. Ewart and McCaughey's Tea Report, dated the 12th instant, states that there were 37,103 packages offered for sale, and there was good bidding for all grades. Assams again were in strong enquiry, and the common kinds quite maintained last week's advance, 6d. being about the lowest quotation, although some were taken at 5¾d.

\* \* \*

**The U. S. Tea Market.**—With liberal sales the Formosa market ruled steadier, prices being quoted up ½c. per pound to 14c. lowest for invoices and 15c. for lines at the close, says the *Tea and Coffee Trade Journal* of September 15. The distributing business was fairly active and the demand from the consuming trade was pretty and at steady to firm prices. India and Ceylon teas were in fair demand and firm.

\* \* \*

The tea auctions were resumed at Calcutta on Friday, the 9th instant, after the Poojahs, when 23,991 packages were offered and 22,580 sold to a firm market. Full average prices were realised for all kinds except Broken Pekoe kinds. Notwithstanding a falling of the quality all round, Colonial.

Bombay and American buyers operated freely. Russian and Australian buyers took a fair proportion.

\* \* \*

**Brick Tea at Nagasaki.**—Of the export of tea in 1902 from Nagasaki 20,081 lbs. was brick tea, which all went to Russia, while practically all the other tea exported, viz., 8,531 lbs. went to China. The advance of this export of brick tea has been very rapid, for in 1899 it amounted to only 191 lbs., in 1900 to 1,808 lbs., in 1901 to 10,288 lbs., and in 1902 to 20,081 lbs.

\* \* \*

**Increased Tea Duty in Russia.**—We append copy of correspondence between the Ceylon Association in London and Downing Street on the subject of Increased Duty on Indian and Ceylon teas imposed by the Russian Government, for the information of all interested :—

The Right Hon'ble J. Chamberlain, M.P., Colonial Office, S.W.

SIR,—I am instructed to invite your attention to the announcement that the Russian Government has by a recent Ordinance increased the duty on Indian and Ceylon teas imported by the European Frontier or the Black Sea by  $1\frac{1}{2}$  roubles per pood, equivalent to about  $1\frac{1}{2}$  d. per pound. From this increased duty China and Japan teas will, it seems, be free.

The total import of tea of all growths into Russia is about 126,000,000 lbs. annually, of which about 50,000,000 lbs. is imported by the European Frontier and the Black Sea.

The following comparative figures for the years 1899 and 1902 show how rapidly Indian and Ceylon teas have been displacing rival growths in this latter portion of the trade when on even terms :—

	1899.	1902.
Ceylon Tea shipped direct from Colombo	3,949,740	11,727,068
„ re-exported from London	1,587,286	3,647,807
	5,537,026	15,374,875
Indian Tea shipped direct from Calcutta and Chittagong	44,811	4,001,423
„ re-exported from London	727,252	2,886,445
	772,063	6,887,868
Total British-grown teas	6,309,089	22,262,743

lbs. or an increase of 350 per cent. in three years.

The larger part of the imports as above into Russia, however, still come from China; and it is to be feared that further progress with our teas may be checked by the differential tax now imposed on them.

I am to suggest that the facts be submitted to the Foreign Office in the hope that representation may be made to the Russian Government on the subject.—I have the honour to be, Sir, your obedient servant, (Sd.) WM. MARTIN LEAKE, *Secretary*.

Ceylon Association in London, 61 and 62, Gracechurch Street, London, E.C., 14th September, 1903.

The Secretary to the Ceylon Association in London.

SIR,—I am directed by Mr. Secretary Chamberlain to acknowledge the receipt of your letter of the 14th instant, on the subject of the surtax recently imposed by the Russian Government on tea imported from India or Ceylon, and to inform you that the matter is receiving the attention of His Majesty's Government.—I am, Sir, your obedient servant, (Sd.) C. P. LUCAS.

Downing Street, September 17th, 1903.

## NOTES.

### Pepper in the United States.

The *Spice Mill* for September reports—Pepper is now far below the East Indian price here. The trade demand improves gradually. Stocks of Acheen here and on the way are extremely light, the principal supplies being Singapore.

### Quinine Auction in Batavia.

(American) Consul B. S. Rairden writes from Batavia, says :—The sixth public sale of quinine by tenders for the year 1903 took place at this city on the 24th ultimo, and the following unsatisfactory prices were realized : There was put up for sale 9,661.08 kilograms (21,253 pounds) of sulphate of quinine, Editio II, packed in cases of 400 ounces, and 240 kilograms (528 pounds), Editions II and III, packing at purchaser's option. Of the above lot, only 2,412 kilograms (5,307 pounds) were sold, at an average price of 14.95 florins (\$6.01) per kilogram (2.2 pounds) or the unit price of 0.05225 florin (2.1 cents) for the bark at the Amsterdam market.

### Tea and Coffee in Hongkong.

At the last Committee Meeting of the Hongkong General Chamber of Commerce, Mr. Pollock asked whether tea and coffee had been tried in the New Territory, and the Secretary stated that an enquiry from the Superintendent of the Botanical and Afforestation Department, had elicited the following notes on the subject :—*Tea* : Extensively cultivated by Chinese and abandoned many years ago on account of heavy taxes imposed on it by Mandarins. *Coffee* : Experimentally tried on the island of Hongkong 10 to 20 years ago by private European enterprise. Never tried in New Territory. The bushes in the Public Gardens do not flourish properly. Coffee requires a continuous hot damp climate and deep rich soil in order to grow properly.

### Cocoa in the United States.

The imports of cocoa keep growing, says the *American Grocer*, in a way which indicates the steady expansion of the cocoa and chocolate industry. The July imports of crude cocoa were 6,173,331 pounds, against 5,447,121 pounds in July, 1902; for the seven months ending July, 39,643,514 pounds, against 32,310,555 pounds for the same time in 1902; 32,166,078 pounds in 1901. The imports of manufactured cocoa do not increase in like proportion, showing that domestic manufacturers of the article are most in favour with the people. In July the imports were only 65,145 pounds, and for the first seven months of this year, 612,910 pounds, against 653,023 pounds for corresponding period in 1902, a decrease of 40,113 pounds. The value of domestic manufactures of cocoa exported during the same period was \$134,105, against \$103,710 same time in the previous year. It is highly encouraging to see this old-established American industry pushing ahead in such a fine manner. It is a case of stimulation due to free raw material, with a protective tariff on foreign manufactures of cocoa, which are sold about as cheap under a big tariff as under a lower schedule of duties. It certainly looks as if the foreign manufacturer paid the duties instead of the American consumer.

### Planters and the Mysore State.

On the opening day, 5th instant, of the Mysore Representative Assembly, Mr. Scot-Skirving, representative of the North Mysore Planters' Association, addressing His Highness the Maharaja, said :—“As the representative of the North Mysore Planters' Association, it is my privilege to congratulate Your Highness on the statesmanlike step Your Highness has taken in opening this Assembly in person. For the honour thus done to this Assembly, to the representatives from various Districts and Associations throughout the

province, and through them to Your Highness' subjects generally, I, on behalf of the Association which I represent, beg to thank Your Highness. I also gladly seize the opportunity presented here, to thank Your Highness for the sympathy shown to the coffee-planting industry by the generous gift of Rs.5,000 towards the expenses of exhibiting our produce at the Exhibiton at St. Louis. The exhibition of our produce will, it is thought, create a demand in America for our coffee, and thereby help us to struggle through the present critical condition of our industry. I take the presence of Your Highness here to-day as a happy augury for the continuance of an enlightened, sympathetic administration, and I wish Your Highness a long, a happy, and a brilliant reign (loud cheers)."

## GENERAL ARTICLES.

### PRODUCE AND PLANTING.

The *Times* of the 17th instant, in summarising the contents of the Government Blue Book on British and Foreign Industry, gave particulars of eight leading articles of food consumed in the United Kingdom. In this summary the value of tea from British possessions is given as £7,976,000, against £865,000 from foreign countries. Mr. Wm. Martin Leake, Secretary of the Ceylon Association in London, in a letter which appears in Tuesday's *Times*, calls attention to these figures. He says: "A noteworthy feature in this statement is the unique position of tea. While in the case of the other seven articles British possessions supply only from 4 per cent. to 33 per cent. of the whole, in the case of tea the proportion is close on 90 per cent. This has not always been so. In 1872, when Messrs. Keir, Dundas & Co., of Kandy, in which firm I was then a partner, produced and shipped to London the first consignment of tea ever exported from Ceylon, the proportion of the home consumption then contributed by British possessions—i.e., by India—was only 13 per cent. Not less noteworthy are the conditions under which this peaceful revolution has been achieved. The British Government, a Government devoted to free trade and to whom a tax on food is as an accursed thing, has throughout selected tea for exceptional taxation. For three years past tea, the average price of which in bond has been about 7d. per lb., has been subject to a duty of 6d. per lb. Indian and Ceylon planters can claim that they have demonstrated the possibility, even under adverse circumstances, of producing within the limits of the Empire an adequate supply of one necessary of life. An incidental result of their efforts not to be overlooked has been that the price of tea in bond has been reduced by about 60 per cent., so that the whole population has shared with the Government in the fruits of our planters' enterprise."

The *Manchester Guardian* quotes Mr. Leake's letter as proof that the theory of the need of preferential tariffs to increase the food supply of the Empire does not hold good in the case of tea. It says:—"Had Mr. Chamberlain with his present views been in power thirty years ago he would no doubt have contended for a preferential duty on Indian as opposed to China tea. India was then only supplying 13 per cent. of the home consumption, and we can imagine how Mr. Chamberlain would have argued that by giving a preference to the Indian planter we should encourage him to increase his production rapidly, until the Empire in respect of tea became self-supporting. Fortunately for the Empire such absurdities were not current in those days, and the Indian tea trade was left free to develop in open competition with the Chinese. The result has been that private British enterprise, with no sort of artificial stimulus from tariffs, has built up a great tea-planting industry in Ceylon, as well as in India, which now supplies 90 per cent. of the tea consumed in this country. Does not such a record suggest that the work of encouraging the production of food in the Empire may be safely left to the colonial farmer, who may be trusted to develop any form of agriculture that will pay? There is every reason to believe, for example, that the production of wheat in Canada is increasing almost as rapidly and on as sound a basis

as the tea industry of our Indian dependency, and preferential duties intended to promote wheat-growing are as unnecessary to the colonists as they would be burdensome to the English people." For all that, Indian and Ceylon planters would have been relieved of a severe struggle in the past had a preferential tariff existed, and they would not have objected to the artificial stimulus which the *Manchester Guardian* holds up to scorn.

The forty-seventh report of the Commissioners of His Majesty's customs for the year ended March 31, 1903, lately published, contains the following particulars:—The revenue from the tea duty in the last financial year was £5,975,483, as against £5,792,967 in 1901-02, an increase of £182,516, or 3·2 per cent. Towards the end of the year 1902-03 it was generally anticipated in the trade that the duty, which had been increased from 4d. to 6d. per lb. in 1900, would be reduced, and clearances were postponed. Had this not occurred the increase would have been somewhat greater. The crops of 1902 were not so large as was originally expected, and prices, which during the Summer and Autumn had been at a very low level, rose in consequence. Between July, 1902, and February, 1903, the rise in price may be put at 1½d. per lb., the London sales of Indian tea in the latter month averaging 7½d. per lb., and of Ceylon tea 7½d. per lb. The exports of tea from the United Kingdom during the financial year 1902-03 have been about 4,600,000 lbs. in excess of those of the preceding year, and this has also helped to raise the price. Of the total revenue in 1902-03, tea from India contributed 57·8 per cent.; tea from Ceylon, 34·2 per cent.; tea from China, 4·6 per cent.; and tea from all other countries, 5·4 per cent. The gross receipts from the duty upon coffee in 1902-03 were £194,152, and the net receipts £178,628. The gross receipts show a decrease of £26,749, or 12·1 per cent., whilst the net receipts show an increase of £4,286, or 2·5 per cent., as compared with 1901-02, the cause of these movements being due largely to the reduced quantities sent away on drawback, owing to the cessation of the South African war.

The Government of New South Wales cannot be accused of recklessness in its expenditure for tea for its hospitals, gaols, and other public institutions. It recently advertised its need of 500 or 600 chests of blended Indian and China teas at a uniform value of 6½d. per lb.

At the Grocery Exhibition, held at the Agricultural Hall this week, the Managing Director of the Company promoting the series of exhibitions referred in his speech to the exhibition to be held at Cape Town next year. He and other speakers are reported as having expressed the hope that Natal would become a tea-producing country. This is rather rough on the pioneers of the tea industry in Natal who have been producing tea for years. Perhaps these exhibition speakers were wrongly reported, and they may have really expressed the aspiration that Natal might soon become a tea-exporting country. Before this happens on a large scale there are the tea requirements of South Africa to consider.—*H. & C. Mail.*

### LEGISLATION IN MYSORE.

During the second day's proceedings, on the 6th instant, of the Mysore Representative Assembly, Mr. SCOT-SKIRVING addressed the Assembly as follows:—

SIR KRISHNAMURTI AND GENTLEMEN,—As the representative of the North Mysore Planters' Association, I do not on the present occasion deem it advisable to occupy the time of this Assembly with any subjects of purely local interest. I propose, however, with your permission, Sir, to refer briefly to two subjects of general interest throughout the Province. These are, the Game Act and the Act for the Prevention of Cruelty to Animals. With regard to the former, I would again congratulate the Government on its introduction into the Province. Without this Act, certain species of wild animals would have become extinct, and I feel sure, that when, with systematic administration of the Act, the people of the Province have become familiarized with its provisions, the end aimed at will be fully attained. The Act as it now stands may not perhaps be perfect but should alteration be found desirable any proposed alteration might well come from the Game Association, which exists and is doing good work, rather than from individuals.

Everyone interested in the subject is at liberty to join that Association and through it voice a collective opinion.

In regard to the Act for the Prevention of Cruelty to Animals, I believe the Act, at present, only extends to certain Municipalities. I here plead for its extension throughout the Province.

As you are aware, Sir, a society exists, under the patronage of Her Highness the Maharani Regent, which aims at inculcating in the youth of Mysore the virtue of kindness to animals, and the amelioration of animal suffering. This society will, without doubt, bear valuable fruit for the future, and it would be a splendid thing if its humane teachings could be extended to every school in the Province. But this society—however noble its aims, however excellent its work—cannot reach the illiterate. I therefore beg for the extension of the Act for the Prevention of Cruelty to Animals throughout the Province. I feel sure that every educated man with a heart that beats in sympathy for suffering would gladly do all in his power to assist the magistracy and the police in bringing to justice the scoundrel who for sordid ends, or from callous indifference for animal suffering, inflicts needless pain on helpless creatures in his power.

The Dewan, in reply, said that he had very little to say with regard to the Game Act which had already been passed; and if any suggestions were to be made for its further improvement, Government would favourably consider the same. Regarding Mr. Skirving's other proposal for the extension of the Act for the Prevention of Cruelty to Animals, Government were prepared to give their best consideration if any definite idea regarding the proposal was given. That was a subject that surely appealed to Government very much, and any practical suggestion would be considered by Government.

### WEST INDIAN GRASS OILS.

In the March issue of the *Bulletin* of the Department of Agriculture for Jamaica an account of some grass oils distilled in Trinidad and in Jamaica was given by the Jamaica official analyst, Mr. H. H. Cousins. It appears that a vigorous attempt is intended to take up the cultivation of the *Andropogon* grasses, with a view to developing the essential-oil industry, on account of the reduced cultivation of the sugar-cane. The Trinidad oils distilled experimentally were those of *Andropogon Nardus* and *A. Schoenanthus*, and were found to possess the following characters:

	<i>A. Nardus.</i>	<i>A. Schoenanthus.</i>
Sp. gr. at 15° .. ..	0.9084	0.9315
Rotation .. ..	+ 0.1°	+ 3°
Aldehydes .. ..	15.5 per cent.	48.2 per cent.

The oil from *A. Nardus* showed a total geraniol and citronellal value of 53 per cent., and thus corresponds with an ordinary Ceylon citronella oil, except that its content in active constituents is somewhat low. This, however, is possibly accidental, and with proper distillation a normal oil would no doubt result. The *A. Schoenanthus* oil did not in the least resemble a palmarosa oil, but much more closely resembles lemongrass oil.

I am indebted to Mr. Cousins for samples of the Jamaica oils, which are of very great interest. I propose to investigate them more fully, but in the meantime give the following details of them:

The oil from *A. Nardus* is a pale oil of exceptionally fine odour, and has the following characters:

Sp. gr. at 15° .. ..	0.8955
Rotation, 100 mm. .. ..	- 3° 30'
Refractive index at 20° .. ..	1.4712
Aldehydes .. ..	25 per cent.
Geraniol and citronellal .. ..	87 ..

In general it appears to closely resemble the fine Java citronella oils, being of much finer odour than the normal Ceylon distillates. It is soluble in 1 volume of 80 per cent. alcohol, and on addition of 10 volumes shows only the faintest opalescence. If it could be produced at a reasonable price in quantity, it would no doubt find great favour in this market. Messrs. Schimmel & Co. have reported on what appears to be the same oil, and say that it takes about an intermediate place between the Java and Ceylon oils;

but I am of opinion that it is more of the Java type than of the Ceylon.

The Jamaica oil distilled from *A. Schoenanthus* is not a palmarosa oil, and is accurately described as a true lemongrass oil. This raises the question as to which grass is really the parent of lemongrass oil, as it appears out of the question that so enormous a change in the character of the product could take place by the grass being cultivated in Jamaica.

This lemongrass oil has the following characters:

Sp. gr. at 15° .. ..	0.8965
Rotation, 100 mm. .. ..	- 0° 30'
Aldehydes .. ..	83 per cent.
Refractive index at 20° .. ..	1.4896
Insoluble in 70 per cent. or 80 per cent. alcohol.	

The oil is a typically fine lemongrass oil, with a very high aldehyde-content, and differs only from normal Eastern oils in its insolubility in alcohol. The insoluble portion of the oil is a heavy body, sinking to the bottom of the alcohol, which I am now investigating. Apart from this insolubility, which may not be normal, and may be found to disappear when the oil is distilled under normal conditions, the oil may be described as a fine lemongrass oil, with a very high citral value; and, since the value of lemongrass oil depends entirely on its citral-content, the oil should command a ready market if produced at a reasonable price.

### COFFEE ROASTING.

"DRY ROASTED AND WARM PACKED"

Writing in the *Spice Mill*, Mr. Chr. H. Thingelstadt says:—

Although the consumption of coffee is constantly increasing, it is surprising how few persons know anything about the characteristics or the peculiar quality of the coffee bean beyond the fact that coffee is the seed of a berry which in colour and size resembles a cherry, and which is the fruit of a tree peculiar to the tropical countries. But the twin seeds, when taken from the yellowish pulp of the berry, have little of the appearance of the coffee bean known to the buyer in the far-off temperate zones.

Raw coffee seeds are tough and horny in structure, and devoid of that peculiar bland and mellow aroma which ascends from the coffee-pot to greet the gratified nostrils of the coffee lover. The raw seed betrays nothing of this. These qualities are developed in the bean by roasting, and are due to the presence in the bean of three things: "Caffeine," which gives it dietetic value; "caffeic," which gives it flavour, and "caffone," which determines its richness of aroma. But these three essential qualities, which are developed and liberated by roasting, are volatile in nature, and, therefore, escape quickly. The roasted coffee bean under the microscope reveals a sponge-like structure, each little cell only too ready to yield up its drop of aromatic volatile oil, and upon which the fragrance and value of the whole depend. It is not the bean itself that is wanted. The coffee-grounds are nothing but waste, and are thrown away. It is the active, volatile principles that are extracted into boiling water, and which give the rich, smooth, aromatic beverage that should grace the table.

The air, however, quickly absorbs these principles from the roasted coffee when exposed; therefore, the consumer who buys his coffee in bulk or from open bins, buys a coffee bean already destitute of a large part of its volatile value. The bean also loses from 15 to 20 per cent. in weight by roasting. Many roasters put back this weight to the betterment of their purses, by filling the sponge-like pores with some foreign matter, and then glaze the bean, to protect the filling and improve the appearance of the bean. This doctored product, of course, suffers in flavour and wholesomeness, while it increases the cost to the consumer in proportion to the weight added by the doctoring. But the innocent buyer knows nothing of this. He only knows it seems impossible to get a good cup of coffee at his table.

To roast the coffee bean dry, to pack it unadulterated while warm into air-tight packages, prevents the escape of the coffee principles, and also does the consumer justice as to weight and purity.

The roaster who values his reputation aims at three things: A good bean well cleaned, a scientific blending for flavour, then well

developed and thoroughly roasted, as you do not obtain the drink with its rich, mellow aroma that is so highly praised by the coffee connoisseurs until it is well done. I have known many coffee roasters to turn out a roast where the outside would be well done and the centre of the berry under done. The reason for this is that they rushed their coffee too much. They should give it proper time to roast.

A roast should never be hurried, nor should it be left over the fire too long. Coffees should be treated according to their nature in order to develop their full aroma. It is easier to roast coffee under done than to roast it to the finishing point.

In conclusion, I wish to add a few statistical facts about coffee and its production. I will here quote from my circular of July 14, 1902.

The following is an example of three years of Rio and Santos crops, and how the world's visible supply resulted:

1898-1899 - Total...	...	...	...	8,771,000
1899-1900 - " ..	...	...	...	8,959,000
1900-1901 - " ..	...	...	...	10,927,000

An average, say, of 9,500,000 bags.

The world's visible supply July 1, 1898, was 5,486,000 bags, against 6,868,000 bags July 1, 1901, showing nearly 1,500,000 bags' increase in the world's visible supply in three years, and with Rio and Santos crops averaging 9,500,000 bags, clearly proving that the world had not required as much as 9,000,000 bags of Rio and Santos coffees on an average in three years, and this, too, taking deliveries as consumption.

			Bags.
World's visible supply, July 1, 1899	...	...	6,200,000
World's visible supply, July 1, 1902, about.	11,500,000		
Plus private stocks, July 1, 1902, about	1,250,000		
			12,750,000
Rio and Santos crops, 1899-1900	...	...	8,959,000
Rio and Santos crops, 1901-1902	...	...	15,200,000

It makes very little difference, in view of the monstrous supplies existing, whether this crop or next crop is nine, eleven, or fourteen millions of bags. Either one of these quantities is much in excess of what is really wanted. Consumption may, however, exceed my calculations and have a favourable tendency to strengthen the market.

Some of my readers may remember that in my circular of October 12, 1899, just after my return from Brazil, where I had spent nearly four years studying the coffee production and its peculiarities, I took the position that there was no prospect of a permanent improvement for coffee until the price itself curtailed production. I still adhere to this view, and I believe that all speculative attempts to sustain prices will only encourage further efforts for larger production. My opinion is not influenced by the speculative actions of others, nor by sentiment. I am governed solely by supply and demand, and on this natural basis I feel that values will continue low for a long time to come, while the values of existing stocks must necessarily rule low until the price itself comes down to a point low enough to permanently curtail production. I have been accused of being a chronic bear. If so, I was just as chronic a bull for ten years, during which time the supplies of the world were undergoing a steady decrease.

## U. S. IMPORTS.

### INCREASE IN TEA AND COCOA—DECREASE IN COFFEE.

The preliminary commercial statement of the Bureau of Statistics of the Department of Commerce, for the closing month of the fiscal year 1903, contains some interesting figures as to the imports and exports of tea, coffee, chicory, and cocoa. It also shows the yearly average value of certain groceries during the past four years.

Americans are apparently becoming greater tea-drinkers, for in 1903 the net imports of that article were 104,632,260 pounds against 74,374,041 in 1902. Compared with the preceding year the imports from Japan increased more than 7,000,000 pounds, and there was an increase from China of more than 19,000,000 pounds.

The gross imports of coffee in the fiscal year 1902 were 1,091,004,252 pounds, while in 1903 only 915,066,380 pounds came in. Despite the falling off in imports, which was probably due to this market having a large supply on hand, the amount transhipped

and exported was 47,701,306 pounds, against 34,462,615 pounds in the previous year. It is interesting to note that the *per capita* consumption of coffee is about thirteen pounds, while that of tea is one and one-fourth pounds. The price of tea, however, is more than double that of coffee.

Although coffee in 1903 was plentiful the price was six points higher than in 1902, and this fact may or may not have had something to do with the remarkable increase in the importation of one of its adulterants, namely chicory. Nearly six times as much raw chicory was entered in 1903 as in 1902, with an average value of 1.98 cents against 1.92 cents. There was also a large increase in the quantity of prepared chicory, the price showing a forty-five point gain over the previous year.

The net imports of crude cocoa showed a gain of 11,357,052 pounds over 1902. There was also an increase in both prepared cocoa and prepared chocolate. The rapid increase of the importations speaks well for the healthy state of consumptive demand for chocolate, breakfast cocoa, and chocolate confectionery. The price of both the crude and the prepared article is slowly decreasing.

The following table of comparative prices, together with the figures already quoted, is taken from a recent issue of the *Merchants' Review*:

		1900.	1901.	1902.	1903.
		per lb.	per lb.	per lb.	per lb.
Coffee	...	6.66	7.35	6.41	6.47
Tea	...	12.45	12.18	12.42	14.42
Raw sugar	...	2.48	2.26	1.46	1.70
Rice	...	2.03	2.13	2.13	2.21
Canned salmon	...	9.95	10.24	8.48	8.64
Cocoa	...	13.55	14.08	12.95	12.34
Chicory	...	1.46	1.92	1.92	1.98
Figs	...	5.83	4.61	4.30	4.71
Prunes	...	10.76	8.50	8.43	9.99
Raisins	...	5.15	7.71	5.98	6.70
Currants	...	2.53	5.71	3.42	2.19
Dates	...	2.06	2.02	1.72	2.24
Almonds	...	15.02	18.40	12.56	16.43
Pepper	...	9.80	11.23	12.81	10.51
Nutmegs	...	22.08	19.65	18.45	18.71

Of the fifteen articles in the foregoing table a dozen—coffee, tea, sugar, chicory, figs, prunes, raisins, dates, almonds, rice, salmon, and nutmegs—show a higher average value in 1903 than in 1902. Three articles—cocoa, currants, and pepper—were lower. In 1902 the following articles: Pepper, coffee, salmon, cocoa, raisins, sugar, figs, prunes, dates, almonds, and nutmegs, averaged lower in value than in 1901, tea alone showing an advance, while rice and chicory were unchanged.

## ATTENTION TO TEAS AND COFFEES.

A salesman went out of a retail grocer's store, in the southern section of our city, mad all over the other day. We will not discuss whether or not it was good business for him to get mad. His parting shot to the grocer who told us the incident, and who had business sense enough to realize its truth, is what we are interested in, says the *Philadelphia Grocers' Review*.

The salesman had a line of teas and coffees from a good house; had vainly tried a number of times to get five minutes of the grocers' time, and at last, discouraged, had darkened his door for the last time flinging this at the grocer's head as he left: "You grocers are a lot of blanked fools. You try hard to sell wash-blue, soap, and cereals at cost; most of you get up before daylight to bring a load of truck up from the wharf, to make a profit on, in the morning and lose most of it in the afternoon, while the very part of your business that would pay you the biggest returns for the least effort you give but scant attention to or else neglect altogether. I mean your teas and coffees."

The grocer was so impressed by what the man said that he went right to work covering a box with paper which he filled with a twenty-five cent coffee he had confidence in, displaying the same on his counter together with a neat sign calling attention to its good qualities and price. He also told his clerks to try and sell the coffee to people whom they knew did not buy their coffees from him. The result was the biggest kind of a surprise to him. He sold more coffee the balance of the week than he had ever sold in the same time before, and made a number of new customers who now buy their coffee from him right along.

It is not much wonder that the average grocer growls at tea and coffee peddlers, cut stores, and the like, cutting into his sales when we consider what small study he gives to those two articles himself. If he gives and takes credit he turns his trade over to some coffee house, good or bad as the case may be, and lets them dictate what he shall sell and how much he shall pay for it. One very conscientious grocer we know, who would not think of selling Maracaibo for Java, for months bought, in Java markets at Java price, a bleached Maracaibo which he sold to his customers as pure Java. The grocer had the clear conscience while the man who sold him the coffee had about 100 per cent. profit. We won't say who'll be the best off in the next world, but we think we know who was the gainer in this; for the grocer as far as we know never discovered the deception, and gets most of his coffee from the same house yet. A very little bit of inquiry would have saved him many dollars.

People whose information is worth having don't throw it at the heads of those whom they think would not appreciate it. It has to be sought after.

We will give an illustration of the possibilities of profit in coffees at the present time. A certain grocer with whom we are well acquainted, and in whose word we have the fullest confidence, told us he had a certain blend of coffee which brought him in a profit of \$10 weekly. The blend cost him 16 cents and he sold it under a fancy name for 35 cents, selling from fifty to sixty pounds of it weekly. It cost him time and effort to work the trade upon it, but it was worth time and effort. Most grocers buy Java and Mocha, paying fancy prices for them, and sell it for their best coffee at a comparatively small profit. The grocer we have just quoted had sense enough to know that what his trade wanted and was willing to pay for was good cup qualities and not standard names.

The first requisite toward building up a good coffee trade is absolute independence in buying. The man who has spot cash gets the worth of his money every time.

Then if he doesn't know much about coffees himself he should hunt up somebody who does and learn the qualities possessed by the different kinds.

A man who can give you this information can also give some ideas about blending. Given a good article, it is now up to the grocer to induce the retail buyer to give his coffee a trial. Personally we do not believe in low prices, as an inducement to the retail buyer of teas and coffees. People, as a rule, have no confidence in low-priced teas and coffees, above everything else the grocer sells. A coffee sold at 15 cents per pound will have a twang to it that the same kind sold at 30 cents or 35 cents will not have. There are exceptions to this rule, but it will hold good with the general run the grocer must work.

Thirty cents a pound plus a good recommendation means more profit and also makes more sales than just plain 20 cents. If you don't believe it just try it and see.

This is not a learned discussion on the qualities of teas and coffees, for the writer does not know as much about them as many who will read this. It is just a little that he has picked up knocking about among hard-working grocers and some who do not work so hard, but seem to be more prosperous than those who do. —*Spice Mill.*

## SCIENCE AND AGRICULTURE.

### A LESSON FROM JAVA.

The recent presentation of a weighty and influentially-signed memorial to the Bombay Government urging the placing of scientific effort for the improvement of agriculture upon a more modern basis has, it is to be hoped, aroused some little interest in a problem of peculiar importance to a population dependent almost entirely upon the cultivation of the land. Despite the fact the question has a direct bearing upon the prosperity of millions of people it has been one of these subjects upon which it is difficult to focus public attention especially in India, and to a more or less extent in other British possessions in the tropics. Popular apathy arises mainly from popular ignorance. Few people have a just appreciation of what thorough, continuous research by the ablest scientists can do—and has done—for countries no better favoured by nature than India, Ceylon or the Straits. Like the fiscal problem it is a question which needs inquiry; and unfortunately it has

had no Mr. Chamberlain to urge its claims upon the public mind. By some the devotion of science to agriculture and horticulture is regarded as one of the fads of modern times upon which every Government which desires to be considered abreast of the age must allot a few thousand pounds a year. But to realise what many thoughtfully expended in research and experiment has accomplished, the inquirer must take a concrete instance and ignoring theoretical advantages, judge by actual results. And such an investigation will, in many cases, lead to the unearthing of irrefutable evidence favouring the scheme urged in the Bombay memorial.

We will take as a beginning what is admittedly one of the finest institutions of its kind in the world, the Botanical Department of Buitenzorg in Java. "Among the twenty or thirty tropical gardens established in the Colonial possessions of the various European Powers," wrote an English traveller ten years ago, "three stand pre-eminent—those of Calcutta, the Peradenia Gardens in Ceylon, and the Dutch Gardens at Buitenzorg." It was probably patriotism which induced him to place them in this order, for, in reality, the Buitenzorg gardens are far and away superior to the others. They serve a Colony, the prosperity of which depends upon the success of its agriculture—and, be it remembered, a Colony with a revenue less than half that of the Bombay Presidency. And what have they done for the planters and the cultivators of Java? Two or three examples may be quoted. Compare the cinchona industry in Java and Ceylon. In 1891, Ceylon exported about nine and a-half millions of pounds of cinchona. Ten years later the exports had fallen to a mere six hundred and eighty thousand pounds. But in Java the cinchona plant has become a very valuable asset. The production of cinchona has increased fifty per cent. in the last eight years and to-day amounts to nearly twelve millions of pounds. The cinchona plantations of Java cover twenty-five thousand acres in Ceylon a mere 700 acres are now devoted to the industry. And the reason? The application of science to agriculture. Years ago Ceylon had as good a chance as Java of maintaining her cinchona plantation. But in those days the Ceylon Botanical Department was incomplete and could render no assistance, whereas the Dutch planters in Java profited by the chemical researches and the new methods of selections carried out by the scientists at Buitenzorg. Science conquered; and the practical abandonment of the cultivation of the cinchona plant in Ceylon—last year's export was only valued at fifty thousand rupees—shows how agriculture may languish for want of scientific advice. Take a still more recent case. The experts in the Agricultural Department in Java have recently studied citronella oil, whereas in Ceylon and the Straits the industry has been left more or less in the hands of natives. Java oil is now worth 1s. 4d., whilst Ceylon oil reaches 10d. with difficulty. Happily Ceylon is now alive to the importance of scientific research and the director of the Ceylon Botanical Department is, assisted by the agricultural chemist, "preparing the ground for the improvement of the Ceylon industry." Mr. R. Dupont, Curator of the Botanic Gardens in the Seychelles, who has recently made a tour from Ceylon to Java has drawn attention to these instances of the value of the application of science to agricultural industries and also mentions that in Java the gutta percha industry has been studied scientifically for the last twenty years whilst the cultivation of this exceptionally useful plant is only being stated in the other colonies.

It is worth while considering an organisation which can point to many results of the character indicated. The Buitenzorg Gardens which have reached such a high pitch of perfection have done so much for the development of agriculture cost only three lakhs of rupees a year to maintain the Bombay memorialists estimated that the annual expenditure which would be required to the local Department on a satisfactory basis would be one and a-quarter lakhs. The manner in which the money is provided is evidence of the intelligent appreciation the Dutch possess of the value of the institute. The planters of Java and the merchants of Amsterdam give a liberal subsidy, and a large grant is made by the Education Department. The Dutch Government of Java take the keenest interest in the condition of agriculture; an interest which almost necessarily grew up under General Van den Bosch's "culture system" which saved Java from bankruptcy in the thirties of last century. The gardens themselves date back before that great administrator's day, but although they were originally established in a corner of the park surrounding the residence of the Governor-General in 1817, it was the famous botanist Teysmann, who went out with Van den Bosch, who first made them known to a wider

public. But it was many years before anything like modern organisation was attempted. Dr. Scheffer, of Utrecht, found in 1876 a school of agriculture with a garden attached to it and his successor Dr. Treub who took over the work in 1880 must be given the credit for organising the systematic scientific investigation and experiment which obtains to-day.

The institution officially known as the Nederlands Plantentuin to Buitenzorg, comprises the botanical gardens, a horticultural garden and a mountain garden. It is managed upon business lines and the useful and the scientific have never been sacrificed for the picturesque or the beautiful. The visitor is struck by the centralisation of institute. The experts, the laboratories; the museums, the libraries and the experimental fields are all in one spot. There is no delay in inter-communication between the departments. The work too is done by a permanent staff of a dozen well remunerated scientists and their assistants. Men are not sent out to Buitenzorg to learn the rudiments of their profession. They are Doctors of Sciences or Professors before they start; they have received the best European training; and they are ready on the spot all the time instead of being sent out for brief tours at long intervals. The ten laboratories embrace pharmacology, agricultural chemistry, agricultural zoology, phytopathology and physiology, a botanic laboratory reserved only for foreign *savants*, and laboratories for the study of tobacco, coffee, and of primeval forests. The Laboratory of Agricultural Chemistry studies the nature of soils, the ingredients to be introduced there, the fermentations of the products, their bacteriology and plants sent by private individuals to be examined: the Laboratory for Primeval Forests deals with wild vegetation; the Laboratories of Agricultural Zoology and phytopathology investigate animal and vegetable parasites which infest plants. The protective value of such work is immense and the interests at stake are so large that the planters do not grudge the expenditure the Buitenzorg Institute involves.

Last year Dutch India produced over one hundred million pounds of coffee—and coffee plantations are peculiarly liable to sudden destruction by disease such as ruined Ceylon as a coffee-growing country last year. Dutch India produced 766.238 tons of sugar—and on sugar-cane no less than 150 insects have been counted. But Buitenzorg is not concerned with protective investigation alone. It possesses a Trial Garden where new growths are tried for the market and efforts made to establish new industries or improve old ones. This garden has a director, a hundred workmen, a supply of tools and a chemical and physiological laboratory. Nor is what may be called missionary work forgotten. By publishing results, by visiting plantations, by examining and reporting upon specimens sent in, the experts at Buitenzorg strive to interest the planting and agricultural community in the best methods, to create as it were a scientific atmosphere so that nothing which may give the products of Java some advantage in the markets of the world may be neglected or remain unknown. When it is added that in addition to the organisation mentioned Buitenzorg possesses a herbarium consisting of tropical and forest flora library of 6,000 volumes and an active publishing or information distributing department one begins to realise the thoroughness of the system which has made the Hortus Bogoriensis, one of the model institutions of its kind in the world. The little botanical garden found by Professor Reimwardt nearly ninety years ago was intended "to screen science to carry high and for the renown of Holland," and his successors have worthily striven to live up to this ideal.—*Times of India*.

## FRAUD IN JAVA AND MOCHA COFFEE.

In response to an invitation from the editor of the *Spice Mill*, August E. Gans, of Chicago, who has recently been more or less prominently before the public as a "coffee expert" seeking to carry on an educational propaganda against the alleged practise of selling Brazilian coffees for Java and Mocha, has furnished the following communication, written upon the letter heads of the Chicago Cooking College, in which Mrs. Nellie Duling Gans is "principal, demonstrator, and entertainer." The letter is sufficiently eloquent to speak for itself.

CHICAGO, August 27, 1903.

Editor of the *Spice Mill*:

"Coffee" is a subject upon which many books have been written, and upon the "American" commercial treatment of which another

one—on asbestos—can be written, as you know perfectly well! "Roasting" is a vital treatment applicable particularly to "cahue" (of the unspeakable Turk), but you—as an editor—will surely appreciate its proper use with regard to the "prosperity" drawn by dealers in and sellers of *coffee*, "misbranded" as "Java and Mocha" at the expense of the "dear people"!

Your query: "How does it come that you are so much in earnest about this matter?" although singularly polite, notwithstanding its "American nerve," should have read simply: "How much cash do you make by your interference in coffee?" However, since the writer three times in his life has had the pleasure of intimacy with the blue pencil as an "editor," he appreciates where you stand, and begs to answer his own paraphrase of your question with "not one cent." Still, as a newspaper man, you scent the battle from afar! Why I have made "coffee" an "issue"—against all the millions and all the type in its defence—would make pretty "hot stuff" in itself, although the heading of this letter partially explains my interest in food matters, and especially in "pure food matters." That is, however, another story! It will be told sometime.

For nearly two years I have investigated "coffee" in Illinois, Michigan, Ohio, Wisconsin, Minnesota, and Missouri, have had at my disposal all the federal statistics and reports of Senate and other Committees on foods, all that has been printed on coffee in French, Spanish, German, and English (including the Coffee Convention, New York, October, 1902, Coffee Exchange), all the Food Commissioners of various States, and their national conventions—in one word I have done with coffee what Heinrich Boerne accuses the Germans of doing when they want to clean a grease spot out of a coat: "They study chemistry first!" And all that without a "dollar" from anybody! Is not that "cranky"?

The absolute "fact"—frozen facts as Oakes Ames used to call them—which nobody dares or can attack, are simply these: We have eighty millions of people. They consumed, in 1901, an average 10.60 pounds of coffee, or about eight hundred and fifty million pounds. In these eighty millions of people the census of 1900 will give you the number of dealers in coffee (importers, brokers, wholesale and retail grocers). Now then, in 1897 or 1898 I paid in Chicago between 40 and 45 cents for a pound of "Java and Mocha." In 1903 I pay the same for the same thing. In the six years from 1897—1902 inclusive, we imported to the United States about one hundred and thirty-eight millions "Java and Mocha," and from Brazil alone about four thousand millions of pounds of coffee. To these four thousand millions you must add the importation from all the rest of the coffee-producing countries. Since acquiring Porto Rico and the Philippines we have also become "producers," only the quantity we produce "cuts no ice" as yet. The entire total of coffee imported into the United States in six years is about five thousand million pounds, of which only nearly one hundred and thirty-eight millions were "Java and Mocha" and of these one hundred and thirty-eight millions there were not twenty millions "Mocha." Now then, the grocers, etc., of the United States have sold us daily in six years (and they all have "boomed" it) "Java and Mocha" at from 35 to 45 cents per pound at retail, when all the genuine "Java and Mocha" in the country in six years amounted only to one hundred and thirty-eight millions of pounds.

And now comes the peculiar "prosperity" question: Why do we pay to-day up to 45 cents a pound for "misbranded" "Java and Mocha" when the price of coffee has gone down in Brazil from \$20 per saco (bag = 60 kilos. = 134 pounds) to \$5 (about) per bag? Who is my authority for that statement? Senor Don J. T. de Assis-Brasil, the Brazilian minister in Washington, as delegate to the Coffee Convention of October, 1902, in New York. And what has Brazil got to do with "Java and Mocha" in the United States?

Simply that the Brazilian "Bourbon Santos" (grown from seeds of the coffee grown on the French island of "Réunion," formerly "Bourbon," on the west coast of Africa, which is known as "Bourbon," and does resemble Mocha) is sold us to a very large extent as "Mocha."

Then there is "Bogus Mocha," "Peaberry Mocha" (in the former of which the buyer simply drops the "Bogus") and the Lord only knows what else that is sold us as "Mocha," partly in tin cans elegantly "labelled" as "Java and Mocha," not to forget the "Mocha" manufactured by sifting machines in Brazil (according to F. G. Carpenter) as well as in the United States. And what is "Mocha"? The first and only coffee ever known in the civilized world, came from Arabia, was known as "Mocha," and has been

appreciated by that name for its peculiar aroma "between new-mown hay and fresh tea" ever since.

In 1683, when John Sobieski, of Poland, whipped the Turks besieging Vienna, the victorious Poles found in the tents of their abandoned camps "Mocha" in all its stages—a fact which I cannot find in encyclopedias, but which I learned at college.

The province of Yemen in Arabia (Arabia felix = Happy Arabia), however, produces now only about twelve millions of pounds of coffee, on which the entire world draws, and which, if they all came to the United States, would make only forty-eight millions of pounds of "Java and Mocha" mixed with three quarters of a pound of Java to each one quarter of Mocha.

Since the people of the United States drink in one year about eight hundred and fifty millions of pounds of coffee, even the entire product of Yemen could not begin to supply in the United States the (artificially increased) demand for "Java and Mocha"! So it is supplied "otherwise."

A grocer in a city of about 200,000 inhabitants, to whom I suggested that I would "educate" the people, said: "Now, don't! the less they know the better they're off." "You are mistaken," I replied, "what you mean is 'The less they know the better I am off.'" He just had sold me for 45 cents one pound of "Java and Mocha"—when there was not one bean of "Mocha" in his entire town! However, the end of this dishonest swindle is near. In Illinois the pure food law passed in 1899 says: Section 14—"An article shall be deemed adulterated \* \* \* \* Fourth: if it be an imitation of and sold under the name of another article."

All the shystering of hired attorneys will not prevent the ultimate enforcement of this plain law, which provides for its violations in Section 23 for fines of from \$25 to \$200 or jail for from thirty to ninety days, or both, in the discretion of the court. I ask you—and all the people who understand "grafting" and "politics"—why is this law not enforced in Illinois? Is it the same "influence" which sent an attorney from Chicago to Washington to argue the perfect propriety and legality of selling glucose syrup as "Maple Syrup"? To those of your readers who desire to go into "medias res," I recommend very seriously the reading of the report of last year's coffee convention committee on the "Causes of the Crisis" in coffee (brought on by the fall in price from \$20 per bag to \$5 per bag), in Senate Document No. 35, which publishes the coffee convention's proceedings, reports, etc. I emphasize "publishes," because W. J. Bryan before the trust conference in Chicago, and Mr. Roosevelt, as president, agreed and agree with the writer that "Publicity" is our national police or "gensdarmierie," and the International Coffee Convention of 1902, by adopting the report of its committee on the "Causes of the Crisis," confess and "admit" their conviction that there is a "monopoly in coffee," otherwise a trust which benefits "middlemen" to the detriment and at the expense of the "totality of producers and consumers."

As they say in Latin-American countries: "Hé dicho!"

AUGUST E. GANS.

## DISTRICT ASSOCIATIONS.

### SHEVAROY.

A Special Meeting of the Association was held at the Victoria Rooms, Yercaud, on Monday, October 5th, to consider the following with respect to the new Feeder Roads.

I. Contract rates.

II. Whether planters are willing to take the Construction Contracts themselves or whether it would be *advisable* to let Government procure an expert.

PRESENT:—Messrs. J. C. Large, Vernede, F. Short, S. M. Hight, Pritchard, C. J. Lechler, C. Dickins, B. Short, Ryle, Limouzin, W. T. Lechler, Rev. H. Anderson, W. Hight, Cole, W. Rahm, Campbell, C. Rahm, and B. Cayley (*Honorary Secretary*).

The following four Resolutions were passed:

1. That the Government rates offered for the Feeder Roads be agreed to. Proposed by Mr. S. M. Hight and seconded by Mr. C. Dickins and carried by 12—3.

2. That, though we have accepted the Contract rates offered by the Executive Engineer, we are of opinion we shall not be wholly recompensed for the loss of our coffee by any profits that may be made on these contracts and hope that this circumstance will be taken into consideration.

3. That it would be fairer to all concerned to hand over the contract of the road only to those planters whose property it runs through, whether private land is taken up or not, also that, as crop is coming on and labour may be interfered with, the contracts be given to those *planters alone* who are interested in the same. Proposed by Mr. F. D. Short and seconded by Mr. S. M. Pritchard. —Carried unanimously.

4. That, as it has been pointed out to this Meeting that the contract for the regrading of the road from Yercaud to Hopeville, passing the Stanmore Estate (a distance of one mile one furlong) has been given to a Contractor, though half the width of the road is still owned by the proprietor of the above estate and khist is still being paid thereon, it was resolved that the matter be brought to the notice of the Executive Engineer with the opinion of the Meeting that this contract should have been offered in the first instance to the above proprietor.

(Signed) BERNARD CAYLEY,  
*Honorary Secretary.*

## KANAN DEVAN.

Proceedings of Quarterly General Meeting held in the Munaar Reading Room on Saturday, the 26th September, 1903, at 1-30 p.m. PRESENT:—Messrs. J. A. Richardson (*Chairman*), R. W. Cole, A. F. Martin, W. C. Martin, W. O. Milne, W. A. Lee, H. L. Pinches, T. C. Forbes, M. C. Koechlin, C. Bell, E. E. Williams, J. M. Bridgeman, C. B. Holeman-Hunt, A. J. Wright, Baron J. Von Rosenberg, E. R. Howlett, J. French, H. R. Quartley, H. S. Holder (*Honorary Secretary*), Rev. F. E. Markby, Messrs. R. Harley, R. F. Thorp, C. H. Corry (*Visitors*).

Read notice calling the Meeting.

Proceedings of last General Meeting were taken as read.

Proceedings of Committee Meetings were read out and confirmed in Meeting.

Proposed by Mr. R. W. Cole, that the Rev. F. E. Markby be elected an Honorary Member of this Association. Seconded by Mr. W. D. Martin and carried with acclamation.

Mr. Markby made a suitable reply.

**Bangalore Delegate's Statement.**—Mr. E. E. Williams who had again kindly represented this Association at the Bangalore Conference then gave his report on the Meeting, touching on subjects that were of greatest interest to this Association, such as Currency Notes, St. Louis Exhibition, Tea Cess Act, Travancore Export Duty on Coffee, Delegate to Brazil, Labour recruiting, and the Madras Planters' Labour Law, his remarks on which it had been decided to receive in General Committee.

Mr. Pinches proposed a vote of thanks to Mr. Williams for having again so ably represented this Association at Bangalore.

Seconded by Mr. Bell and carried unanimously.

Baron Von Rosenberg moved the following Resolution: That since this Association is still in ignorance as to what local rules are likely to be introduced by the Travancore Government under Section 42 of the Act, the question of accepting or rejecting it be deferred and a correspondence entered into on the subject with the Travancore Government.

Seconded by Mr. Pinches and carried by 15 for to 9 against.

**Cooly Rest-Houses, Bodinaikanur.**—Read President, Dindigul Taluk Board's letter, dated 19th July, on above subject.

The Chairman directed the Secretary to reply the President that this Association were anxious to meet the Board in this matter but would like to know if the Board could help this Association in the way of a site for the rest-sheds.

**Rate of Batta.**—Proposed by Mr. H. D. Martin, that the District rate of cooly batta be fixed at 2 annas. Seconded by Mr. A. F. Martin and carried.

**Duty on Tobacco and Cigars.**—Read District Magistrate's letters and enclosures on this subject.

*Resolved*, that the Honorary Secretary do write to the District Magistrate asking if it were necessary to pay duty on manufactured Tobacco and imported Cigars that had already paid duty in British India, also that the District Magistrate be asked whether it would not be possible for him to authorise some official near Munaar to receive the duty on native Tobacco or Cigars imported by post.

**Bodi Ghaut Road.**—Read Mr. Knight's letter asking for funds with which to carry on repairs to the Ghaut Road.

*Resolved*, that the Secretary do write Mr. Knight that funds are at present not sufficient to allow of any payment being made on account of the road and that moreover it was considered too late and too near the North-East monsoon to commence repairs now.

*It has since transpired that Mr. Knight had already executed considerable repairs to the road.*

Read Mr. Bewley's letter of the 3rd August in regard to want of funds for the road.

*Resolved*, that the Honorary Secretary do write through Mr. Sealy to His Highness' Government pointing out our troubles in connection with this road and asking Government to sanction a donation of Rs.1,000 towards the cost of repairs.

**Statement of Finances.**—The Honorary Secretary laid a statement on the table showing the state of Finances; the Association had altogether Rs.615-6-1 in hand.

Read U. P. A. Secretary's letter dated the 2nd of September asking for this Association's subscription or part thereof for 1903-04.

*Resolved*, that the Honorary Secretary be instructed to pay half the subscription now, i.e. Rs.260.

**Opening of Markets in the District.**—Mr. Holder proposed that Government be asked to declare markets open at Yellapatti, Panniar and Munaar where coolies and others in the neighbourhood could purchase their weekly provision. Seconded by Mr. Richardson and carried *nem. con.*

**St. Louis Exhibition.**—Read Mr. E. E. Williams' letter of the 29th August suggesting that this Association approach the Travancore Government with a view to obtaining a donation towards the St. Louis Exhibition expenses on the same lines as those on which the Mysore and Madras Governments have subscribed, also letter from the Hon'ble Mr. G. L. Acworth making a similar suggestion.

*Resolved*, that Honorary Secretary do communicate with the C. T. P. A. on the subject.

With a vote of thanks to the Chairman the Meeting terminated.  
*Papers laid on the Table—*

U. P. A. Circulars.

I. T. A. do.

District Association.

H. S. HOLDER,

Honorary Secretary, K. D. P. A.

5th October, 1903.

## NILGIRI.

Proceedings of a General Meeting held at the Armoury, Ootacamund, on the 23rd September, 1903. PRESENT:—

**Members and Non-Members:**—Messrs. T. Stanes, F. M. Cockburn, L. C. Liebenrood, L. N. Achard, A. K. W. Downing, E. G. Windle, A. N. Groves, F. Bell, W. Deane, H. P. Hodgson, T. Brown, N. Gray, L. W. Gray, A. F. Vans-Agnew, A. R. Piggot, W. Barton Wright, A. Allan, W. Rhodes James, F. Minchin, J. McKenzie, C. H. Brock (*Honorary Secretary*). **Honorary Members:**—Messrs. C. M. Mullaly, G. Romilly, W. H. Hamilton. **By Proxy:**—Messrs. O. K. McCallum, A. W. Brodie, J. G. Findlay, F. J. Hill, A. J. B. Hare, H. Simon. Mr. T. Stanes was voted to the Chair.

The Proceedings of last Meeting were taken as read.

**I. U. P. A. S. I. Delegate's Report.**—Mr. H. P. Hodgson then read his report which ran as follows:—

**GENTLEMEN,**—As desired by you I attended the Annual Meeting of the U. P. A. S. I., at Bangalore as your delegate. The Meeting

was held on the 3rd of August and the succeeding days. Ten District Associations were represented at the Meeting by their delegates. And a large amount of business was transacted.

The *Madras Mail* kindly accorded us considerable space in the columns of its daily issue. And those interested were thus enabled to follow the proceedings which took place in General Meeting, and in consequence it will be unnecessary for me to go into the details of every subject of discussion, but there are one or two of the most important which I feel you would like me to touch upon. Perhaps the most important of these is the Madras Labour Act of 1903.

A whole day was given to the discussion of this Act in Committee. I have the full proceedings with me, but they are very lengthy. I am prepared to answer any question you wish to ask me upon them.

Several District Associations had instructed their delegates to vote against the Act, but, after hearing the discussion, I am glad to say that the final Resolution when put in General Meeting was carried unanimously. The Resolution reads:—"That this Association tenders its most cordial thanks to the Government of Madras for their endeavours to meet the requirements of the planting industries as embodied in Act I. of 1903, and while regretting that it is made to apply to all forms of contract, and to all conditions of labour, and that Act XIII. of 1859 has not been allowed to run concurrently with it, accepts it, as likely to prove of benefit to several of the Planting Districts of South India, and will endeavour to induce its members to give the Act a trial in their respective Districts."

You will see that the Resolution while tendering to the Government of Madras our thanks, which are their due for having endeavoured to meet often repeated requests for protective legislation for our labour contracts, does not commit any Districts to its acceptance, and gives only a qualified approval of the Act. At the same time in the light of the discussion that took place the majority of delegates were convinced that it is advisable to give the Act a trial, and agreed to induce their respective Planting Districts to do so. The discussion of the Labour Act is down on the Agenda paper to-day and I will say more on this subject when it comes up.

**St. Louis Exhibition.**—This subject was considered as one of highest importance to both Tea and Coffee planters, as presenting an opportunity of advertising and pushing their products in a country having a large demand for both. Tea planters both in Northern and Southern India have fully realised this and are taking active steps for the proper representation of their product. I can only express a hope that Coffee planters will do the same. The opportunity will be given them to do so, and it remains to them to accept or neglect it.

The U. P. A. S. I. has given a grant of Rs.10,000 and the Madras and Mysore Governments have each kindly assisted us with grants of Rs.5,000, and we hope to get further grants in aid from other Districts.

But, gentlemen, let me impress upon you here that if you desire to secure any real permanent advantage in the market which this exhibition opens up to you, you must bestir yourselves and arrange for supplies of coffee to meet the demand which we hope will arise after the exhibition. You are having a big advertisement provided and paid for for you. Opportunities will be given to thousands of people who have never tasted East Indian coffees to do so, and if it is really as superior to most other coffees as we believe it to be, there must be a demand for it, which, if carefully met and fostered, may lead to a new and extensive market, in which it is reasonable to expect better prices may be obtained than by dumping down our crops in the overstocked markets of London, to fetch such prices as they choose to give us.

A Committee consisting of Messrs. Harris, Martin, King Church and myself was appointed to arrange details for pushing coffee in the U. S., after the closing of the St. Louis Exhibition. This Committee is about to issue a circular to ascertain what support planters will accord to the proposal, and everything must depend upon the result of the appeal. You will realise that without the means the Committee is powerless.

**Delegate to Brazil.**—Had to be abandoned for the present from want of funds, the St. Louis Exhibition taking precedence in importance in the opinion of the Meeting.

The Secretary was however instructed to communicate with the Government of India with a view to eliciting their good offices towards obtaining through the Minister for Foreign Affairs and His

Majesty's Consuls in Brazil as much information as possible regarding the condition of the coffee industry in that country.

*Guaranteed Analyses of Fertilizers.*—Perhaps India is the only country in the world in which cultivators are content to spend large sums of money on chemical fertilizers without a guarantee of what they are buying.

And yet the value of manure depends entirely on its component parts. That these vary very widely in manures of the same kind especially the poonacs, was demonstrated to me by Dr. Lehmann both at the Meeting and subsequently in his Laboratory, but we have been buying them as poonacs without any regard to their respective values, and thereby often wasting our money in putting out a comparatively useless manure, when we can ill afford to do so. The Secretary has been instructed to again ask all firms who have not yet arranged to do so, to give guaranteed analyses of all fertilizers they supply. The names of such firms as agree to do so will be circulated to Districts Associations after which it is hoped planters in their own interest will purchase their fertilizers as much as possible from such firms.

*Remission of Coffee Assessment.*—It was resolved that the Government of Madras be addressed by the U. P. A. S. I., with a view to obtaining a remission of Assessment on all Coffee Estates, as a means of assistant to the industry in its present difficulties.

*The British Tea Duty.*—The burden on the industry caused by the present heavy duty on tea amounting to about 80 % of its present market value, has again been brought to the notice of the Chancellor of the Exchequer.

I have touched as briefly as possible upon what I consider to be the most important subject discussed at the late Meeting. But if there are any other subjects that any member present wishes for information upon, I shall be glad to answer questions.

I would draw special attention to the very interesting lecture given by Dr. Lehmann touching on the very important matters connected with coffee to which he is devoting his attention. Also to the interesting paper read by Mr. Cameron. For these as well as for what took place in Committee, I would refer you to the Book of Proceedings with a copy of which I hope every member will supply himself. I can assure him that he will get a good deal of every interesting matter.

(Signed) H. PERCIVAL HODGSON.

A vote of thanks to Mr. H. P. Hodgson was proposed by Mr. L. C. Liebenrood and seconded by Mr. C. H. Brock was carried unanimously.

The Honorary Secretary announce that Mr. H. P. Hodgson had given the Association a donation of Rs.100 to augment the N. P. A. Subscription to the U. P. A. S. I., thus raising it to Rs.350.

Mr. L. N. Achard then offered Rs.100 from Dunsandle Estate for the same purpose, which was gratefully accepted by the Meeting.

II. THE LABOUR LAW.—A prolonged discussion arose on this subject which lasted for 1½ hours, during which Messrs. H. P. Hodgson, G. Romilly, E. G. Windle, L. C. Liebenrood, F. M. Cockburn and C. H. Brock advocated giving the Act a trial in this District, while Messrs. W. Rhodes James, A. Allan, F. Bell, L. N. Achard and L. W. Gray opposed the introduction of the Act.

Finally Mr. W. Rhodes James proposed, and Mr. L. N. Achard seconded:—

"That this Association begs to decline the introduction of Act I. of 1903 into this District for the present as being not required."

Then Mr. E. G. Windle proposed the following amendment seconded by Mr. A. F. Vans-Agnew:—

"That this Association is willing to give Act I. of 1903 a trial in this District for one year."

On this amendment being put to the Meeting, 16 votes were recorded both for and against it. The Chairman gave his casting vote in favour of the amendment which was accordingly carried.

III. TEA CESS AND CALICUT CUSTOMS.—Read letters from Mr. F. J. Hill and the Hon'ble Mr. G. L. Acworth, and extracts from the Honorary Secretary's letter to the I. T. A.

The Honorary Secretary was instructed to await reply from the I. T. A., and if that body were not going to move in the matter, to address the Board of Revenue, Madras, if possible, in conjunction with the Calicut Chamber of Commerce.

IV. ST. LOUIS EXHIBITION.—Mr. H. P. Hodgson said that the Committee elected by the U. P. A. S. I. would shortly send round a circular with a view to ascertaining what support planters will give, so that they may arrange to have supplies of coffee to meet such demand as may arise from the exhibition.

The U. P. A. S. I., with the help of the Governments of Madras, Mysore and Travancore have collected Rs.23,000 to meet the expenses of exhibiting coffee (also to be served in the cup). Pepper and Cardamoms in conjunction with the Indian Tea Cess Committee's exhibits of Tea.

V. REGISTRATION OF DOMESTIC SERVANTS.—"With reference to the District Police Officer's report on the proposed Registration of Domestic Servants on the Nilgiris, this Association wishes to strongly support the movement, and again urge its necessity." Proposed by Mr. C. H. Brock, seconded by Mr. F. M. Cockburn and carried unanimously.

VI. GOVERNMENT CINCHONA ON DODABETA RESERVES.—Proposed by Mr. E. G. Windle and seconded by Mr. H. P. Hodgson:—

"That this Association offers an unqualified protest against the proposed acquirement of the Dodabeta Reserved Sholahs by the Government Cinchona Department."

Carried unanimously.

VII. MEETINGS AT COONOOR AND KOTAGIRI.—Read Mr. J. S. Hawkins' three letters to the Honorary Secretary re-holding Meetings of the N. P. A., also his proposal to form Sub-District Associations which should be represented on a United Nilgiri Planters' Association.

The Honorary Secretary was instructed to write to Mr. J. S. Hawkins and inform him that twice formerly Sub-Associations at Kotagiri had been formed but which fell through, as have General Meetings called at other places than Ootacamund, but at the same time to draw his attention to the fact that, by Rule 8, Extraordinary Meetings can be called at any time and at any place by any 8 members who must attend to form a quorum.

Votes of thanks was proposed by Mr. C. H. Brock to the Chairman and to Capt. C. T. Swan for the loan of the Armoury Room for the Meeting. Seconded by Mr. Bell and carried unanimously.

A number of papers received since last Meeting were on the table.

(Signed) THOMAS STANES,

Chairman.

( „ ) CHARLES H. BROCK,

Honorary Secretary.

## MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated September 25th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 .. .. .	388,419	403,276	35,740
1902-1903 .. .. .	410,518	436,861	28,591
41,957 pkgs. INDIAN 20,078 „ CEYLON 2,085 „ JAVA	Total 64,120 packages were offered in public auction this week.		

The official telegram from the producing districts which will be published at the end of this month is awaited with particular interest. There is no doubt that buyers are showing timidity owing to the increased crop which was reported to have been made up to two or three weeks back, and have been operating with great caution in consequence. Private cables received during the last week nearly all show that the increase is not continuing in the same proportion as it was in the early part of the season, and should the official wire confirm these reports growers will be in a strong position, especially as the usual Autumn trade in the country has not yet been done.

INDIAN.—Some teas of indifferent quality have been offered, and quotations for the same have been marked down quite ¼d. per lb. A few parcels of medium teas have also sold at slightly cheaper rates, but for the best liquoring kinds a good demand has existed, and some very satisfactory quotations have been recorded.—Amongst these the following are worthy of note:—"Rungmook," 2/1½; "Amal. T. Est. Nagri," 1/9½; "Poobong," 1/4; "Tara T. Co.," 1/2½; "Amal. T. Est. Lattakoojan" and "Beheating," 1/1½.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 37,610 pkgs., av. 7-87d. 1902, 29,680 pkgs., av. 7-13d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 247,994 pkgs., av. 7-92d. 1902, 259,334 pkgs., av. 7-13d.

*Comparative prices of Indian tea in London.*

		1903.	1902.	1901.	1900.
Dust.	(Fair ordinary, dark liquor)	5½d.	3½d.	3d.	4d.
Fannings.	(Red to brown, strong rough liquor)	5½d.	4d.	3½d.	4½d.
Broken Tea.	(Brownish to Blackish, strong liquor)	6d.	5d.	5½d.	5½d.
Pek. Soug.	(Blackish greyish, useful liquor)	6½d.	5½d.	5½d.	6d.
Pekoe.	(Greyish to Blackish, some tip, useful liquor)	6½d.	6d.	7½d.	6½d.
Pek. Soug.	(Blackish greyish, inferior liquor)	5½d.	4½d.	4½d.	4½d.
Pekoe.	(Blackish, greyish, some tip, inferior liquor)	5½d.	4½d.	5½d.	5½d.

CEYLON.—Ceylons were fairly steady and quotations for all but the lowest grades were maintained. Only small supplies are likely to be brought forward for the present, and the amount printed for next week totals little more than 13,000 packages, which is the smallest quantity that has been offered in a full working week since November, 1901.

Average for week 7·33d., against 6·78d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 780,804 pkgs., av. 7·44d. 1902, 866,909 pkgs., av. 6·68d.

*Comparative prices of Ceylon tea in London.*

		1903.	1902.	1901.	1900.
Pekoe Soug.	(Ordinary leaf, fair liquor)	6½d.	5d.	5½d.	5½d.
Pekoe.	(Ordinary leaf, little twist, fair liquor)	6½d.	5½d.	7d.	6½d.
Pekoe Soug.	(Rather bold leaf, indifferent liquor)	5½d.	4½d.	5d.	4½d.
Pekoe.	(Somewhat bold leaf, indifferent liquor)	6d.	4½d.	5½d.	5½d.

JAVA.—The Javas were mostly of useful character and met with a steady demand at prices showing little or no alteration on previous quotations. Since 1st June 30,336 packages on Garden Account realised an average of 6·59d. per lb.

Bank Rate 4 per cent. Exchange on London three months' sight:—Calcutta 1/4½. Colombo 1/4½.

## COFFEE.

Messrs. C. J. Leech & Co. write:—"We have had a series of moderate markets this week, but with a steady tone throughout. The Brazilian markets were closed on the 7th and 8th instant but on the other days cabled firm prices, and Santos offers are rather dearer on the week. There is certainly no pressure to sell from Santos, where prices are maintained at a level materially above the European "terme" parity, which latter would appear to be too low. One or two items of crop information have come to hand, and would seem to disprove the rumours that last week's smaller Santos movement was owing to rains, which would prove beneficial to the next crop. On Tuesday, Messrs. W. Botel & Co. (Santos) announced: 'Weather unfavourable for next crop; too dry; rain much wanted; drought has done considerable damage; too early to estimate.' On Thursday, Messrs. Prado, Chaves & Co. announced: 'Santos flowering reported very irregular and rather poor; weather unfavourable.' On Tuesday, Messrs. Barboza & Co. (Sao Paulo) cabled that to date one-third of the Santos crop had been received. If correct, this would mean for Santos a yield of some 6,000,000 bags only, against receipts of 8,350,000 bags last season and 10,166,000 bags in 1901-02 at that port. This week's comparison of receipts, as regards Santos, is not really as favourable as it looks, because, there were three days' holiday against only two days last year; but, all said, the figures are encouragingly moderate. Rio receipts this week, 121,000 bags, against 117,000 bags last year and 159,000 bags in 1901, Santos receipts, 193,000 bags, against 233,000 bags last year and 318,000 bags in 1901. The speculative markets in Europe have fluctuated but slightly; but New York has improved steadily. Compared with our last, we note the following price changes:—London futures: September, 6d. dearer, other months 1½d. dearer; Havre, ¾f. to ¼f.; and Hamburg, ¾pf. to ½pf. advance. New York has advanced 20 to 10 points, except for August, 1904, which is 5 points higher."

**IT ACTS LIKE MAGIC.**

SAFE, SURE, and NEVER FAILING. Price 1/1½ & 2/6.

# CONQUERS PAIN

Great firmness has again characterised the market for landed parcels this week, and the bulk of the supply brought forward has been taken off at somewhat further improved prices for the coloury sorts, the particulars being as under:—19 pkgs. Ceylon, small and grey at 49s. to 57s., middling at 80s., bold at 96s. 6d. to 100s.; 560 bags East India plantation, common Neilgherry from 40s. 6d. to 55s., other growths from 61s. to 74s., and peaberry at 36s. 6d. to 63s.; 5,180 bags Costa Rica and Guatemala, low to good ordinary at 24s. 6d. to 38s., low middling and middling at 42s. to 58s., good middling and coloury at 60s. 6d. to 68s., good and fine blue at 70s. 6d. to 80s. 6d., with peaberry from 36s. to 73s. up to 83s. and 90s.; 2,110 bags New Grenada and Columbian, part country damaged, very ordinary at 24s. to 23s., low middling and middling at 38s. to 49s., good middling greenish at 51s. 6d. to 58s. 6d., and peaberry at 36s. to 45s. 6d.; 750 bags Salvador, ordinary and middling at 28s. to 33s. and 43s. to 48s. 6d., peaberry from 45s. to 54s.; 540 bags Mexican from 34s. to 50s., and bold at 59s. 6d.; 527 bags Vera Paz on proportionate terms; and a few Nyassaland of the new crop from 35s. 6d. to 53s. for small to bold. Likewise 495 bags Washed Dumont Santos, small at 31s. to 33s., medium at 38s. 6d. to 42s., bold at 46s. to 48s.; and 2,226 bags Unwashed ditto from 28s. to 37s., with peaberry at 34s. to 39s. per cwt. The usual number of ups and downs have been observable in Futures this week, but without materially affecting the general run of quotations, which have differed little from those of Friday last, and good Santos for delivery between now and next July has been operated in at 26s. 6d. to 28s. 9d.

Comparative receipts of Brazil Coffee at the shipping ports from July 1 to September 16, 1903, have been as under:—

	1903.	1902.	1901.	1900.
At Rio ... bags	1,376,000	1,266,000	1,606,000	770,000
At Santos... "	2,635,000	2,528,000	3,044,000	2,213,000
Total... "	4,011,000	3,794,000	4,650,000	2,983,000
Crop ... "	...	12,324,000	15,496,000	10,900,000

### COFFEE IN THE U. S.

A review of the August movement will be found on another page. The market, in view of the enormous visible supply, is very steady and looks as if it was on bottom. If it can stand up under the heavy receipts at Rio and Santos and lighter deliveries in August this year as compared with last, it certainly cannot be called weak. The market for mild sorts unchanged, with prices nominal on the bulk of the stock. The sales from August 21 to September 4 include 9,879 bags Maracaibo, from 5½ @ 11c.; 16,490 bags Savanilla, from 5¼ @ 12c.; 2,234 bags Central American, 3½ @ 13c.; 577 bags La Guayra, 5½ @ 10½c.; 111 bags Jamaica, 5¼ @ 11½c.; 100 bags Coro, 5 @ 6c. Quotations nominal. Good Cucuta, 7½c.; choice, 10 @ 11c. and better; washed Maracaibo, 8½ @ 11c.; Bogota, high grade, 12 @ 14c., and better; Bucaramanga, 10½ @ 14c. for choice to fancy; Padang, interior, 14½ @ 15½c.; fancy, 20 @ 26c., and possibly

### TEA.

Messrs. Wm. Jas. and Hy. Thompson, in their Report, September 24, say: The market this week presents no new features to record—common tea has been rather easier and medium grades devoid of character have also participated in a slight reaction, but those invoices with desirable cup quality have sold freely at fully previous quotations. Home consumption this month to date shows an expansion of over ¼ million lbs., but export has fallen off some 600,000 lbs., the total clearances, however, showing a slight increase. Shipments from Calcutta on Russian account are 1¼ millions in excess of last year, while the exports from Colombo are lighter, though it seems probable that a good proportion of the heavier clearances entered for China were ultimately destined for Russia, perhaps *viâ* the new Siberian Railway. The sales have amounted to 42,000 packages against 35,300 packages last year, making the total offerings of this season's tea to date 259,000 packages against 304,000 packages a year ago. The tone has been firm for price teas, and at the decline quoted on the 17th instant buyers have come in freely, influenced possibly by the feeling that there is a general understanding among some of the larger importers not to place more on the market at one time than can fairly satisfy trade requirements. With so little of this crop realised it is early perhaps to make a hard and fast rule, but the principle is sound and is a cause for satisfaction, showing, as it does, that sellers, at all events, do not anticipate an excessive crop. The best invoices have now been mostly sold, and a slight falling off in quality is noticeable from all districts—this, as usual, has first affected the values of medium teas, which are selling ¼d. to ½d. per lb. lower in many instances than was the case the early part of this month. Fine and finest are getting scarcer, but continue to command good prices, an average of 2s. 1¼d. for a small invoice from Rungmook Estate, Darjeeling, being worthy of mention. The withdrawals from auction have not been so heavy as previously, and a fair proportion has been placed at a slight improvement. For next week about 40,000 packages are in print. There was a fairly good demand at the Calcutta sales last Friday, common tea being quoted slightly easier; the 23,000 packages offered realised an average of 5a. 8p.

### CINCHONA.

The auction to be held at Amsterdam on October 8 will consist of 7,537 bales and 421 cases, weighing 712,485 kilos. of Java bark. The stock in first hands at Amsterdam on September 15 consisted of 3,094 packages Government and 8,223 packages private bark, including the quantity to be offered at auction.

### QUININE.

A further improvement took place in second hands after the close of our last report, a good spot business being done at 1s. to 1s. 0¼d., and December at from 1s. 0½d. to 1s. 0¾d., the week closing firm at the higher figure. This week the activity has subsided somewhat, with a small business at 1s. 0¼d. spot, 1s. 0¾d. for December, and 1s. 0¾d. for March, the market closing quiet to-day at these figures.

In these tables all packages are chests unless otherwise stated. ½c stands for half-chests; p for packages; prices marked thus † represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

### RUSSIA'S DIFFERENTIAL TEA DUTY.

OUR present issue contains some interesting references to the Russian Tea Duty. The announcement was made a short time ago that the import duty on Indian and Ceylon teas imported into Russia by way of the European frontier and the Black Sea had been increased from 31 roubles 50 kopecks to 33 roubles. This meant a preference of about  $1\frac{1}{16}$ d. per lb. to China over British-grown teas. Among planters, opinions may be said to vary. Some regard this increase of duty as a counter-stroke against England because of action by her in regard to the Sugar Duties. Others assert that Russia is merely trying to stimulate traffic on her great railway in Asia. The latter is the version authorised by the Russian Consul-General in London; but it would be interesting to know what has been said to the Chinese authorities by Russian Consular representatives in the Celestial Empire. The probability is that while in England Russian representatives disclaim any intention of damaging British interests, in China they claim a determination to advance the interests of that country. The Russian Consul-General in London prepares us for little double-faced manoeuvres of this kind. Upon the question whether

Commerce of 1859, he declares that it is not: "The treaty specifies that British goods are not to pay a higher duty than the goods of any other country, but Britain is the only European country, practically, that sends tea into Russia, and the treaty, therefore, does not apply in this instance." *Ergo*, the treaty applies to *European* countries alone! Another plea, not reconcilable with the above, is that Britain by her exclusion of Russian bounty-fed sugar has already violated the above treaty.

Now, if the action taken is really intended to be retaliatory, it certainly affords an instance of the kind of thing that Britain would have to face if either Mr. BALFOUR'S or Mr. CHAMBERLAIN'S fiscal policy were adopted. There is, however, this to be remembered. Retaliation is a game that two can play; and if India were to retaliate by imposing a fairly heavy duty on Russian petroleum the probability is that Russia would not gain by her recent move, but lose, and lose heavily. We are not among those who advocate such a course. To threaten to adopt it, might be useful; but if it were really adopted a heavy loss would fall upon the consumer of Russian kerosene oil in India. This oil is now sold throughout the length and breadth of the land. Of the oils available in large quantities it is the cheapest, and if its price were materially raised by the imposition of a heavy duty, the public in most parts of India would have to bear the extra charge if Russia persisted in giving Chinese, Japanese, and Java tea a preference, and thus forced India to give effect to a threat of retaliation in regard to kerosene oil. This does not appear desirable in the interests of India, and we are inclined to think that it would be wiser for this country to face the handicap of  $1\frac{1}{16}$ d. per lb. and push her teas into the Russian market all the more vigorously, until she has conquered that market and made the duty a tax on Russian consumers rather than on British producers. Russian fiscal principles are not those that are in favour in England; Russia is sadly in want of money, and in the hope of obtaining it may for a time resort to curious methods. In the long run, however, China and Ceylon tea should win, even though their rivals be afforded a substantial preference; especially as that preference is really not so large as it appears to be when the increase of duty is set against first cost of the tea instead of, as it ought to be, against the cost of the tea laid down in Russia duty

paid. It is not in price alone that Indian tea will gain in the race against China, and the handicap referred to is really not such a very heavy one as to be regarded as fatal to all chances of a victory for British-grown teas on the Russian markets.

In this connection we would call our readers' special attention to an article on "Russian Paternalism" quoted among our Tea Notes. The price generally paid for tea in Russia will amply cover even the enhanced duty that has been announced with reference to British teas. What we want is to secure a taste for our teas among Russian consumers. In the early years the enhanced duty may lessen our profits; in the long run, if it be continued, it will merely fall upon the Russian tea consumer, who has become accustomed to carrying a very much heavier burden. To call upon India to adopt any method of retaliation at the present time would, we think, be a mistake. The probabilities are that in the near future Russian financial exigencies will be extraordinarily great. Therefore, enhanced duties all round are at least a possibility. Indian planters should push steadily ahead in the teeth of all disadvantages, certain that they will reap their reward in the course of time, and that their teas, if adapted to the requirements of the Russian markets will find an increasing sale there, no matter what obstacles the Russian Government may throw in their way.

#### COFFEE NOTES.

**Dutch East-India Figures.**—The Government crop is estimated at 221,000 piculs Java and 34,900 piculs Padang. The first Government sale will be held at *Batavia*, October 9th, containing: 16,800 piculs Passaroeang, 8,000 piculs Preanger.

Messrs. Pinto & Co., Santos, cabled that the receipts of coffee are retarded by bad weather. Crop accounts are good and Santos blossoming is luxuriant. Prospects are for large Rio and Santos crops.

Havre de Grace (Md.) *Republican* says editorially:

"It is reported that the competition of the Brazilian coffee plantation, together with exhaustion of the soil, is driving the coffee industry out of Java. It is a well known fact that there is not a pound of Java coffee on the American market and has not been for years."

Editor McCombs has been misinformed, says the *Merchants' Review*. There is really no competition of consequence in the market for fancy Java coffees, and so far from being extinct the supply of Java coffee in our market yearly amounts to fully 20,000,000 lbs. It is, however, true that much of the so-called ordinary Java coffee is of Brazilian origin.

The coffee-men of Porto Rico met in San Juan, September 20, and organized for trade purposes. The meeting—the first coffee convention in the history of the island—brought together 200 men interested in the industry, every bank being represented, who pledged themselves to aid the movement to bring about better conditions. Acting Governor Hartzel announced the receipt of a cablegram from Governor Hunt assuring an immediate discussion of the reciprocal

commercial treaty with Spain which would open the Spanish market, now closed by the tariff. The planters are encouraged by the plans under discussion, which are directed to reaching the retail trade in the United States.

**Central American Coffee Crops.**—Private mail advices received from Central America note that the Costa Rica crop will be considerably smaller than the last one, but reports from other districts vary greatly, the crop in some parts amounting almost to a complete failure, whereas in the higher parts a good crop is expected. It is, however, feared that the size of the bean will only be moderate. News from Salvador state that the Santa Ana and Oriental districts promise a good crop, but not so large as the one this year, which was exceptionally large. Around Salvador city the prospects are not so favourable. The estates at Guatemala, which last year suffered so severely from the eruption of the Santa Maria volcano, have greatly recovered in appearance. They will, however, yield no crops this season, for although there have been signs of flowering, the buds have not set. The shortage this season from these estates amounted to 200,000 quintals. Reports from Mexico note complaints of too much rain in the higher districts (Orizaba, etc.), whereas a good crop is expected in the lower ones (Tapachula).

This is the season of big consumption, says the *American Grocer*, and as blended coffee has caught the popular fancy there is a higher basis for choice to fancy Guatemala, Bogota, Bucaramanga, and other desirable Mexican and Central American coffee than for the bulk of the stock.

Estimates of the 1903-04 Brazil crop place the outturn at 13,000,000 bags.

**The U. S. Coffee Market.**—The market for both actual supplies and contracts was firmer, says the *Tea and Coffee Trade Journal* of the 22nd ultimo, and prices advanced  $\frac{3}{16}$  to  $\frac{1}{4}$ c., with a tendency still upward. This was attributed to the stronger and higher Brazilian and European cables, a slight decrease in the crop movement and rumors current to the effect that the yield of the present Brazil crop has been overestimated to a great extent. Private cables received here from a prominent firm at Santos, say that labourers are retiring from the interior of São Paulo, which is an indication that the picking of the crop is at an end. This news has caused a bullish sentiment in trade here and in Europe. The demand in the local market was more active, as is usual at this time of the year, and buyers showed a good disposition to purchase more freely on the basis of present prices, which looked attractive. There was also an improved inquiry for invoice lots for shipment from Brazil, which resulted in fair sales of Rio Nos. 7 and 8 at about  $4\frac{7}{8}$  to  $4\frac{15}{16}$ c.; Santos No. 3 at 6-30 and described as good roasters of Rio No. 7 at about  $5\frac{1}{16}$  to  $5\frac{1}{8}$ c., all cost and freight terms. Trading in invoices on the spot was narrow, and no sales of importance were effected. The rise in prices towards the close of the week brought the distributing business to a standstill and a general quiet pervaded the market. Holders of invoice parcels on the spot were firm and named  $5\frac{5}{16}$  for Rio No. 7,  $5\frac{1}{16}$  for Rio No. 8,  $6\frac{1}{8}$  to  $6\frac{1}{4}$  for Rio No. 4,  $6\frac{5}{16}$  and  $6\frac{3}{8}$  for Santos No. 4,  $6\frac{1}{16}$  to  $6\frac{1}{8}$  for Santos No. 5, regular New York terms. The quality of the

receipts at Rio and Santos continues to show an improvement, but it is expected that the quantity of the better grades will not be as large as last season, consequently there had ought to be no reason for changing the official differences between the different grades of coffee.

Trading on 'Change was not active and general conservatism on the part of operators was apparent. The drawback was principally the unprecedented large visible supply of coffee. The advices to the effect that the present crop has been underestimated were accepted by operators as mere theories, as they have received similar reports in previous years, which failed to materialize. Prices show a partial advance of 5 points.

The demand for mild grades of coffee showed an improvement and prices rested on a firm basis in sympathy with the advance in values of Brazil coffee. Transactions for the week were fairly large and included sizable parcels of good Cucuta at  $7\frac{1}{4}$  to  $7\frac{3}{4}$ c. Good roasters brought as high as 8 to  $8\frac{1}{4}$ c. East India growths were steady, but no large parcels were traded in. It was rumored that an invoice of pale Padang interior was sold at  $15\frac{1}{4}$ c., *ex store*. Private mail advices from Holland state that the tendency was firmer and although transactions were not over-important, the sales in the aggregate were satisfactory and higher prices obtained. The demand for fancy Javas was active, and full prices were obtained by sellers. Holders asked 26c., Dutch currency for good ordinary Java.

\* \* \*

In the coffee report issued by Mr. C. E. Bickford, broker of San Francisco, on September 4, 1903, is the following account of the present condition of the coffee market: Little change has occurred since the 7th ultimo. The period is a dull one and all markets remain quiet. Some exceptional sales have been made of strictly fancy, bold blue washed Costa Rica at 14 @ 15c., but the quantities were small, owing to depleted stocks. The business could be repeated on a larger scale with suitable coffee. Salvadors are held on the basis of  $7\frac{1}{2}$ c. for current unwashed, but without transactions; buyers at 7 @  $7\frac{1}{4}$ c. Inferior and ash-damaged coffees have sold irregularly, generally lower. Conditions as to next Brazil crop are by some regarded improved on reports of rains being general throughout the State of San Paulo. Others contend that the crops had not been menaced by the lack of it up to this time. The present crop is coming forward freely, receipts at the ports of Brazil being still in excess of last year's some 300,000 bags.

#### TEA NOTES.

**Russian Paternalism; ITS INJURIOUS EFFECTS UPON THE TEA TRADE OF THE EMPIRE.**—A correspondent of the *Evening Post*, who is making a study of economic conditions in Russia, has the following to say of the blighting effect of Russian Paternalism on the tea trade:

The illustration which Pierre Leroy Beaulieu gives of the way Russian paternalism affects the tea trade is a case in point. The Russians are probably the greatest tea-drinkers in the world. Hankow, on the Yangtze, in China, is their great supply market. There are two ways by which its output may reach the Russian consumers; one is by sea *via* Odessa, and the other is overland, largely on camel back. From official data, registered in 1893, it costs \$9.80 to convey

a pood, or thirty-six of our pounds, from Hankow to Nijni-Novgorod, while the same quantity of tea can be transported through the Suez Canal to Odessa, and from there to Nijni by rail for \$3.12. Economic laws have marked out the tea route, but Russian paternalism, assuming to be wiser than nature, sketches a different course. At Odessa the custom-house authorities meet the tea with a duty of \$17 for the pood, while at Kiakhta, on the other route, they ask but \$9.72 on leaf tea, and less than one-fourth as much on the tea pressed into bricks, such as the poorer people use.

The immediate and outward effects of this radical piece of paternalism are, of course, good; its real effects would be, could consuming interests be ignored. This transit supplies thousands of Siberians with a livelihood. Tea begins to pour into Kiakhta in November; in December it is not uncommon to see 5,000 boxes delivered daily. Tea destined for this point from Hankow, as he described the process in 1900, is first sent by boat to Tien-tsin, whence it goes up the Pei-ho on junks to the foot of the Great Wall, where it is packed on the backs of camels. Its first journey is one of 900 miles across the desert to Urga, the sacred town of Mongolia. Transport can take place only at this end of the line in October, when the roads are hardening with frosts and the camels have returned from their Summer pasturage. These camels are hired from the Mongolians, and for them the tea merchants have to compete vigorously, since there is great profit for those who secure the first of the crop of tea. A certain quantity of tea is also conveyed in little Mongolian carts, which, in turn, carry back wood.

The camels are unloaded at Kiakhta, and the wicker boxes, each containing about 150 pounds of tea, are divested of the camel's hair covering which has served to protect them across the desert of Obi, where rain is almost unknown. For the rest of the journey across Siberia it is necessary to screen them with waterproof covering. The earlier teas which arrive are carried by sledge for the next stage of their journey, although river boats and ultimately the railroads help in their further conveyance. The outlines of this trip show something of the difficulties of getting tea by an overland route through such a stretch of country; it often takes a year from the time of gathering the leaves. The notion that this method of conveyance improves the quality of the tea is regarded by experts as something of a superstition. In any event, it must ride many miles on the sea, and that is the supposed deteriorating influence. The Hankow-Peking Railroad will doubtless cut out the sea trip but this had not become a factor when Beaulieu wrote his scholarly treatise on the subject. The Trans-Siberian Railroad, great as its effects as a trade route have been, does not remove the need of Government subvention if it is to compete with waterborne freight. This it gets in the form of lower duties at its ports of entry. The iron horse and the camel are treated alike whenever economic law would of itself decide against either.

Tea costs, after these transportation charges and middlemen's profits have been met, about five times its value where it grows. This the Russian consumer has to pay for. The difference between the duties at Odessa and those by the land route the Russian treasury loses. No one gains the difference; it is wasted in an expensive method of transportation. It comes to pass that, although tea is the great drink of Russia, occupying a larger place in the country's social life than almost any article that we have in America, the peasantry drink a wretched quality made from the steeping of the leaves over

and over again till the decoction is only straw-coloured water. Suppose the Russian Government left this business to economic law, and assessed on the water-borne tea only the duty that she now collects from that which comes overland, what would be result? Tea would be cheaper. Her people would consume more of it. Business of the transporting agencies would increase by leaps and bounds. Perhaps some of the money that the peasantry saved in this way they would expend on something else, and so employ the labour temporarily thrown out by withdrawing the Siberian overland subsidy. But this would not be paternalism.

**The U. S. Tea Market.**—The demand was more active, says the *Tea and Coffee Trade Journal* of 22nd ultimo, and the trading in lines as well as in invoices was confined principally to parcels on the spot. Desirable grades of green teas were mostly patronized, and sellers obtained full prices. The spot stocks of the latter grades are light, and arrivals from the East were readily absorbed at full values asked. As a result of the scarcity of the better grades of Formosa and Congous, prices are very strong, and an advance is not improbable. Business transacted in spot invoices, included 5,000 packages of Pingsueys at about 21 cents for pea leaf, 19 cents for seconds and 23 cents for firsts; 1,000 packages of fine Formosa at about 19½ cents; 600 packages of good Congous at about 9 to 9½ cents, and 1,200 packages of Imperial country greens, seconds, at about 22 cents. The lower grades were not wanted, but prices were steady in sympathy with the firmness of the better qualities. Advices from the East were steadier, but prices asked for parcels for shipment were too high to admit of business.

Packet tea is deservedly growing in favour in the States.

**Colombo Tea Sales.**—The demand was strong for all grades on the 14th instant, and bidding was brisk. Leaf teas were again firmer, while a recovery was noticeable to some extent in Broken Pekoes, which sold more readily than of late.

**London Tea Market.**—Reports to Calcutta state:—At the usual auctions 43,000 packages of Indian tea were offered and 39,000 sold. The market was generally firm and prices were fully maintained. 15,000 packages of Ceylon tea were offered and 14,000 sold. There was generally a good demand at fully previous rates. Broken Pekoes were firm and prices rather dearer. The average price of Indian tea was 8d. and Ceylon tea 8d. also. Pekoe Souchongs fetched 6¼d.

The total exports of China and Japan tea to U. K. from commencement of season to date (excluding Java) was 14,000,000 lbs.

Soluble Tea is being advertised for sale in Ceylon as "an absolutely pure extract of Tea from the finest Ceylon leaf." Price per 1-oz. bottle, cents 68; per 2-oz. bottle, Rs.1-13. It is stated that one ounce makes 50 cups of tea.

**Cheap Teas.**—Quite recently a representative of *Commercial Intelligence* had a conversation with a prominent merchant of Mincing Lane; and, in the course of it, C. I. wanted to

know the place taken by Britain in the tea trade. "That would be a long story," said the Man of Tea; "but I can tell you all about cheap tea. On account of over-production they had seen tea from India and Ceylon down to 4d. per lb. Probably it was brought about by climatic influences, but the planters really did not possess undivided profits to apply to the development of their land. Consumption had overtaken production, and consequently brought up the price until the commoner grades were 2d. more than the lowest. Provided no more than 10 million extra lbs. were sent from India on last year's shipments, the price would remain at the same high standard. But should the quantity materially exceed that amount, there was hardly any doubt the old level would prevail. A feature in the tea trade within recent years had been the rapid opening up of branch shops by retail companies. At the present time in districts where there were from 30,000 to 40,000 inhabitants, there were frequently five or more large companies with an establishment in the principal street. In most cases each sells tea under cost price. It was simply a question of "the survival of the fittest," but in the meantime the single-shop grocer found it very difficult to get a profit or a fair return for the money invested and the energy bestowed upon the enterprise. The bait of "1s. 6d. is our price" was a serious point both from the point of view of a planter and a grocer. It was ridiculous to imagine that the best tea could be sold at that price. Still the public were met at every corner with—"1s. 6d. the best—why pay more?"—and the consumer forgot quality altogether so long as the tea was cheap.

Here is a significant fact. Teas from the districts of Assam and Darjeeling fetched better prices this year than has been the case for a considerable time. This proves that the taste for the finest teas of the earth has not been lost. From 3s. to 4s. per lb. under the hammer has been obtained for "Stand high teas, and many parcels were sold between these prices.

The tea market of the world is still in London. Australian, Canadian, Russian, and New Zealand buyers have sold a large quantity of tea in Calcutta. This plan is adopted in order to save freight, insurance and warehouse charges by shipping the tea direct from the countries of production. Java tea is the only one that has increased in consumption in England, as well as in India and Ceylon. During the last four months the low quality China teas are showing an increase, on account of the high price of Indian and Ceylon, which compel large retailers to use a certain portion in their proposed blends. Most of these common Congos are first shipped to New York from China, and, because they are of such inferior quality, they were found to be unusable. They were then shipped to London, and sold readily.

The foreign market for British-grown tea shows a steady though slow increase. One of the newest developments has been the production of pan-fired Indian and Ceylon grown tea—prepared on the same principle as the Japan and China grown. This tea is being sold readily in America and Canada.

With regard to sugar, the outcome of the Convention has been an additional duty in Russia of 1 rouble 50 kopecks on every pood of tea coming from India and Ceylon or across the European frontier from other than Baltic ports. The duty on China tea, however, remains unchanged in Russia. This appears to be a retaliatory measure for excluding Russian sugar. Many retailers have little or no profit on sugar, and do not stock it. In fact, many grocers refuse to sell sugar unless tea is purchased. Possibly the provision dealers who

sell tea will now be forced to add sugar. The question of weighing tea with and without paper was discussed, but as the matter will shortly be settled on appeal, it is unnecessary to say more than that the whole dispute has arisen out of over competition.

**Japan's Tea Trade.**—Tea trade for this year, says *Commerce*, of Tokio, Japan, began with a higher quotation by over ten yen than was the case last year. But the price has steadily fallen and there is now the leaf quoted for a little over 30 yen per picul; although the depreciation does not

depend upon the inferiority of its quality. In fact the market value of tea remains as firm as it was fixed in the beginning of the season. Nay, it is even higher than the quality of the leaf may warrant it. At any rate it does not show a tendency to fall, now that about half the amount of tea for the season has been brought on the market. Such being the case, although transactions in general are far from being active, we cannot but regard them as being favourable in every respect.

Moreover, the quality of this year's tea being somewhat superior to that of last year's product, there is no reason to regard the market value of the former as higher than the latter. As to sales effected, it may be noted that the amount delivered up to the 10th instant did not fall short of 4,969,500 kin, valued at 2,472,961 yen, the average price per picul being 49.73 gen.

\* \* \*

**Calcutta Tea Sales.**—Offerings continue to come forward on a fairly liberal scale, and the auction on the 16th instant consisted of 24,500 packages which included about 550 packages of green manufacture. Taken as a whole the average quality may be said to be somewhat higher than that seen last week on account of larger offerings from Assam and the Dooars, but these call for no special comment, as such improvement as is noticeable, taken mark for mark, is but small. Other teas are without material change, but the neat leaf Pekoe kinds usually secured by the Bombay and Persian Gulf buyers continue to gradually lose their black glossy appearance so much appreciated for those outlets. The position in London continues very strong, which will doubtless be reflected on our local market, and anything like a decline in prices, at any rate for common leaf grades, can hardly be looked for.

From crop returns made to date by garden managers in the various producing districts as compared with those to the same period last season, prospects would now appear to be much more favourable, and the likelihood of a short crop very small. In nearly every district outturn is ahead of last season to date, and in some cases very considerably so, attributable to a large extent no doubt to improved climatic conditions, but indications are not wanting that some concerns are resorting to coarser plucking as a means of realizing a perhaps somewhat high estimate. This policy has proved a fruitful source of loss in the past when over-production caused such disastrous results to tea-growers generally. Last season's short crop, however, to a very great extent rectified this by reducing stocks in all consuming centres to a very low level and thus placing the industry as a whole on a sounder basis. With fresh markets opening up and an increasing demand from already existing ones, a larger outturn can this season be handled without inconvenience. It is estimated that the Indian crop will show roughly an increase of about ten per cent. on last year's final figures, which should mean that 158 to 160 million pounds would be available for the United Kingdom. This quantity, it is considered, would not be in excess of requirements but it is to be hoped a system of coarse plucking will not be indiscriminately adopted and an unwieldy quantity of tea produced and forced on the market, thus undoing all the good that has resulted from last season's early close. Here and there managers speak of the cold weather setting in rapidly and hint at an early close, which is customary news at this time of year, but most reports mention favourable

and over again till the decoction is only straw-coloured water. Suppose the Russian Government left this business to economic law, and assessed on the water-borne tea only the duty that she now collects from that which comes overland, what would be result? Tea would be cheaper. Her people would consume more of it. Business of the transporting agencies would increase by leaps and bounds. Perhaps some of the money that the peasantry saved in this way they would expend on something else, and so employ the labour temporarily thrown out by withdrawing the Siberian overland subsidy. But this would not be paternalism.

The position in London continues very strong, which will doubtless be reflected on our local market, and anything like a decline in prices, at any rate for common leaf grades, can hardly be looked for.

From crop returns made to date by garden managers in the various producing districts as compared with those to the same period last season, prospects would now appear to be much more favourable, and the likelihood of a short crop very small. In nearly every district outturn is ahead of last season to date, and in some cases very considerably so, attributable to a large extent no doubt to improved climatic conditions, but indications are not wanting that some concerns are resorting to coarser plucking as a means of realizing a perhaps somewhat high estimate. This policy has proved a fruitful source of loss in the past when over-production caused such disastrous results to tea-growers generally. Last season's short crop, however, to a very great extent rectified this by reducing stocks in all consuming centres to a very low level and thus placing the industry as a whole on a sounder basis. With fresh markets opening up and an increasing demand from already existing ones, a larger outturn can this season be handled without inconvenience. It is estimated that the Indian crop will show roughly an increase of about ten per cent. on last year's final figures, which should mean that 158 to 160 million pounds would be available for the United Kingdom. This quantity, it is considered, would not be in excess of requirements but it is to be hoped a system of coarse plucking will not be indiscriminately adopted and an unwieldy quantity of tea produced and forced on the market, thus undoing all the good that has resulted from last season's early close. Here and there managers speak of the cold weather setting in rapidly and hint at an early close, which is customary news at this time of year, but most reports mention favourable

weather for growth and manufacture which scarcely leads to the belief that many gardens will fail to reach their estimated quantity.

\* \* \*

Though Indian production is far ahead of last year's figures, the excess only serves, says the *Englishman*, to supply the deficiency of the Ceylon crop, and consequently there is not actually more British-grown tea available to date than there was last year. Indian shipments to London are in excess of 1902 to same date by some  $7\frac{3}{4}$  millions the figures to 12th instant being 1903,  $87\frac{1}{2}$  millions, 1902,  $79\frac{3}{4}$  millions. Ceylon shipments to U. K. show to 5th instant, the latest available figures, on almost exactly corresponding deficit with  $80\frac{3}{4}$  millions gone forward in 1903 against  $73\frac{1}{2}$  millions in 1902. Thus the *status quo* in London is preserved and consumption having been more active the steady tone of the market is accounted for. It remains to be seen, however, how the remainder of the Indian producing season will affect these figures. Last year the flush closed down early, but as yet there have been no signs of an early close to the present season. Foreign and Colonial demand (except Australia) continues on the up grade. The Russian trade is doing remarkably well. The revised tariff on teas ruling European Russia direct is having the foreseen result of firing the article round by Dalny and the Siberian Railway, which was doubtless the Russian Government's intention in imposing it. The consequence of this development must be a quickening of demand direct from Calcutta and a cessation of the re-exporting business from London and so far is in favour of the local market. Green teas have been lower of late, but after the rains these are past their prime and quality in cup of recent invoices have not been equal to former offerings.

\* \* \*

**London Tea Market.**—Cabling to Colombo on the 15th instant Messrs. Gow, Wilson & Stanton, of London, reported a fractional advance. They quoted fair-liquoring Ceylon Pekoe Souchong  $6\frac{1}{4}$ d., average for the week 8d. (up  $\frac{1}{4}$ d.). Reuter gave the average for Indian at 8d. also (up  $\frac{1}{8}$ d.). Of 15,000 packages Ceylon offered 14,000 were sold.

### NOTES.

#### Java Cinchona.

The shipments from Java for the whole of September were 1,237,000 Dutch lbs., as against 950,000 Dutch lbs. for the same month last year.

#### The Rubber Canker in Ceylon.

Mr. J. B. Carruthers, Government Mycologist, has been working at the Peradeniya laboratory for some time over the rubber canker, and lately proceeded to Kalutara to make an exhaustive study in the field. If necessary, Mr. Carruthers will devote three weeks to this work. Besides much rubber on privately-owned estates in this district, Government has an experimental plantation which is affected

### GENERAL ARTICLES.

#### PRODUCE AND PLANTING.

Whether the object be retaliation for the exclusion of Russian sugar from our market or merely cussedness or something more diplomatically subtle, the fact remains that the Czar's advisers have by levying an increased duty on tea from India and Ceylon aimed a blow which it is intended shall be felt. The import duty on Indian and Ceylon teas imported into Russia by way of the European frontier and the Black Sea has been increased from "31 roubles 50 kopecks to 33 roubles." This means that the duty on Indian and Ceylon teas entering Russia by any other route than Dalny and the Trans-Siberian Railway has to pay a duty roughly of  $9\frac{1}{8}$ d. and 1s.  $11\frac{1}{2}$ d. per lb. instead of 8d. and 1s.  $10\frac{1}{2}$ d. per lb. respectively, and amounts to a preference of  $1\frac{1}{8}$ d. per lb. to China over British-grown teas.

The Russian Consul-General in London, Baron Ungern Sternberg, denies that this duty is retaliatory in intention, or has any relation to the Sugar Convention. His explanations are that Indian and Ceylon teas are imported into Russia only in very small quantities. Russia is very anxious to encourage the Trans-Siberian Railway, and at the same time foster the town of Dalny, which at present, it may be explained, exists only in the shape of stone and lime, and, so far from wishing to retaliate against Great Britain, she only desires to admit by a quicker route an article which has recently grown greatly in favour in the country. "Russia," said the Baron, "only uses Indian and Ceylon teas for blending with Chinese teas because a better flavour is produced. "Besides," he added, "Russia wants a little money. That is all that it amounts to." This is the official explanation of Russia's action, but the conclusion is inevitable that the increased duty is retaliatory in intention and will be retaliatory in effect. Only teas re-exported from Great Britain or sent into Russia *via* the European frontier and the Black Sea will be subject to the increased duty. Teas going over the Trans-Siberian Railway are subject to no increase, and the import duty on China teas is not changed. China tea, in fact, obtains a preference over British-grown teas, and the latter are subjected to an impost amounting, roughly, to £100,000 a year, unless British exporters consent to use the Trans-Siberian Railway. It is impossible to say as yet what the effect of the new duty will be, but it is a significant fact that since 1901 the exports of Indian and Ceylon tea to Russia have grown considerably. In 1901 the quantity of Indian tea exported direct from Calcutta and re-exported from the United Kingdom was 6,540,356 lbs.; in 1902 it had risen to 8,488,528 lbs. From Ceylon the quantity exported to Russia was, in 1901, 17,726,824 lbs.; in 1902 it was 18,270,467 lbs. The City is optimistic, but it is scarcely to be expected that the figures for 1903 will show the same proportionate increase. Exporters point cheerfully to the fact that in the ordinance imposing the new duty nothing is said about tea sent *via* the Baltic, and in that direction they think they may be able to checkmate the Government of the Czar. Upon the question whether this new duty is a violation of the Anglo-Russian Treaty of Commerce of 1859 the Consul-General is emphatic in declaring that it is not. "The treaty," he said, "specifies that British goods are not to pay a higher duty than the goods of any other country, but Britain is the only European country, practically, that sends tea into Russia, and the treaty, therefore, does not apply in this instance."

The Foreign Office, we learn, has the matter under consideration, recognising its importance and the necessity for action. The *Daily Graphic* on this subject says: "We have inquired into the statement made by a correspondent in our issue of the 26th instant in regard to Russian retaliation for our exclusion of Russian sugar under the Brussels Convention, and we find that it is quite accurate. The Russian Government have notified their intention of levying an increased duty on Indian and Ceylon tea. The seriousness of this step does not lie in the amount of duty levied, but in the fact that it is a deliberate violation of the Anglo-Russian Treaty of Commerce of 1859, and, if persisted in, must lead to the denunciation of that Treaty. The Russian plea is that by our exclusion of Russian bounty-fed sugar we have already violated the Treaty, but on this point there is a difference of opinion, and the law officers of the Crown have advised the Foreign Office that the Russian contention is untenable. With regard to the penalisation of Indian and Ceylon tea by Russia there is, however, no difference of opinion. It is an act of tariff hostility on the part of Russia, and it is not pretended that it has any other meaning." The interest taken in the matter by those who are opposed to Mr. Chamberlain's policy is keen. If Russia's move is one of retaliation it serves to illustrate the new dangers to which we shall be exposed if Mr. Chamberlain's ideas were carried out, and the incident is made to point a moral. Commenting further on the subject, the *Daily Graphic* says: "Retaliation has come upon us sooner than we expected, but, unfortunately, we are not yet the retaliators, only the retaliated. . . . How is Lord Lansdowne going to meet this 'revolver' practice? So far as we can see there is only one course to pursue, and that is to denounce the Anglo-Russian Treaty. Of course that will not better matters, especially as Russia is negotiating a Treaty of Commerce with Germany at the present moment, and we shall lose our right to participate in all the concessions Russia will make to German industry in return for German concessions to Russian agriculture. Nevertheless, the denunciation is inevitable, for a treaty which is deliberately torn up has no longer any real existence. The incident is only a further illustration of the lamentable blundering which has characterised our whole policy in regard to sugar bounties."

It will be obvious to our readers that the importation into this country of a quantity of tea so bad in quality that it is condemned in the United States must go far to neutralise the good effect on prices achieved at considerable cost by the removal of several million lbs. of black tea from the London market by growers, and also equally so that if a practicable quality test has been found in America below which very poor teas are rejected (even if not dust), it must also be possible, if the Customs will only do so, to apply the same test in London. If this were done, then the remedy appears to be in the hands of the tea producers, as it is impossible to believe that the Customs have the least desire to assist the foisting on the public of such very low-grade teas, and all that in this case is necessary is to bring the matter, i.e., the nature of the abuse and its suggested cure as applied successfully in New York, before the proper authorities.

An American Consular report has recently supplied the State Department at Washington with a long statement on the tea industry of India, which gives ample details. This report says: "The area under tea in India at the end of 1902 was 525,252 acres, nearly two-thirds being in the valleys of the Brahmaputra and Surma, which contain as much as 339,640 acres. In Bengal the area under tea was 135,158 acres, or about 25 per cent. of the whole. Its cultivation is, therefore, to the extent of nine-tenths in the two provinces of Assam and Bengal, the other tenth being divided between northern and southern India. The area added to tea growing during the last five years was about 55,000 acres. Under the discouragement of low prices of tea, caused by placing on the markets more than their consuming capacity, endeavours have been made to restrict the cultivation and production and to supply a better quality in smaller quantity, so that the addition to the tea area in the last two years was only about 2,000 acres, considerable areas on which tea could not be grown with profit at the present range of prices having been abandoned. From Assam reports were received from 805 estates for the year 1902, with an area of 339,640 acres, the average area of an estate being about 420 acres. In Bengal 300 acres was the average for 452 estates and in Travancore the average for seventy-five estates was 337 acres.

In other localities the average of the estates is much smaller. These figures only refer to tea-bearing acres. While the area has increased since 1885 by 85 per cent., the increase in production has been 167.7 per cent. The actual production in 1902 is reported to have been about 190,000,000 lbs., which is 56 per cent. larger than the reported production of ten years previously in 1892. The tea produced in India is exported mainly to the United Kingdom, to the extent of nearly 97 per cent. of the product. The United States took, in 1902, 2,672,000 lbs. and Canada 5,554,000 lbs. exported direct, or nearly double that of the previous year; but a large quantity of Indian tea was probably transhipped to both countries from the United Kingdom. The production of tea in India and Ceylon has increased so much more rapidly than the consumption that there has been a heavy fall in price, and the tea industry in 1901 passed through a critical period, but now the prospects are brighter."

The report goes on to say: "The Indian tea is much stronger than the China tea, and it is claimed that if 1 lb. of China tea will produce 5 gallons of liquid tea of a certain flavour and colour, 1 lb. of Indian tea will produce 7½ gallons of a similar beverage. The average price per pound of Indian teas in Calcutta was as follows during the last two years:—

Description.			1901-02.	1902-03.
			Cents.	Cents.
Assam Valley	...	...	12.25	12.08
Surma Valley	...	...	9.25	9
Darjeeling	...	...	15	14
Dooars	...	...	11	12

The Indian Tea Association of Calcutta will have a pavilion at the St. Louis World's Fair in 1904, where they will have a large exhibit of Indian teas, and I have no doubt that when their excellent qualities are brought more to the notice of our people, in comparison with other teas, a much larger demand will be created for them in the United States."

It is proposed to inaugurate a propaganda in the United States in favour of coffee. The reasons, as given by the *Tea and Coffee Trade Journal* of New York, are:—First, the largely increased output of the plantations, particularly in Brazil, which is now largely in excess of consumption; second, the active advertising campaign of a certain coffee substitute concern, in which coffee is alleged to be responsible for almost all the ills of humanity. This concern, it is said, has appropriated 1,000,000dols. to be spent in advertising during the current year, with the result that every daily paper and magazine of this, the greatest coffee-consuming country in the world, is filled with warnings against the use of coffee and gross misstatements as to its injurious effects. The growers of Central and South America are already looking for some remedy for the ruinous prices that have prevailed for a year or more. The governments of some of the coffee-growing countries are considering measures of relief, but so far have done nothing more than to assist in the publication of a monthly newspaper printed in Spanish for circulation among the growers. Obviously what is needed is to curtail the production or increase the consumption. The former is admittedly impracticable since the growers cannot be expected to destroy bearing trees, and even if some were willing to join in an agreement to destroy part of their trees it would be impossible to get the majority to carry out such a compact. The remedy lies, then, in increasing the consumption."

Our New York contemporary points out that "The conditions are very much the same as those confronting the tea trade some years ago, when production so far outstripped consumption that ruin threatened the growers, and importers and dealers found no profit in handling tea. The East India and Ceylon Governments then levied a small tax on tea, which it spent in advertising its merits and in spreading broadcast in England and Canada, the United States and elsewhere the proper method of brewing, etc. The results were immediate and satisfactory. The amount annually expended in advertising is said to be more than 500,000dols. The need that something of this nature be undertaken in the coffee interests is even more urgent. It is estimated that not half of the coffee-drinking families in the United States know how to brew coffee properly. They should be taught. But perhaps the greatest factor in arresting coffee consumption in the United States is the persistent newspaper advertising of cereal substitute manufacturers, in which coffee is pronounced injurious and

poisonous. Coffee growers, or the governments of coffee-producing countries, and those who import and distribute it should co-operate to bring the merits of coffee to the attention of the consumer, and to teach him how to prepare it. This might be done by each producing country levying a small export tax, or by all importers agreeing to contribute a fraction of a cent a bag on all importations for this purpose. This might be supplemented by an appropriation by the governments of the coffee-growing countries."

"It is some time since Mincing Lane exhibited so much life and enterprise as we have witnessed this week, and this change has come none too soon," says the *London Commercial Record*. "The prolonged inactivity was getting very serious, and was beginning to tell upon the general trade of the Lane. Shellac is maintaining its lead, remaining firm with a strong rising tendency, and it is probably due to the abnormal position of this market that others display improvement also. Many speculators have made money over their ventures in shellac, and they, feeling probably that values there have attained a somewhat dangerous altitude, prefer to invest some of their profits in articles which have so far escaped the attention of the speculative element, but which owing to their unduly low values lend themselves readily for a bull venture. Thus probably the movement in peppermint oil and quinine has been started and supported, and even cloves, we are inclined to believe, have benefited by the boom in shellac. Strange to say that an article like ginger has attracted no attention, although its statistical position strongly invites buying. Probably London speculators have not yet recovered from the effects of last year's fiasco, and they continue to regard the article as one to be left severely alone. Our American cousins are different; they like to look for their silver where they have dropped it, and they bear ginger no grudge. We hear that a fair business in new crop Calicut special sizes has been done to New York, and even brown rough Calicut has been purchased in limited quantities. D, we understand, has fetched 27s. and 27s. 6d. c.i.f., and rough 29s. c.i.f., New York. London, on being approached simultaneously, declined to give the business a moment's consideration. Our dealers and speculators are evidently under the impression that as the monsoon has been a good one, all crops in India must, as a matter of course, turn out bumpers, they forgetting that what is beneficial to one plant is harmful to another. It is by no means certain that the sanguine ideas entertained about the new East Indian crops will be realised. In the case of Tellicherry pepper, for instance, Continental buyers consider the present values low enough for speculative purchases, and they have bought very largely lately, and have at the first sign of firmness on the part of sellers immediately agreed to pay the advance asked. Business has been done as low as 53s. 6d. c.i.f. delivered weights, northern European ports, but 53s. 9d. has already been bid for January-March shipment. We should be glad to see pepper joining the number of articles now booming in the Lane; surely its position is favourable enough."

—H. & C. Mail.

## RUBBER PRODUCTION AND MANUFACTURE.

### INCREASE OF PRODUCTION.

There are already quite a number of instances of successful rubber plantations in various parts of the world, which quite suffice to show that rubber planting has, indeed, emerged from the stage of a mere commercial experiment. At the present moment considerable areas are under cultivation in some of the northern states of South America, Central America, Mexico, the Malay Peninsula, Ceylon, and Java, which have already begun to produce rubber, and the aggregate production of which within the next few years should attain to fairly large dimensions. The state of affairs is not so favourable as regards the African rubber production. Almost everywhere in Africa rubber-yielding trees and plants are exploited in a way which must lead to their not far distant extermination. The orders issued in the British possessions, as also by the Congo Administration, have largely remained a dead letter: as a matter of fact, it is highly questionable whether the orders issued by the last-named administration were ever meant to be more than a sop to public opinion. The planting experiments which have been made in various parts of Africa still leave some considerable doubt as to prospects, as well as to the best tree to cultivate.

### QUALITY AND QUANTITY.—DETERIORATION.

So far, the production of crude rubber has fairly kept pace with the increasing demands of the factories, but, while at the same time the prices have shown a continuous upward tendency, the quality has, in many cases, distinctly deteriorated. This, unfortunately, applies more particularly to the highest of all rubber qualities—Pará rubber. While fifteen years ago, fine Pará rarely showed a loss in washing exceeding from 10 to 12 per cent., this rose, within the last ten years, to from 12 to 16 per cent., and in the last five years has reached from 15 to 20 per cent. During the same interval, Colombia Virgen, at one time one of the finest brands of rubber, has practically entirely disappeared from the market. What little still occurs under that name is an altogether inferior product. All the numerous brands of rubber shipped from the Central American rubber districts have greatly shrunk in bulk, and enormously deteriorated in quality. The fine qualities of rubber, almost equal to Pará, which were formerly obtained from Madagascar, have likewise fallen off in quality and quantity, and the same is true of all the rubber grades of India and the Indian Archipelago. On the other hand, the quality of the African rubber grades has distinctly improved, largely owing to the exertions of the companies operating in the Congo district.

### "RECOVERED" RUBBER.—SUBSTITUTES.

During the last few years the use—and particularly the misuse—of substitutes has distinctly decreased, owing, no doubt, to the recognition that in recovered rubber we possess an incomparably better material for the reduction of the cost of the mixings. The recovery of india-rubber is based upon the fact that by heating ground vulcanised rubber waste, either with high pressure steam or with certain solvents, the rubber can be re-converted into a plastic mass which is capable of re-vulcanisation. This capability of re-vulcanisation is due to the circumstance that soft vulcanised rubber is still a largely unsaturated product, and as with increasing saturation of the rubber with sulphur its chemical indifference also increases, recovered and re-vulcanised rubber naturally possesses a higher degree of saturation than vulcanised native rubber. Hence follows the interesting fact that soundly manufactured rubber goods containing recovered rubber are invariably more stable products than goods manufactured from native rubber only. For this reason the use of recovered rubber for the cheapening of rubber mixings must be pronounced a most satisfactory expedient.—*India-Rubber Journal*.

## THE RUBBER INDUSTRY IN CEYLON MARKET.

### HAS IT COME TO STAY.

In view of the unprecedented demand that has sprung up in Europe and America during the past year and the interest that is now being taken by a large number of the planting community in rubber, the *Ceylon Independent* interviewed a gentleman, who has had considerable experience of this article, and from his replies we are led to conclude that the prospects of rubber in Ceylon are such as to encourage all those that have suitable land to plant up.

### THE QUESTION OF OVER-SUPPLY

was naturally one of the first put and here, although admitting that such an event was not impossible, our informant was of the opinion that the uses that rubber could be put to, were so varied that for many years to come prices would remain at a figure that would show the producer an extremely handsome return on his outlay. The real danger that threatened the rubber industry was the finding of a substitute, but even then it was a moot point whether the substitute when found could compete in price with rubber as Ceylon rubber could stand a lot of cutting down in price and yet show a good return. On the other hand, rubber obtained from South America and Africa was daily getting more difficult and expensive to lay down in Europe.

### THE EFFECTS OF UNSKILLED LABOUR.

Why it was that rubber was getting more difficult to obtain in America was due to the fact that those who had the task of collecting it did not trouble themselves as to whether the amount of latex that they extracted from the tree was more than it could stand, but acting on the idea that the more they could get, the more they would make, the trunks and branches were mutilated and hacked to such an extent that if not totally destroyed the trees were thrown back, and practically became useless for a long time

to come. In fact, those engaged in collecting acted very much in the same way as our average cooly would if he were placed in a field of tea and told that he would get so much for every lb. of leaf plucked and no restriction placed as to the quality.

In Africa, very much the same way of collecting is carried on and the expenses incurred in securing the article are extremely heavy, one of them being that the Europeans employed die so rapidly that beside big salaries they have all to be heavily insured by their employers for the benefit of their families. Taking these facts into consideration it was our informants' opinion that should the supplies increase so much in the Straits, Ceylon, and India, as to bring down prices, the first to feel the pinch would be the uncultivated areas of America and Africa from which the present world's supply is practically drawn. Beside this it is quite possible that the supply from these parts may be considerably exhausted long before this period arrives unless steps are taken to control the indiscriminate scramble that is now taking place to obtain rubber. In this case prices should remain much about what they are at present.

#### PLANTING IN CEYLON.

Rubber has been planted indiscriminately over the Island, but so far no one has come forward and volunteered much information as to the yield per tree, while experts are still at variance as to soil, elevation, etc. The ideal soil to this gentleman's thinking is a rich loamy one, but this is difficult to obtain in anything like large areas in Ceylon.

The rubber planted in Kalutara appears to have found a climate, if not soil, congenial to itself and small parcels that have been sold locally as well as at home have fetched high prices. At the same time the K. V. has been turning out a first rate article, while rubber planted as far down as Galle is reported as doing well. A good deal of discussion has been taking place as to whether Pará does or does not grow well at a higher elevation than 2,000 feet. With suitable soil I do not see why Pará should not grow to advantage between this and 3,000 feet, although the higher the elevation the longer perhaps it takes to yield. What is wanted is a forcing climate and given plenty of evenly distributed rain and heat, he considered rubber should do well even if planted away from marshy land which is by some considered to be the only suitable situation for rubber.

#### RUBBER VS. TEA.

It seems generally felt that by planting rubber amongst tea it means in the course of three or four years that the latter will go out. I do not see any ground to doubt this, but it stands to reason that when planting up amongst his tea the planter will choose that tea which will not effect him to any great extent if it has to be abandoned. The policy of planting over one's good tea seems a risky proceeding and not one to be ventured into with a light heart, but as a by-product he considered it one of the most valuable we have in Ceylon.

### SOLUBLE TEA.

#### MORE INTERESTING INFORMATION.

When Mr. John Roger, the representative of the Soluble Tea Company, returned recently from his business trip to India, a representative of the *Times of Ceylon* obtained from him all there was of interest about the new tea at that time. The industry has advanced some steps further since then, but can yet be considered only in its infancy. Yesterday, for the first time, soluble tea was

#### SOLD RETAIL IN COLOMBO

and we learn that there has been a ready demand for it. Oakes & Company, the Madras Agents, have also ordered a quantity, and, as has Already been stated, the military authorities at Simla, including Lord Kitchener, have expressed their entire satisfaction with the samples which Mr. Roger presented to them. There is the initial difficulty which is always met with when a patent process is first begun to be worked. The machinery is very complicated, and, as such machinery has never before been made, progress is slow; and, in fact, if the present machine got out of order, it is probable no Engineer in Ceylon would understand it. In short

#### EVERYTHING IS EXPERIMENTAL,

but from the results already achieved the shareholders of the Soluble Tea Company entertain the highest hopes of the patent tea. Shares are at a premium, and it is impossible, it seems, to

find sellers at any figure, which is a sure indication of the healthy state of the Company. We understand that at present about 1,000 lbs. of tea a week can be turned out from the Erroll Factory. The retail price per oz. (50 cups, or equal to almost a lb. of ordinary tea) is, in Ceylon, 68 cents; England, of course, is the market it is desirous to exploit. At present, owing to the prohibitive duty on "extracts," it would be unprofitable to attempt to open a market there; but, as we have already stated, it has only to be proved—and it is not a difficult matter—that soluble tea is of practical utility to the community in general, and the special duty will have to be removed. In previous articles we have referred to the great advantage which soluble tea possesses

#### FOR AN ARMY, OR ON BOARD SHIP.

It is reasonable to suppose that the conservative housewife will fight shy of the innovation for some time, because she will miss the tea leaves for tea carpets and dusty floors; but its convenience will soon outweigh all other considerations. It is hoped to place soluble tea on the English market at 1s. per ounce. Soluble tea is prepared from the very finest Ceylon tea—from Erroll Estate at Hatton—and only the best leaves are employed in its manufacture. Consequently the English housewife will be getting, in soluble form, the best Ceylon tea at practically one shilling per lb.; a fact which should appeal very strongly to her practical mind.

#### PROSPECTS.

Samples of soluble tea have already gone to America; but this immense market will have to be systematically exploited. In France the prospects are very favourable, and in proof of this it may be pointed out that one business-man on the Continent, even before he had been definitely appointed an Agent of the Company, sent a large order for soluble tea, which is a fairly good indication of what people think of the invention. The Colombo Agents believe that in a very short time it will be necessary to enlarge the factory accommodation at Erroll; and when the business has developed tea from other estates will have to be obtained. When the business is put upon a sound footing in India, a factory will probably be started in the Darjeeling district, and Indian tea will be used to make the soluble tea which will be sold there. A point which it is important to remember in connection with the new tea is the absolute cleanliness in the methods of manufacture. The leaf is never touched, and it is impossible, the Agents say, for any dirt or extraneous matter to find its way into the powder.

It will be seen from the foregoing that soluble tea starts its career with every prospect of success; and planters and tea-merchants may have no fear that its successful progress will injuriously affect the ordinary tea interests.

### NOTES ON TEA AND COFFEE.

#### Cup quality.

That is the first consideration in selecting tea or coffee.

Style is important in both coffee and tea, and if it can be had with cup quality a double hold is obtained on customers, but it ought not to be the first consideration.

It is because that combination is hard to find that fancy marks of tea and coffee generally command a premium over goods of ordinary grade.

Blends of either tea or blended coffee are the outcome of the desire to combine cup quality with style. To blend so as to tickle the palate is an art which is acquired by experience, but not difficult to one having a discriminating palate. Recently we had occasion to call a number of times upon a well-known New York retail grocer, and at every visit found him at a revolving round table testing tea or coffee; comparing the samples and studying their relation to the stock on hand.

He was bound to be the judge of the merit and value of the tea and coffee placed in stock; determined to know all about the goods sold and able to meet objections if made by a consumer.

He is an enthusiastic buyer of tea and coffee and prides himself upon the high character and uniformity of his brands. He knows that consumers soon acquire a taste for a certain sort of tea or coffee and are apt to take offence if the retailer fails to furnish uniformly the desired flavour, and hence it is absolutely essential that the tea or coffee offered should always be uniform in cup quality, and so designated as to insure to the customer the same sort at every purchase.

Flavour is a distinctive yet varying quality in coffee and tea, but one may soon educate the palate to detect the difference between the various sorts and so fasten the taste upon the memory that they can detect differences at once whenever called upon to make a purchase. The consumer becomes wedded to any flavour to which his palate is accustomed and rebels if something different is offered, either intentionally or by mistake.

An illustration of this was given by a grocer noted for having a large and profitable trade in coffee. He kept not only high-grade goods, but also a ground coffee containing coffee mixture, for which he had a large demand. One day a prized customer addicted to the mixture complained of the poor quality of the coffee sent, and said: "If you send me any such poor coffee again I shall stop trading with you altogether. The coffee you sent me was vile—not fit to drink."

Upon investigation it was found that the dissatisfied customer, whose palate had acquired a taste for the mixture had been given by mistake a fancy Java and Mocha blend, but its flavour was so different from that to which they had been accustomed that it made the impression that the quality was bad, and the result was a dissatisfied patron.

To avoid this retailers should designate tea and coffee by names or numbers, so that customers would always ask for the same sort every time a purchase was made.

Many retailers designate the different sorts of coffee carried in stock, partly as follows: Mo-kof-fee, American Breakfast, No. 41, Guadalajari blend, French Breakfast, Strong Rio, Royal Stuart blend, Cream Java, English blend, Turkish blend, Venetian blend, Golden Santos. This same policy is used to designate tea. We find listed: Royal blend, Orient blend, Ceylon blend, Russian Caravan, Salada, Tetley's, Lipton's (each sort bearing a different colored label), Formosa Tea Blossoms, Light of Asia, Ceylon, etc., etc. These names are fastened in the buyer's memory, and the distinctive flavour of the tea or coffee being impressed on the palate, the users are quick to detect any change in flavour and make complaint, although the merits of the article may be higher in price and regarded by experts as superior in flavour to that habitually used. Some price-lists go farther and specify the characteristics of the different sorts of coffee and tea listed. For instance:

Washed Mexican, heavy body; distinctive "acid" character. Best Maracaibo, smooth; thick, heavy body with popular flavour. Mo-kof-fee, a rare grade of coffee, of unique character, and intended for those who desire the very choicest coffee, regardless of price. A pleasing feature of Mo-kof-fee is that while it is the highest price coffee per pound, it is also economical, as it goes farther than ordinary coffee. Ceylon blend: Composed of the finest Ceylon tea, skilfully blended with pure and uncolored China and Japan teas, so that Ceylon character is agreeably modified to please the American taste. The advantages claimed for Ceylon blend tea are richness, strength, purity, quality, and flavour. Formosa Oolong: Exceedingly rich, flavoury, and fragrant. Especially cured and fired so as to produce a rare and mellow character. Foochow Oolong: Less "rosy" than Formosa; of a fine neutral character. Japan (green): Light amber liquor and with "toasty" flavour.

The consumer having found a tea or coffee the cup quality of which satisfies, is almost certain to cling to the sort chosen, and takes offence when served with something different. The retailer can always keep for reference and test the different grades kept in stock and use them for comparison in purchasing supplies, but cup quality must be the chief consideration if a profitable trade is to be secured.—*American Grocer.*

## A CENTURY OF PROGRESS—AND MORE.

HOWARDS AND SONS.

The announcement which we make this week that the historic business of Howards and Sons, of Stratford, has been converted into a limited liability company is, says the *British and Colonial Druggist*, a striking evidence of the hold which this system of trading has obtained on the commercial community. The firm, which has its foundation back in the 18th century, has always been justly regarded as the *beau ideal* of the best class of British houses and the adoption by so conservative an undertaking as "Howards" of company style will, no doubt, cause considerable interest in the trade. That Messrs. Howards and Sons contemplated taking this

step has been known to us for some time, but we have had to refrain till now from making an announcement on the subject owing to the fact that the information was confidentially communicated. We may say at once that the new departure on the part of the world-famous house will involve no change whatever in the general management of the business, the proprietary will remain in the hands of the present members of the firm, and the directors all bear the honoured name of "Howard." The Chairman is Mr. David Howard, D.L., F.I.C., F.C.S., President of the Institute of Chemistry, Ex-President of the Society of Chemical Industry, and the other members of the Board are Mr. Theodore Howard, Mr. Alfred Gravely Howard, F.L.S., F.C.S., Mr. David Lloyd Howard, F.C.S., Mr. Bernard Howard, and Mr. Geoffrey E. Howard.

The birth of the firm dates back to the closing years of the 18th century. At that time two young chemists, Wm. Allen and Luke Howard, were partners in the business in Plough Court, Lombard Street, which is now known as Allen and Hanburys, Limited. Both partners were Quakers—we may here pause to remark that a notable number of the earlier workers in pharmacy were members of the Society of Friends, and in this connection in addition to Allen and Howard the names will occur of Bell, Southall, Ransom, and many others. At the time of which we speak by far the larger proportion of medicinal substances were of vegetable and animal origin, the number of chemicals in use being comparatively few. But the demand for chemicals was growing and Allen and Howard determined to open a factory in which pharmaceutical chemicals could be prepared on a manufacturing scale, although the quantities turned out—large for their day—would seem almost microscopical to a present day maker. In 1797 a piece of land was acquired at Plaistow, and Luke Howard took over the management of the manufacturing branch of the business established there, while Allen retained the control of the more strictly pharmaceutical concern in the City. The venture was a success from the first, and by the beginning of the last century larger premises were acquired at Stratford. It was now decided to dissolve the partnership, Allen retaining the City pharmaceutical business, which has since developed into the well-known house of Allen and Hanburys, Limited, having premises in addition to the retail and distributing branches at Plough and Vere Street, London, at Bethnal Green and Ware. To Howard was reserved the Stratford business, the premises acquired there were known as the City Mills, and had previously been used as a distillery.

The business continued to grow, and many additions were made, until 1875 when a disastrous fire occurred, which destroyed a large portion of the buildings, but the offices of the firm and the old watermill, from which the whole takes its name, still retain, almost unchanged, their original external appearance. The entire character of the neighbourhood has, however, altered amazingly. Stratford Marshes, which, a century ago, was a great waste of undrained marsh, and bore but few dwellings, is now almost covered with houses, and what was then the haunt of the heron and the wild duck, has become a teeming centre of industrial enterprise. The arm of the River Lea, which brought fresh water to the Mills, has now been utilised as one of the sources of East London's water-supply, and wells have had to be sunk to provide for the firm's needs. Among the surroundings we have outlined, and which, although somewhat drear and uninviting, were admirably suited to the purpose, has grown up a business which ranks among the foremost chemical concerns in the world, and which, conducted on able business lines, coupled with unimpeachable integrity and scientific arrangements has made the name of "Howard" a hall mark of quality throughout the globe.

Like his former partner, Mr. Allen, with whom he retained a warm and close friendship to the end, Luke Howard was a Fellow of the Royal Society, and took a wide and active interest in the scientific progress of his time. He was a prominent member of the now defunct Askesian Society, to which almost all the leaders of scientific thought then belonged, and it is interesting to note that in 1800 this society carried out experiments into the anæsthetic properties of the then little known nitrous oxide gas. Further, it was before the same body that Luke Howard read his paper on "Modifications of the Clouds," which has remained the basis of the nomenclature of the subject to this day. Another point to which we can only briefly refer, but which is of interest as showing the part played by Howard in the scientific movements of his time, is his friendship with Dalton, and letters from the propounder of the atomic theory are still treasured by the Howard family.

We must here say a few words concerning a somewhat remarkable man whose work did much for the earlier days of the firm. Joseph Jewell began life as a farm hand, and at 28 years of age was working as a porter at Plough Court. He set himself to master the principles of chemistry as applied to manufacture, and having on one occasion succeeded in a process where two of the chemical workers had failed, he was transferred to the manufacturing department, where, although entirely self-taught, he became of such value that he rose to be works manager to and finally partner with Howard. Jewell retired after 40 years' service. It is a noteworthy fact, showing that with proper care for health chemical workers need not suffer from their employment, that a number of Howards' employees have lived far into the "eighties." The earlier articles for which the firm became noted were calomel, borax, camphor, and bicarbonate of soda, for all of which they established a reputation which is still retained unimpaired; but it is, perhaps, with quinine more than anything else that Howards' stand out most unmistakably as *facile princeps*. The manufacture was taken up about 1827, and still remains a prime factor in the operations of the house.

The work commenced by Luke Howard was continued by his two sons. Robert, the elder, entered the business in 1816, and his brother, John Eliot, seven years later. Both were keenly interested in scientific thought, and both assisted at the foundation of the Pharmaceutical Society. Robert was one of the earlier members of the Chemical Society, but his younger brother, was perhaps more famous, John Eliot Howard was a Fellow of the Linnean Society, and like his father an F.R.S. He was, in his day, the greatest of English quinologists and his ranks with the classic names of de Vrij, Hasskarl, and Junghuhn. In 1883 the year of his death he received the "Hanbury" medal, the previous award in 1881 having been to Flückiger. What he did for the cultivation of cinchona was detailed in the *B. & C. D.*, but we may say here that to him is largely due the honour of the introduction of the cultivation into India and Ceylon.

The firm of "Howards," while quick to improve their methods wherever new discoveries have pointed out the way, have always endeavoured to avoid unnecessary alterations, thus several of their machines are much the same as those in use a hundred years ago. The calomel apparatus is that patented in 1807, and except that the machinery in use is enormously larger than the first installation, no change of moment has been made.

Quinine manufacture still retains a foremost place among Howards' specialties, although the price, formerly as high as 21s. an ounce, touched low-water mark in 1897 at 7½.

Stratford, once so suitable for a manufacturing business, has latterly lost much of its special advantage, and some three or four years ago 33 acres of land were acquired at Ilford, on the banks of the "Roding," and large works have been erected, known as the Uphall Works. The giant chimney, nearly 200 ft. high, forms a landmark which can be seen for miles round. Hither, already, has

been transferred the making of citric acid, borax and boracic acid, and here will shortly be installed the quinine branch of the business.

Colonel Samuel Lloyd Howard, C.B., D.L., J.P., the son of Robert Howard, left the business in 1897 (he died in 1901), and Wm. Dillworth Howard, son of John Eliot Howard, retired about a year ago, so that the directors of the new company will consist of two grandsons and four great-grandsons of Luke Howard, the founder of the house—Mr. David Howard, Mr. Theodore Howard, Mr. David Lloyd Howard, Mr. Alfred Gravely Howard, Mr. Bernard F. Howard, and Mr. Geoffrey E. Howard; a glance at the following genealogical table will show the exact relationship of each member of the firm to Luke Howard and to his co-directors.

We have no doubt that this brief historical account of a house whose name has so long been intimately associated with the manufacturing chemical trade will be of interest to our readers, and, in conclusion, we cannot feel pessimistic of the future of British trade so long as it still retains among its most notable exponents, firms of the class of Howards and Sons. We feel that the best traditions of our commerce will continue to be upheld as they have been in the past by the famous Stratford and Ilford House.

### MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated October 2nd, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

		Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904	...	433,903	416,718	36,717
1902-1903	...	450,043	462,688	30,508
45,484 pkgs. INDIAN	} Total 59,903 packages were offered in public auction this week.			
13,442 " CEYLON				
977 " JAVA				

The deliveries of Indian and Ceylon Tea last month were about one million lbs. less than during September last year. It is satisfactory however to notice that this decrease is not due to any falling off in the Home Consumption, as duty payments were in excess of last year, but to smaller exports. Foreign markets have not been buying more than actual requirements for some few months past, and it is therefore probable that the export trade is yet to be done, which is a feature in favour of sellers.

As has been indicated by recent cables giving exports from Calcutta, the imports into this country are considerably in excess of those of last September. However, notwithstanding this increased import, stocks of Indian Tea are still some two millions less than they were a year ago.

INDIAN.—The offerings have included a rather large proportion of teas of indifferent quality, and for these quotations have been

The King.

**CELEBRATED OILMAN'S STORES.**

## When you feel Limp and Languid,

When your head is dull and heavy, your tongue furred, your bowels costive, and you awake in the morning fagged and worn out, with no relish for breakfast and dreading your work, be sure your stomach and liver need help. Indigestion is poisoning your blood and sapping your strength. Mother Seigel's Syrup will cure you. It will purify your blood and restore vigour and tone to your system. Take it daily after meals.

# SEIGEL'S SYRUP

"I suffered for years from chronic indigestion and wind spasms," says Mrs. M. Moss, of 127, Quay Street, Ultimo, N.S.W. "After eating, I was tortured with terrible pains in the chest and beneath the shoulders. I lacked energy and was languid and weak, especially during the Summer. Four months ago I was induced to try Seigel's Syrup and when I had emptied only two bottles, all traces of indigestion had vanished."

**Will re-invigorate you.**

marked down another  $\frac{1}{4}$ d. Other kinds have remained fairly steady.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 39,033 pkgs., av. 7·83d. 1902, 34,814 pkgs., av. 7·44d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 287,027 pkgs., av. 7·91d. 1902, 294,148 pkgs., av. 7·17d.

CEYLON.—The quality of many of the teas marketed this week has shown distinct signs of improvement, and this has resulted in rather better quotations and a slightly higher average price.

The official wire gives exports to U. K. during September as 5,500,000 lbs. against 6,750,000 lbs. same month last year, making the shipments from 1st January to end of the month 74,500,000 lbs., against 80,643,025 lbs. (revised figure) last year. It also estimates the shipments for October as seven millions, against an actual shipment of 7,000,000 lbs. during same period 1902.

Average for week 7·58d., against 6·60d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 793,316 pkgs., av. 7·45d. 1902, 890,158 pkgs., av. 6·68d.

JAVA.—Javas met with fair competition at a small decline, similar to that noticed in Indian Tea. Since 1st June 31,313 packages on Garden Acct. realised an average of 6·59d. per lb.

### COFFEE.

Messrs. C. J. Leech & Co. write:—"After last week's adverse crop news from Brazil, markets were treated on Monday to reports of quite an opposite nature from Messrs. Pinto & Co., Rio, as follows: 'The present reduced receipts are the result of adverse weather up-country. Rio and Santos crop accounts are good, Santos flowering is exceptionally luxuriant, and gives promise of a large crop.' On Wednesday other news arrived, Messrs. Hellweg & Co. cabling: 'Santos crop progresses unfavourably; drought doing harm.' Messrs. Rose and Knowles: 'Receipts

are in no way retarded by rains; on the contrary, they are large, considering the reduction in interior stocks. Estimate the present Santos crop at 6,500,000 bags.' On Thursday Messrs. J. W. Deane & Co., Santos, were reported to have cabled: 'Crop prospects unfavourable; rain wanted'; but it may be that this news applies to Rio, concerning which province no news of drought has hitherto been received. From the above it will be seen that this week's crop news is decidedly conflicting. Receipts are rather larger this week in Rio, and 1,000 bags larger than last week in Santos; but it is still too early to figure on the probable total for this season. The October movement should, however, throw some light on it. The Havre *Bulletin de Correspondence* writes this week that private advices received both by mail and cable from Santos predict that in October receipts will fall somewhat under 1,000,000 bags, a total smaller than has been since the season 1899-1900. Rio receipts this week, 116,000 bags, against 127,000 bags last year and 169,000 bags in 1901. Santos receipts, 280,000 bags, against 294,000 bags last year and 389,000 bags in 1901. The market in Santos was again firm and dearer, and we quote good average 29s. c. and ft. This time last year the price was 30s. c. and ft. London futures have ruled irregular, an early decline of 6d. to 4 $\frac{1}{2}$ d., followed by an advance of 10 $\frac{1}{2}$ d. to 7 $\frac{1}{2}$ d. from the lowest prices accepted on Tuesday, closing steady. Compared with our last, we note the following changes: London futures, 1 $\frac{1}{2}$ d. to 3d. advance, Havre unchanged  $\frac{1}{4}$ f. advance, Hamburg  $\frac{1}{4}$ pf. higher to unchanged. New York is unchanged to 15 points higher on the week."

Messrs. G. Duuring & Zoon's Monthly Market Report dated Rotterdam, September 30th, 1903, says:—

Two months of depression led to a reaction, the more natural, as crop reports were less favourable and trade demand better.

In the Trading Company's sale of 8th September better values were realized, good ordinary Java 1 $\frac{1}{2}$  to 2cts. higher than in the

June sale. Preanger 3cts., Tagal 3 $\frac{3}{4}$ cts. dearer, whilst Liberian shows an advance of 2 $\frac{1}{2}$  to 3cts. since June. Next sale to be held on October 27th, being the last one this year.

Importers met the market freely and fair progress has been made with the liberal supply, consisting chiefly of Java Plantation. Values however had to give way about 2cts. for fine highgrown and medium kinds. Liberian has been offering sparingly, values fully 1ct. dearer for the month.

Present arrivals from Santos are giving more satisfaction, leading to a good turn over at hardening prices. New crop coffees, although of smaller size, seem to be better roasters. Closing quotations are about 1 $\frac{1}{2}$ cts. dearer, prime beany even more.

Arrivals with us were rather moderate, 48,000 bags from Java, and 68,400 bags from Santos. Deliveries of the latter amount to 89,000 bags, reducing our stock from 827,700 bags to 807,100 bags.

Terme was firmer and values 1 $\frac{1}{2}$ cts. dearer in consequence of rather unfavourable crop reports, closing quotations being 17cts. per December, 17 $\frac{3}{8}$ cts. per March, 17 $\frac{5}{8}$ cts. per May, and 18cts. per September. Dealings amount to 92,500 bags or 673,000 bags since 1st January. September contracts 240,000 bags, whilst 77,500 bags were tendered.

According the Colonial budget, there will be sold for Government account during 1904.

145,000	Piculs in Holland, estimate	28cts.
100,000	" at Batavia, "	f 32.—per Picul.
40,000	" " Padang, "	" 45.— "
1,000	" " " (broken) estimate ...	" 15.— "

Central American crops are reported smaller than those now ended, especially so in *Costarica* and *Guatemala*. Haciendas which last year, have most suffered from the volcanic eruptions, to the extent of about 160,000 bags, will probably yield no crop this year, the buds not having set.

Markets have been favoured with a batch of crop reports, as usually during this time of the year. Commissarios estimate the present crop at 7 to 7 $\frac{1}{2}$  million bags, whilst some private reports even mention 6 $\frac{1}{2}$  million bags as a probable outturn. Little importance can be attached to any of these figures, although it may be

taken for granted that last year's frost has done some damage to the crop now in course of shipment. Going by facts and not by opinions, receipts are closely watched and are ruling the market more than anything else. Public opinion is now adhering to about 11 $\frac{1}{2}$  million bags as a probable outturn for Rio and Santos, instead of 12 million bags and this in some way accounts for the advance experienced during the month. Regarding next crop, the September blossoming is reported to be satisfactory, but rain to be badly wanted.

European stocks were again 3,050 tons less at the end of August, whilst the visible supply was 40,830 tons more, but it looks as if the maximum should be reached sooner than usual.

### TEA.

Messrs. George White & Co., in their Report, October 1, say: Sales have passed with a fairly steady tone. A quotation has been made for low common leaf at 5 $\frac{1}{2}$ d., but this is mostly due to quality, which in several instances, particularly in the case of Bheel gardens, is the poorest we have seen since the big crop of 1900. Fine and finest have been strongly competed for, suitable leaf kinds being in request for Russia, while the best Broken Pekoes with a good show of tip have met a keen demand for the home trade, and mark an advance. Common to ordinary medium descriptions have been a quiet market throughout, and close easier, especially for Pekoes. Our recent remarks that the prospect of anything approaching excessive supplies is improbable are confirmed by a private cablegram estimating the excess over last season available for United Kingdom at about 12,000,000 lbs. Should this prove to be approximately correct the crop will be easily dealt with, and does not afford grounds for anticipating any undue depression if supplies are judiciously controlled. The exports from Calcutta to foreign markets up to 7th ultimo show an increase of  $\frac{3}{4}$  million lbs., indicating moderate, though on the whole satisfactory progress, and at a slight decline in values for common and ordinary descriptions a further expansion in the off-take may be hoped for. Our attention has been drawn to a Calcutta circular under date September 10, which states that out of 31,300 packages sold there up to June 19, only 9,700 had re-appeared in the Mincing Lane sales up to August 21, and the inference has been deduced that less than one-third of the Calcutta

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

## CURES

RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,

And all Aches and Pains usually treated by outward application.

IT HAS NO EQUAL ON EARTH AS A PAIN  
RELIEVER.

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1 $\frac{1}{2}$  & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

sales reached London. This, unfortunately, is not the case, as exports show that not more than half the sales have so far been diverted from London. What is really disclosed by the figures alluded to above is the increasingly large proportion of the Calcutta sales shipped to London to be dealt with here privately, this phase being in a great measure due to the fact that home distributors have lately become large buyers on that side for their own trade at such times as the market suits. For 38,800 packages on estate account 7½d. per lb. was realised contrasted with 7½d. per lb. for 34,300 and 8½d. per lb. for 41,300 in the two foregoing seasons.

### CINCHONA.

At the auctions to be held at Amsterdam on October 8, 7,448 bales and 421 cases will be offered, containing 35,126 kilos., or 1,229,410 oz., quinine sulphate, or an average of 5.42 per cent. for the manufacturing bark against 5.06 per cent. for the auction in September last, and an average of 5.51 per cent. for the ten auctions held at Amsterdam in 1902. The shipments from Java during September amount to 1,237,000 Amst. lbs., against 950,000 Amst. lbs. last year and 1,182,000 Amst. lbs. in 1901. The total shipments for the nine months are 9,298,000 Amst. lbs., against 9,232,000 Amst. lbs. last year and 8,623,000 Amst. lbs. in 1901. In the drug auction 6 cases of thin long quill Java were limited at 9d. per lb., and a case of red bark sold without reserve at 5d.

### QUININE.

There was a decline in the second-hand market towards the close of last week, about 30,000 oz. for December delivery selling at 11½d.; but on Monday sellers in this position asked 1s. 0½d. for good

German sulphate, and subsequently some 40,000 oz. changed hands at this price. January delivery has also been sold at 1s. 0½d. to 1s.; and February at 1s. 0¼d. To-day 1s. 0½d. has been paid for January, and on the spot there are sellers at 1s. It is reported that the article is being pressed for sale by speculative brokers.

### CARDAMOMS.

Cardamoms sold at about steady prices, although for decorticated Seed 1s. 1d. per lb. was willingly paid. The following prices were paid for the pod: Ceylon-Mysore, extra bold pale, 2s. to 2s. 1d.; dull ditto, 1s. 9d.; bold pale good, 1s. 7d. to 1s. 9d.; fair medium and bold pale, 1s. 1d. to 1s. 4d.; small and medium pale, 10½d. to 11½d.; medium palish lean, 9½d.; fair splits, 11d. to 11½d.; brown splits and pickings, 8d. to 8½d.; peas, 8d. to 9d. Good bold pale picked well-bleached cardamoms were highly limited at 2s. 5d.; and a bid of 2s. 1d. was refused.

### VANILLA.

At auction on Friday about 1,100 tins were offered, of which about half sold at a decline of from 1s. to 2s. per lb. for good and fine, common being about steady, while mouldy beans were firmer. The following were some of the prices paid: Seychelles, Mauritius, etc., fine chocolate, 8½ to 9 inches, 18s. 6d.; 8 inches, 12s. to 13s. 6d.; 7 to 8 inches, 8s. 9d. to 11s.; 6½ to 7 inches, 7s. to 7s. 6d.; 4 to 6½ inches, 6s. to 6s. 9d.; and 4 to 5 inches, 5s.; brownish to fair, 8 to 8½ inches, 11s. to 12s.; 7 to 7½ inches, 7s. 9d. to 8s. 6d.; 5½ to 7 inches, 5s. 3d. to 5s. 6d.; 4½ to 5½ inches, 4s. 9d. to 5s. 9d.; 3 to 4 inches, 4s. 6d.; common to good dry brown, 3s. 6d. to 6s.; splits, 2s. 9d. to 7s. 9d. per lb.

# PLANTING

# OPINION.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, OCTOBER 31, 1903.

[No. 43.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 6th proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*Weather*—N.-E. monsoon with very heavy showers on now, the rain this year has been far too much. *Coffee* looking grand. *Supplies* brightening up. *Works*—Weeding, handling, digging. *Interesting* on Sukrawarsante—Kodlipett and the Kodlipett Balol roads conglomerate pudding stone is being put down, it can be crushed with the little finger, of what use is it?

#### Coorg.

*POLLI BETTA, 28th October.*—*Weather*—Heavy North-East showers at intervals of 2 or 3 days. Last Saturday over 2½ inches in the 24 hours. *Plant diseases*—Individual trees bad with leaf-disease; but coffee, on the whole, looking very fine. *Crop*—There is not the least sign of crop ripening. Fly-picking used to be begun by this time usually. *Labour*—Plentiful. *General health*—Fair. Plague is in abeyance at Gonicopal. Several cases are still occurring on one estate in our midst.

### EXPERIMENTAL PLANTING.

It has been suggested, we believe, that an experimental farm should be established in Southern India, with a special view to conducting experiments with planting products, as distinguished from the grains, etc., grown by the ordinary Indian agriculturist. There is in this suggestion the germ of something really useful. Yet there are many difficulties to be overcome and many points to be considered before any proposal of the kind can be put into shape in such manner as to permit of its being laid before the Government or Governments concerned. Emanating from Mysore, the suggestion may be presumed to have special reference to

Coffee and, in a minor degree, to Cardamoms and Pepper. But what about the Tea industry? Whether we take the Coffee and Tea industries together or either of them separately we have to deal with various districts and various Governments. For example, Tea is produced in Southern India in the Nilgiri and Wynaad Districts of Madras, and in Travancore, under the Government of that State. Coffee is grown in the Travancore, Cochin and Mysore States and Coorg as well as in the Madras Presidency. If the idea is that one farm should deal with both Tea and Coffee, such farm must be located in Travancore or in the Madras Presidency, as Tea is not grown in Mysore or Coorg, and has not achieved any success in Cochin. If for Coffee alone, the selection of site might be made within a wider area. It is questionable however, if a really "typical" site could be selected, and if it were, the question would arise, whether each of the Governments interested would contribute towards the cost of its upkeep, and whether both Madras and Mysore scientists would be free to share the control, when the farm was situated in territory belonging to one Government alone. It stands to reason that the farm must be so situated. If in Mysore, will other Governments take a practical interest in it? If in the Madras Presidency, will other Governments give assistance? The Governments concerned are those of India (Coorg), Madras (Nilgiris, Wynaad, Shevaroy, and Anamallais), Mysore, Travancore, and Cochin—five Governments in all.

Even assuming that all these Governments are willing to co-operate in regard to a farm situated in the territory of any one of them, how is one farm to be made of value to all the diverse interests involved? Taking Coffee alone, to simplify the argument, we need scarcely lay stress on the well-known fact that soil and climatic conditions vary greatly in the different districts that produce coffee; that even the methods of cultivation differ in various districts. It seems to us that these circumstances would greatly militate against the successful working of any one farm, and that, in fact, no one farm could be of real use to all the districts concerned. Possibly, if a farm were established in Mysore or in Coorg, it would serve both Mysore and Coorg. If one were started on the Nilgiris or the Anamallais, its work might be of use to all the coffee-producing districts in the Madras Presidency. But, as far as we can judge, two farms, at the least, would be necessary,

and if the Tea industry is to be aided, three—preferably one on the Nilgiris, one in Mysore, and one in Travancore. This widens the suggestion referred to very materially and opens up the question of expense, in regard to which all Governments are apt to raise the cry of *non possumus*. The main point is, however, that if one farm is started, or more, each such farm must be so situated and so worked that it may be useful to the planter. Perhaps some of our readers may be able to elaborate a scheme of this kind, and to present it in a form likely to command the respect of the various Governments, or to at least induce them to give it consideration.

Possibly we are pessimists in regard to this matter. At any rate, our view is that if planters want help from Governments in regard to it they must first show signs of doing something on their own behalf. Time after time it has been urged that every planter should lay out a few experimental plots and keep a careful record of results. The Agricultural Chemist in Mysore has volunteered help, in the way of advice beforehand and advice when progress is reported to him. How few are the planters in Mysore who have seriously availed themselves of this offer! More have started such plots than are now maintaining them; the latter might probably be counted upon the fingers of one hand. We can quite believe that one central farm, under the control of a scientist; might be made very serviceable if it were backed up by the systematic upkeep of experimental plots on private estates; but unless these plots are maintained we do not think that a State Farm could render any assistance commensurate with the cost of its upkeep. If this view appears too gloomy, the way to brighten it is for some one or more of our readers to enlarge upon the suggestion to which reference has been made, to add a little substance to the skeleton, to fill in the all too obvious gaps. Unless a definite and clear and practical scheme can be drawn up, no Government is likely to give the matter serious attention. Nor do we think that, in any case, good can come of a suggestion that would have experiments conducted in Mysore for the benefit of planters in the Madras Presidency or in that Presidency for the advantage of planters in Mysore and Coorg. If scientists from both Madras and Mysore were to assume a sort of joint control, there would be at once introduced a dangerous element of divided responsibility, which might easily wreck the whole project.

### THE COFFEE POSITION.

Among our "Coffee Notes" we give statistics of the World's Visible Supply on the 1st instant. The total is very large, but there is some little comfort to be derived from the fact that, comparing October figures with those of September, 1903 returns show a smaller increase *proportionate* (and with the sole exception of 1899), a smaller increase *actually* than in any year in the quinquennium 1899—1903. It is cold comfort at best, but it is something. As regards stocks, in the eight principal markets of Europe these are almost double what they were in 1899 and 1900, as the following figures will show:

October 1st, 1899	...	...	...	223,200	Tons.
" 1900	...	...	...	223,050	"
" 1901	...	...	...	240,050	"
" 1902	...	...	...	375,650	"
" 1903	...	...	...	436,050	"

The position in the six principal markets of the United States of America is similar:

October 1st, 1899	...	...	...	70,058	Tons.
" 1900	...	...	...	46,000	"
" 1901	...	...	...	94,823	"
" 1902	...	...	...	163,000	"
" 1903	...	...	...	145,058	"

Yet it will be seen that 1903 compares very favourably with 1902 in the States, though not in Europe.

It must be added that while supplies have increased, deliveries have been by no means stationary. The following figures for the first nine months of each year tell the tale of the development of deliveries—

	EUROPE.	U. S. A.	TOTAL.
1899	356,970	271,820	628,790
1900	386,530	233,290	619,820
1901	389,590	279,467	669,057
1902	384,690	285,057	669,747
1903	426,850	311,589	738,439

How far the sudden increase between 1902 and 1903 represents increased *consumption* is a point that cannot be stated with accuracy, but there is of course, some probability that the low level of prices has induced dealers to purchase in anticipation of requirements lately, not merely from hand to mouth.

### COFFEE NOTES.

Messrs. Rose and Knowles, Santos, state that receipts of coffee are not retarded by rains and that the present receipts are large, and estimate the present Santos coffee crop at 6,500,000 bags.

\* \* \*

The *Tea and Coffee Trade Journal* (New York) says that Porto Rico coffee-growers have failed to take advantage of the opportunity afforded them. They have done nothing to place their coffee before the eyes of the people, that they might be. This is just what we have said about coffee-planters in India, though the blame that should fall on them is modified by the fact that American buyers are *not* predisposed in favour of their product as they are in favour of Costa Rican coffee.

\* \* \*

**The U. S. Coffee Market.**—The market for both actual and coffee contracts is steadier and prices scored further advances, says the *Tea and Coffee Trade Journal* of September 29th. The strengthening factors have been the small receipts of coffee at Rio and Santos and the bullish crop cables from Brazil noting unfavourable weather for the growing crop as a result of the continuance of the drouth. As was pointed out in our last report, the continued decrease in the crop movement is having a good influence in the trade and the general belief that the outturn of the present Brazil crop will not exceed 11,500,000 bags is gaining more ground. The rumours which have been prevalent here, to the effect that certain large known coffee factors who have been bears in the coffee market for several years are about to take the bull side, is considered by well-known local authorities as absurd. The metal interests had their turn at it several years ago and have ceased to prosecute their bull movement, having lost a large sum of money. The above interests have an enormous capital, but even at the present low prices they prefer to let the market alone. The world's tremendous visible and invisible supply is too large a burden and serves to cripple speculative dealings in futures on an extensive scale.

Trading in the local market in spot invoices continued to be light and sales during the week embraced 1,000 bags Santos No. 4 at 6½c., 5,000 bags Rio. No. 7 at 5¼c., 2,000 bags Rio No. 4 at 6½c., 1,000 bags Bahia No. 7 at 5½c., and 3,000 bags Rio Nos. 2 and 4 on the basis of 6½c. for Rio No. 4. Firm offers from Brazil were slightly lower during the week and included Rio No. 4 at 5·90c., Santos No. 4 at 6·40c., Rio Nos. 6 and 7 at 5·45c., Rio No. 4 at 6·10c., Rio No. 2 at 6·90c. and 6·95c., and Santos No. 3 at 6 ⅙c. and 6¾c., all cost and freight for shipment to New York. Business transacted on cost and freight terms included 1,500 bags Rio No. 8 at about 4 ⅙c., 3,500 bags Santos No. 3 at about 6½c., 2,000 bags Bourbon Santos No. 3 at 6½c., and 2,000 bags Santos No. 4 at 6¾c. The demand from the interior continued to be moderate and only a hand-to-mouth distributing business was done. Prices closed steadier and holders of spot invoices named 6½c. to 6¼c. for Rio No. 7, 6½c. for Santos No. 4, and 5½c. for Rio No. 8.

Speculative interest in contracts lacks animation, but some interest is being displayed by outsiders. Prices are steady and show an advance of 15 to 20 points for the week, which is attributed to bullish crop cables from Brazil and smaller receipts of coffee at Rio and Santos. The buying has been distributed and trading in the forward months is apparent. Operators are cautious as a result of the world's unprecedented visible and invisible supply. At times during the past week tired holders sold in order to realize profits. The total sales for the week amount to 200,500 bags.

The market for mild coffee has been fairly active and large sales in spot parcels and in sizable lots to arrive have been made at full prices. Transactions in West India growths included about 10,000 bags Maracaibo, 800 Guatemala, 2,000 bags Central American, and 6,000 bags Bogota. Good Cucuta brought 7¾c. and fair 7c. Prices are firmer and closed with the tendency upward. In the East growths there is little doing and transactions for the week have been light. Sales reported are 400 mats of Padang interior, pale bean, at 15¼c. and 200 mats Kroe at 14¼c. *ex store*. The country demand has been slow.

\* \* \*

From the monthly returns for September it appears that the total landings of Tea at the Port of London amounted to 31,575,800 lbs., as contrasted with 26,515,850 lbs. in the same month last year, so that with deliveries comprising only 24,273,700 lbs., or barely equal to those in 1902, a material addition was made to the general stock, which on the 30th ultimo approached much nearer to that in the previous year, though still exhibiting a deficiency of nearly 8,279,000 lbs.

\* \* \*

The American Supreme Court handed down a decision in favour of W. H. Crossman & Brother in the suit instituted against them by H. Labaree Company to compel the former to make a delivery of coffee on contract, the steamer carrying the cargo having cleared from Santos when the bubonic plague prevailed there. The Local Board of Health refused to permit the landing of the green coffee, and the Court holds that under the circumstances there had been no arrival.

\* \* \*

**Brazilian Crops.**—A despatch has been received at the Foreign Office from H.M. Consul-General at Rio de Janeiro reporting that the returns give the amount of the coffee crop for the year ended June 30, 1903, as 12,993,559 bags,

showing a decrease of some 20 per cent. as compared with the crop of 1901-02, and an increase of some 14 per cent compared with that of 1900-01. The world's visible supply on June 30 last is given as 11,857,000 bags as compared with 13,233,000 on November 30, 1902. The average prices of coffee during the three years ended June 30 were as follows :—

	1900-01.	1901-02.	1902-03.
	s. d.	s. d.	s. d.
Rio No. 7 ... per 10 kilos.	6\$ 524 (6 7)	4\$ 773 (4 8½)	4\$ 377 (4 4)
Santos ... " 10 "	5\$ 745 (5 8)	4\$ 722 (4 8)	4\$ 114 (4 1)
New York spot No. 7, per lb.	7·53cts.	5·99cts.	5·34cts.

The maximum and minimum prices during 1902-03 were :—

	Maximum.	Minimum.
	s. d.	s. d.
Rio No. 7 ... per 10 kilos.	4\$ 902 (4 10½)	3\$ 813 (3 9½)
Santos ... " 10 "	5\$ 100 (5 1)	3\$ 500 (3 6)
New York spot No. 7 ... per lb.	5·96cts.	5 06cts.

Coffee shipments for the three years were :—

	1900-01.	1901-02.	1902-03.
For foreign ports ... bags.	10,893,969	15,273,451	13,012,353
For Brazilian ports .. "	252,806	289,364	360,843
Total bags ... "	11,146,775	15,562,815	13,373,196

H.M. Consul at San José, in a report to the Foreign Office, states that the coffee crop of Costa Rica in 1901-02 was a reduced one, 236,037 bags, as against 320,934 bags of the previous crop, or 26·45 per cent. less. On the other hand, the average price realised abroad was considerably better than in 1901; but, although this has been an encouragement to the planters, there has been no increase in the area planted, and the export of coffee is likely to remain at between 250,000 and 300,000 bags per annum. The export to the United Kingdom amounted to 73 per cent. of the whole crop, as against 66 per cent. in 1901.

\* \* \*

Porto Rico coffee requires high roasting to bring out its best quality.

\* \* \*

Coffee may look nice in the bean and taste anything but nice in the cup. The cup test is as necessary for coffee as for tea, if the buyer is to get a uniform grade every time.

\* \* \*

Some Mexican coffees are said to have a decidedly unpopular 'twang.' Some Mexican coffee is said to be of superb body and flavour and will equal any East India coffee ever seen on the New York market.

\* \* \*

**Coffee in Hayti.**—Prices of coffee varied during 1902 from 7 to 12c. currency per lb. and do not seem to have shown much dependence on the European quotations. Nearly the whole export goes to Havre. Of a total of 64,428,104 lbs., Port-au-Prince exported 13,266,054 lbs.; Jacmel, 12,804,771 lbs.; Cape Hayti, 9,546,144 lbs.; Aux Cayes,

8,115,061 lbs. ; Gonaives, 6,614,890 lbs. ; Jeremie, 5,865,847 lbs. ; Petit Goave, 5,042,490 lbs. The remaining 3,172,847 lbs. were exported from St. Mare Port-de-Paix, Miragoane and Aquin. The latest harvest, October 1, 1902, to January 31, 1903, yielded for export 20,763,158 lbs., as compared with 33,882,314 lbs., in the corresponding period of the year before.

From Brazil came lately a variant of the old, old pessimistic forecasts. The flowering of the coffee trees on Santos was admitted to be good, but drought was said to be affecting the fructification of the blossoms, and it was reported that the trees had been weakened. It would be of interest to know, however, how many fresh trees are likely to be coming into bearing for the first time in each of the next few years. In the meantime the supply everywhere is still very heavy.

An American paper remarks:—"It is strange that coffee should have done so well in the new world, since it is indigenous to the old world. Its cultivation on this hemisphere goes back to 1,725 or 1,730." In the same paper we read:—"The poorest grades of coffee from the Philippines formerly brought a higher price than Javas in some parts of Europe. When is this market to get the lion's share of the Philippine coffee?"

This comes from New York:—"In South America the odor of the blossom of the coffee trees is so powerful that when the plantations are near the coast, sea-captains miles from shore can smell the perfume. Coffee trees, like fig trees, bear fruit, leaf, and flower at the same time." Were it not that Indian Coffee is of the "mild" description, obliging "sea-captains" might be found who would swear that they smelt the coffee-plantations of Coorg as they safely found their way outwards from the Gulf of Aden!

### TEA NOTES.

Monsoon conditions are disappearing, in the Northern Tea districts, and cold weather is setting in, though there are no signs of the early closing of manufacture.

At the Colombo Tea sales on the 21st ultimo 15,465 packages = 1,235,627 lbs. were offered, of which 12,891 packages = 1,023,736 lbs. were sold. The market was

strong and active, and, with the exception of the better kinds of Broken Pekoe, a general advance took place. Pekoes and Pekoe Souchongs, as well as common Broken, were about two cents dearer, while other kinds shared more or less in the rise in spite of the poorer quality. Green teas were steady, the demand being chiefly for good invoices.

A correspondent writes to the *Times of Ceylon*:—"As was expected, the temporary reduction in freight to Australia from Rs.35 to Rs.15 created a better demand for common to medium teas for the Australian market at to-day's sale, and prices advanced. The Russian buyers found more competition than usual." This has reference to the sale of 21st ultimo and the reduction of Colombo freight (to Australia) to Rs.15, as against the Calcutta rate of 50s.

A Passara correspondent, writing on October 19th to the *Times of Ceylon*, says:—"The North-East monsoon is well on us now. It marked its presence amongst us on the 15th by more than a capful of wind, and an exceptionally heavy shower of rain which commenced at 5-55 p.m. finishing off a little after 10 p.m. It has been regularly wet since then. The total rainfall for October to date is 9.26 inches short of October, 1902. Tea is flushing magnificently, and nearly 80 per cent. of the estimate is already in. The balance ought to be easily in by the end of the year at the present rate of yield.

**Ceylon Tea in Canada.**—There has been a better demand recently for Ceylon and India blacks, and the market has improved locally as well as in London and primary markets. Pekoes and Orange Pekoes are about  $\frac{1}{2}$  to 1d. higher and there has been a keener demand for lower grades. In Japan there has been a good demand for teas from 17 $\frac{1}{2}$  to 20c. There has been rather a falling-off in Japan, 15 $\frac{1}{2}$  to 16c., as Young Hysons are reported as showing so much better value at same figures. No change in China blacks. Ceylon and India greens are being picked up quite freely and the demand is on the increase. The market generally has been active during the past week, some very good lots of Ceylon and India greens having been sold, these being on invoices from garden outputs. We quote:—

Good to medium Japans	...	...	0	17 $\frac{1}{2}$	0	20
Fine to choice Japans	...	...	0	23	0	26
Ceylon greens	...	...	0	14	0	18
Indian greens	...	...	0	16	0	19

—*Canadian Grocer*, September 18.

**The U. S. Tea Market.**—The stronger and higher cables from the markets of production served, says the *Tea and Coffee Trade Journal* of 29th ultimo, as a strengthening factor in this market, and prices particularly of desirable grades of Pingsueys and country greens are very strong. Cables from Shanghai note a higher market, owing to the sharp advance in the rate of exchange, and country greens as well as Pingsueys are now quoted  $\frac{1}{2}$  cent per pound higher. The movement in the local market, in invoices has been slow, but a large business has been done in Pingsueys and country greens, which are due here shortly by steamer. The spot supply of green teas of fine quality is exceedingly light, and prices are tending upward. About 3,500 packages of common

Congous have been sold at private terms for export to London. The price paid, it is believed, is in the neighbourhood of 8 cents per pound. Transactions in India and Ceylons are fairly good, and there has been a good call for the good and medium sorts. Sales of several large-sized parcels of India Pekoe and Pekoe Souchong have been made at about 14 cents, *ex store*. Parcels to arrive have also been sold at private terms. The distributing business has been slightly better and indications point to a fair movement of supplies into consumption, during the balance of the year. No large transactions, however, are expected to be made, as the interior buyers, according to latest reports from travelling salesmen, have ample supplies to meet their requirements for some time to come.

\* \* \*

The quality of recent offerings of South Indian Tea in the London market is described as "rather unattractive."

\* \* \*

Settlements of Japan tea at Yokohama to and including August 21, and Kobe, August 23, 281,126 piculs, against 244,710 piculs for corresponding time in 1902.

\* \* \*

July imports of tea at all American ports, 10,399,611 pounds, against 8,412,638 pounds in July, 1902. For seven months ending July, 37,632,718 pounds, against 35,821,304 pounds same month 1902; 28,534,296 pounds July, 1901.

\* \* \*

**London Tea Sales.**—Cabling to Colombo on the 22nd instant Messrs. Gow, Wilson & Stanton reported a fractional advance in the tea market, teas for price being dearer. The average of Ceylons was unchanged, at 8d. Reuter reported similarly, and stated that 14,000 packages Ceylons had been sold out of 15,000 offered. Of Indian teas 45,000 packages were offered, 40,000 sold. Average 8d.

\* \* \*

**Calcutta Tea Sales.**—Reuter's London telegram reached Calcutta on Friday morning quoting the Mincing Lane market  $\frac{1}{4}$ d. higher for common and medium teas and strong for good to fine grades. In the face of this information it is not surprising that the auctions evinced a very strong tone for all descriptions. The sale opened with a good general demand and brisk bidding which was maintained throughout. Leaf grades up to six annas were in chief request and closed 2-3 pie above last week's rates. Medium and better classes were also well supported and realised in every case fully previous prices. Of fine teas there were none but where Assam offerings showed rather better quality buyers were not slow to show their appreciation. Dusts were in rather stronger demand than of late and sellers on this market of those descriptions have reason to congratulate themselves on results. Outside markets continue to operate with freedom and a fair quantity was again secured for the Bombay and Gulf demand. More interest was shown in green teas and better prices were forthcoming in most cases only a small quantity being withdrawn. Of 22,432 packages offered, 21,190 were sold.

Somewhat of a blow, however, has been experienced by India's Colonial trade direct by the reduction of freight from Colombo to Australian ports to Rs.15 per ton last week, Calcutta freight still remaining at 50 shillings. This unless met will end in a further reduction of our Australian trade.

Both in Calcutta and in London there has been a decided fillip to buying recently, and it looks at present as if a prosperous time were in store for sellers. The situation generally remains unchanged so far as supply is concerned, shipments of Indian tea to United Kingdom being still well in advance of last year's, and it being generally known that this season's Indian crop will be a large one. The improved position of the article must therefore be put down to better demand owing to increased consumption, and the policy adopted by the Indian Tea Association of fostering demand instead of artificially restricting production therefore stands fully justified. The large Indian crop, however, undoubtedly stands to be helped off by the shortage from Ceylon, but as the island planters have converted the proportion of leaf thus withdrawn into green tea for the States, the general aim of increased consumption has been maintained throughout. Green tea has indeed both in India and Ceylon carried off just that proportion of production that might otherwise have proved embarrassing.

\* \* \*

A new problem in regard to the classifying of tin canisters as a dutiable article, is a puzzling one to the custom officials in the United States, because, in the case of the Southern Pacific Company at San Francisco, the Court held that the canisters were unusual and therefore subject to a duty of 45 per cent.; whereas in Chicago they were held by the Court as usual and entitled to free entry.

Conflicting opinions were handed down in the United States Circuit Courts at Chicago and San Francisco, again brought up before the Board on Classification of the United States General Appraisers by the protest of Wm. J. Howland, Chicago, and heard on September 28th before the Board. From the testimony taken at the hearing it became apparent that Eastern tea interests are considerably involved with those of the West, where the coverings in dispute are almost entirely used, principally, it is stated, for the purpose of advertisement, there being strong competition for Western trade.

This case was brought up by the Treasury Department's action in instructing the Collector of Customs at Chicago to classify the coverings as "unusual," and it is their intention to carry the case to the Circuit Court. The Board of United States General Appraisers rendered a decision some time ago on the protests of a number of importers, in which the Board necessarily followed the Court's decision and held that the canisters or tea caddies in question were usual coverings and therefore not dutiable. The Department did not then appeal from the Board's decision.

\* \* \*

**Mr. Larkin on Ceylon Tea in the States.**—A representative of the *Grocer* had the pleasure of meeting Mr. P. C. Larkin, of the Salada Tea Co., on Saturday last at his office in St. Paul Street, Montreal. Mr. Larkin was on his way to Toronto from an extended inspection trip through the Eastern, Middle, and Southern States. Interviewed as to the progress the introduction of Ceylon and Indian teas in the United States was making, Mr. Larkin said: "Last year there was consumed in America 27,000,000 lbs. of Ceylon and Indian teas out of the annual consumption of 100,000,000 lbs. of all grades and kinds. This figure is remarkable when it is considered that it is only within the last few years that these teas have been introduced to the American public. The Salada Tea Co. has set itself the task of drawing the attention of the American housekeepers to the superior qualities of the teas of Ceylon and India, and, though the missionary work has been hard, I can already see a remarkable change in favour of the teas of Ceylon and India. The volume of business turned over by the

Salada Tea Co. is enormous, and my tour among the different agencies south of the line has shown me that the business is but in its infancy. All of our agencies show marked increases in business, some of them exceptionally so, and the future prospects are most encouraging. 'Salada' tea will be a household word in the United States as it is in Canada, and as the Ceylon and Indian Governments are going to spend a large sum in erecting a magnificent bungalow at the St. Louis Exposition, the quality of the teas of those countries will be demonstrated to the citizens of the great Central and Western States. 'Salada' tea representatives will be found there during the entire exhibition."—*Canadian Grocer*, September 25.

### NOTES.

#### Cocoa in Hayti.

The harvest of cocoa in 1902 was small, and prices were too high to make exportation profitable.

#### Italian Fertiliser-manufacturers.

A syndicate of Italian firms who produce artificial fertilisers has been formed, with a capital of £600,000.

The objects are to amalgamate Italian factories which produce fertilisers and allied chemical products, and to regulate prices and production. Some important firms are outside the syndicate.

#### Plant-protection.

An association of geographical and systematic botanists was formed at Berlin on September 17 for the purpose of protecting the natural formation and individuality of plants. Professor Engler was appointed President, and Herr Pfitzer, of Heidelberg, Vice-President. It was decided to hold the next meeting at Stuttgart in August 1904.

#### Phosphates in Japan.

A British consular report states that deposits of phosphates have been discovered at the village of Kaino in Japan. The quality of the deposits varies a good deal, but the average is about 10 per cent. phosphoric acid. Exploration so far made shows that there is a considerable quantity of the phosphate. The mine is about  $1\frac{1}{2}$  miles from the port of Funatsu, on the Bay of Toba, so that shipments can easily be made.

#### Java Quinine.

The exports of quinine from Java during July amounted to 502 cases (200,800 oz.), of which 174 cases were shipped to the United Kingdom (probably in transshipment for Holland or New York), 20 cases to Genoa, and 308 cases direct to New York. From January 1 to July 31 the exports have been—

	1903	1902	1901	1900	1899
Cases ...	1,148	583	1,141	1,037	933

#### The Java Cinchona Combination.

It is authoritatively stated, says the *Batavia Newusblad*, that the Java Trading Company in Holland has decided to support the combination of the Java cinchona-planters, and consequently to maintain the Amsterdam unit of Government bark at 6c. during 1904. Now that the Government has intimated its approval of the combination, it is to be hoped, says the *Batavia Newusblad*, that the remainder of the planters will join the combination.

#### Rubber in Ceylon.

Writing of Rubber cultivation in the Kalutara District, a Ceylon paper says:—Rubber cultivation is going on rapidly in this district, and, if the industry turns out all that is promised, the lucky

proprietors have good times ahead of them. Sorana, Knutsford, Heatherly, Hattangalla, Ellekande and Culloden, are having rubber planted among the tea, which will mean a falling-off in the tea outturn of the district in a year or two. A syndicate, of which a well-known expert on rubber is the head, are putting in a clearing of 300 acres.

#### The St. Louis Exhibition.

It has been decided to open a Commercial Sample Room and an Enquiry Bureau in the Ceylon Court at the St. Louis Exhibition. It is no secret that this idea was inspired by Mr. Stanley Bois, the Ceylon Commissioner, before he left Ceylon, and Mr. Peter de Abrew, the well-known broker of Messrs. Volkart Bros., is said to have been appointed to take charge of the sample room on a remuneration of Rs.500 per month. It is evident that Ceylon means to work this Exhibition for all it is worth.

#### Banana Coffee.

It is said banana coffee is the richest, most aromatic substitute for the real thing of the kind. The manufacturer is a fruit evaporator of British Guiana. This is how the idea of banana coffee was born. A coffee tester and expert in New York was inspecting samples of evaporated fruits and vegetables, in which was a package of evaporated bananas. With his sensitive smell he detected a rich, natural coffee flavour from the evaporated bananas, and remarked it. This was a tip for the owner, and at once he made some experiments, which astonished him, giving the coffee a most delicious flavour. He did not stop there, as he was fully convinced from experiment that he could produce from bananas a perfect substitute.

#### Java Cinchona.

The following are particulars regarding the shipments from Java :

#### The Rise in Rubber.

At the beginning of this year the price of fine Pará in an active market stood at 3s. 8 $\frac{1}{4}$ d. per pound. In the first week of this month it was 4s. 7 $\frac{1}{4}$ d.—a figure that has not been touched since the third week in January, 1900, when it was 4s. 9 $\frac{1}{4}$ d. In comparison with these figures, Pará rubber throughout last year was low. It opened at 3s. 6 $\frac{3}{4}$ d., and, touching 2s. 11 $\frac{1}{4}$ d. in February, varied between this and 3s. 2 $\frac{3}{4}$ d. until September, when it rose to the starting price of 1903. The 1901 and 1900 figures may also be chronicled. In the first-named year it started at 3s. 11d., declined in March to 3s. 6 $\frac{1}{4}$ d., rose to 3s. 11d., and then fluctuated to 3s. 7d. at the end. The year 1900 found Pará at 4s. 7 $\frac{1}{4}$ d., and it then advanced to the

maximum figure mentioned above, followed by a decline in May to 3s. 8 $\frac{3}{4}$ d. A recovery ensued—4s. 2 $\frac{1}{4}$ d. in June, 4s. 3 $\frac{3}{4}$ d. in September—and then a decline again, but it did not get below 3s. 9 $\frac{1}{2}$ d. As to whether the price of the raw material will advance still further in the few remaining months of this year, we can only rely on the experts, some of whom prognosticate that 4s. 8d. will be reached within the next few weeks, followed by a drop to 4s. 4d. before Christmas.

## LETTERS TO THE EDITOR.

### THE N. P. A. AND THE LABOUR LAW.

To

THE EDITOR,  
*Planting Opinion.*

SIR,—Have just seen your issue of 17th October, 1903, with Proceedings of the Nilgiri Planters' Meeting of the 23rd September.

How is it that the Honorary Secretary, in submitting the names of those present both in "person" and "proxy" very *carefully* leaves out the "name" of the "proxies" put in by him? I ask, because it was the "proxies" produced by him "*as his own subscription*" that caused the equal vote on the "Labour Act." The Honorary Secretary put in 7 proxies, if I remember, and it would be interesting to know what "area" they represent and also whether the absentee proprietors represented by them had been consulted as to their views on the Act.

ONE OF THE NILGIRI ASSES.

## GENERAL ARTICLES.

### PRODUCE AND PLANTING.

Tea, coffee, and sugar-planters will note with interest that Mr. Chamberlain's proposals as set forth at Glasgow involve remission of taxation as follows:—1. Three-fourths of the duty on tea. 2. Half the duty on sugar. 3. Substantial preference on colonial wines. In the first instance the abolition of the tea duty was mentioned as one of the features of his proposals, but this has evidently been modified.

The *Daily News* has been gathering some trade opinion about the proposed remission of the duty on tea. When asked the probable effect of the remission of 75 per cent. of the duty, one of those questioned stated that "it would only put up the cost of the tea." "Put the cost of tea up?" exclaimed the inquirer in astonishment. "Yes, that is my honest opinion, and for the same reason as it was put up two years ago; that is to say, by combination of growers and shippers." Mr. Lough, M.P., was asked: "Do you think the reduction of tea will compensate for the rise in the price of bread?" To which he replied, "No; the buyer of bread will not be compensated by the reduction on tea, but there is not likely to be any prospective rise in the price of tea after the remission of duty. It would be ridiculous to leave any duty at all on coffee or cocoa, because it produces so small a sum. All those duties should be swept away, and the money should be found by the reduction of expenditure and the taxation of ground rents." Asked further as to tea, Mr. Lough continued: "The present duty is 6d., which produces £1,000,000. To take off three-quarters would be most inconvenient, because one-quarter is not worth retaining."

In his latest pamphlet, to which reference is made in another column, Mr. Chamberlain says:—"Our free food friends will have to be a little more definite and a little more accurate. They will have, for instance, to explain why a transfer of taxation, say, from tea to bread, would be disastrous." This is too much for the feel-

ings of some of the papers who oppose Mr. Chamberlain. One of them says: "Bread is the staff of life, and tea is not the staff of life. A working man and his family could subsist on bread, but they could not subsist on tea."

The working man and his family might find it difficult to subsist on tea alone, but some of these journals which now see so wide a difference between tea and bread as articles of diet used at one time to tell us that tea was nearly as important to the working classes as bread. But that was when an argument was needed to show the wickedness of a Tory Chancellor of the Exchequer who—and here we were in full sympathy with those journals—had, with that characteristic audacity of Chancellors of the Exchequer, gone and increased the tax on one of the necessities of life, *viz.*, tea. Mr. Chamberlain is, therefore, not so very far out in his argument.

The *Grocer* says:—Excluding Indian and Ceylon tea helps M. De Witte's economic projects in two ways—(a) by encouraging the use of the Russian tea which he is trying so hard to grow in the Caucasus, (b) by providing additional tea traffic from China along the whole length of the Trans-Siberian Railway. These developments were bound to come on some pretext or other, and it is just such developments as these that the 'new fiscal theorists' are trying to meet by taking Time's forelock instead of waiting to clutch at his hinder parts when past. At the same time, 'it is an ill wind that blows nobody good'; and it should not be forgotten that if Indian and Ceylon teas are thus to be returned on our hands from a hostile market the effect ought logically to be to benefit the British consumer of such tea, if not the Indian and Ceylon producers."—*H. & C. Mail.*

## THE CONSOLIDATED ESTATES COMPANY, LIMITED.

### REMARKS ON TEA PROSPECTS.

The twelfth Annual General Meeting of the Consolidated Estates Company, Limited, was held at the offices, 34, Great St. Helens, E.C., on Wednesday, October 7.

Mr. H. Gough Arbuthnot presided.

The notice convening the meeting and the auditor's certificate having been read.

The Chairman said: This is the twelfth Annual Meeting of the Consolidated Estates Company, and it is also the twelfth successive year that I have had the pleasure and the privilege of addressing you from this chair. . . . Those who were present last year may remember that on that occasion I mentioned that by the returns we had received up to September 27 the crops were turning out extremely satisfactorily, and that then we had actually harvested nearly 50,000 lbs. more than we did during the corresponding period of the previous year. Unfortunately that was the high tide of our good fortune, and immediately afterwards it began to ebb, and for nearly the whole of the remaining nine months the weather was more or less adverse, so that not only did the 50,000 lbs. surplus disappear, but a deficiency of nearly 100,000 lbs. was substituted in its place at the end of the twelve months. However, happily this was more than counteracted by better prices, so that the net result of the season's campaign has been decidedly more favourable than that of the previous year, though the cost of production was a little more, owing to the fact that the crop was so short, for, as you will understand, many charges, such as management and salaries, are just as high when the crop is small as when it is large, and that increases the cost of production on a short crop. Otherwise it was about the same. . . . Of course I need not say that in this company tea is, if I may use the metaphor, the backbone of our products. Nevertheless we are most anxious to do all we can to encourage other products, and we have been to a very fair extent successful. I have before me the particulars of the amount actually realised for these products in addition to tea, and it may interest you to know the details. Cinchona bark realised £585, cardamoms £578, cinnamon £153, cocoa £40, pepper £86, and Areca nuts the handsome sum of £3 18s. 5d. I am afraid that this last is not a product which will be of much advantage to this company. But there are others now coming forward, which we hope will eventually increase our income. Thus, for instance, next year we hope to get about £50 or £60 from rubber. We have at present about 40,000 trees on the Tallagalla and Sorana estates,

from which in a few years' time we hope to receive a considerable income. They will be very useful, and will, we hope, in some measure compensate for the falling-off in bark; but in the meantime, as I explained last year, we can hardly look on the bark as ordinary revenue, and we, therefore, thought it advisable again to put £500 of the proceeds to the reserve fund, which will then amount to £2,500. . . . But the question in which the shareholders are mainly interested is that of the prospects for the current year. As regards crop, the returns which we receive weekly are, so far, decidedly satisfactory. The return which we received the day before yesterday from our Ceylon managers shows that we had a thousand pounds more of crop harvested than we had at this time last year. As I explained to you just now, last year's outturn for the first three months was particularly good, showing as it did an advance of 50,000 lbs. on the return for the corresponding period of the previous year. We shall now begin to compare with the lean nine months of last season, and I have every hope that the comparison will show up very favourably. The question is, will the present good prices be maintained? and I think we may fairly expect an affirmative answer. For a good many years past very little extension of tea cultivation has been entered upon, either in Ceylon or in India, so that we need not fear any great increase of supply, apart from the ordinary contingencies of good and bad harvests, while the consumption of tea seems to be gradually but steadily increasing. I need not say, gentlemen, that this is not the place for a political discussion, except in so far as the direct interests of the company are affected thereby. You will no doubt all have read the speech delivered by Mr. Chamberlain last night, which had been looked forward to with so much interest all over the country as defining his Fiscal proposals. You will have seen that he proposes to conciliate the colonies by putting a tax on foreign corn and other food, while colonial produce is admitted free. He recommends as a set-off to the tax thus imposed on our home consumers to take off a corresponding or even greater amount of the existing taxes on food, and among other things to reduce the duty on tea from 6d. to 1½d. per lb. Theoretically, when any new tax is imposed it is considered that such tax is paid by the consumer, and similarly when a tax is reduced, that the reduction goes into the pocket of the consumer, but practically the producer is pretty sure to benefit by the reduction, more especially in such a case as that of tea, on which the duty is so enormous relatively to the value. At present it costs us 4½d. per pound to produce excellent tea on which the duty is 6d., or more than 100 per cent., and it stands to reason that when the cost of tea to the producer is reduced, as is proposed by 4½d. per pound, the consumption is sure to be largely increased, which, of course, means an enhanced value to us; and even if we can only secure ½d. per pound out of that 4½d. which it is proposed to take off, it would mean a difference to this company of £3,500, which is equivalent to an additional dividend on the ordinary share capital of about 9 per cent. But it may be said that Mr. Chamberlain is not in power, and that this reduction may be a long way off. But the only thing to be said is that, whether we have Mr. Chamberlain's party in power or the Radicals, I think it is perfectly certain that the tea duties must be reduced. The Liberals are pledged to a reduction of expenditure and, therefore, of taxation, and whether the Unionists or Radicals are in power, the reduction in duty is pretty certain, and we shall accept it with the greatest satisfaction, from whichever party it comes. I think, therefore, that on the whole we may take a favourable view of the future. . . . With regard to the Albizzia Moluccanas or leguminous plants which I referred to in my speech last year, I think you will be interested to hear what the company's Ceylon agents write to us on the subject. The following is an extract from a letter which we received from them the day before yesterday: "As regards Albizzia Moluccanas, it may be mentioned that these trees are being planted on Rutland as well as on all the other estates of the company. They afford good shade where that is wanted, besides improving the soil in which they grow by the collection in their roots of atmospheric nitrogen. They also provide a good deal of useful matter in the way of green manure." We quite hope, as I explained to you last year, that these trees will eventually help us a little by reducing the amount of manure that will be necessary, though, of course, it is not expected that they will in any way take the place of manure, which, so far as we can see at present, will always be required. Therefore we must make up our minds for a considerable expenditure on manure, though I firmly believe we shall be fully compensated by abundant and continuous crops.

## THE ARAMINA FIBRE.

It will no doubt be remembered that a Scientific and Technical Department exists in connection with the Imperial Institute in London, with laboratories attached for the purpose of investigating new or little known products, with a view to their utilisation in British commerce, and also to provide trustworthy scientific and technical advice on matters connected with the trade and industries of our Colonies. In the current *Bulletin* issued by the Institute an interesting account is given of a fibre which, it is thought, may possibly compete with jute for some classes of goods. It is derived from the "Carrapicho" plant of Brazil, and was mentioned by Mr. Consul-General Rhind in his report on the trade of Rio de Janeiro for the year 1899. In his despatch Mr. Rhind quoted the opinion of Dr. Silva Tolles, of the Sao Paulo Polytechnic School, to the effect that the fibre, which is probably derived from "Urena lobata," is likely to be of great value for cloth-weaving, spinning, and other purposes being more silky and stronger than jute, and comparable with the best kinds of hemp. It was stated that information as to the cost of production and price could not be given, as systematic cultivation was only in an experimental stage. It was, however, known that the plant was easily grown, and the cost of production would probably therefore be very low. A sample of this fibre has lately been subjected to investigation by the Department above mentioned, but as it was rather small, a decisive opinion as to the value of the material is reserved until a larger quantity has been examined. The specimen consisted of fine silky fibre of great length in staple, having in general the characteristics of the best jute, but very much less lignified and of good colour. On chemical examination, it was found to contain a high percentage of cellulose, the results being very similar to those obtained from jute of the best quality. A portion of the sample was afterwards submitted, with a statement of the results of its chemical examination to a well-known firm of fibre-brokers, who reported that it could be employed for the same purposes as fine jute. Its value was estimated approximately at from £17 to £18 per ton. The brokers stated, however, that it was impossible to give the precise value of the fibre until a much larger quantity had been examined with special reference to its behaviour during spinning, weaving, and other processes to which it would be submitted. They suggested that a hundredweight or two should be sent in order that these further trials might be made. In his report upon the trade of Rio de Janeiro for 1901 the Consul described the steps which have since been taken to utilise this fibre locally. Numerous experiments have demonstrated its excellent qualities, samples of rope and other woven materials were manufactured from it, and an exhibition of these products was held in the City of Sao Paulo. The plant is now being extensively cultivated, and a factory has been erected at Sao Paulo exclusively for the manufacture of goods from Aramina fibre. The price paid at the factory for the clean fibre is about 1d. per lb.—*Textile Mercury*.

## FUTURE COFFEE TRADING AT NEW ORLEANS.

The Board of Trade of New Orleans has adopted the rules formulated by the Special Committee appointed to look into the matter of future trading in coffee. Section 14 provides for a meeting of the Committee on Revision of Differences between Grades on the Thursday following the second Wednesday of November at 10-30 o'clock a.m. At this meeting the differences between grades will be established for the year, and Thursday was chosen because on the Wednesday previous the New York Committee meets.

The regulations provide for a board of Managers, to have authority under the directors of the Board of Trade of the Coffee Department. The Managers shall be nine in number, five to constitute a quorum at a Board meeting. The term of office shall be one year. After the first board, election shall be by members registered as dealing in coffee.

Members of the Board of Trade desiring to trade in coffee must register their names and pay a fee of fifty cents for each contract of 250 bags.

The Committees are: Trade and Statistics, five members; Spot-Quotation Committee, five members; Quotations of Futures, five members; Adjudication, three members; Revision of Differences.

between Grades, nine members. The Committees shall hold office for a year.

A very important rule is that regarding the Committee on Revision of Differences.

The trading in coffee options on the Board of Trade shall be for the growth on the North and South American continents, Central America, Mexico, and Porto Rico.

No artificial colored coffees shall be delivered on contracts for options.

The grades are those established by the Committee or Board of Managers of the Coffee Department of the New Orleans Board of Trade, say, number from one to nine. All transactions to be based on the New Orleans Board of Trade, type No. 7, and any of said grades may be delivered at the differences existing at the time of delivery as established by the Committee on Revision of Differences between Grades.

The coffee to be of any grade, from No. 9 to No. 1 inclusive, provided the average grade shall not be below type No. 8.

Contracts shall be for 32,500 pounds in about 250 bags.

All offers to buy or sell coffee for future delivery shall be in cents and decimal fractions of a cent., and no transactions in contracts shall be permitted wherein the difference in price shall consist of a smaller fraction than five-hundredths of 1 cent per pound for each pound of coffee represented by such contracts or contract, nor shall any additional moneyed consideration whatever be allowed.

## THE LEEMING SYSTEM.

*(From a Planting Correspondent.)*

Signs are not wanting, not only in India but almost all over the world, that there is to-day an awakening to the need of science in agriculture and horticulture. Some nations are especially enterprising in organising Experimental Stations for scientific research; others, again, are quick to take advice in matters in which they have failed to originate. It has been said that the more we know of the way in which the plant lives and of the manner in which it carries out its life's work, the fuller our knowledge of the conditions and limitations under which these operations are carried on, the greater will be our success as practical men. Ordinary routine work well carried on ensures a large measure of success, but it affords no hope of advancement, no chance of breaking new ground, and no power of adapting ourselves to unforeseen conditions.

What has been found to be true of agriculture and horticulture generally is especially the case with coffee cultivation. Coffee-planters in Southern India were very prosperous some seven or eight years ago. Profits on most estates were high and men could afford to cultivate highly. Then when conditions changed and the unforeseen conditions of over-production and consequent low prices, as well as deterioration in the coffee produced, had to be faced, how many were able to adapt their methods accordingly? Many men who had to cut their coat according to their cloth enforced most stringent economy in the working of their estates, but it was mostly at the expense of labour or manure that could ill be spared. One planter only, I believe, studied the coffee plant scientifically and introduced a system whereby he made certain of reducing his expenses to the lowest possible figure, and, at the same time, thought to improve both the yield and the quality of the produce of his trees. Needless to say I refer to Mr. Leeming, about whose system much has been written, but of which much is yet imperfectly understood. It is in the hope of correcting existing misunderstandings that the following notes have been written, and of enlisting on behalf of the system the attention of those who so far have not thought fit to give it trial. Those who can "make coffee pay" under present conditions may be wise to "let well alone." Even they, however, could do no harm by experimenting with the system on a few small blocks. They might obtain even better results than they obtain now. In agriculture, as in most things, there is no standing still. We must advance or, sooner or later, go backwards. To those, on the other hand, who cannot at present prices make coffee pay, but hope on for better times in the assurance that "it is a long lane that has no turning," I would say "try Leeming," because there seems very little chance of any turning being encountered for a long time yet.

The first stages in the evolution of Mr. Leeming's system date back many years. He first gave up pruning and handling because he saw no good in forcing new wood to grow to be eventually cut off again, and because he found it did not pay him to continue these works. The money he saved thereby he put into manure and into labour, with the result that his trees grew matted, and it was evident that they suffered from too little space within which to develop. Mr. Leeming was led by this fact, and by the appearance of old coffee trees grown on neighbouring estates and in the neighbourhood of the Malayalis' villages which were at least 15 ft. in diameter, and by what he had read of coffee-growing in Brazil and Central America, to cut out half his trees diagonally throughout a plot of two acres. The 600 trees per acre which were left he allowed to grow as they would, without even removing the suckers. This was in 1894. He was so pleased with the result both in the crops obtained and in the appearance of his trees that in 1898 he treated 25 acres similarly; and he has continued the process ever since, till now it has been adopted all over his estate of "Scotforth," on the Shevaroy Hills. This estate is composed of the following gardens:—

1. 64 acres old coffee planted 6' x 6'. The whole of this block (except 10 acres which contain 600 trees to the acre) has been cut out now, for the second time, leaving 300 trees to the acre.

2. 25 acres planted 6' x 5' in 1888. First cutting out was done in 1898. Second cutting out was commenced in 1900, carried on in 1901 and completed in 1902, leaving 350 trees to the acre.

3. 3 acres planted 6' x 6' in 1891 and 1892. First cutting out was done in 1899, and second cutting in 1901.

4. 35 acres planted 8' x 8' in 1895. These have only been cut out once, in July of this year, leaving 325 trees per acre.

5. 45 acres planted 8' x 8' in 1896. These have only been cut out once, in June and July of this year, leaving 325 trees per acre.

6. 17 acres planted 8' x 8' in 1899, 1900, and 1901. These have not been cut out at all as yet.

The total area planted was thus 189 acres, from which must be deducted 40 acres entirely destroyed by borer (30 acres of 1895 and 1896 plantings and 10 acres from rest of the estate) leaving 149 acres of old and young coffee in good order.

These 40 acres destroyed have since been "supplied," and concerning them a Mysore planter who has just visited "Scotforth" writes:—"I should never have believed you could have eradicated borer as you have done after what I did see two years ago. . . . The old coffee is looking wonderfully vigorous and healthy compared with when I saw it last and the improvement in the patches, which were bored, struck me especially."

The following returns from three fields, longest under "the system," may prove of interest:—

Field No. 1, cut out first in 1898. Second cutting out commenced in 1903, continued in 1901 and completed in 1902, so that there now remain 25 per cent. of the original number of trees. It yielded 1,343 bushels of cherry per annum for four years previous to cutting out and 1,217 bushels after cutting out,—a loss of 129 bushels. There is little doubt, however, that the loss would have been turned into a gain had the second cutting out not been commenced, and continued, so soon.

Field No. 2, cut out in 1899 and again in 1901 (leaving the trees 14' x 14' apart) yielded 288½ bushels of cherry per annum for four years previous to cutting out, and 333 bushels after cutting out,—a gain of 44½ bushels.

Field No. 3, cut out in 1899 and again in 1901 (leaving the trees 12' x 12' apart) yielded 93 bushels of cherry per annum for four years previous to cutting out, and 162 bushels after cutting out,—a gain of 69 bushels.

Coffee trees may be seen in all stages of development at "Scotforth," and two noteworthy points in connection with the system are (1) that the results of cutting out have in each case been so conspicuous as to induce Mr. Leeming to persevere with the same treatment with the remaining blocks and in no case has he regretted doing so, and (2) that the whole system is still only in the experimental stage and therefore no final results have yet been obtained.

As regards the distance at which the coffee should be finally left, Mr. Leeming says that all depends on circumstances. For instance, his practised eye will tell him whether the blocks which now contain coffee 14 ft. x 14 ft. will be allowed to remain at that distance or whether they will require yet more space. Similarly with regard to that at 12 ft. apart and with the young coffee at 8 ft. x 8 ft., the growth of the plants will enable Mr. Leeming to decide when the time has arrived for giving them more room. No definite rule can

be laid down. It is in this particular more especially that Mr. Leeming's experience stands him in good stead, and where those who would profit by his example would do well to enlist his services. Coffee trees, if left too close together too long, receive a check, Mr. Leeming finds, from which they will not recover sometimes for years. Some express surprise that Mr. Leeming undertakes the second cutting out at such an early period, but practical experience and results obtained from experimental blocks show that he has made no mistake in acting as he has done. The crops are larger and in spite of increased bearing, the trees withstand, and recover from, the effects of leaf-disease in a way that they never used to do before.

As regards the experimental stage in which the system is at present, it will be seen that only a small portion of the older coffee of the "Scotforth" estate has been left alone since 1900. By far the greater area has but lately received its final thinning out. Now Mr. Leeming considers that for the full benefit of thinning out to accrue four years at least must elapse. It will thus be seen that it is too early yet to gauge the efficacy of the system by the crops which have been picked, and that several years must first elapse. Mr. Leeming acknowledges that had he been aiming at large and immediate returns per acre, irrespective of quality, he would have left at  $8\frac{1}{2}$  by  $8\frac{1}{2}$  ft. a considerable portion of the estate which he has since cut out to 12 ft. by 12. Had he done so, however, he estimates that his trees would have got a bad attack of leaf-disease and would have received a check, from which they would have taken a long time to recover. Asked what results he had obtained from the gardens which first received attention, Mr. Leeming said that an acre or so had given him an average of two-thirds of a bushel per tree, and that when they were more fully developed he thought he would have no difficulty in getting one bushel per tree in alternate years. Asked whether he would not prefer to have half a bushel only per tree and have it each year, Mr. Leeming said:—"Yes, but that is not Dame Nature's way." He is content, therefore, to take what Nature provides even if only in alternate years, and he expects the average will work out at least 8 cwts. per acre per annum.

So far we have dealt with Mr. Leeming's expectations as regards crops. He has had, however, two far more important objects in view than bumper crops. They are (a) improving the quality of his produce and (b) cutting down expenses. As regards (a) Mr. Leeming, who has had some practical experience of the London market, holds very decided views as to deterioration in the quality of coffee being due to leaf-disease, and his system is directed to checking leaf-disease more than to anything else. He has found, as a result of his methods, the most extraordinary development in the size of the bean his trees produce in spite of a big crop. The figures as regards the different grades of the "Scotforth" crops during the last four seasons, as given in the following table, show more clearly than can any description of mine the remarkable results which Mr. Leeming has achieved:—

SEASONS.

Size of Coffee.	1899-1900.	1900-01.	1901-02.	1902-03.
A. ...	6.45 %	17.59 %	19.86 %	38.73 %
B. ...	49.76 "	43.48 "	49.57 "	37.40 "
C. ...	23.84 "	15.26 "	18.74 "	8.27 "
P. B. ...	13.55 "	11.67 "	7.16 "	7.69 "
T. ...	6.07 "	11.73 "	4.27 "	7.60 "
R. & B. ...	.33 "	.27 "	.40 "	.31 "
	100 %	100 %	100 %	100 %

During the same period the number of bushels (struck) of cherry required to produce a ton of crop was as follows:—In 1899-1900, 266; in 1900-01, 260.80; in 1901-02, 238.20; in 1902-03, 244.60. The figures for 1902-03 would, Mr. Leeming is convinced, have been better than for any previous season had October, November, and December last not been so abnormally wet. Mr. Leeming attributes this extraordinary improvement to the elimination of the evils of overcrowding, viz., leaf-disease, drying up at the end of the branches, *bili hunnu* or white ripe fruit, and inability to ripen the crops; and the greatest of these is leaf-disease.

As regards (b), cutting down expenses, Mr. Leeming has modified his system somewhat in the last year or two. He has given up all attempts to grow green manure and prefers to aim rather at obtaining the natural mulch which Dr. Lehmann recommends so highly, and to the latter he expresses great

indebtedness for pointing out to him the difference between natural and artificial mulch. Mr. Leeming has accordingly given up trenching and digging in any form, relying on drains which he has had dug to a depth of three feet all over his estate, at intervals of about 20 feet. He has found by experience that they accomplish all that is required in the way of aeration of soil and that in land so treated his trees always looked fresh, however dry the weather. For shade, which a bad attack of borer in 1901 led Mr. Leeming to attend to without delay, he prefers *Erythrina*, it being a quicker grower, more leguminous and therefore richer in nitrogen, and less liable to the attacks of insect pests than the indigenous forest trees. Excluding the work of planting shade and digging drains, which Mr. Leeming considers should be charged to capital account, his ordinary expenses are divided between weeding and manuring. Ten weedings at a cost of Rs.8-8 per annum per acre in the aggregate he finds to be necessary (but this item as the shade and coffee trees close up and cover the ground more and more will in the future be probably reduced); and an application of 450 lbs. per acre of poonac at a cost, including application, of Rs.11 to Rs.12 per acre. All such works as pruning, handling, topping, etc., are absolutely tabooed, the trees being left free to grow entirely as they like.

The chief arguments which have been brought against the system are the following:—(1) That the trees will yield two large crops under it and nothing afterwards. (2) That the amount of manure required per acre will be as much as under the old system. (3) That though it seems to answer on the Shevaroy, yet it may not be equally suitable for other Districts. Now, as regards the first of these allegations, one may ask if the men who make this assertion have ever given a reasonable explanation of their statement which, from Mr. Leeming's experience, is quite contrary to facts.

As regards (2) one can safely reply that planters used to give their trees, if the analyses were worked out, far more food than should have been necessary. In other words they made little or nothing out of the soil, which was hardly satisfactory from a monetary point of view. So far Mr. Leeming has found 450 lbs. [i.e.,  $1\frac{1}{2}$  lbs. per tree at 300 trees to the acre] of the manure he applies to be sufficient per acre and the analysis shows that he is even then allowing a good margin for safety. This can only be explained by the assumption that, owing to a more healthy root development, the trees at "Scotforth" are now in a position to extract some of their food from the soil which they were, apparently, unable to do before. The third allegation may be true. However, the principles of "the system" surely remain the same though they may require altering to suit local conditions. Otherwise, how is that they answer so admirably in such an enormous area [as compared with Southern India] in Central and South America?

That the Leeming system in the main is the right way to grow coffee appears to admit of less and less doubt, and its introduction into the several coffee-growing Districts of Southern India is gaining ground year by year. By the words "in the main" we refer especially to giving the tree freedom and space within which to expand, which is the rule in most of the countries of the world which grow coffee. That many of the methods which Mr. Leeming finds to answer best will require modifying and adapting to other localities is, however, equally certain. On some estates, for instance, 3-foot drains may not be necessary; on others indigenous shade may be found most suitable; and on all, the particular requirements of the soil must be ascertained before any hard and fast rule as regards manuring can be laid down. The need of experiment, therefore, in Districts where the conditions are different to those of the Shevaroy cannot be too strongly urged; and Mr. Leeming's experience affords the best example of the lines upon which to work. Fortunately for his brother-planters that gentleman has shown himself hitherto most willing to show enquirers round and answer their questions on his estate; but not, he says, by correspondence. If he could be induced to visit other localities and give would-be disciples the benefit of his advice *in situ* we cannot but think that the best results would ensue, it being as necessary to ultimate success for the system to be begun correctly as it is subsequently for it to be continued thoroughly.

To sum up, Mr. Leeming may be said to have done for coffee what men of science are trying to do for agriculture and horticulture everywhere. By the aid of long experience and persistent effort he may fairly claim to have made two beans grow where only one grew before; and, moreover, beans of a better quality.—*Madras Mail*.

## LORD AMPHILL AND ANAMALAI PLANTERS.

In pursuance of his policy of endeavouring to get to the root of local "grievances" by informal discussion with the persons immediately affected, in preference to hearing them set forth in a formal address, His Excellency the Governor during his recent visit to the Anamalai Hills met several of the planters at the Monica Bungalow on the 13th instant, and had a long and interesting talk with them about their prospects and wants. The planters were represented by Messrs. Windle, Marsh, Walsh, Congreve, Duncan, Watt and several others. They seemed to be very hopeful and confident of the success of their newly-developed District. Messrs. Finlay, Muir & Co. are putting up expensive buildings and machinery; the Monica estate is employing Cinghalese workmen to build a tea factory; while one of the planters has constructed at considerable cost a wooden bungalow in the style of a Swiss chalet. Several estates have been opened up and cultivation has already made a considerable advance. In 1902-03, 74 tons of coffee were harvested, as against 10½ tons in 1901-02, and the crops now on the trees are estimated at 136 tons. Cardamoms are expected to yield 34,500 lbs. this year; last year the yield was 18,515 lbs. This year's crop of tea is estimated at 50,000 lbs., and the following crop at 150,000 lbs. All this looks like development and prosperity, and if better times are in store for coffee, the Anamalai District, with its newly-planted soil and favourable climate, ought to do well.

The first and principal request put forward by the planters was that certain branch roads should be constructed. This request was preferred in an Address presented to His Excellency at Coimbatore last year; and His Excellency, while promising to give his attention to the subject, which was undoubtedly important from the point of view of the expansion of planting, pointed out that the construction of the Ghaut Road had cost a great deal more than was originally anticipated, and expressed a fear that it might not be possible to provide money for the construction of branch roads as fast as the planters wished. The branch roads more particularly asked for on the present occasion were:—

1. A bandy road from Peralai to Monica, a distance of 7 miles, to serve Puthentotam estate (400 acres under cultivation), Stanmore (795 acres under cultivation), and Castlecroft (285 acres under cultivation).

2. A bridle-path from Stanmore to where the Serabundera bridle-path now stops, a distance of 4 miles. This would serve Serabundera, which has 100 acres under cultivation and is 4 miles from the Ghaut Road.

3. The conversion into a bandy road of the existing bridle-path from Monica to Karangamudi, a distance of 4 miles. This would serve the Karangamudi estate, which has 400 acres under cultivation and is 4 miles from the Ghaut Road, and also enable cultivation in two other blocks to be extended.

Mr. de Winton, C.I.E., Chief Engineer, who was also present at the interview, thought that the roads and bridle-paths could be made for about Rs.35,000. His Excellency could not give any definite promise that these roads would be constructed by Government, but promised to consider the request carefully on his return to Madras, and expressed a hope that it might be found possible to meet the planters' wishes in the matter. The question of the maintenance of the Ghaut Road was then discussed. The planters were anxious that it should be maintained by the P. W. D. as the District Board has not the requisite funds to spare for the purpose. His Excellency promised to refer the point to the Departments concerned for consideration.

The next point raised was the revision of the terms of the leases, so as to enable planters to cut and trade freely in the timber growing on their lands. His Excellency considered such a request quite inadmissible, as also the next one, that the Section of the leases which prohibits planters from trading in minor forest produce should be expunged. It appears to be true enough that the Kaders (local hill tribe) trespass on the estates and commit theft of minor produce; but the point was fully considered at the time the leases were drawn up, and the Section was deliberately inserted in pursuance of a promise made by Government to the jungle folk.

The last request made was that rubber might be included in the schedule of plantation products. This seems reasonable. Rubber is not indigenous on these hills, but has been imported and cultivated by several of the planters. No hardship would, therefore, be caused to the Kaders by its being classified as a plantation product. The Conference ended with some discussion about the applicability of the Planters' Labour Act to the circumstances of the Anamalai Hills.—*Madras Mail*.

## THE INTELLIGENCE OF PLANTS.

Between the older belief that the actions of all living creatures but man are entirely automatic, and the modern idea of certain popular writers on natural history that beasts think, feel, and reason precisely as man does, lies the scientific attitude that sees in the doings of the lower creatures a manifestation of many different grades of intellect, all lower than ours, and growing simpler and simpler as we get farther away from man. Where, then, shall we draw the line? In an article on "Plant and Animal Intelligence," in *Harper's Magazine*, Prof. N. S. Shaler asserts his belief that it is unnecessary to draw it anywhere. He follows the manifestations of intelligence down through the organic scale to the lowest forms of animal life, and is even of the opinion that we can trace them in the plant world—whence his title. Says Professor Shaler:

"To those who have not followed the studies of modern botanists which bear upon what we might term the animal-like habits of plants it will be difficult to convey an adequate idea of how like are the actions of these apparently remote creatures. Moreover, any effort to set forth the facts in illustrative detail would require space not here admissible. Taking, however, certain familiar instances, we may cite the growth of plants in darkness toward the light, and the movement of tendrils in the direction of a support which they seek. There is a host of similar actions which may conceivably be automatic if we are willing to introduce the conception of the automaton wherever it is needed, though without proof that it is present, much as the ancient astronomers dealt with the notion of epicycles when they found their computations called for it. In effect, the automaton hypothesis, though in a way legitimate, now appears to be in many instances more objectionable than that which accounts for the action of plants by the operation of some mode of intelligence. The question is one of great difficulty, for the means whereby critical tests may be made are not in our hands; the best we can do is to approach the problem with an open mind and with the conviction that on its solution may depend the view we are to hold as to the nature of the control which shapes the world.

"In approaching the question as to the existence of intelligence in plants the student has but one available resource. He must contrive to build a series, or a kind of a ladder, reaching from the clearly determinable, step by step, over the unknown to the point he is to determine. In this instance the first step of the ladder must rest on human nature, on the intelligence we know in ourselves, and thence the successive steps of the series lead by way of the animals downward until we attain to the grade of creatures not above the plants in complexity; then by comparison between the earlier animals and the plants we may obtain a basis for a judgment—as we shall see, a fairly well-affirmed foundation for belief.

"Even the automatonists have to acknowledge, apparently to their sorrow, that intelligence exists in man, but they hold this to be an eminent peculiarity of this aberrant species. Moreover, they hold that even in man the automaton is the greater, the basilar part, the intelligence being no more than a light upon the summit of the structure, which as a whole is essentially mechanical. This view as to the nature of man appears to be based on a confusion of the intelligence which is conscious of itself and that which is below the plane of that peculiar mode of mental action. One of the most important results of modern psychology has been to establish the fact, long fairly evident, that a large part of our mental processes, as truly intellectual, save for the peculiar illumination of self-consciousness, as any of our mental work, goes on without our knowledge. . . . In a word, we may accept the statement that our higher intelligence is but the illuminated summit of man's nature as true, and extend it by the observation that intelligence is normally unconscious, and appears as conscious only after infancy, in our waking hours, and not always then."

Besides this, we are reminded by Professor Shaler, our knowledge of other men's intelligence is based only on inference from their actions—we have no such direct knowledge of it as each man has in his own case. Remembering then that intelligence is not necessarily conscious, and that its existence must be inferred from action, Professor Shaler sees no reason to limit it to man. Actions that imply it occur in the whole animal series from the higher forms to the lower. Even in the jelly-like amebæ and other

protozoa, motion, feeding, choice of position, etc., are not essentially different from similar actions in the higher vertebrates. Even the fact that the so-called intelligence of insects is so radically different from that of vertebrate animals suggests that the two forms may have developed from a common foundation that "contained the germs of mind." Now, granting all this, have we any right to stop here? May we not carry our observations and conclusions down into the plant world? Professor Shaler thinks that we can. He says:

"If we may regard it as established that the animal series from the lowest to the highest forms are in some measure influenced by intelligence—the evidence seems to me to compel this opinion—the question arises whether there is any reason why we should limit the action of mind to this kingdom, allowing it no place in the vegetable. On this point it may be said that while the ancient views as to the strong demarcation between plants and animals have had to be revised, there remain certain physiological differences, which serve in a general way to separate the two groups. Thus the plants are so ordered that they are all able to obtain food directly from inorganic matter, while animals have that ability in very small measure. Plants have also the capacity to break up the compound of carbon and oxygen, commonly known as carbonic acid, which is not characteristic of animals. Yet when these differences are weighed they do not lead us to believe that the two groups are anything like as distinct as they are commonly supposed to be. The most reasonable view is that they both are derived from some common ancestral form which could not well be termed either animal or plant, but was merely organic, and from this primitive stage of life diverged the two series: the plants to keep a close relation to the mineral kingdom, and to develop toward structures not greatly affected by intelligence; the animals, to take their food from plants, and to push up toward structures destined to afford habitations for mind.

"Looking toward the organic world in the manner above suggested, seeing that an unprejudiced view of life affords no warrant for the notion that automata anywhere exist, tracing as we may down to the lowest grade of the animal series what is fair evidence of actions which we have to believe to be guided by some form of intelligence, seeing that there is reason to conclude that plants are derived from the same primitive stock as animals, we are in no condition to say that intelligence can not exist among them. In fact, all that we can discern supports the view that throughout the organic realm the intelligence that finds its fullest expression in man is everywhere at work."

## DISTRICT ASSOCIATIONS.

### WYNAAD.

Proceedings of a General Meeting held at Meppadi Club on October 21st, 1903. **PRESENT:**—Messrs. Armstrong, Atzenwiler, Behr, Day, D. J. Duncan, Mackinlay, J. R. Malcolm, Nicolls, Powell Jnr., Rithelmann, Romilly, Taylor, Trollope, Waddington, West, and B. Malcolm (*Honorary Secretary*). **By Proxy:**—Messrs. Arbuthnot & Co., Capt. Carslake, D. Jackson, D. Mackenzie, Parry & Co., and R. K. Walker. **By Managers:**—The Panora Company, Mr. H. Parry, and the Wynaad Tea Company. **Visitor:**—Mr. P. Guard. Mr. George Romilly in the Chair.

1. **Proceedings of the last Meeting.**—The Honorary Secretary pointed out that under "Labour Law" (b), the words "carried unanimously" had been inadvertently omitted after the resolution proposed by Mr. Behr and seconded by Mr. Powell, Jnr.—*Resolved*, that the omitted words be added.

2. The Chairman proposed that the Association record with deep regret the death of one of its oldest members, the late Mr. E. C. Mitchell; and that the Honorary Secretary write to Mrs. Mitchell conveying the sympathy, and expressing the regret of the Association.—*Carried unanimously*.

3. **Roads.**—Read the President District Board's reply to letter of September 21st, 1903.

The District's member on the Board, stated that he had had a long conversation with the President, who had said that he was personally looking into the matter of the work on the Chundale-Choladi Road, and would do his best in the matter.—*Recorded with satisfaction*.

4. The Honorary Secretary was instructed to write to the Executive Engineer, P. W. D., Calicut, asking if there was any necessity for metal being laid so far ahead of the rolling as is being done between Lakadi and Chundale, as the unrolled metal caused considerable discomfort and loss of time to traffic.

5. Read letter from Mr. Jaffer Mahomed Sait on the matters of Roads and Assessment. The Honorary Secretary was instructed to reply pointing out that action had already been taken in the matters referred to and suggesting that if he wished to keep in touch with Association affairs he should become a member.

6. **Coffee-Stealing Act.**—Read Government Order No. 1319 of September 11th, 1903, by which the date of submission of statement B of Coffee Cultivation and Crops is altered to 1st April from 1st March.

7. **Tea Cess and Marking of Chests.**—Read letter to the Indian Tea Association.—*Recorded pending reply*.

8. **Mr. Maxwell Lefroy.**—Read letter from Honorary Secretary, Nilgiri Planters' Association—*recorded*. The Honorary Secretary was instructed to send Mr. Maxwell Lefroy copies of the proceedings of the Association as requested.

#### 9. Labour Law—

(a) **Voting Power.**—Proposed by Mr. J. S. Nicolls and seconded by Mr. B. Malcolm, "that the voting on 'Labour Law' be on a coolly assessment of—

1½	per acre for Tea.
1	" " Coffee.
½	" " Pepper."

An amendment was proposed by Mr. Waddington and seconded by Mr. Atzenwiler—

"That the voting on the matter of the introduction or otherwise of the Madras Planters' Labour Act be by personal vote of each member as has been the custom heretofore on all other matters, the voting power being by subscription of Rs.18 per annum, each vote of Rs.18 to be given by the member or his accredited agent."

The amendment was put to the vote and carried. The original resolution was then put and lost.

(b) **Madras Planters' Labour Act I. of 1903.**—Read letter to the Collector of Malabar enclosing a copy of the resolution passed at the last meeting of this Association.

Read reply from the Collector of Malabar dated October 11th, 1903, with the request "that you will be good enough to inform me whether the Association thinks it desirable that the provisions of the 'Madras Planters' Labour Act of 1903' should be extended to the Wynaad and if so, the Association is requested to send its own proposals regarding forms and rules."

Proposed by Mr. B. Malcolm and seconded by Mr. Taylor—

"That this Association considers that the 'Madras Planters' Labour Act I. of 1903' should be put in force in this District as soon as possible; and that its members are willing to give the Act a trial for one year provided that the rules and regulations are such as are approved of by the District; but at the same time it wishes to place on record, that however well the Act, as a whole, may suit some Districts the sections referring to the employment of local labour are totally unsuited to this District, and the Association hopes that the Government will take the earliest opportunity of amending such sections of the Act, on proof being forthcoming that they are unsuitable."

An amendment was proposed by Mr. Waddington and seconded by Mr. Mackinlay—

"That this Association does not consider Act I. of 1903 suitable to the conditions of labour in this District and would ask the Collector that it be not brought into force in Wynaad."

The amendment was put to the meeting and lost by 12 votes against and 11 for it.

The original resolution was then put to the meeting and carried by 13 votes for and 11 votes against it.

10. **U. P. A. S. I., St. Louis Exposition.**—Read letter to the Secretary, U. P. A. S. I., and reply.—*Recorded pending further information*.

Mr. Taylor suggested that the Committee be asked to consider the advisability of having the business of selling the coffee, after

advertisement at the Exposition, entrusted to reliable business firms of standing.

**French Import Tariff.**—Read U. P. A. S. I. circular drawing attention to the proposed increase of import duty on Coffee going into France as from January 1, 1904. Read Honorary Secretary's letter to the Chairman of the U. P. A. S. I. on the matter, and his reply stating that the U. P. A. S. I. were addressing the Government of India and Madras Chamber of Commerce "with the hope that H. M.'s Government will be watchful in this respect as any preference to Brazil or any other coffee-producing country would be ruinous to our already crippled industry."—Recorded.

**Madras Industrial Exhibition.**—Read U. P. A. S. I. circular and also Circular No. 4 of the Exhibition Committee. *Resolved*, that exhibits be sent from the District and that Messrs. M. D. Taylor and B. Malcolm do form the Committee for carrying out the necessary arrangements.

**Experimental Farm for Coffee Cultivation.**—Read U. P. A. S. I. circular containing a resolution of the South Mysore Planters' Association suggesting the establishment of an experimental farm.

*Resolved*, that in the opinion of this Association this is a scheme that should be carried out by the Government as is done by the Governments of other countries such as Java and the United States of America.

**Postal and Money Orders.**—Mr. Taylor drew attention to the difference in the cost of transmitting money by Inland as compared with Foreign money orders. The Honorary Secretary was instructed to ask the U. P. A. S. I. to take the matter up.

A vote of thanks to the Chair terminated the proceedings.

Papers on the table—

## COORG.

Minutes of a Quarterly General Meeting of the Coorg Planters' Association, held at the North Coorg Club, Mercara, on Thursday, October 15th, 1903. **PRESENT**:—Messrs. C. E. Murray-Aynsley, A. B. Chengappah, H. F. Davy, T. W. L. Hext, M. I. Maudannah, C. M. Nanjappa, E. Richter, R. D. Tipping, A. J. Wright, W. R. Wright, H. C. Wood, and G. K. Martin (*Honorary Secretary*). **Visitors**:—J. Green-Price and E. J. Cockerton.

Read telegram from the President regretting he was unable to be present at the Meeting.

Mr. C. E. Murray-Aynsley was thereupon unanimously voted to the Chair.

### BUSINESS.

1. **St. Louis Exhibition.**—Mr. Martin, as member of the "Coffee Committee," spoke at length on the subject.

He explained—as far as was at present known—the details of the arrangements which were under two headings.

(1) As regards exhibits, and service of coffee in the cup.

(2) As regards subsequent action, to back up with supplies, the demand that may be created by No. 1.

In the matter of No. 1, he said it was proposed to leave all details of arrangements and responsibility to the I. T. A. Commissioner—

(a) as regards the show-case and purchase of samples to be exhibited therein;

(b) the purchase of coffee for service in the cup, together with tea. These purchases, he was sure, would not be made without first consulting with, and taking the advice of competent authorities on the subject: he thought probably one of the leading Coffee Brokers or Agents in London. Samples for show of cardamoms and pepper would also be selected by advice of experts in those lines.

In fact he was sure the best would be done to present a fair and attractive show of these products.

By these means he hoped that a demand would be created (especially of coffee) such as arose at the Paris Exhibition, and this brought him to

No. 2. It was very necessary that the lesson afforded by what happened at the Paris Exhibition should be profited by, and he urged everyone present, who was in a position to do so, to support the movement by arranging to send coffee to back up a possible demand. He gave some details of the probable arrangement that would be made by the Coffee Committee in the matter. He was not, however, able to say much about this, as the Committee were in consultation and hoped soon to issue a circular on the subject.

The sense of the Meeting was generally in favour of the whole scheme, and a hope was expressed that full details would be issued as soon as possible.

2. The next subject discussed was the proposal emanating from the S. Mysore Association for the establishment of an experimental farm in a suitable locality in S. India. No details were forthcoming, and the discussion was, therefore, very perfunctory. The idea, however, met with approval, and the following Resolution was carried unanimously:—

Proposed by Mr. R. D. Tipping and seconded by Mr. G. K. Martin, "that the scheme of an experimental coffee garden which shall have the benefit of the advice of the various Government Scientists, is one which should receive the support of our Association, pending further details."

3. **Railway to Coorg.**—The Honorary Secretary said that this subject was placed on the Agenda at the request of the President who was of opinion that it was a question that should always be to the fore.

He then read a letter from Mr. John Logan giving particulars of a conversation he (Mr. Logan) had with an Engineer in Mysore of much experience in railway matters, and who had suggested that as it seemed impossible to get a railway to Coorg constructed in the ordinary manner, it might be possible to get one made on cheaper principles that would be sufficient for our wants as a beginning.

The letter went on giving details of a scheme by which the railway might be constructed, and worked at one-third of the cost of a permanently built line. A scheme of this sort had already been worked out for the Mysore State and the details might be obtained if applied for.

A letter from Mr. H. G. Parsons was also read in which he gave reasons for thinking that the Madras Railway authorities should be addressed on the subject, and offering to do all he could for us in the matter whilst in Madras.

The Meeting was of opinion that it was desirable to keep the question of the railway always to the fore, and the Honorary Secretary was directed to write and ascertain the views of the Agent to the Madras Railway Company on the subject. Also to enlist the assistance of Mr. Parsons in representing the matter.

4. **Remission of Taxation.**—This question was one that had come before the Meeting of the U. P. A. S. I. in August last, when a Resolution was passed, "that the Government of Fort St. George be addressed by this Association with a view of obtaining a remission of assessment on all coffee plantations, as owing to the crisis in the coffee markets the land is being worked at a loss, and is unable to bear the charge of taxation \* \* \*." In connection with the above it was thought advisable that Districts which were members of the U. P. A. S. I., but not connected with "the Government of Fort St. George," should support the action of the parent Association.

Moreover, it was thought possible, that according to certain provisions to be found in the Coorg Revenue Manual, the Local Government would have the power to grant considerable relief in that direction without having to set any great machinery in motion.

Mr. R. D. Tipping read to the Meeting certain sections of the Manual in question bearing on the point, and Mr. C. M. Nanjappa was of opinion that it was quite within the power of the Local Government to grant such relief even to the extent of total remission of taxation for a certain period on any industry or product that could be shown to be suffering from a depression owing "to calamity of season or other cause," by which "the profits of the Estate have been materially reduced."

It was resolved that the Commissioner of Coorg be addressed on the subject of a remission of the present taxation on Coffee lands and the matter be represented strongly. While on the subject of

taxes Mr. H. F. Davy desired to know what was the outcome of the representation by deputation that was made on the question of remission of taxes on uncultivated wet lands, and on unopened jungles forming parts of Estates—the opening of these jungles being deferred on account of hard times and low prices. He (Mr. Davy) was under the impression that the matter had met with favourable consideration from the Chief Commissioner. The Honorary Secretary said that no further communication had been received on the matter. It was thereupon resolved that the Commissioner be addressed on this subject also.

5. **General.**—Mr. Martin, as a member of the District Board, announced that a grant of Rs.1,000 had been obtained towards the improvement and upkeep of the Pollibetta-Gonicopal Road, a condition being made that the owners of land along that road should be willing to concede sufficient space on either side to allow off the full width of roadway, as well as for stacking metal, and obtaining earth for the purposes of construction and maintenance.

Mr. Tipping thought there would be no difficulty in obtaining the required concessions.—Recorded with satisfaction.

A letter from the Commissioner of Coorg was read enquiring whether, in the opinion of the Coorg Planters' Association, it is desirable to move the Local Government to extend to this province Act II. of 1900 containing provisions amending Act VIII. of 1878 (Madras Coffee-Stealing Prevention Act). Resolved, that a Sub-Committee be appointed to look through the Acts in question and reply to the Commissioner's letter. Messrs. C. M. Nunjappah and G. K. Martin were appointed for the purpose.

Read correspondence from Mr. Lefroy, Entomologist to the Government of India, re insect pests, and informing the Association that he was about to issue a preliminary report on the pests of coffee, and a detailed account of the "Mealy bug"; also read a letter from the Honorary Secretary, Nilgiri Planters' Association, who wrote by request of Mr. Lefroy, to say that he (Mr. Lefroy) hopes to return to South India in April next, and will bring with him spraying machines and the necessary material for spraying, and desires to be posted in the various insect pests prevalent in our District. He would be glad to receive any specimens for examination and classification, together with details as to elevation, climate, aspects, etc., of each Estate on which they are found.—Recorded with appreciation.

The visit of Dr. Butler, Cryptogamic Botanist to the Government of India, was much looked forward to, and a question was asked why his proposed visit to Coorg had not been carried out.

The Honorary Secretary said that in accordance with the intimation he had received through the Commissioner of Coorg, in August last, he had sent out circulars informing all members that Dr. Butler would visit Mysore and Coorg in September. Mysore had been favoured, but no further information had been received as to his proposed visit to Coorg. Resolved, that the Commissioner of Coorg be asked to invite Dr. Butler to visit this province at an early date, in order to investigate leaf-rot, leaf-disease, stump-rot, and other cryptogamic pests that are very prevalent in Coorg.

Dr. Lehmann's letter to Mr. Lambert was read in which he regrets not being able to visit Coorg this year, as he hopes to go Home on leave in March and will be very busy until this.—Recorded with regret.

The Meeting closed with a vote of thanks to the Chair, the Honorary Secretary, and to Mr. Davy for recording the Minutes of the Meeting.

(Signed) G. K. MARTIN,  
Honorary Secretary,  
Coorg Planters' Association.

### INDIAN TEA ASSOCIATION.

The following is from an abstract of the proceedings of a Meeting of the General Committee on the 13th October.

The principal subjects dealt with in the correspondence with the Indian Tea Association, London, were:—

(a) *The Louisiana Purchase Exposition.*—In the letter of 24th September it was stated that the Secretary to the Royal Commission for the St. Louis Exposition had applied for space in the Department of Agriculture and had promised to provide India with the necessary space for her Exhibit. This official had also promised to do all in his power to assist in promoting the success of the

Indian Exhibit and to locate it in a convenient position, so that all the Colonial Exhibits might be in close proximity to each other.

Application had also been made to the Director of Concessions, St. Louis, for a suitable site for erecting a Tea House in proximity to that to be built for Ceylon and also for the privilege of selling tea on similar terms to those given to Ceylon.

Negotiations were also proceeding with Mr. R. Blechynden, who acted as Commissioner for the Indian Tea Exhibit at the Chicago Exhibit in 1893, regarding terms for similar services in connection with the Association's Exhibit at St. Louis.

(b) *Proposed Manufacture in India of "Oolong" Teas.*—With the letter of 11th September were forwarded three samples of Formosa Oolongs which, it was stated, had been recently sold in the London market at 1s. 11d., 2s. 2½d., and 2s. 4½d. per pound respectively. The Brokers, Messrs. Stenning, Inskipp & Co., advised the making of only small quantities of this class of tea for trial shipments so that experience might be gained in the manufacture.

The samples referred to were too small to admit of their distribution among enquirers and the Secretary was instructed to ask for larger samples.

(c) *Russian Import Duty on Tea.*—Reference was made in the letter of 11th September to the increase in the Russian Import Duty on British-grown teas from 31 roubles 50 copecks per pound to 33 roubles per pound, equivalent to an increase of about one penny per pound. It was hoped that the small increase of the duty would not adversely effect the trade.

It appeared to the General Committee that as the increase was understood only to affect teas imported into Russia over the European land frontiers and by the Black Sea, the real object of the increase was to divert the traffic *via* Dalny to the Siberian Railway. In any case it did not appear to the Committee that the increase would seriously affect the trade since, apparently, no increase on duty on tea *via* Dalny was contemplated. The London Committee, it was mentioned, had addressed a representation to the Secretary of State for India in connection with the matter.

(d) *British Import Duty on Tea.*—In compliance with a request from the United Planters' Association of Southern India, a copy of a Resolution passed at the last Annual Meeting of that body, drawing attention to the urgent need of a reduction in the British Import Duty on Tea, had been forwarded to the London Committee for such action as they might see fit to take in connection therewith.

It was stated that the matter would receive due consideration, but the political situation at the moment was not opportune for sending in a petition as the office of Chancellor of the Exchequer had just been vacated by Mr. Ritchie. It was therefore very unlikely that any change in the rate of duty would be made before April next.

The Secretary was instructed to advise the United Planters' Association accordingly. It appeared to the General Committee that the matter was certain to be taken up at Home in due course as the tariff question was now so prominently before the public. The London Committee were to be asked to take the matter up in good time before the introduction of the Budget.

### MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated October 9th, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1903-1904 ...	474,077	434,968	37,853
1902-1903 ...	494,957	482,731	32,062
40,174 pkgs. INDIAN	Total 59,560 packages were offered in public auction this week.		
18,250 " CEYLON			
1,136 " JAVA			

Although imports of all tea since the 1st June were three millions ahead of last year, deliveries showed an increase of over four million, and the stock at the end of September was reduced to 75,620,539 lbs. against 83,899,320 last year.

INDIAN.—The general tone was distinctly steadier and last week's prices were readily obtainable, good teas selling well while common kinds were in somewhat better demand.

Exports to U. K. from Calcutta and Chittagong for second half of September 10,810,000 lbs. against 13,390,000 lbs. same period, 1902; from 1st April 78,072,000 lbs., against 74,620,000 lbs. in 1902. The following averages are worthy of note:—"Rungmook,"  $1/3\frac{3}{4}$ ; "Con. T & L Powai," "Deamoolie T Co.," and "E M P Namgaon,"  $1/-$ .

Week's av. of New Season's Tea sold on Garden Acct. 1903, 34,518 pkgs., av. 7.75d. 1902, 39,009 pkgs., av. 7.01d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 321,545 pkgs., av. 7.89d. 1902, 333,157 pkgs., av. 7.15d.

CEYLON.—Another moderate auction, combined with improving quality, imparted a better feeling to the market and produced a welcome advance in quotations, good and fine teas especially being rather dearer, while for common descriptions prices were fully firm.

Average for week 7.69d., against 6.78d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 810,312 pkgs., av. 7.45d. 1902, 908,698 pkgs., av. 6.68d.

JAVA.—Nearly everything was sold in the auction room with good all-round competition, prices tending to show some improvement on recent quotations. Since 1st June 32,427 packages on Garden Account realised an average of 6.59d. per lb.

Bank Rate 4 per cent. Exchange on London three months' sight:—Calcutta  $1/4\frac{5}{8}$ . Colombo  $1/4\frac{3}{16}$ .

### COFFEE.

The principal sales by auction have comprised 3,100 bags Dumont Santos, of which two-thirds Unwashed went at very full rates, small at 29s. 6d. to 30s., medium at 32s. 6d. to 33s., bold at 35s. to 37s. 6d., and peaberry at 35s. 6d. to 40s. 6d.; the remainder Washed being taken at 33s. to 41s. for small and medium, and at 40s. to 47s. 6d. per cwt. for peaberry. Beyond which the week's supply in public sale has been composed of merely odd and second-hand parcels of Central American and plantation East India of uncurrent

and indifferent qualities, which have been taken off at relatively good, if not actually stiffer, prices. The market for Futures, influenced by encouraging Continental advices, has preserved an upward tendency during the week, and sales that have transpired have been on advancing terms, good Santos, deliverable between now and July next, having been contracted for at 28s. 6d. to 30s. 9d. per cwt. The deliveries of Java Coffee by the Dutch Trading Company in Holland during September amounted to 20,530 bags, against 15,060 bags last year, and 11,500 bags in 1901. For the first nine months of 1902 the total reaches 122,300 bags, in comparison with 90,600 bags in 1902 and 97,800 bags in the preceding year.

### TEA.

Messrs. Wm. Jas. and Hy. Thompson, in their Report, October 8, say: It is satisfactory to note that the public are not unaware of the altered condition of the Tea industry, the figures of the values of 45 companies, as indicated by Mr. George Seton's tables, showing an advance of £50,000 during last month and £1,500,000 over September, 1902—an appreciation of 25 per cent. This is remarkable as affording evidence of a general return of confidence in the future. The foreshadowing in Mr. Chamberlain's speech last Tuesday night at Glasgow of a 75 per cent. reduction in the Tea duty deserves more than passing notice. Were such a proposal to come into operation, it should prove of substantial advantage to planters in India and Ceylon as well as to consumers at home. Deliveries should be stimulated by increased and less economical use, and demand should be thrown more on the produce of those countries and districts manufacturing the better qualities, rendering less dangerous competition from places outside the British Empire. The offerings this week have been on about the same scale as previously, 40,300 packages being brought to auction, making the total sales of this season's tea to date 344,500 packages, against 388,500 packages last year. Prices on Monday showed but little change from the rates ruling last week, common tea being steady

# CONQUERS PAIN

at the recent decline in values: medium leaf grades between 7d and 9d., however, were subject to irregularity; in some cases being quoted slightly easier. Following the brisk market for Ceylons on Tuesday, a better tone prevailed at Wednesday's auctions, competition for all grades being good. Fine teas, Brokenes especially, continue to realise satisfactory prices, and the market closes with a more cheerful feeling. Some of the teas now coming forward from Darjeeling are showing improved quality, and judging from musters received of teas made in Assam the early part of last month it seems probable that we may also from that district look for improvement in flavour. This should relieve our market and lighten the present over-supply of ordinary medium quality. Referring to last month's figures, it is satisfactory to note that the actual entries for home consumption are slightly in excess of last year, though the falling-off in re-exports makes them appear at first sight disappointing. Shipments during the last fortnight in September were lighter than was expected—10,810,000 lbs.—thus reducing the increase in exports over last year to  $3\frac{1}{2}$  millions; by wire from the gardens we learn that manufacture towards the close of last month fell off in quantity. For next week about 42,000 packages are in print. There were no sales in Calcutta last week on account of the Poojah holidays. For next Friday 22,000 packages are advertised.

### IN AUSTRALIA.

SYDNEY, *October 2nd.*—The tea market suffered neglect, purchases being almost entirely confined to small parcels of Ceylon and Indians. Buyers were operating up to about  $8\frac{1}{2}$ ., or possibly 9, for Ceylons, beyond which it was difficult to do business.

MELBOURNE, *October 5th.*—The market is dull, the principal inquiry being for Indians for quality. Sales reported consist of

50 chests Ceylon at up to 8d., 50 chests Indian at 7d., and 100 quarter-chests medium S. O. Pekoe (China). *LATER, October 7th.*—Transactions in tea covered 50 chests of good common Indian, 50 half-chests of medium Panyong, and 250 half-chests of medium Hankow, all for shipment, and 150 packages of Ceylon was sold locally, up to  $8\frac{1}{2}$ d.—*Australian papers.*

### CINCHONA.

At the auctions of cinchona held at Amsterdam on October 8th 7,869 packages were offered (weighing 712,485 kilos.), compared with 10,899 packages offered at auction on September 3. Of this quantity 7,729 packages were sold at an average unit of 7.45c. per half-kilo., as against 9.90c. per half-kilo. paid at the previous auction. The approximate quantities of quinine sulphate purchased by the principal buyers were as follows: The English and American factories, 9,727 kilos.; the Brunswick factory, 6,367 kilos.; the Mannheim and Amsterdam factories, 9,177 kilos.; the Frankfort-on-Main and Stuttgart factories, 4,032 kilos.; and various buyers, 5,562 kilos. The prices paid for the manufacturing-bark ranged from 7c. to  $70\frac{1}{4}$ c. per half-kilo., and for druggists' bark from  $12\frac{1}{4}$ c. to  $52\frac{1}{4}$ c. per half-kilo.

### QUININE.

The market has shown more activity in second hands this week, at advancing prices, a large speculative business having been done on the spot (estimated at about 500,000 oz.) at from  $11\frac{1}{2}$ d. up to 1s.  $0\frac{1}{2}$ d. per oz. for good German sulphate, and December delivery at from 1s.  $0\frac{1}{4}$ d. to 1s. 1d., and March 1s.  $0\frac{3}{4}$ d. to 1s.  $1\frac{1}{2}$ d. To-day 1s.  $0\frac{1}{2}$ d. is quoted for spot.

During September the landings amounted to 2,000 oz., and the deliveries to 86,592 oz., leaving a London stock on September 30 of 3,109,456 oz., against 3,417,120 oz. in 1902.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, NOVEMBER 7, 1903.

[No. 44.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 13th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Coorg.

POLLI BETTA, 4th November.—

*Weather*—It has been fine, clear and

hot during the days and chilly of nights and it seemed as if the cold weather had set in; but yesterday it clouded up heavily. Nothing however came of the "demonstration." This morning the face of the sky is entirely overcast and there may be rain inside the next 24 hours. *Crop*—It will probably be early next month before we are in the full swing of crop-picking. There are as yet very few trees with ripe crop on them. *Plant diseases*—The recent fine weather has been of great benefit to coffee. There is still a good deal of leaf-disease about; but coffee, as a whole, is looking very fine. *General health*—Plague does not appear to be spreading.

#### CHINA'S TEA TRADE.

SOME interesting information regarding China's Tea trade is furnished in the British Consular report on the Foreign Trade of China for the year 1902. Naturally, the statistics dealt with are now somewhat stale, but they indicate that at least one important change has come over the trade, and there is more than a hint that other changes are likely to follow. Whatever may be said of the world's markets generally, China Tea still occupies a good position in the United States and in Russia. It has not yet been entirely ousted from the United Kingdom, and there have lately been signs that foreign traders in China have no intention of letting Tea exports languish, but are bent upon bringing

about an increase in them, if this be possible. During the last ten years the average annual export of tea from China has been 215,043,000 lbs. In the course of last year she exported 202,561,600 lbs. This, though below the average, showed an increase of over 48,000,000 when compared with 1901. According to British returns the United Kingdom took 17,365,300 lbs. The principal advances were made in green and brick tea; but black tea increased by 2,905,200 lbs. while tabloid tea remained stationary. One very significant feature of the trade returns should be specially noted in view of the efforts of the tea-planters of Ceylon and India to get their own teas taken in the United States in lieu of Chinese leaf. It will be remembered that they first pushed Black teas; latterly more attention has been given to Green. Well, of China's black tea the United States took 22,466,700 lbs. in 1902, against 12,909,340 lbs. in 1901, and of her green tea 16,826,133 lbs., against 11,566,000 lbs., Ceylon at the same time raising her exports of green tea to America from 797,796 to 1,968,456 lbs. Stocks in the United States had been allowed to run down in anticipation of the special war-tax of 10c. (5d.) per lb.; and the above figures show how, when replenishing, American dealers still gave the preference to China leaf.

The following figures relating to Green and Brick tea exports show how these branches developed:—

	1901. lbs.	1902. lbs.
Green Tea	25,257,200	33,834,400
Brick Tea, black	32,608,800	64,414,000
„ green	6,527,600	11,590,800

From the ports of Canton and Amoy come the customary complaints regarding the moribund condition of their trade in tea; but Foochow, Hankow and the districts whose produce is shipped *via* Shanghai, had little reason to grumble last year. Another interesting point is touched upon by Mr. J. W. JAMIESON, Commercial Attaché to His Majesty's Legation at Peking. Reporting on the trade of 1902 he remarks:—"The export duty on tea was last year lowered from a specific duty of 2½ Haikuan taels per picul to an *ad valorem* rate of 5 per cent., but, dissatisfaction having been expressed with the working of the scale, it was altered to a specific duty of 1.25 Haikuan taels per picul. In how far this reduction of duty, which still presses heavily on low-class tea, it being in some cases equal to 12 per cent. *ad valorem*

combined with low exchange has stimulated exports it is impossible to estimate." Unfortunately, Mr. JAMIESON's allusions to exchange are not as clear as they might be. Apparently referring to *Silver* exchange he remarks that the average rate of exchange ruling throughout the year was lower by some 12 per cent. than the average rate of 1901; but very little is said about variations of the ratio between silver and copper. The importance of this latter metal in regard to China's internal currency was discussed in our columns a couple of years or so ago. Whether Chinese produce profited by low exchange or not, there is a warning for Indian and Ceylon planters in Mr. JAMIESON's statement that fears are entertained that the profits made by the producers of *Green* tea last season will lead to over-production this (1903) season, and consequent loss.

In explanation of the following table of comparative prices during 1902 it may be remarked that 1 picul = 133½ lbs., and that the average value of 1 Haikuan tael for the year may be taken at 2s. 7-2d.

		AVERAGE PRICE.	
		1902.	1901.
<i>Black Tea—</i>		Hankow Taels.	Taels.
Hankow	...	16	19
Kiukiang	...	28	26
Dust	...	7	9
Brick	...	10	11½
		Shanghai Taels.	
Shanghai	...	14	15
<i>Green Tea—</i>			
Country	...	36	27
Shanghai packed	...	28	24
Pingsuey	...	34	26

The above figures show a decline in the value of black tea of 6¼ per cent. and an advance in that of green tea of over 25 per cent. Canton reports that all round about 2 taels per picul more were paid in 1902, giving a percentage of 7 to 12 per cent. Improved harbour accommodation at Kelung and direct shipping facilities from there to the United States will soon deprive Amoy of the transit trade in Formosan Oolongs, and an attempt is being made by a British firm to see whether or not it would be possible to grow teas, suitable to the European and American markets, in the country round about that port. Finally, it is stated that a scheme to resuscitate the Chinese tea trade by means of advertisement has broken down, owing to scepticism on the part of exporters in Central China as to its practical value.

## BRITISH BOARD OF TRADE RETURNS.

SEPTEMBER 1903.

**Cocoa (raw).**—During September the movements of this article in the United Kingdom were without much significance, though the bonded stock on the 30th ultimo showed a surplus of 544,000 lbs.

In the first nine months.		1903.	1902.	1901.
Imports	...	41,812,674	45,861,701	43,691,019
Home consumption	..	31,026,423	36,065,866	32,749,077
Exports	...	9,035,525	10,423,400	8,428,905
Stocks in bond	...	12,219,000	11,675,000	18,867,000
Value of imports	...	£1,174,132	£1,331,085	£1,314,364
Do. exports	...	264,035	291,688	260,043

**Cocoa (prepared)** bears evidence of an augmenting trade as regards the home demand and foreign supply.

In the first nine months.		1903.	1902.	1901.
Imports	...	7,708,634	6,324,417	6,114,544
Home consumption	...	7,319,041	5,827,330	5,695,721
Exports	...	330,991	533,438	626,715
Stocks in bond	...	108,000	173,000	160,000
Value of imports	...	£763,939	£647,585	£630,769
Do. exports	...	38,850	57,382	68,134

**Coffee.**—Light imports and heavy clearances brought the stock down somewhat, but there was still a notable excess in the latter over that in 1902.

In the first nine months.		1903.	1902.	1901.
Imports	...	997,043	793,078	838,259
Home consumption	...	206,865	225,912	254,355
Exports	...	514,485	271,997	543,802
Stocks in bond	...	795,000	533,000	321,000
Value of imports	...	£2,814,599	£2,324,195	£2,713,356
Do. exports	...	1,284,957	797,335	1,577,296

**Chicory.**—Only scanty amounts are to be recorded here for 1903, and the stock in bond is almost ridiculously small.

In the first nine months.		1903.	1902.	1901.
Imports	...	61,874	75,116	76,737
Home consumption	...	56,581	63,374	59,554
Exports	...	173	440	504
Stocks in bond	...	4,000	12,000	21,000
Value of imports	...	£28,147	£33,967	£34,799
Do. exports	...	181	492	515

**Tea.**—Under this head the receipts were considerably augmented, and notwithstanding good duty-paid entries, the bonded stock was swollen so as to show a much narrower discrepancy than before existed.

In the first nine months.		1903.	1902.	1901.
Imports—China	...	15,364,282	14,611,209	11,676,255

## COFFEE NOTES.

**The U. S. Coffee Market.**—A broader market, higher and fairly active, are the salient features in coffee, says the *Tea and Coffee Trade Journal* of 6th ultimo. Reduced coffee receipts in Brazil, and reports of severe injury by drouth on the crop now in blossom have stimulated attention and business in the trade. It develops that the lugubrious reports in past years of drouths and frosts have had substantial basis in fact, to the subsequent acceptance now that the cables of to-day deserve attention rather than contempt, as has been the disposition to receive them. If present receipts in Brazil continue, it will prove that the frosts of one year ago were not exaggerated, and that the crops that will be marketed will be only 11,250,000 bags instead of 14,000,000 bags, as expected two months ago. Should the the Brazil crop now growing be only as large as this one, the chances are that the crops of the next two years will be considerably less than the world's consumption, and the present over-supply will suffer a proportionate reduction. Enhanced prices will therefore be in order and justified, and the market has been quick to respond. In a month option prices have advanced one cent, and actual coffee one-half cent. It is not likely that there will be an immediate return to the low basis of values that obtained in the Spring and Summer, however much reactions may occur. They are to be expected, and are natural, and even a healthy sign. Indeed, the market closed reactionary; but it is safe to say there will be a recovery and a further advance, followed by another reaction; but the lowest basis reached will be above the lowest one reached previously, and in this seriated movement the continued upward tendency of the market will disclose itself. Our predictions in the Summer of just such a market are being realized.

In consequence of the halt in the advance in options, both at New York and in Europe, the market closed last week a trifle easier, which extended even to Brazil. Santos, Nos. 3 and 4, was considered at  $6\frac{3}{4}$  c. & f. In the week term offers were Santos, No. 3, at 7 to  $7\frac{1}{2}$  c. & f., and Santos No. 5 at  $6\frac{1}{2}$  c. The firm offers have generally been above the basis of values ruling locally. In spot invoice the market closed  $5\frac{3}{8}$  c., for Rio No. 8,  $5\frac{1}{2}$  c. for Rio No. 7,  $6\frac{1}{2}$  c. for Rio No. 4, and  $6\frac{1}{2}$  to  $6\frac{3}{4}$  c. for Santos No. 4. Some sales in the week were 2,500 bags Rio No. 7, spot at  $5\frac{1}{2}$  c.; 3,000 bags Rio No. 6, spot at  $5\frac{1}{2}$  c.; 1,000 bags Rio No. 7 at  $5\frac{3}{4}$  c.; 1,000 bags Bahia at  $5\frac{1}{2}$  c.

Jobbing is reported as fairly active.

In the option market the sales have been on an extensive scale. They were mostly prompted by the desire to realize profits. Not a few have made considerable money. In the course of the week the market jumped from 10 to 15 points at a time. November is now at hand. In the course of the year trading in this month has been on such an extensive scale, on a gamble that there will be a change in the grading of coffee, that the liquidation is sure to be heavy.

The market in mild coffee has been active and on a higher basis of values. Some of the transactions have been very large, recent sales reported including 30,000 bags of Maracaibo, 27,500 bags Savanilla, 5,300 bags Guatemala, and 3,500 bags Mexican. Importers' stocks have been reduced by this free buying, inducing a better tone in the market with holding by sellers for higher prices. Good Cuzcuta is 8c. East India coffees are firm.

The market on Monday, October 5, experienced a considerable decline, options showing a loss of 20 to 25 points, chiefly on reports of rains in Santos and liquidation. Actual coffee eased in sympathy, milds excepted. Firm offers from Brazil were easier but not attractive to buyers and spot closed  $5\frac{1}{2}$  c. for Rio No. 8,  $5\frac{1}{2}$  c. for Rio No. 7,  $6\frac{3}{4}$  c. for Rio No. 4,  $6\frac{1}{2}$  to  $6\frac{3}{4}$  c. for Santos No. 4.

**Brazilian Review's Coffee Estimates.**—The *Brazilian Review* is credited with estimating the yield of the Rio coffee crop now being marketed at 4,000,000 bags, and that of Santos at 7,250,000 bags, a total of 11,250,000 bags, or a million bags less than the total realized in 1902-03.

**Costa Rica and Mexican Coffee Advices.**—Advices from Costa Rica point to a considerably smaller crop than the last one, but the reports from the different districts vary very much, amounting, in some parts, almost to a complete failure, whereas in the higher parts a good crop is expected. It is, however, feared that the size of the bean will only be moderate. From Salvador the Santa Ana and Oriente districts promise a good crop, but not so large as this year, which was exceptionally large. Around Salvador City the prospects are not so good. Guatemala advises that the estates which last year suffered so severely from the eruption of the Santa Maria volcano, have greatly recovered in appearance. They will, however, yield no crops this season, for, although there have been signs of flowering, the buds have not set. The shortage this season from these estates amounted to about 200,000 quintals. From Mexico come complaints of too much rain in the higher districts (Orizaba, etc.), whereas a good crop is expected in the lower ones (Tapachula).

**Rain in Santos.**—Schmidt & Frost, Santos, cabled Monday, October 5: "Prospects of smaller crop than last year. Too early to estimate crop yet. It entirely depends upon weather. In no case a record crop. Crop reported damaged by drouth. Actually raining; not enough. Crop will be later than usual coming to market."

**Brazil Crops.**—The cables from Rio and Santos have been hot with messages of gloomy news regarding the growing coffee crop. It is said to be in a rather bad way from the blighting effects of bad weather. Such reports are usual and popular at the present time of the year, and are meeting with considerable attention and credence, owing to the experience now being realized that the reports of drouths two years ago and of frosts one year ago, had considerable substantiation in fact, affecting the growing crops of those years considerably, compared with the bumper realizations of the crop market in 1901-02. Following are some of the cables:

De Couto & Co., Rio: "Growing crop badly damaged."

John Moore & Co., Rio: "Crop prospects unfavourable; rain much needed."

Hellwig & Co., Santos: "Reports from the interior very unfavourable."

Prado, Chaves & Co., Santos: "Weather unfavorable for growing crop."

The Santos Agricultural Bureau reports: "Worms attacking roots in Sao Carlos de Pinhal doing damage."

The *Brazilian Review* says: "In the following States the August and September blossom is lost—Juiz de Fora, Porto Novo, Itacoara and Palinas in the State of Minas, and Cardenas in the State of Rio; partially lost Itacoara. Rain much needed for October blossom."

Total stock in United States October 1, 2,465,686 bags against 2,771,000 bags October 1, 1902. Brazil stock in the United States October 3, in store and afloat, 2,624,341 bags against 2,851,827 bags at the same time last year. Other than Brazilian, 397,500 bags, against 254,771 bags last year.

Brazil coffee in New York October 3, 1,811,530 bags. Stock in other coffees, October 1, 329,329; in San Francisco, 59,396 bags, and in New Orleans, 8,775 bags. Visible supply in the world of all coffees, October 1, 13,770,429 bags.

Brazil stock in Baltimore October 3, 62,363 bags; in New Orleans, 152,671 bags.

\* \* \*

Green coffee imported into the United States from Hawaii during the last seven months ending in July was 1,002,635 pounds, against 544,375 during the same period in 1902; the respective values were \$131,286 and \$60,233.

\* \* \*

New Orleans has, says the *Tea and Coffee Trade Journal*, thoroughly entered upon its purpose to have an option market in coffee of its own, and how all sufficient the preliminaries are has doubtless been gleaned from the reports as stated in our issue of last week. The city thinks very well of itself as a coffee centre, and already sees New York—until the present time the unchallenged coffee emporium of America—trailing far behind, a bad second to the Southern metropolis on the Mississippi. The newspapers are especially optimistic, the most exultant of them all being the *Times-Democrat*, which says that in coffee "New Orleans as a port is fast taking away the laurels of New York," and that "shippers are discovering that New Orleans is closer to the coffee countries than New York, and this valuable discovery, in addition to the fact that the railroads have been making distribution cheaper, has been the means of forcing New York to the background." Inasmuch as stocks in New York in Brazil coffee alone are on the average 2,000,000 bags, and those in New Orleans 150,000 bgs, and deliveries in favour of New York in the ratio of 80 to 3, it is to be surmised that as a matter of fact, New York still leads the procession, with no one near enough behind to produce uncomfortable feelings. It is to be feared that New Orleans shares with the rest of the country an inaccurate press, and the coffee-men there would do well to set it right in the matter of statistics, so that the city may start on its coffee embarkation with no misconception respecting its bearings. But no doubt New Orleans intends, and is going, to become a more considerable coffee port, and the zeal and expansion noted down South is to be welcomed as a factor, enlarging the field of coffee, and therefore tending to assist the prosperity of the industry. As financiers, New Orleans men have demonstrated themselves shrewd and efficacious manipulators of options, and if these same mental qualities and money resources are to play their part in a coffee pit in New Orleans, we are sure the similar pits at New York, Hamburg, and Havre will feel the influence, and have something substantial to think about; but whether as lambs in the maw of the bull, or the bear enjoying the lamb, we are unable to divine, for we have heard that New Orleans men are voracious bulls, whereas not a few of these animals have been entirely consumed in the pit of the New York Coffee Exchange. Here many bears are stalking about exceedingly fat, yet not averse to take on more weight, and we are sure they would risk some tossing. So, whether or not the New Orleans Board of Trade men shall prove invincible in coffee tauromachy, its pit will not be met at the outset with jealousy at New York, whatever may be the imprecations at large in the world of actual coffee.

#### TEA NOTES.

**The U. S. Tea Market.**—A brisk fall trade generally is reported in tea, says the *Tea and Coffee Trade Journal* of October 6, and the market is firm, with a realization of full values in the desired kinds, the better selections, especially the greens and Japans. Indications are that present conditions will be maintained for some time to come, as supplies are not being rushed to market, and are even below normal importation. The consuming demand is steady, conceding as a rule the values demanded; and jobbing is reported as having spirit. Sales of the week included 1,000 packages

Foochow, 500 packages Congo, 1,500 packages of Japans, 1,500 packages of Formosa, 4,000 packages of Pingsuey, 1,000 packages of country greens. The Eastern markets remain firm and unchanged, excepting low-grade Formosa, which is said to be difficult to secure at previously quoted rates, and therefore firming up for an advance. Indians and Ceylons are firm. The greens are said to be in good request, especially in Canada, which reports a good demand in all grades of all kinds of teas in favour there.

London advices are that in Indian teas the demand is somewhat slow at irregular prices. Common again rules in favour of buyers. Medium, however, is in steady request at previous rates. Ceylon teas meet with a fair demand at generally steady prices. Common brings barely previous rates. Medium continues to show some irregularity, especially Pekoes. Good to fine, however, are in good request, and very steady prices realized. A fair demand continues to prevail for China teas, most noticeable in the lower grades. Scented Caper continues in demand up to 7½d.

Well-founded reports of more exports from New York to London, of Congous, were heard yesterday. 2,500 packages, it was said, will be shipped.

\* \* \*

**Ceylon Tea Exports.**—In his Address at the opening of the Legislative Council of Ceylon on 26th ultimo Sir J. West Ridgeway remarked:—As regards the exports of the Colony, in the first seven months of the current year there were exported 91,263,746 lbs. of tea, against 96,231,924 lbs. in the corresponding period of 1902, the exports being distributed as follows:—

	1903. lbs.	1902. lbs.
United Kingdom .. ..	63,459,470	68,525,612
British Colonies .. ..	14,582,645	14,782,080
Foreign countries .. ..	13,221,631	12,924,232
	91,263,746	96,231,924

A feature of the year as regards the tea industry is the increase in the export of green tea, especially to the United States of America. The amounts were 1,303,329 lbs. in 1902 and 3,576,682 lbs. in 1903, the United States alone taking 487,958 lbs. in 1902 and 2,144,204 lbs. in the present year.

\* \* \*

**Japan at the St. Louis Exhibition.**—According to the *Japan Times*, the Central Chamber of Tea Guilds has devised a plan designed to increase the attractiveness of the Japanese tea-house, 10 by 6 yards, at the St. Louis Exhibition. Magic lantern views of famous Japanese gardens will be displayed, and the girls who pick the tea-leaves will be represented in effigy. The estimated cost of the scheme is 3,000 yen. The Rs.15 per ton freight on tea from Colombo to Australia did not last long. Competition having been crushed, the Australia Conference liners quickly raised the rate to Rs.35 again.

\* \* \*

**Colombo Tea Sales.**—At Colombo on the 28th ultimo the market was strong for "leaf" teas, particularly common to medium Pekoes, and prices were steady all round. Broken Pekoes were in less demand and somewhat weaker, except for the more tippy kinds. Green teas were unchanged.

\* \* \*

**The Russian Import Tariff.**—London Tea merchants do not appear to regard the raising of the Russian import tariff in regard to teas entering the country from the Europe

and Black Sea sides as likely to seriously prejudice their trade with the country. Lower grade teas may be interfered with to some extent, but not higher grades. The London correspondent of the *Times of Ceylon* recently pointed out that in one respect London has a great advantage over Colombo for Russian buyers. Samples of suitable teas are sent to Moscow on Wednesday; the buyers there taste there and wire back their limits in time for the next Tuesday's sale. In Colombo, on the other hand, they must buy on type, and, in the time that must elapse before teas can reach Russia *via* Dalny, many changes may occur. These considerations would not affect common teas to a great extent, but they would come in when fine teas were in question, partly because more money is at stake and partly because fine Ceylon teas lose their delicate aroma very rapidly.

\* \* \*

Mr. R. G. Coombe gave at a recent meeting of the Haputale P. A., Ceylon, an account of some of his experiences with the shot-hole borer. 'A fine field of tea yielding about 600 lbs. an acre was attacked,' he said. "I took the precaution every month of going through the field, cutting out the branches where the borer was seen at work, and burning them at once. The field next to this one, belonging to another estate, was pruned; borer was pointed out to the Superintendent and he was asked to move in the matter, but with no result. Our experience is that, if prunings are not burnt or buried, the borer comes out of the pruned branches after a time, and enters the stem of the bush; it is then almost hopeless to try and get rid altogether of the pest. I maintain, however, that it can be kept in check to a considerable extent if prunings are buried or burnt. I mentioned at the beginning of my speech (I think) that we lose on our affected acreage 100 lbs. of made tea an acre, which is, I venture to think, just the difference between profit and loss to several estates in this district."

\* \* \*

**Evolutions in the Tea Trade.**—On Wednesday last, says the *Grocer* of 10th ultimo, when 1,059 chests Sylhet tea were offered at public sale on account of the importers, biddings to advance  $\frac{1}{2}$ d. per lb. were printed and accepted instead of the customary  $\frac{1}{4}$ d. Several years ago a catalogue was issued under similar conditions, but the experiment was not repeated. On the present occasion most buyers appeared to regard the innovation with lively satisfaction, and with the exception of one lot the entire invoice was disposed of at the current value. Contrary to the general rule the names of the tea estates in the various lots were omitted from the catalogue, while each break, irrespective of size, was restricted to one line, whereas hitherto in the case of large breaks of, say, about 100 chests, the rule usually adopted has been to divide the lot into two lines, thus giving the buyer the option of "dropping." We have on more than one occasion drawn attention to the uncertainty and friction caused by doubts as to whether bids of  $\frac{1}{2}$ d. should be permitted, but the question still remains for settlement. Most importers seem indisposed to countenance the change, while among brokers all kinds of decisions have been given when "in the box;" and whether biddings of  $\frac{1}{2}$ d. per lb. will eventually be accepted it is difficult in the present state of affairs to determine.

\* \* \*

**London Tea Market.**—According to a London cablegram, Messrs. Gow, Wilson & Stanton's Report, dated the 29th instant, states that competition is general and well distributed.

The market for medium-liquoring Pekoes shows a fractional advance. The market for teas for price is dearer. The average price of Assam and Indian tea sold on garden account this week was 8d. and 8 $\frac{1}{4}$ d., respectively.

Private telegrams of 29th ultimo from London to Colombo report common to medium qualities rather dearer. During the week 16,000 packages of Ceylons were offered and 15,000 sold. Fair Pekoe Souchong 6 $\frac{1}{2}$ d. and the average 8 $\frac{1}{4}$ d. Of Indians, 42,000 packages were offered and 39,000 sold, average 8d. Competition is said to be general and well distributed.

Telegraphic advices from London last week indicated a rise in the average. The market is declared to be firm; broken Pekoes are very firm; and Pekoes and Pekoe Souchong are firm and dearer for all kinds.

\* \* \*

During 1902 Morocco imported Tea to the value of about £137,000, an increase of over 35 per cent. as compared with 1901. The Tea was mostly from the United States. An inferior green tea is drunk in large quantities by the natives.

\* \* \*

Damascus consumed in the year 1901, 500 chests of Indian tea, each chest containing forty kilogrammes or 88 lbs. and paid three francs seventy-five centimes per kilogramme. In 1902, one thousand chests, of the same size and at the same price, were drunk in the same town. This increased consumption was consequent on the Government advice to drink tea as a healthy beverage during the cholera epidemic.

\* \* \*

**The Tea Duty.**—Mr. Ernest Tye writes to the *Home and Colonial Mail*:—In view of Mr. Chamberlain's proposals to reduce by 75 per cent. the duty on tea, which is now 6d. a lb. to which figure it was raised from 4d. in April, 1900, owing to the war in South Africa, it may be of some interest to your readers to note the extent to which duty is levied in other countries on this most necessary article, especially as tea is such an important British industry. The crop from India and Ceylon last year reached 330 million lbs.—*viz.*, 180 millions from India and 150 millions from Ceylon.

Portugal levies the high duty of 2s. 0 $\frac{1}{2}$ d. per lb on tea.

Russia on her Western Frontier levies on Indian and Ceylon tea 1s. 11 $\frac{1}{4}$ d. per lb., and on China and Java tea only 1s. 10 $\frac{1}{4}$ d. per lb., while on her Eastern Frontier the duty on all tea is 1s. 5 $\frac{3}{4}$ d. per lb. Norway levies 1s. per lb., France 9d. to 11 $\frac{3}{4}$ d. per lb., Germany 5 $\frac{1}{2}$ d. per lb., Holland 2 $\frac{1}{4}$ d. per lb., Switzerland 1 $\frac{3}{4}$ d. per lb.

In the United States, Canada, Australia, Tasmania, Belgium, and the Straits Settlements there is no duty on tea.

In the Cape Colony and Natal 4d. is levied, and in New Zealand 2d. per lb.

It will be noticed that in the most protectionist of all countries, *viz.*, the United States of America, no duty is levied on tea. By legislation enacted in May, 1897, a Pure Tea Law was passed by which the American public are most carefully protected from any inferior tea, a series of standards being fixed as tests. The only provision in this country against the rejections of other markets is the provision contained in the Sale of Food and Drugs Act, 1875, which was found on a recent occasion to be of no avail to prevent the importation of some 600,000 lbs. of so-called tea which had actually been rejected by the New York authorities as unfit for consumption.

**Calcutta Tea Sales.**—At the auctions on the 30th ultimo the demand was again strong and the sale passed with spirit for all classes. Pekoe Souchongs with fair leaf and liquor in the range of 5/3 may be quoted 1—2 pie dearer, but common kinds here and there inclined to weakness, though no actual decline can be quoted. Medium grades were in greater request and met with good competition, in many cases establishing a rather higher range of prices. Darjeeling teas, although possessing only fair quality, realised full rates. Dusts continue to be taken freely for the Russian demand, and results must prove very satisfactory to producers. Outside markets as usual secured a fair proportion of the offerings, but although Bombay buyers were keen to operate prices often proved in excess of their limits. Green teas are in small supply, as must now be expected, and offerings of those classes will probably become smaller every week. Quality is again here and there a touch better, some of the Dooars kinds having rather more flavour. Assams too in many cases show better quality. Other districts remain without material alteration, though sometimes being slightly improved in cup the leaf shows a corresponding falling off. Garden advices continue satisfactory all round, and outturn taken on the average appears to be well ahead of last year, though not excessively so. Reports from Assam advise good weather for growth and manufacture. It is expected that a much improved quality will be seen from that district in the near future.

\* \* \*

**Tea District Reports.**—The tea districts reports are as follow :—

CACHAR—Dry cold weather ; leaf scarce.

ASSAM—No rainfall ; leaf moderately good.

SYLHET—Leaf scarce ; indications of an early close.

DARJEELING—Season closing up ; leaf moderate on several gardens ; bushes are flushing slowly.

\* \* \*

A correspondent writes to the *Civil and Military Gazette* from Ceylon :—Soluble tea is now on the market. The idea is most ingenious. The first stages of preparation are the same as for ordinary tea ; then an infusion is made and passed through an apparatus like a cream separator where it is filtered. In this stage it is hot. It is next passed over corrugated sheets of metal, and the temperature reduced to about freezing point. Then it goes into another separator machine where the tannin is thrown out of solution owing to the reduced temperature. This forms a sort of chocolate cake all round the sides. The liquid then goes into a vacuum and is evaporated and the powder that remains is soluble tea, containing all the soluble properties of the ordinary tea. The advantage for travellers and expeditions is obvious. No teapot is required ; it dissolves in hot or cold water and takes up so little space that enough for 100 cups can be carried in one's waistcoat pocket, whereas a pound packet of tea gives about 35 cups. The idea has gone up for Lord Kitchener's approval, but the result has not been heard yet.

\* \* \*

**The Tea Trade during 1902-03.** AN INTERESTING REVIEW.—Messrs. Brooke, Bond & Co., of London, write under date the 8th ultimo :—

To some members of the tea world the cheerful view we took last year of the outlook may have seemed somewhat optimistic. The event has, however, justified the opinion we then expressed that "the prospects of the trade, which had been very depressing a year

ago, are brighter." This year, to quote Lord Curzon, we "seem to see a silver lining in the dark cloud which has hovered so long over the tea industry." The silver lining is the fact that consumption has at last overtaken production.

This improvement is due to three main causes :—First, lessened production ; secondly, the manufacture of green tea instead of black ; thirdly, the most important of all, the exploitation of new markets for British-grown teas.

The lessened production was owing partly to climatic causes, partly to the labour difficulty, partly to finer plucking, and partly to the fact that much less land has come into bearing during the last two years than during the previous three. The manufacture of green tea has been taken up so vigorously that Ceylon estimates to displace black tea during the current year to the extent of 12,000,000 lbs. The manufacture is also carried on with great success in India, though not to the same extent as in Ceylon. The opening up of new markets is, however, the chief cause of the improved outlook. This course we have advocated by letters to the Press, and have endeavoured to help forward for a long time past. It is now generally recognised as the only way to enable the industry to preserve its prosperity, the only way, in fact, for the planter to preserve his existence.

Great efforts are being made to push the sale of British-grown tea in countries where until lately it was almost unknown, notably in India itself. The endeavour to popularise the drinking of Indian tea among the natives of India, which was the principal subject of a letter, "Indian Tea for the Indians" which we wrote to the *Times* and other papers a year ago, has been vigorously carried on. The Indian Tea Markets' Expansion Commission continues its work, with the satisfactory result that tea is becoming popular among the poorer classes and that there is an increasing demand for good tea throughout the country, as the consumer is being educated to like sound tea, and therefore refuses the rubbish sold by the irresponsible native hawker.

The Report of the two years' work of the Commission is extremely interesting. The principal method adopted for inducing the natives to drink tea, as we explained last year, is the sale of packets of dry tea and of cups of brewed tea at one pice ( $\frac{1}{4}$ d.) each. The sale of the packets and cups increased enormously during the first 18 months of the Commissions operations. During the last six months the sale slightly decreased, but not because tea was not growing in favour. On the contrary, the decrease was due to the fact that many small traders, after selling packets for a time, ask for the same class of tea in bulk and retail it. This shows that the habit of tea-drinking has taken root.

The Commission took advantage of the opportunity afforded by the immense assemblage of persons of all ranks and many nations at the Delhi Durbar to bring Indian tea prominently forward. Depôts were opened in several of the camps and in the city, where very large quantities of tea were sold. It was also hawked about the streets. At the restaurants in the Fine Arts Exhibition and the Polo Club nothing but pure Indian tea was sold.

In addition to the work done by the Commission, a similar system is being carried out in the city of Madras and in other parts of South India. In Madras, hawkers go round with kettles of prepared tea morning and evening, and supply the native population at a pice a cup. They also visit the officials in the various public offices during tiffin time. The sales of brewed tea and of tea in packets are going up every month.

These efforts of private enterprise are now assisted by what is known as the tea cess, which is a voluntary tax of  $\frac{1}{4}$  of a pie (equivalent to 1.48 of a penny) levied on every pound of tea exported from India. The money thus raised is devoted to exploiting new markets for Indian tea.

Turning to the consideration in detail of the world's consumption of British-grown tea outside the land of its production during the year 1902-03, we find that the United Kingdom is still the largest customer ; Australia, America, and Russia following in order.

The uncertainty as to the duty on tea in the United Kingdom naturally greatly affected the trade during the earlier part of the year ; no more tea was imported than was absolutely necessary. It does not appear, however, that less tea was drunk. There was already a large quantity in the country, which supplied the deficit. On May 31, 1903, this stock was 12,000,000 lbs. less than on the same date in 1902. The consumption per head has not declined. As the lessened production is owing greatly to finer plucking, the diminution of supply has been chiefly of low-priced teas. It is

impossible now to supply good tea at as cheap a rate as heretofore. Tea is not really dearer, as the higher-priced teas go a great deal farther, than the so-called cheap ones. Consumers are beginning to realise that a pound of 2s. tea makes twice as many cups as a pound as 1s. 4d., and that the higher the price paid the smaller is the proportion absorbed by the tax and the larger the proportion really spent in tea. Those persons who insist on having low-priced tea may find they are using what has been rejected by foreign markets.

Australia has taken rather less tea during the last two years than during previous years, owing, doubtless, to the depression in trade caused by droughts.

Until lately America has been a coffee-drinking country, and of the small quantity of tea she consumed the black came almost entirely from China and the green from Japan. Now tea is becoming popular, and imports of British-grown tea have risen in a few years nearly 100 per cent. Two clubs in New York make a feature of afternoon tea. Men who drink it are not laughed at, even by their enemies. There are very few villages, no matter how small, where it is not possible to get good tea. These changes are owing almost entirely to the enterprise of certain tea-producing firms in India and Ceylon. The utmost pains, assisted by wonderful machinery, are devoted to preparing tea, particularly green tea, for the American market. Green tea has always been more drunk in America than black. Therefore Ceylon planters have taken up the manufacture of green tea, and turn out blends equal to the best Japanese productions. As it is found that the same kind of tea does not suit all parts, samples of water from all the great cities in North America are sent out and tea is manufactured to suit them. The sale of the tea is also vigorously pushed by good advertising and by demonstrations. Both in the United States and in Canada people are learning that a pound of British-grown tea produces two or three times as much beverage as a pound of China or Japan tea, and also that the strong Indian and Ceylon teas are as sustaining as coffee, which the weaker growths from China and Japan are not. The removal, in January, of the 10-cent (5d.) tax on tea doubtless increased the demand in the United States.

Exports to Russia of Indian tea have more than doubled during the year. The Russian Government has lately increased the duty on British-grown teas, leaving the duty on China tea unchanged. The intention doubtless is to check the growing trade in Indian tea, and encourage the import of Chinese tea by the new Trans-Siberian Railway. It is quite certain, however, that the Russian merchant, who is a very business-like man, will buy the tea he prefers wherever he can get it cheapest. If he finds that Indian tea suits his purpose best, Indian tea he will have. Russia consumes more liquid tea per head than any other country; but the people take it very weak, generally making five brews from one spoonful of dry leaf. This fact makes Indian tea very valuable to the Russian blender, as no other growth will bear so much watering. A proposal is under consideration to use the Trans-Siberian line for the purpose of importing British-grown tea, which will be sent from Calcutta, *via* Shanghai, to Port Dulni (Arthur), and thence to Moscow, so that instead of retarding our trade with Russia the new railway may help it. If Indian and Ceylon planters will study the Russian market, they may feel sure of securing a very valuable and increasing trade with that country.

Tea-drinking is also gaining ground in Turkey in Asia. The British Vice-Consul at Adana says that thousands of Circassians drink tea, though he himself considers there is no drinkable tea to be had in Turkey. What there is comes from Russia, and though very inferior commands a very high price.

Exports to Western Europe are steadily increasing. Afternoon tea is rapidly becoming an institution in Paris. In Rome, also, English tea-rooms have been opened. Ceylon tea is sold in over 1,300 shops in Switzerland and in many towns in the south of France. In Germany, Austria, and Scandinavia consumption is increasing.

The above remarks show that the demand for British-grown tea is steadily growing, and that the prospects of the trade are better than they have been for some time past. There is every reason to hope that the improvement will continue. Very little land will come into bearing during the next few years, so that, unless planters revert to the fatal system of coarse plucking, consumption and production will be fairly balanced.

We may hope that the "silver lining" will shine more and more brightly till at last the "dark cloud" will entirely disappear.

**Ceylon Tea for Turkey.**—A NEW MARKET.—The quantity of Ceylon tea which at present finds its way to Turkey, either directly or indirectly, is probably infinitesimal; yet there are immense possibilities there. The first to make a serious attempt to introduce Ceylon tea into the land of the Unspeakable one seems to be the French firm of M. Landau & Son, who have their headquarters at Constantinople. One of the members of that firm, M. Landau, is now in Colombo for the purpose of buying Ceylon tea for the Turkish market. To a *Times of Ceylon* representative he gave some interesting facts about the consumption of tea in that much-discussed quarter. It appears that, so far, China tea has had a monopoly, and about 10,000 lbs. a month of China tea were imported by M. Landau & Company, about one-third of this amount being green tea. Most of the tea consumed in Turkey was imported from London and not direct from China. M. Landau, in fact, claims that two years ago he was the first to ship direct from Hankow to Turkey.

Both the Turks and Persians are inveterate coffee-drinkers, but they are being educated to drink tea, which M. Landau says is daily growing in favour. The chief centres of the business are Constantinople, Smyrna, Salonika, and a few of the other principal towns. There is an 8 per cent. duty on tea imported into Turkey, and the retail price for medium tea—that is tea which can be bought in Colombo for about 40 cents—is nearly 2 francs a lb. or 1/7d. The Turkish Custom officials, M. Landau says, have a curious way of getting the 8 per cent. duty at their own valuation. Tea is sometimes imported which they think should be priced much higher than it is; and then they must either take the 8 per cent. of the face value of the tea, or the duty in kind. For instance if 100 chests of tea are imported, and there is any dispute, they must take 8 chests if the importer so desires.

M. Landau thinks that Ceylon green tea will find favour with the Turks. They are fond of very strong tea and drink it principally with lime; though some use milk. Sugar is rarely used. He has not yet commenced buying, but hopes to send his first shipment by the end of the month. The tea will probably go by the N. D. L. steamers, being transhipped at Port Said. M. Landau had at first thought of sending his tea by the ships of the Russian Volunteer Fleet, but they want shipments of at least 50 tons, he says; while at present he contemplates sending only about 150 chests in each shipment.

\* \* \*

**Over-supply of Tea in Australia.**—The immediate effect of the important reduction in the freight from Ceylon to Australia was the increase in the quantity of tea which buyers purchased for that market. A tea-man who has had considerable experience in buying for that market, and who knows the way things go down there as well as any one in Colombo, wishes to emphasize our recent remark that there would be some over-supply to take advantage of the lowest freight. These sudden changes of freight are, of course, objectionable—they are better than the previous iniquitous Rs.50 per ton, that is all.

"After all," said the gentleman referred to; "Australia is a very small market, and it is easy to swamp it, and there will be a tremendous reaction. I have known the time when it was impossible to give the tea away. My firm in China, perhaps, have sent to me a cable saying 'Sell without reserve,' and I have put up every chest of tea at public auction. I got no offers, and cabled to them to that effect, and in reply—there was no mistaking the orders this time, for plain English was used—I was directed to sell it anyhow, and I found it impossible. You will find the same thing happen again if the Australian market is again flooded. Ceylon tea will be upon the dealers' hand in such quantities that they will find it impossible to sell all they have. It will be kept in stock, and, naturally, it will deteriorate; and, when they want to dispose of it, they will find they can't give it away." Our informant further added that he had abstained from buying more tea than usual for the Australian market, and that he had written to the firm for whom he bought giving the reasons quoted above.

\* \* \*

Editor Small protests his disappointment that the National Tea Association of the United States has so far not risen to the full measure of his expectations and revolutionized the manner and method of tea dealing and tea philosophy. He discourses with acerbity on the seeming lack of strenuousness in the Association, and implies that unless some life is shown, it might as well get some one to say that there is none. The editor—and probably some others with him—does not understand the situation. It is said

that great bodies move slowly, and by this general truth the Association is most naturally swayed, for its membership is scattered over the entire territory of the United States, and even beyond, and it is the policy of the Association to permit all its members to assist in shaping its essential operations. This may seem a cumbersome procedure, but the corps of tea-men is such that what is done has to be done with a very fine regard to the customs and proprieties of the trade, else all is lost. Much time is therefore consumed in getting the sense and consent of the members to plans and acts of the body, and moreover, it is far from the intentions of the Association to parade to the tune of cymbals and tomtoms what it has in mind to do and is doing. It makes its announcements when a finished product can be offered, abiding its own time. It might as well be understood that much of the looked-for tea propaganda will be asserted through the members working individually, but concertedly, rather than through the Association acting officially; and if anybody expects the expenditure of several hundred thousand dollars in advertising, he may dismiss this expectation, if we understand the purposes of the Association. At such times as it will be necessary for the Association to act in a body this will be done, and when done, effected invincibly, and with such hurry as the occasion may require, and almost never is the tea world in a hurry.

### NOTES.

#### Rubber Sickness.

tour of inspection.

Mr. J. B. Carruthers, the Government Mycologist, Ceylon, has completed his

#### Union is Strength.

establishing a Planters' Association.

Planters in British Central Africa are urging the necessity for es-

#### Java Cinchona.

The exports from Java during the first half of October amounted to 568,000 Amst. lbs. against 1,070,000 Amst. lbs. last year.

#### Java Quinine.

The result of the tender held at Batavia on October 14 is as follows : Of 3,279 kilos. Ed. II., 120 kilos. were sold, at an average of 19½f. per kilo. (about equal to 7½c. Amsterdam unit), against 17·30f. per kilo. paid at previous tender. The next tender to be held at Batavia will take place on November 18.

#### The St. Louis Exhibition.

We are glad to learn that the Indian Tea Association have received a contribution of Rs.75,000 from the Imperial Government towards the representation of the tea, coffee, and allied industries of the country at the St. Louis Exhibition. The donation is a handsome one and worthy of the Government.

#### Chinese Labour in Ceylon.

With the preparation of green tea in Ceylon, says a Colombo paper, a few Chinese hands have been employed locally as they are reported to be adepts at the work, and of late the number of Celestials in our midst has increased. Chinese labour is wanted in the Transvaal and we wonder if with the arrival of Sir Henry Blake, our new Governor, John Chinaman will come over to Ceylon in larger numbers.

#### Ceylon Tea for Turkey.

It is a healthy sign for the industry that a new buyer has entered the Colombo market in the person of M. Landau, a representative of the French firm bearing that name who have their headquarters at Constantinople. He says that the Turks and the Persians are inveterate coffee-drinkers, but they are being educated to drink tea and he is of opinion that Ceylon green tea will suit them well. M. Landau will not buy largely at the start and will forward his shipments by the German steamer. This firm has the credit of being the first to introduce our staple into Turkey and we are confident all will wish further effort to popularise Ceylon tea every success.

#### Quinine.

The sale of quinine—the product of the Government cinchona plantations in Bengal and Madras—through the agency of Post Offices in the country continues to shew remarkable progress, as each year's work comes under review. In 1902-03 the total number of packets (5 grains each) so disposed of to the public amounted to the huge figure of 7,192,309, or an increase of 1,061,540 packets over the sales of the preceding year. The increased demand was mainly in the Madras, Bengal and Central Provinces circles. Evidently the native population have now come to seriously appreciate the Post Office channel of securing the indispensable drug at prices within their means and hence the yearly expansion in the sales.

#### Ceylon Produce.

Addressing the Legislative Council of Ceylon on the 26th ultimo Sir J. West Ridgeway observed *inter alia* :—Of cinchona, the

quantity exported fell from 247,173 lbs. in 1902 to 123,359 lbs. in 1903. Cacao shows an increase in quantity of 7,736 cwt. Cinnamon (plantation and wild) shows an increase of 5,092 cwt. Cocoanuts have decreased from 8,779,961 nuts to 6,639,860 nuts. Considering the products of the cocoanut palm as a whole, there has been a remarkable increase in value as compared with 1902. The value of exports in the seven months January to July, 1902, was Rs.9,476,268: for the corresponding period of this year the amount is Rs.14,274,203. Cardamoms show an increase in quantity of 809 cwt.; coffee shows an increase in quantity of 231 cwt.

#### Crude Saltpetre as Manure.

Some interesting experiments to test the value of crude saltpetre—which contains about 60 per cent. of nitrate of potash—as a manure, and of *sitta* (impure saltpetre salt) as food for cattle are being carried out under the direction of the Inspector-General of Agriculture in India. Consignments of the former have been supplied by the Government Salt Department of Upper India to Government Farms in Bombay, the Central Provinces and Bengal, while the “food salt” has been sent to some half-a-dozen Government cattle farms for trial as cattle food. Experiments of this nature are of considerable economic value and the more they are tried the better it will be for the agriculture of the country. For instance, the production of a really cheap cattle salt would prove of inestimable benefit to the cultivator, who would shower down blessings innumerable on the “Sirkar” for his latest miracle.

#### Canker in Rubber.

On the 31st ultimo Mr. J. B. Carruthers, the Ceylon Government Mycologist, delivered an interesting address on Canker in Rubber, which he has been investigating, before a well-attended Meeting of the Kalutara Planters' Association at Tebuwana. The disease, he said, was first noticed two years ago; but not till five months ago was his attention called to it. He visited fifteen or more estates in Kalutara. The proportion of diseased trees in Kalutara was about one in two hundred. Yateporua and Edengoda estates were not included in the estimate. If they were included it would be about double the figure. The canker had been on these two estates for some years, possibly five. After describing the appearance and the method of canker spreading, he recommended the treatment of cutting out the canker, entire excision of the affected portions, and burning all bark cut. After the operation on the affected portion, the tree would go on as usual. A discussion followed, and Mr. Carruthers explained that the disease would not effect seed. There was nothing serious in that rubber canker. Nursery plants were not liable to get disease. Trees on damp, low land were more liable to disease than trees on ridges and well-drained land. The disease could be eradicated.

#### Gutta-Percha in German New Guinea.

Further details are to hand concerning the discovery of gutta-percha in the low country in New Guinea by the Schlechter Expedition, as reported some eighteen months ago. According to the German Colonial Scientific Committee the gutta-percha is of good usable quality, and may be employed in a mixed form for cables. It is said that, if carefully collected, it might even be used for such purposes in its pure state. Herr Schlechter states that the quality of

the gutta-percha in the high lands, in the Finisterre and Bismarck mountains, is even better. The New Guinea gutta-percha is now being tested in various German cable works. The Secretary of the German Imperial Post Office has granted a considerable sum for the purpose of experimental manufacture with the product. The Committee proposes to create, for a period of three years, some kind of an establishment which will undertake the training of the native population of New Guinea to extract the gutta-percha, under the supervision of the expert Herr Schlechter.

#### A New Field for Rubber Cultivation.

In view of the possibility of many planters of Seychelles taking up the cultivation of Pará rubber, the Curator of the Botanic Station, Seychelles, has prepared a valuable report on the industry following his agricultural investigations in Ceylon and the East. This has been issued as No. 22 of the Colonial reports (miscellaneous series). The report observes that there is a very great similarity between the valley of the Amazon, where Pará rubber is indigenous, on the one side, and Ceylon, the Malay Peninsula, and Seychelles on the other, both as regards soil and climate, and that the planting of Pará rubber may prove a profitable industry from all points of view. Even ten acres of land devoted to this plant on some estates may give a good profit, and a certain assistance to the planter in the form of a by-product. The numerous swamps and valleys of Seychelles which contain a good deal of waste land (10,000 acres at least), and even the young cocoanut plantations, or those which need a supply of new trees, should be used for Pará rubber planting. An acre of land may yield 200 lbs. of rubber at least, and give more profit than an acre of cocoanuts, in any case in the present conditions of the markets of both products.

### GENERAL ARTICLES.

#### PRODUCE AND PLANTING.

According to Mr. Basil Matveieff, who writes to a contemporary on the subject, “the new addition to the Customs duty in Russia or India and Ceylon tea can in no sense be considered as an act of tariff hostility or as a violation of the Anglo-Russian Treaty of 1859, as it only applies to tea imported through the European ports and frontiers, and no extra duty has been imposed on teas sent over the Siberian frontier and ports in the Far East. At those places Indian and Ceylon tea pays the same duty as China tea, which is for both less than on either by the European frontier. The object of the addition is to provide traffic for the Siberian Railway. It will hardly stop—it was not intended to stop—the consumption of Ceylon and Indian teas in Russia.”

There is plenty of room for improvement in the quality of the tea offered at some of the refreshment shops, and this question is more important in the interests of those who wish to increase the demand for tea than it looks at a first glance. The *Daily News* publishes a letter in which the writer says:—“I remember reading, not long ago, a letter in your paper from a working man, in which he laid stress on the point that it was very difficult to obtain anything non-alcoholic to drink in a strange place, and this served to put abstinence actually beyond the means of a poor man. I am not an abstainer, and when going about the country I have usually had no scruples, when thirsty, in laying out twopence on a glass of beer; but on Saturday it occurred to me to put the working-man to the test. I entered a tea-shop. My request to be served with tea without anything to eat along with it created blank amazement, and my statement that I was not at all hungry seemed to be no excuse.” However, the correspondent goes on, “I was served. On my asking what was to pay, the person in charge informed me that the usual charge for ‘tea,’ including several

kinds of food, was ninepence; but that in the circumstances I need only pay sixpence. I ought to add that the tea given me was as nearly undrinkable as it could be—unpalatable is much too mild a word. Now, how is the temperance movement (which has my most hearty support) going to meet this? In that small town I could have obtained without the smallest trouble, and for a third of the cost, an infinitely more pleasant beverage. Bad beer may certainly be found; but bad tea is almost universal, both in tea-shops and in public-houses, outside a few big towns. And it is always, absolutely always, excessively dear."

In commenting on this and other letters on the same subject, the *Daily News* says: "A large number of licensed houses are waking up to the demand for tea, which pays far better than beer, on a given turnover. Take the great catering firms which provide non-alcoholic restaurants in London. Where do their dividends come from? Not, we think, from the food supplied, but from the innumerable cups of tea, coffee, cocoa, and chocolate, and especially the first two of these. No single cup of tea or of coffee costs 3d., or, we should fancy, a quarter of 3d. when it is one of an immense brew, skilfully administered. It is thus no wonder that licensed houses are beginning to enter an exceedingly lucrative line of business, which hitherto they have despised as 'teetotal.' After all, the publican does not mind what he sells so long as he makes a profit, though we should like to know how the tea-room is regarded by the brewery which own the licence, but which gains nothing by the business transacted. Railways might make immense profits on tea if they worked their opportunities properly. The tea-room at Euston is an object lesson how the thing should be done."

On the subject of tea and coffee drinking Dr. George H. R. Dabbs, writing in the *London Argus*, says: "The stimulant of tea and coffee is not enough appreciated. When in large general practice—in earlier life—one had to treat a great deal of typhoid, and I was never addicted to the use of brandy, as a rule, but I rarely omitted tea and coffee. I have often combined brandy with either or both, and in a great emergency I never, of course, for any fad, omitted brandy, but I depended almost invariably on coffee and tea. And in the long and starving marches of Isabella's ragged and ill-fed soldiery in Spain, I was often astounded to witness what hot tea would do for them where wine often proved useless."

The Directors of Lipton, Limited, declare an interim dividend on the Ordinary shares for the past half-year at the rate of 6 per cent. per annum. With trade bad it is not surprising that the company should have been among the sufferers, but the steady decline in profits is as alarming as it is consistent with market anticipations. A reduction of 25 per cent. in the interim dividend distribution is a serious matter. The present position is conspicuously unfortunate in view of the flourish of trumpets with which the inauguration ceremony was accompanied.

Some twenty years ago a company was formed in London for making coffee from dates. It did not thrive, but there are plenty of coffee substitutes still on the market. One of these is figs. From particulars given in a consular report it appears that large quantities of dried figs are exported from Italy to Austria, where it is said that they are made into coffee.—*H. & C. Mail*.

### THE RISE IN RUBBER.

Lead pencils, historians say, were first mentioned by Conrad Gesner, of Zurich, in the year 1565, about the time of the discovery of the famous Borrowdale graphite mine in Cumberland. A couple of centuries later—to be exact 1770—Priestley in a lecture recommended indiarubber as a means for removing the marks of such recording agents. At that time there was a considerable element of novelty, not alone in the recommendation, but in the article itself. It is, in fact, not before 1820 that we can date the beginning of the great indiarubber industry. In that year Nadier found a way of cutting it into threads. Three years later Mackintosh created the waterproof garment trade by applying a solution of indiarubber in naphtha, and in 1836 Hancock discovered, by submitting small strips to kneading under moderate heat, that indiarubber could be reduced to thick masses, deprived for a while of its elasticity and worked into whatever shape desired. Other investigators attacked the problem of the manipulation of the

article, and in 1832 Ludersdorf noticed that the viscosity of india-rubber dissolved in spirits of turpentine could be removed by sulphur, Hayward, an American, about the same time, dusting indiarubber sheets with sulphur to overcome the sticky adherence of the gum. It was, however, Nelson Goodyear's experiments which led, in 1839, to the all-important discovery of vulcanized rubber which preserves its elasticity and suppleness within a wide range of temperature. This vulcanization proved an earlier stage of the transformation of the rubber hydrocarbides under the action of heat and an excess of sulphur, the final product being a horn-like substance—ebonite.

These epoch-marking researches paved the way for the industrial application of rubber, the limits of which it is at the present time difficult to define. In the past-times, the garments, the buildings, in the domestic, medical and surgical equipment of the world, it finds a large number of uses. Therefore, it is not surprising that a curtailment of its supply or an increase in its value should cause concern to widely divergent sections of the community. The *B. & C. D* article, last week, outlining the probable effects of the rise in rubber so far as chemists and druggists are concerned, proved, we believe, beneficial to the trade interests of our readers in general, and the succeeding remarks are designed to further forewarn and forearm. It will not be far wrong to attribute the prevailing high prices of the raw material to a considerable excess in demand over supply, and as there seems every possibility of the consumption being maintained at least at the present rate, we cannot, in reviewing the situation, anticipate much diminution in values. The probability of a considerable augmentation of the supply does not at all encourage us to a contrary view. The larger portion of the world's rubber is constituted of Pará kinds. In fact, their production has been gradually advancing from the initiation as shown by the exports from the Amazon River, which in 1864 totalled 7,840,000 lbs., and in 1902 62,809,500 lbs. There are very considerable difficulties in the way of increasing the areas of Pará grades under cultivation. Of these mention may be made of the necessity of navigable rivers to convey the raw product to the ports, as the construction and maintenance of railways in the tropical parts, where rubber would practically be the sole freight, would never make the lines remunerative. The labour difficulty, too, increases in seriousness in climates so treacherous to human life. Therefore, without unnecessary pessimism, it does not seem justifiable to anticipate rectification of the surplus of demand over production, nor does there in the face of this appear reasonable grounds for believing in any early departure from the general upward trend of the crude Pará market during the last two decades. What a chance is presented in these circumstances for artificial rubber! Velvrl marked a distinct advance in the synthetical article, and who can say what may result in the investigations which are proceeding—especially when we hear of products which have 25 per cent. elasticity.—*B. & C. Druggist*.

### AGRICULTURE AND SCIENCE.

The agriculturists in India have more friends willing to help them than they think if their eyes were only opened to see and know them. There are no scientific chemists in the world like those which nature produces by the thousand million, ready to help man so soon as he can recognise them and harness them to their appropriate work. Witness (for example) the wonderful septic system for the utilisation of sewage, carried on by countless myriads of lowly and almost microscopic chemists with unceasing devotion and unfailing success in converting what was looked upon as noxious waste into healthful elements. Now the farmer has found his friend. Guano deposits are nearly exhausted and the nitrate beds of Chili and Peru are beginning to give out, and at the present rate of exportation will be almost exhausted in another generation. The chemists at Washington have, therefore, been on the alert to see from what other sources the indispensable nitrogen for plant life can be cheaply and abundantly supplied. They have found out.

It has long been known, and indeed Mr. H. H. Mann, the Scientific Officer to the Indian Tea Association, alluded lately to the fact in one of his papers, that it was the bacteria on the roots of legumes which enabled them to absorb nitrogen from the atmosphere, and now for over a year the Government Agricultural Chemists in the United States have been studying the cultivation of these friends

of the farmer. They have mastered the mystery of their growth and they say they are prepared to introduce a factor destined "to revolutionise the whole field of American agriculture." Henceforth, the farmer, instead of importing his manure by the wagon load, can have his fertilising friends sent to him in little packets by post. A farmer, in the pockets of his ordinary working suit, can easily carry 160 packages containing 2,400,000,000 bacteria enough to enrich the soil and increase the yield on what the Americans call a quarter section of land.

Clover in a depleted soil that was yielding only 200 lbs. to the acre, yielded as high as 2,000 lbs. to the same area after the nitrogen-breathing bacteria were introduced to aid the plants. Now here is a lead given to our slow-moving Government Agricultural Department in India. If Director-General Mollison has not any deep-rooted prejudice to all things American, as he had to the introduction of machinery from that quarter for the manufacture of cotton seed oil, let the Government despatch him to the United States to make himself acquainted with this newest branch of scientific agriculture, and learn how to cultivate these fertilising bacteria, and then come and start the business in every province and district in India.

The supreme danger to India, preventing it from keeping pace with the times in everything that relates to the new discoveries of science and their application to the things of every day life, lies in the fact that the heaven-born officials in every Government Department out here think they are perfect beings, and have nothing further to learn regarding anything connected with their own special lines. The consequence is they get atrophied, and if left alone, would speedily reduce everything around them to Chinese stagnancy. Just think, for instance, what the belated Telegraph Department are doing. More than a couple of years ago, wireless telegraphy was an accomplished fact, and is in use by all the civilised Governments of the world—except India. But just because the heaven-born *Sub janta-wallah* did not happen to invent it, the man at the head of telegraph affairs in India has been allowed to potter and scutter away at useless experiments during the past two seasons to see if, by any chance, he may hit upon some plan of his own. He is now to be permitted to experiment with the Marconi system during the present cold weather to test its efficiency. The Government might permit this genius to find out for them if the sea contains salt, or if the sun is capable of giving out light and heat. This apparently is work he is quite fit for.

It is this kind of nonsense that penetrates like dry rot through all Government Departments in India, and I am just afraid the Agricultural Department will succumb to the same kind of smug satisfaction with itself, and take no hints at all from the progress being made in other countries, and His Excellency, being now a tired man—very tired, cannot be expected at the end of his five strenuous years of hard work, to give the necessary fillip to the several belated Departments who wish for nothing else than to be let alone, first, to draw their salaries, and then their pensions. But if the Agricultural Department does nothing along the line of the great American discovery referred to, surely there are plenty of enterprising men interested in the various crops of the Empire who will be up and doing, and not rest until myriads of nature's nitrogen-breathing chemists are put to work to make two blades grow where only one grew before. Here we are confronted with no mere speculative theory. The clover experiment shows that the new system is an eminently practical one.—"MAX" in *Capital*.

### TEA SPECULATION.

"M." writes in *Capital* :—

One would have thought that those interested in tea would have allowed the investing public a little time before beginning the old game of flotations, but one, as yet unfinished, but probably good season, after such a succession of bad ones, is not allowed even to pass before the fledglings begin to appear; and it is sincerely to be hoped that the investing public will give such ventures such a reception that there will be no more hatching for some time. In addition to new ventures being foisted on the market, there are old birds appearing, under a new plumage, although how these birds, even with new feathers, can be expected to weather the storm with an inflated capital seems a marvel. For seven years it struggled on without paying anything with a capital of Rs.380,000 and

the confiding public are now asked to find an increase on this. 'Tis true that there has been a good deal expended on buildings, and the new Company may be freed from any expenditure on this heading, as also on box account, as we notice in the published accounts of the Company prior to liquidation that a sum of almost Rs.16,000 was spent in 1901, so that there ought still to remain some to meet the requirements of 1904. If we hark back a few years, say to 1896 and 1897, we find that the average price for Sylhet teas was a goodly bit better than in 1903, or, likely to be in 1904; and yet during that time this Company failed in dividend paying, so how is it going to be such a gold mine now? However, *revenons à nos moutons* do we find anything to justify flotation at the present juncture? And we say no. The first and most important item to be taken into consideration is labour, and everyone connected with the industry is aware that, not only is this scarce, but that many gardens have during the late crisis had to abandon for one reason—that of expense—and for another, on the grounds (very substantial ones too) that coolies were not to be had no matter what price gardens were willing to give, and unless the recruiting regulations laid down by the Government are relaxed the situation, instead of improving, will become more acute, and on these grounds there is danger ahead. One new Company, which may be put on the market, estimates to open out and bring to a paying stage a garden at the rate of just over Rs.300. Have we so far advanced beyond the early days of tea-planting that the same work can be done 25 per cent. cheaper? And we say no. The trend of later years has been all the other way, and few, if any, estates have been opened out originally under Rs.400 per acre. 'Tis true, Hope, and a few others we could mention, now show a lower capital than this per acre, but it has been attained by extending out of revenue without increasing the block account about 15 to 20 years ago. Rs.300 per acre was considered very cheap for Cachar, and Rs.400 for Assam, but, mark, this did not include a factory or machinery. This was simply for opening out an estate up to the bearing period, with, perhaps, a cutcha erection made to do duty for a tea-house for a year or two, when the garden was in its infancy. A fair amount to estimate for any estate to furnish it and supply machinery of a good type is Rs.450 per acre, and in most cases this is exceeded, so that to put a prospectus before the public estimated to cost Rs.300 an acre is simply an inducement to invest money which cannot be realised, but to which the unfortunate investor will have to add to in the shape of debentures, or something of that kind, or else see his whole investment swallowed up. Our advice to those intending investors in tea, as it is now, is "beware."

### SOME FOOD PRODUCTS IN THE U. S.

The Department of Labour, through its Bureau of Statistics, publishes a table, showing the value of tropical and sub-tropical foods and animals brought into the United States in 1870, 1890, and 1903. We take the following figures from it:—

Articles.	1870.	1890.	1903.
Coffee ...	24,234,879	78,267,432	59,920,597
Chicory ...	71,595	...	45,460
Tea ...	13,863,273	12,317,493	15,620,229
Cocoa and mfrs. of ...	418,064	2,859,642	8,217,441
Vanilla beans ...	...	559,867	1,032,654

The above must be considered in relation to population which, in 1870, was 38,500,000; in 1890, 62,600,000; in 1903, 81,000,000. Considered in that manner we find that the *per capita* import of tea in 1870 was 1.10 pounds; in 1890, 1.33 pounds, and in 1903 the same, having risen from .94 pound to 1.33 pounds, the wide difference being due to decreased imports in 1902, in expectation of the removal of the ten-cent per pound duty. It appears that thirty-three years has not brought about any increase in the *per capita* use of tea.

With coffee the record is very different. The *per capita* imports rose from 6 pounds in 1870 to 7.83 pounds in 1890 and 11.3 pounds in 1903, and an average of 11.7 pounds for the past three years.

Another significant indication of the increase in prosperity and more generous food requirements of the United States is reflected in the cocoa imports, which, from a *per capita* value of one and one-tenth cents increased to 10 cents in 1903. This is a small, yet significant item.

## SCIENCE AND AGRICULTURE IN CEYLON.

We have so often laid stress upon the necessity for the application of Science to the needs of Agriculture that it is with particular pleasure that we reproduce the following extract from the opening address of the Governor of Ceylon (Sir J. West Ridgeway) at the meeting of the local Legislative Council on the 26th ultimo :—

## THE ROYAL BOTANIC GARDENS.

During a large part of the year the Director was absent on leave, and his duties were efficiently carried on by Mr. Carruthers. During his absence the Director spent several months visiting the United States and the West Indies to study the organization and working of other botanical institutions, agricultural colleges, experiment stations, etc., and to collect ideas, suggestions, etc., for the successful working of the Ceylon department.

The work of the last year has largely consisted in the consolidation and detailed organization of the expanded department, more especially in regard to the new Experiment Station at Gangarooa, the new garden at Nuwara Eliya, and the horticultural side of the work at Peradeniya, which now has room to expand by the transfer of the agricultural plots across the river. The Experiment Station is being steadily brought into working order with the aid of the Committee on Agricultural Experiments, and has already proved of much interest and value to the planting community. When first taken over it was chiefly planted with cacao, amongst which was a vast number of other trees, especially cocoanuts, arecanuts, and shade trees; the number of trees of all kinds averaged over 500 per acre, and the estate was far too crowded for anything to succeed, while the cacao canker was rampant, over 96 per cent. of the trees being diseased. The first thing to be done was obviously to get rid of the canker and the excessive shade. Thousands of trees have been cut out, and the canker has been regularly excised according to the methods recommended by the Government Mycologist. The first rounds of the coolies detailed for excision work were protracted and costly, but now the canker has been largely got under, and the result of the work is already evident in increased crops. The whole history forms an instructive object lesson. At its best, in 1897, the cacao crop, then just beginning to be attacked by the canker, was at the rate of almost 3 cwt. per acre; by 1901 it had fallen to  $\frac{2}{3}$  cwt. per acre. That cacao in the Island generally has not similarly suffered, is largely due to the work of the Mycologist. A large area has been cleared and planted with plots of various products for experiments on yield, manuring, different methods of treatment, etc. Among the products now under observation are tea, cocoanuts, rubbers, castor oil, several fibres, cardamoms, groundnuts, etc. A commencement has been made in terracing part of the sloping land to ascertain the cost of such work and the resulting improvement, for it seems probable that in the long run Ceylon cannot stand the constant washing away of soil that is now going on in the hills, and will have to adopt terracing, like other countries with heavy rainfalls. A series of experiments is also in progress to determine the value of different leguminous plants as nitrogen collectors for soil improvement.

The former agricultural plots in the Peradeniya Botanic Gardens are now mainly devoted to horticulture, especially to an extensive collection of vegetables which is being made, including all kinds known to be locally cultivated up to moderate elevations, and all possible kinds of foreign vegetables that will grow here. When reliable tests have been made and a sufficient stock propagated these will be largely distributed through the school gardens and in other ways, and by sale to the public, in the hope of bettering the quality and quantity of vegetables now grown in the Island. Another large area of experimental plots is used by the Scientific Assistant, Mr. Lock, who is carrying on extensive experiments in the possibility of breeding improved local varieties of vegetables, etc., a line of work hitherto little touched upon in the tropics, and both uncertain and tedious, but to which the wonderful progress of European horticulture is largely due.

The new experimental garden in Nuwara Eliya, occupying 10 acres in a corner of the new park, has already yielded interesting results. The object in view in opening it was largely to see what could be done with the sour swampy soil of the high-level uplands,

and to improve the appearance of this unsightly part of the town, as well as to introduce and try ornamental and useful plants suitable to these soils and elevations. Analyses of the soils have been made by the Government Chemist, and recommendations for treatment followed out which have already caused a remarkable improvement. Many plots of grasses have been tried, and several kinds of exotic fodder grasses have been found to yield good crops on the prepared land, and maintain their hold against the inferior native grasses. A large number of useful fruits, ornamental plants, trees, etc., have also given good results, and much information of value to local horticulturists has already been acquired.

Another series of experiments, to occupy a few years, has just been commenced in the dry country now being opened up by the new railway and irrigation works. It is of great moment to know what prospects this region offers for other cultivations than rice—cultivations which may bring traffic to the railway, and perhaps an export trade to the Island. Rice, cocoanuts, palmirah palms, gingely, and Jaffna tobacco may be pretty safely left to private enterprise to introduce in suitable spots. But in view of the fact that cotton, which is one of the largest staples in the very similar country of the Madras Presidency, is rising in price, while great efforts are being made by the British Cotton-growing Association to encourage the growth of cotton within the Empire, it seems particularly desirable to try what can be done with this product in the dry region. An area of about 80 acres is being reserved for cotton under the new tank at Maha Illuppalama, about 20 miles south of Anuradhapura, and a thorough trial will be given to large plots of Tinnevely, Egyptian, and American cottons, with and without irrigation. The experiment will be made three-cornered by adding fodder and stock, the latter to supply manure for the cotton, while at the same time they may be partly fed on the cotton seed for the Colombo market. Plots of rubber and cacao under irrigation are also to be tried, the experience of the Anuradhapura Botanic Garden making it seem probable that they will do well under regular irrigation. The general object aimed at in this experiment with cotton is to see whether it is possible to get a yield better in quality and quantity than that obtained in South India, which leaves an excessively smaller margin of profit. Besides the Government experiment, it is intended to grant favourable terms to capitalists intending to experiment with the industry, and also to encourage cotton growing among the villagers by grants of good seed on credit, and by purchase of the crop for a few years, until the possibilities of the industry securing a hold in Ceylon have been thoroughly tested.

The work of the Entomologist and Mycologist has continued to be of much benefit to the planting community, and the desirability and advantage of such work is being more and more generally admitted. The fumigatorium at Kochchikada has been completed, and in future plants, fruits, etc., liable to introduce dangerous insects will be dealt with there. Circulars have been issued dealing with various pests attacking tea and other crops. Much discussion has been aroused over the proposals made by the Entomologist for legislation against the spread of shot-hole borer—probably the most troublesome insect pest at present affecting tea—many people imagining that the very simple proposals made, that all infected estates should be registered with the Entomologist, and that no estate not certified by him as free from the pest be allowed to sell tea-plants, were the thin end of the wedge for much more drastic measures on the part of Government, or extensive interference in planting matters and methods. Opposition, however, appears to be steadily decreasing. Legislation in such matters must largely follow and crystallize public opinion, but the sooner cultivators recognize that plant-diseases are as insidious and infectious as those of animals, and that it is their duty to keep their cultivations as free from them as possible, the better for agriculture in Ceylon.

The staple products of the Island continue in good condition, and realize fair prices: the price of tea in particular shows a distinct improvement. The export of cacao for the past year was the largest yet recorded, but the price has been lower, chiefly owing to the increasing proportion of the darker-coloured Forastero beans. Cardamoms, as was predicted some years ago, show signs of suffering from over-production, large areas having been planted here and in Southern India.

Among new and minor products, rubber deserves first mention. This is now an established and rapidly expanding industry, and probably not less than 11,000 acres are now devoted to it. A considerable export has already occurred, and, thanks to the care

taken in the preparation of the milk, the prices obtained are much higher than those of the best native Pará rubber, which has hitherto topped the market; further, there is but little "scrap," so that the bulk of the export has sold at a price of about 4s. a pound. The cautious estimate published by the department in 1898 has been considerably exceeded on several estates, both as regards quantity and price. The investigations into the Ceylon gutta-perchas, mentioned in my address to this Council at the opening of the 1901 session, have been completed with the aid of the re-organized Imperial Institute, but, I regret to say, with somewhat disappointing results, it being found that these products, which can be obtained in considerable quantity in our forest, have so small a market value at present that it will not pay to collect them.

Investigations have been continued with citronella oil, an industry which is in a depressed state from over-production, adulteration, and the competition of the pure Java oil. A plot of the grass has been planted at 2,000 feet elevation on the Experiment Station, and is doing well, thus showing that there is much land in the Central Province suited for the industry and now lying waste under mana grass. Experiments in distillation are now being tried, and there seems reason to suppose that Ceylon may once more be able to turn out an oil which may compete with that of Java in purity and price.

Camphor has been planted in a large number of places, and the present year should see a small export of this product, but it is too early yet to say whether it is likely to become established as a minor industry in the Colony.

Ceylon coca continues to figure in the London drug markets as obtaining about the highest prices. The demand for this leaf is of course very small, and any considerable increase of production would lower the prices considerably.

Pepper, in former days a staple product, continues to be planted in small quantity, and Ceylon pepper has realized good prices in London.

Among more specially native products which continue to expand may be mentioned cassava and vegetables for the markets of the larger towns.

## INDIA AND THE ST. LOUIS EXHIBITION.

A Ceylon paper says:—

Mr. Palmer L. Bowen, the Commissioner to India for the St. Louis Exhibition and who has been engaged for the last ten years in Exhibition work, is spending a brief holiday in Ceylon before resuming his travels in the interests of his special work. Our visitor is charmed with all that he has seen of this Island and admires not only its scenery and its climate but more especially the up-to-date and enterprising character of its people. He is himself a splendid type of American, long-limbed, clean-shaven, with handsome features and that magnetic influence, which is so frequently met with in the educated American. This is Mr. Bowen's first visit to the East. His presence in Ceylon is due to a happy accident allied to a natural curiosity the fame of which had reached his ears. His constituency is France, Switzerland, Western Germany, Spain, Portugal, Greece, and Egypt. When the Hon'ble Mr. John Barrett was suddenly taken away from his special work on behalf of the St. Louis Exhibition and sent as the diplomatic Agent of the United States to the Argentine Republic, leaving the vast field of India practically untapped, Mr. Bowen volunteered to pick up the threads and see the thing through. His task has proved by no means either easy or enviable. He found India as indifferent as Ceylon is eager. Speaking to a representative of the *Independent* yesterday, before leaving for Kandy, Mr. Bowen said he hoped India would after all make a very good exhibit of planting products, such as tea, coffee, cardamoms, jute, etc. There would also be a good show of native crafts but that portion was being done on private initiative as the Government of India had declined to assist. Altogether the exhibits would represent a value of some thirty lakhs of rupees. An India Pavilion was to be erected and the building would be typical of some of the ancient monuments of the country. It was expected that a Commissioner would shortly be nominated by the Tea Association, in whose hands the exhibit would practically be, the Government itself sending forward certain technical exhibits in the departments of geology, forestry, education, survey, and post and telegraphs. It would be a creditable show but not what

India, with its vast resources, was fully capable of. It seems that the apparent reluctance of the Indian authorities to make the best use of the opportunity was ascribed to the wish not to accept the invitation to participate in the Exhibition, otherwise they might be establishing an awkward precedent which might embarrass them on some future occasion. The logic of this representation is not very clear seeing that India took part in the Paris Exhibition and that it might rightly be considered that the precedent had already been set. On leaving Ceylon, Mr. Bowen will visit Turkey and will then proceed on his own account to the Balkan States just "to see what they are doing." Although Turkey had declined officially to participate in the Exhibition he was hopeful of being able to induce a few private individuals to make an exhibition. His work in Europe had been practically completed and there were only one or two questions such as insurance and freight to clear up. Mr. Bowen will be returning to Colombo on Saturday.

## CARDAMOMS.

THEIR NATURAL CHARACTERISTICS AND THEIR USES.

Mr. P. C. MacMahon, of Woodside, Urugala, wrote the following essay for circulation at the St. Louis Exposition under the scheme approved by the Executive Committee: but, it having been rejected, with regret, by the Cardamom Committee of the P. A., as too long, Mr. MacMahon sent it for publication in the *Times of Ceylon*:—

The Cardamoms of commerce are the cured fruit, or capsules with their seed, of a plant known botanically as *Elettaria Cardamomum* Mat. Many kinds more or less related to the above grow wild in the higher mountain-forests of Ceylon, Southern India, Cochin-China, Madagascar, and a few other countries. Of the above-named species what is known as the "Mysore" variety is the kind now almost entirely cultivated in Ceylon. It is distinguished from some of the others by a more robust habit, smooth glossy leaves, tall and erect inflorescence, unfurrowed and slightly-elongate capsules. The plant is of a bulbous nature, and in the laying out of a plantation two of its bulbs with the whole of their long stems, which sometimes reach to the length of 12 feet, are planted in shallow holes, at the distance of 7' x 7' or 8' x 8' according to the fancy of the planter or the nature of the soil he is bringing into cultivation. The stems are allowed to lie flat on the ground. Great care must be taken in choosing soil, as only the richest loam of the primeval forests will successfully grow this product. The trees of the latter must be thinned out, to afford the plants sufficient light, and, at the same time, to exclude the direct rays of the tropical sun. After two months shoots appear above ground from the planted bulbs, and, as these grow and mature, they in turn throw out further shoots or stems, until at the end of three years a large clump of from 3 to 4 feet in diameter is formed—the inflorescence or racemes, which also rise from the bulb, intermingling with the stems or in sloping situations gracefully hanging over. The racemes are now covered for the whole length with bracts from which spring the pretty orchid like flowers of whitish colour with centre pink markings. These flowers are great favourites of the wild bees of the Island, who gather from them a rich store of honey and wax, and, at the same time, freely bestow their humming services in successfully fructifying the same—the fruit buds of which, after three to four months' growth, changing into ripe capsules. When arrived at this state they are collected by the labourers of the estate into bags and carried to the curing factory, where they are at first washed, and, for several days after, bleached and dried in the sun, care being taken to avoid discolouration either by rain or damp, and at the same time prevent, as much as possible, by not too great exposure, the capsules from bursting and losing their precious seeds. The next work is clipping the dried stems of the capsules which came off with them when being plucked. This work is done by women with small scissors, and is a slow and delicate operation. After having been clipped, they are further bleached and dried, and then sorted into different grades usually called Nos. 1, 2, 3, 4, "splits," and "seeds," after which they are packed in paper-lined boxes and despatched to the metropolis of the island, Colombo, where they are either sold locally for export to India or shipped to England and the "continent" for commercial sale.

The uses and virtues of cardamoms have been known to many of the Eastern nations from the earliest periods, and so highly do the

Hindus value them that they have bestowed on the seeds the poetical name of "grains of paradise." In the receptions of the higher classes of this nation among themselves sugar-coated cardamoms are always presented to the guests, and often on these occasions the youthful mother of the house, if there happen to be such a one, hands or leads round for inspection what she in the intensity of her delight loves to call her "sugar cardamom," namely, her latest-born babe and favourite child. The consumption of cardamoms by these people and the Burmese is very great, and must reach close on 1,000,000 lbs. annually. They use them extensively in cooking, in the manufacture of confectionery, toilet oils, medicines, tooth-powders, and in masticating with the betel leaf, which is a kind of pepper. In England and the other States of Europe they are also largely used, and the export from India and Ceylon and Indo-China to there totals now over another 1,000,000 lbs. per year. The principal uses which the home countries apply them to are the manufacture of cakes, confectionery, sausages, liquors, and in the packing of fruit, fish, etc., etc. In the public bars, too, they are also coming into use for dispelling from the breath of the frequenters the nauseating smell of tobacco and alcohol. In medicine and for toilet purposes their use is legion, and far too numerous to mention here. On the whole it may be safely said that as a spice they are now the most appreciated of any known to mankind. This to some extent is shown by the rapid extension of cultivation in Ceylon—that island in 1883 exported only 21,655 lbs., while in 1902 it rose to 615,922 lbs., and this year it is expected to yield 750,000 lbs.

It is to be regretted that the "giant republic" so far this year has taken direct only 1,215 lbs. By the help of the better knowledge of the spice which this great Exposition will afford its people, and the fast rising commercial marine which the nation is sending forth, it may safely be predicted that a larger import of cardamoms and more reciprocity of trade will soon spring up between it and "little Ceylon," the Taprobane of the ancient Greeks, and "Pearl of India."

### MORE DESTRUCTIVE THAN WAR.

Ignorance of the cause and nature of human ailments, and of what best to do when attacked by sickness, is responsible for greater loss of life, and infinitely more prolonged misery, than the most desolating war that was ever waged. Wars break out, rage fiercely, subside, and there is peace once more in the land; but everywhere and always there is a proportion of the people who are sick and ailing; who cannot properly sustain their part in the competition of life, and whose time is passed in suffering pain, from which they perceive no way of escape except by death.

In all ages the wisest and noblest of mankind have exerted their mental power to the utmost to avert, so far as may be, the suffering and wastage of humanity, and they have been rewarded by a large measure of success. The evils we deplore great as they undoubtedly still are, have been enormously diminished by their efforts.

Many modes of treatment formerly in high repute have been proved by modern science to be positively detrimental to patients, while remedies have been discovered of such wonderful efficacy that the cures they work would have been accounted miracles in a darker and more superstitious age. The foremost place among these disease-dispelling life-savers must be given to Mother Seigel's Curative Syrup. For thirty-five years that great remedy has been doing its humane work in all parts of the world. No other medicine is so much esteemed, nor likely to be while people voluntarily write of it in terms such as those employed by Mr. Isaac T. Sihiya, of Engunjini, Sneezewood, P.O., Griqualand East, Cape Colony, who, in a letter dated 10th June, 1903, says: "I am convinced that but for Mother Seigel's Curative Syrup I should not be alive to-day. Some years ago I had a bad fall from my horse, and sustained a great shock. I lay for a long time on the ground helpless, and when assistance arrived it was found that I had severely sprained my spine. After a while I recovered somewhat, and was not greatly troubled by my accident until after I entered upon my present duties as Forest Guard for this district. The work at that time was very hard, the people being unruly and giving much trouble. I had to be on horseback the greater part of every day, and very soon my back began to trouble me again. My kidneys were affected and caused me dreadful pain. Many times I was

obliged to dismount from my horse and walk, leading the animal behind me; for I was not in a position to give up my work. A doctor whom I consulted informed me that one of my kidneys had been displaced, and was otherwise injuriously affected. For three years I suffered in this way, and none of the medicines I tried benefited me in the least. But one day a friend gave me a little book to read, and advised me to try the medicine described therein, which proved to be no other than Mother Seigel's Curative Syrup. I followed his advice, and to that fact owe the good health I now enjoy. I am confident that I could not have continued much longer to endure the terrible anguish with which I was afflicted before resorting to Seigel's Syrup."

Testimony such as this must convince even the most sceptical; yet let it not be forgotten that Seigel's Syrup is the unrivalled remedy for indigestion and of the numerous complaints which arise from that malady. "As regards my family," writes Mr. C. F. Morsner, of French Hoek, Paarl Division, Cape Colony, 15th June, 1903, "we keep Seigel's Syrup as our house doctor. It cured me of liver complaint. I have recommended it to numerous people, and always with satisfactory results.

Humanitarians look forward to a time when suffering shall be reduced to its lowest possible limit the goal alike of the best politicians and physicians.

### MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated October 16th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904	517,384	449,996	39,399
1902-1903	533,304	502,175	32,648
43,307 pkgs. INDIAN 15,028 " CEYLON 1,546 " JAVA	Total 59,881 packages were offered in public auction this week.		

The use of Indian and Ceylon Tea in countries outside the United Kingdom still increases, but the figures up to the 30th June this year show that the excess during the six months was largely made up of Ceylon Green Tea sent to North America.

	1903.	1902.	1901.	1900.
Indian	11,164,672	11,515,735	13,084,232	7,655,887
Ceylon	31,824,183	27,252,742	29,379,018	23,650,669
Total lbs...	42,988,855	38,768,477	42,463,250	31,306,556
	1899.	1898.	1897.	
Indian	7,303,375	6,640,119	8,672,473	
Ceylon	16,610,286	17,787,535	14,150,950	
Total lbs...	23,913,661	24,427,654	22,823,423	

This fact seems to clearly emphasise the importance of encouraging the manufacture of Green and Uncoloured Tea, and it is gratifying to note that some progress is at length being made in India in the manufacture of this article.

*Export of Indian and Ceylon Tea (in lbs.) to places outside United Kingdom from 1st January to 30th June.*

INDIAN TEA.				
	1903.	1902.	1901.	1900.
Re-exports from U. K.	4,810,736	6,434,444	6,957,488	4,010,980
Transshipments via U. K.	678,779	685,911	347,233	410,900
Direct expts. from Calcutta	5,675,157	4,395,380	5,779,511	3,234,007
Total lbs...	11,164,672	11,515,735	13,084,232	7,655,887
CEYLON TEA.				
	1903.	1902.	1901.	1900.
Re-exports from U. K.	7,807,034	7,955,197	8,884,044	6,431,995
Transshipments via U. K.	1,375,919	1,504,773	1,087,099	679,132
Direct expts. from Colombo	22,641,230	17,792,772	19,407,875	16,539,542
Total lbs...	31,824,183	27,252,742	29,379,018	23,650,669

It should not be forgotten that the manufacture of Green and Uncoloured Tea produces a two-fold benefit, as it not only displaces other Green Teas in foreign markets, but also reduces the output of Black Tea.

INDIAN.—Although the auction was rather heavier than last week, the effect was to some extent counteracted by the reduced offerings of Ceylon Tea. Hence, the steadier tone noticed last week was fully maintained, prices in many instances becoming a trifle dearer, while buying appeared to be more general, good liquoring teas especially being well competed for, and common kinds slightly firmer. The following averages are worthy of note:—"Brit. Darj. Co. Thurbo" and "Darj. Con. T. Co. Singbulli," 1/3; "Selimbong," 1/1½; "Darj. Co. Phoobsering" and "Tara T Co.," 1/0½; "Budla Beta Co. B. B.," "Ass. Fron. Co. Ledo," and "Ang. Am. Co. Kolony," 1/0¼.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 38,358 pkgs., av. 7·89d. 1902, 31,307 pkgs., av. 7·58d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 359,903 pkgs., av. 7·89d. 1902, 364,464 pkgs., av. 7·19d.

CEYLON.—The improving quality of arrivals is having a good effect not only in imparting a distinctly better tone to the market, but also in reducing the supply of the commonest grades. All kinds were in strong demand, spirited bidding characterising the auction, with somewhat dearer rates, especially for the better descriptions.

Average for week 7·98d., against 7·13d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 823,433 pkgs., av. 7·46d. 1902, 926,587 pkgs., av. 6·70d.

JAVAS brought somewhat improved rates with good general competition, most of the teas being disposed of in the auction. Since 1st June 33,855 packages on Garden Account realised an average of 6·59d. per lb.

Bank Rate 4 per cent. Exchange on London three months' sight:—Calcutta 1/4½. Colombo 1/4⅓.

## COFFEE.

The *Produce Markets' Review*, reporting on the coffee market for the week ended the 3rd October, 1903, says:—With continued light receipts at the Brazilian ports and reports of drought having affected the growing crop, the terminal market has been particularly strong throughout the week, and quotations have daily advanced, closing at 1s. 3d. to 1s. 6d. above last week. All markets have apparently become convinced that prices are going to a higher level than we had become accustomed to, and this idea has been only too readily encouraged from Brazil, where, of course, there is every desire to realize their abundant supplies at as high prices as they can obtain. News of short crops in other countries, notably Guatemala and Costa Rica, have helped the upward movement, and a good trade has again been done in mild coffee at advancing rates. The shortness of present supplies of those kinds has helped this, and a good profitable business has been done with old importations, which only a month or so ago were not saleable, excepting at a considerable reduction. The few lots of Costa Rica in auction fetched rates fully 2s. above the previous sale, some marks being from 8s. to 9s. dearer than they were six weeks or two months ago.

Greater firmness has been observable in this market since our last report, and the scanty supplies in public sale have gone off readily at again somewhat stiffer prices, viz.—625 bags East India plantation, faded small and greyish at 35s. to 39s., low middling and middling at 43s. 6d. to 55s.; 2,570 bags Costa Rica and Guatemala, low and ordinary at 30s. to 36s., fine ordinary and low middling at 39s. 6d. to 48s. 6d., middling to good middling at 50s. to 67s., coloury at 69s. 6d. to 73s., blue at 85s. 6d., peaberry from 42s. 6d. to 75s. 6d. up to 94s.; 354 bags Mexican, small and middling at 43s. to 50s., good middling at 61s. to 65s., bold at 79s. to 80s. 6d. peaberry at 70s. 6d. to 87s.; 1,920 bags Columbian and New Granada, very common at 24s. to 30s. 6d., ordinary at 35s. to 39s. 6d., low middling and middling at 41s. 6d. to 49s. 6d., greenish at 54s. 6d. to 59s. 6d.; 1,600 bags other Central American on similar terms, part Nicaragua at 33s. to 59s., and 78s. 6d., Coban at 35s. to 54s. 6d., and Vera Paz from 43s. to 62s. and 81s. 6d.; besides 1,540 bags Washed Dumont Santos, small and medium at 32s. 6d. to 41s.,

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

## CURES

**RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,**

And all Aches and Pains usually treated by outward application.

**IT HAS NO EQUAL ON EARTH AS A PAIN  
RELIEVER.**

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

bold at 4ls. 6d. to 48s., peaberry at 39s. 6d. to 49s.; and 1,500 bags Unwashed ditto at 33s. to 40s. per cwt. At first the market for Futures was in a buoyant condition, when good Santos for present and future delivery fetched 28s. 9d. to 31s. 7½d.; but since unfavourable advices speaking of much larger receipts at the Brazil shipping ports have been cabled there has been a relapse, and later transactions for October-September deliveries have mostly been at a material decline at from 27s. to 30s. 6d. Stocks of Coffee in the chief European ports on the 1st instant embraced 436,000 tons, against 376,000 tons last year and 240,100 tons in 1901.

### CEYLON TEA IN AUSTRALIA.

SYDNEY, *October 13th.*—Tea remained steady, but, apart from a little business in Ceylons, nothing was done.

MELBOURNE, *October 12th.*—Business has been done in Ceylon tea to the extent of 150 chests at 7½d. to 10¾d. Of Indians, 300 chests have been sold, partly from the recent catalogue and partly to arrive, at up to 8½d. In China tea, 50 half-chests medium Panyong have been placed. Colombo cable advices report that all common grades are firmer. Since the shipments per *Hobart* and *Fortunatus*, good common Pekoes have risen ½d., fine Pekoes ½d., and choice Broken 1d. The Calcutta sale last week showed generally a firm tone, and common leaf was a shade higher. —“Australian paper.”

### INDIAN TEA.

Messrs. George White & Co., in their Report, October 15, say: The firmness in the market noted last week has developed and the sales have passed with considerable spirit, prices for all descriptions ruling in sellers' favour. Quotations for common to ordinary show an advance of ¼d. from the lowest point, and it is satisfactory to note that medium kinds, which have of late been somewhat sluggish, fully participated in the improved inquiry. There was

no abatement in the competition for high-grade tea, broken kinds as before having the best of the market. Latest cables to hand reporting on the crop for the current month are to the effect that many estates are now only running level with last year. It will be remembered that it was in October, 1902, that the shortage in the outturn began to be demonstrated. South India was represented by some 4,000 packages. The unfavourable weather for quality experienced at the time of manufacture was in many instances evidenced in the want of flavour, but at the same time there was a fair proportion of invoices giving useful coloury liquors, and these met with the usual good support from the trade. For 38,300 packages on estate account 8d. per lb. was realised, versus 7¾d. per lb. for 31,500, and 7¾d. per lb. for 32,000 in the two foregoing seasons. Telegrams from Calcutta state that the 24,000 packages sold there on the 9th instant brought 5a. 7p. per lb., without much change being apparent in quotations. For to-morrow (Friday) 24,500 were declared.

### CINCHONA.

In auction 52 serons of Crown bark were offered and sold at from 9d. to 10d. for Loxa, and 10½d. for Huanoco. A further 16 serons of Crown bark were offered, and sold at 10d. per lb. Good bright Cartagena quill was limited at 5½d. per lb., and for 2 bales of Maracaibo bark a bid of 3d. is to be submitted.

### QUININE.

Although the unit at the Amsterdam bark-sale improved by 8 per cent. (the average unit paid being 7.45c. per half-kilo. against 6.90c. at the previous auction), no alteration was made in the makers' price of quinine, as was anticipated in some quarters. It remains at 1s. 1d. The second-hand market has been much quieter this week, and is the turn easier, with small sales of December delivery at 1s. 0½d., and March at 1s. 1d. per oz.

(AVERAGE FOR ALL INDIA 7.89d., OCTOBER 16TH.)

In these tables all packages are chests unless otherwise stated. ½c stands for half-chests; p for packages; prices marked thus † represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

# PLANTING

# OPINION.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, NOVEMBER 14, 1903.

[No. 45.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 20th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*Weather*—North-East showers every two or three days; wind moderate. Temperature cool. *Coffee*—Generally cleaning up for crop, a little handling going on and shade lopping, also the usual weeding. *Crop prospects*—much better than expected; a fine flush on for next year. *Health*—Good. *Labour*—Abundant. *Interesting item*—Roads awful.

### NOTES ON RUBBER.

In our present issue we publish some very interesting notes on Rubber Culture in Guatemala and Southern Mexico. These are the outcome of studies made by Mr. O. J. Cook, of the botanical staff of the Department of Agriculture at Washington, U. S. A., and are extracted from that gentleman's report on "The Culture of the Central American Rubber Tree." Mr. Cook is again on the spot making further studies which are directed primarily to the question whether rubber-planting is advisable for Porto Rico and the Philippines. The report will, however, afford useful information to all interested in the development of rubber-culture in other places as well as Central America, and to planters in this country who take up rubber as an auxiliary product. Mr. Cook has arrived at the conclusion that the practicability of the agricultural production of rubber has been demonstrated, but that it bids fair to become probable only under favourable natural conditions. These conditions are as yet but imperfectly understood, and it is precisely on this point that Mr. Cook's present and later reports should throw light. It is obvious that at present rubber-culture is vested with perhaps more difficulties than uncertainties than the cultivation of most other products. Any man who goes in for rubber must run the risk of grave disappointment. Yet from various

parts of the world have come, during the last few years, reports that point to the successful cultivation of different species of rubber-trees, and from a few countries we have had acres of successful experiments on a wider scale.

When the subject was first taken up there was a strong impression that rubber-trees would only thrive and yield rubber if left to grow wild. Early experiments perhaps tended to deepen this impression, but persistency won its way at last, and it may now be said to have placed beyond doubt that the production of rubber by planting trees is practicable. Naturally, where Nature has formed a rubber-forest, and time has brought about a large development of this in regard to the number, the height and the growth of trees, rubber is plentiful and cheap; but it almost invariably happens that such forests are situated in remote and usually very unhealthy tracts, so that the advantage derived from prolific yield is lost again on the difficulties of labour and transport. Mr. Cook writes with caution and reserve. Yet he has at least one very encouraging statement to oppose with regard to *Castilloa*, the rubber-tree with which he specifically deals. He says that its essential requirements yet require to be more fully known. But—here comes the remark to which we have alluded—he inclines to the view that *Castilloa* is not essentially a forest tree, but, even if it were, it does not follow that it should be planted under the same conditions as in the wild state. Planting *Castilloa* in the undisturbed forests he regards as clearly inadvisable; but as to the proper degree of shade or its absence, "each planter will need to use his best judgment in determining what local conditions require. . . . No general principles will determine what is best, because no one method is applicable everywhere." It has been found possible with many plants to increase the average percentage of starch, sugar, or oil through the planting of selected seed or cuttings, and Mr. Cook suggests the probability that a like result is possible in the case of rubber. There is, in the natural state, no uniformity in the yield of the rubber-tree of any given species, nor is such uniformity to be looked for in planted rubber. There are conditions under which rubber-trees may not yield any *latex*, whether wild or cultivated. Moreover, there is more than one species of *Castilloa*, and all are not of equal value as rubber-producers. For scientific investigation and for experimental cultivation there is, therefore, ample scope.

Here we would add a few remarks as to the fluctuations of prices of rubber. During the last twenty years or so these have, at times been very violent; but there has always been this satisfactory feature, that not once have prices gone below the level that would under fairly favourable conditions, leave a profit to the planter. In the United States the highest price ever reached was \$1.20 (5s.) in 1882 for Pará. In 1886 the range of prices at New York was from about 2s. 7d. to 3s. 5½d.; in 1890 as high a price as 4s. 2d. was reached; the following year there was a lower range, then came a period of minor fluctuations between, say, 2s. 9d. and 3s. 4d., then from 1896 to 1900 a sharp series of rises until 4s. 7d. was reached. From 1900 to 1902 the tendency of the market was downwards though in the latter year a recovery set in, and another rise, more steady than ever, occurred. Every great advance is usually put to the account of speculators, but it is worth noting that prices have frequently been at a very high level while stocks were unusually heavy; and that the harvest price (in 1899) belongs to a period of low stocks. These are matters that defy explanation, but it is safe to say that the probability is that, for some years to come, the tendency will be towards a rapid growth of rubber consumption and that, making allowance for failures that are almost inevitable, it is unlikely that production will grow more rapidly than demand.

#### COFFEE NOTES.

**Brazil Weather Conditions.**—Europe cabled Monday, October 12, that it has heard of rains at Rio.

Cable advices said that the *Brazilian Review* of October 6, said: "Rio and Minas drouth continues. São Paulo rain is not general. September blossom damage serious."

Messrs. Hellwig & Co., Santos, cables: "Conditions are not as satisfactory as we should desire; insufficient rains; weather fine again; holders waiting; withdrawn from market."

Messrs. J. W. Doane & Co., say: "Drouth continues in largest district of Santos, Janu."

**Java Coffee Going.**—Coffee culture in Java is on the wane, says a recent cable, and it is not impossible that in the course of time it may be given up entirely. The reasons for this are the exhaustion of the soil and the competition of Brazilian coffee.

**Cotton Bull in Coffee.**—It is generally reported, says the *Tea and Coffee Trade Journal*, that William P. Brown, who recently cornered the cotton market, will presently strive to do the same in the coffee market, acting as a bull. He became a member of the Coffee Exchange in May last. Mr. Brown has refused to confirm or deny the report. Be that as it may, Wall Street, from whatever source, is entering the coffee future market with spirit and generous orders, believing that "undoubtedly there is opportunity for active business in coffee." The statement in Wall Street was to the effect that Mr. Brown is planning a move in coffee that will make as great a stir as his transactions in cotton.

The President will no doubt be called upon, says the *Tea and Coffee Trade Journal*, to urge Congress to admit Porto Rican coffee within the sacred limits of our protective tariff

laws, but as the coffee is not a United States product, doubtless short shrift will be made of the appeal. This point is enlisted against all petitions in the colonies asking inclusion in our tariff laws. Besides, there are other reasons, some of which we have already stated. Much to the point is the argument of the *New York Post* when it says, with fine derision: "A duty on all coffee imported into the United States, except from Porto Rico, might be so arranged as to make every man, woman, and child in the island independently rich. We think that the scheme will fail, for two reasons. In the first place, the Porto Ricans have no votes in our Congress. Tariff favours are distributed according to political influence, and here Porto Rico is deficient—through no fault of its own, we admit. In the second place, the United States Treasury does not want the money which a tariff on coffee would supply. The Secretary is all the time searching for banks in which to deposit his surplus. Moreover, the example of serving our colonies as we serve ourselves might prove embarrassing at a future time when possibly the Philippines may present similar tariff requests respecting hemp or tobacco or sugar. The facts are against the Porto Ricans. We wish them well, but we do not wish them to 'tinker with the tariff'; that is, with our tariff." After all, the commercial needs adjust themselves naturally. Without being invited by Congress, we have enormously increased our use of Cuban sugar, and the same has happened with our use of Porto Rico coffee. But all the same, if national legislation must be invoked in behalf of the West Indies, let us include our adopted kin *de facto*, if not *de jure*.

**The U. S. Coffee Market.**—Actual coffee is firm at an advance of ½c. in Brazil grades over the close of one week ago, says the *Tea and Coffee Trade Journal* of 13th ultimo, whereas in futures the advance is 25 to 30 points, which has had its natural effect on the price actual coffee, making it higher. The trading has not been large, buyers being disinclined to come out extensively on the advance, yet holders have not offered freely, confident of a still further advance, owing to the activity and buoyant conditions in the market in futures. There last week considerable was done. The market early recovered from the reaction with which it began the week, receiving more encouraging cable reports on the drouth in Brazil and also many orders from Wall Street, which has confidence in bull situation in coffee, and is strongly disposed to invest, and is doing so. Exceeding active times in the immediate future are foreseen by usually sure and conservative sources, which go even so far as to predict 7c. for March options. It is worth while noting that the metal interests, which have been such heavily losing bulls, are very quiescent; scarcely doing anything at all, and content to follow where others lead. This fact is important and also its corollary that the bear clique is turning into a bull, which it was before the metal interest came into the market. This bear interest has been a shrewd reader of market conditions and actually foresaw the extreme conditions that have prevailed in the last few years, shaped its policy accordingly and reaped fortunes. All conditions point to this interest entering the other side of the market. The great loss of the bears will be the great gain of the bulls. The entrance, as an active trader, of the leading cotton bull, is also rumored.

It is believed that the new operations are not so much based on the bad weather reports in Brazil as on knowledge that the coffee plantations are so situated that they cannot produce

large nor good crops. The planters have been unable to meet expenses, and worse still, have been unable to borrow money to maintain the coffee trees in good condition. Fertilizing and other care of the trees have had to be neglected, with the results that the trees have impoverished their fructifying power, yielding less berries and berries of poorer quality. So it comes about that the crops being marketed and growing, are showing greatly reduced quantities and the berries are smaller and much inferior. It would seem that the extreme end of the lean years had been reached, and that the pendulum has begun swinging in the other direction. In other words, the reaction to better times has set in. The option market is now one cent. higher than it was one month ago, and is within three-quarters of a cent. of the boom prices of one year ago, occasioned by the report of frosts, which have turned out as bad as declared.

This activity and advance in the contract or option market will have its effect on the actual market, which must respond to the upward tendencies. Further improved conditions are expected this week on expected smaller receipts in Brazil. With Brazil a moderate business is being done; firm offers, as a rule, are above the parity obtaining in New York. In spot the market is firmer, but at light trading. The market closed at 5 $\frac{3}{8}$ c. for Rio No. 8, 5 $\frac{5}{8}$ c. for Rio No. 7, 6 $\frac{1}{2}$  to 6 $\frac{3}{8}$ c. for Rio No. 4, and at 6 $\frac{5}{8}$  to 6 $\frac{7}{8}$ c. for Santos No. 4. The jobbing business has been fair.

In mild grades the market is firm, but there has been no heavy trading, holders waiting for still better prices than those which rule. The advances tend to check business. East India coffees are steady.

\* \* \*

**New Orleans Coffee Futures.**—The Coffee Committee of the New Orleans Board of Trade held a Special Meeting last week, which was attended by the Cotton Exchange members, who have recently become members of the Board of Trade.

The object of the Meeting was to discuss the rules as they have been adopted by the Coffee Committee for the governing of trading in contracts for the future delivery of coffee. The rules were carefully considered, and it was decided to eliminate one clause, which provides that all brokers registering as future brokers in coffee will be required to contribute 50 cents for every 250 bags traded in to the Board of Trade for the maintenance of the coffee future department. It was decided that the rule would work a hardship, especially as future trading in coffee is a new venture in New Orleans. The rules, as re-considered, will be submitted to the Board of Directors for adoption.

\* \* \*

**Brazil Coffee Crop in July.**—The Brazilian Agricultural Bureau publishes the following on condition in July of the coffee crop:—

"Of the first district (Central Railway) there is nothing particular to report. Planters have reduced rates to 50\$000 per 1,000 trees for caring, and 300 réis per alqueire of berry for harvesting, without encountering much opposition.

"In the second district (Campinas) a slight frost fell at the beginning of the month, but not enough to damage the trees. The prolonged drouth is much more serious. Picking was nearly finished in this district, owing to the smallness of the crop. The coffee, however, is of good quality.

"Harvesting in the third district (Ribeirao Preto) is proceeding regularly, but owing to the lack of labour somewhat slowly.

"The Inspector of the fourth district (S. Carlos) states harvesting to be well advanced and expected to be finished by the middle of

August. The yield continues about 76 litres per arroba, the least being 73 and the most 80. The quality, however, cannot be considered good, the bean being very small, which makes separation more difficult. The trees are all in bud, which only want rain to open. Rust stains are appearing on the leaves, a sign of weakness. The drouth continues and a great many plantations have been abandoned. The trees bitten last year by frost have not yet flowered.

"In the fifth district (Sorocabana) the weather has been dry and harvesting has proceeded regularly. The Railway is also working well. Some planters at Monte Mor sold their crops at 5\$200 per arroba without distinction of quality.

"In the sixth district (Iguape) the crop will be 25 to 50 per cent. less than last year's, prices being from 3\$500 to 4\$500 per arroba."

\* \* \*

**The Leeming System.**—"Planter" writes to the *Madras Mail*:—"I have read with interest the article on 'The Leeming System' from a planting correspondent which appeared in the *Madras Mail* last Wednesday, and should like to be allowed to make some remarks on the article and the system. To begin with, it is quite a mistake to call the system after Mr. Leeming, as its origin is much older than the 'Scotforth' estate. In fact, it is the oldest system ever practised. It may be said to date back to the time of Adam, and the leaving of the growth of plants to Nature was continued by him and his sons till it was found that better results could be obtained by tilling the soil and improving on or assisting Nature by pruning and in various ways. It was in use on the Babubooden Hills when the first coffee-plants were introduced to India, and by many planters since. The method of pruning was adopted as it was found that by restricting the amount of wood and confining the nourishment to those parts of the tree alone that would bear crop a better quality was arrived at. Experienced planters do not ruthlessly cut off bearing wood. They did not 'prune and handle new wood to grow to be eventually cut off again' until it had served its purpose, and they found there was no loss of receipts from careful pruning as the smaller crop realised enhanced prices. A visit to the famous vine at Hampton Court will show the wonderful results of judicious pruning where more than half the crop is cut off, but the residue attains a size and quality which is impossible with the full crop. In these days it is all important to obtain a good quality of crop, but it has yet to be shown that the pruning system is the best to secure it. My experience is all in the other direction, and by referring to the Market Report of the sales I have not found that 'Scotforth' coffee stood very high in the list.

Your correspondent is not quite correct in saying that Mr. Leeming's trees grew matted as a result of manure and labour, but in my opinion as a result of a neglect of pruning while still topping the trees. Had they not been topped they would probably have grown in height. The trees would have found room for themselves perpendicularly if they could not find it horizontally. At the same time such matting is frequently the want of sufficient nourishment, the growth of the plant being in consequence stopped. The figures your correspondent gives of the improvement in the outturn of Mr. Leeming's coffee would be very reassuring could they be attributed to his system of leaving the trees to grow naturally. But from the whole article it is very clear that this cannot be done. It is very evident that Mr. Leeming cultivates more highly than he did formerly. The outturn of 1899-1900 shows plainly that the plants had not received attention previously, and the better result in 1902-03 shows the trees had responded to a more liberal treatment. But some of the improvement must be attributed to the proper cause, and that is a more favourable season, as it is well-known that outturns generally were much better in that year than they had been for some time. I have seen much better results from the ordinary system than Mr. Leeming can show. The above remarks apply equally to the number of bushels per ton of crop. But Mr. Leeming is surely wrong in saying he is convinced the figures would have been better than for any previous season had October, November, and December last not been so abnormally wet. These are the months of harvesting the crop. Why, the principal reason the figures are so good is that the rains were continued so long. I have seen the best crop produced during a wet harvest when it was difficult to dry the parchment, and indeed when the beans were sprouting on the barbecues. I would like very much to know if Mr. Leeming never gave more than 1 $\frac{1}{2}$  lbs. of poonac

to a tree? If that is the case and he did not, it must be a very superior kind of poonac. Has he not used some other ingredient than poonac alone? I am of opinion that he has, or he would not derive such results from the best kind of poonac in such small doses. I fancy your correspondent means fertiliser or mixed manure. Then again the system of draining is by no means a new custom. It is the very old one of trenching or pitting, the object being to prevent wash and to renovate the soil, and is followed on all well-managed estates. Mr. Leeming has not given up trenching. What he does is to make the trenches further apart and bigger. As a consequence of this draining the cost of the weeding is reduced to a minimum, as the soil from the drains is thrown over the ground and so keeps down the weeds.

While writing as I have done I do not wish to disparage any of Mr. Leeming's efforts to arrive at a better method of cultivation, and am obliged to your correspondent for his account of the system. All planters are too much interested in the matter not to welcome the results of experiments, but I wish to see the results attributed to the proper cause. Mr. Leeming's experiments are not sufficiently advanced for us to decide whether they should be generally adopted or not. His results are prospective in a great measure. He speaks of his expectations. It is not yet settled that the results he has achieved are due to the causes to which he attributes them. Has he never applied more than  $1\frac{1}{2}$  lbs. of manure to a tree? I think he must have and that after having given the plants an impetus he finds  $1\frac{1}{2}$  lbs. sufficient to carry on the advance made.

The great aim in planting is to raise crops and of a good quality. With this in view it is important to nourish the plant in the first place, and with cattle manure in preference to everything else. If that cannot be obtained in sufficient quantity supplement it with a small quantity of artificial manure, containing a composition of the chemical ingredients of the soil. The plants must of course have room, and if you cannot give them room by judicious pruning it must be done by removing the obtruding plant. A tree left to Nature will grow large vertically and laterally, but the crop may in that case be beyond the reach of the pickers. Many branches are broken if the plant is not topped to a convenient height, and the crop lost. Mr. Leeming's system requires a few years' more trial when it is to be hoped he will give us the results again.

### TEA NOTES.

**Third Crop Japan Tea.**—Messrs. M. J. Brandenstein & Co. report, September 12, on Japan tea:—

"Since our last report the third crop has arrived. Prices are on a higher basis than last season. Sellers are very firm, in sympathy with firmness of the holders in the interior districts. Low grades are in demand, but on account of the wide difference in prices between asks and offers settlements are prevented. A moderate quantity is on the market, but arrivals are gradually falling off in consequence of country brokers holding back supplies for home consumption. Native reports are to the effect that pickings of third crop will be smaller than usual. Quality slightly inferior to last season. Style on an average about the same as last year. Total settlements since opening of season:—

		Current Season.	1902 to 1903.	1901 to 1902.
		Piculs.	Piculs.	Piculs.
Yokohama	...	183,299	159,392	172,064
Kobe	...	112,664	98,629	86,057
Total	...	295,963	258,021	258,121

**War Cloud Over Japan Tea.**—The threatening war clouds hanging over Japan and Russia concern tea-men, some of whom look for a "gerk" in the market should hostilities actually break out soon. A more thorough probing into possible consequences suggests rather a demoralization. It is probable that the Easterners would want to dispose of

their tea in a hurry and fling it upon the market for what it would bring. There would be no difficulty about shipping the tea in non-Japan bottoms, as the Russian fleet is insufficient to maintain an actual blockade of the Japan coasts and the other nations would never consent to a paper blockade. Besides, honors are even in the measuring of strength between the Russian and Japan fleets.

**China Tea.**—Hankow statistics from the Hankow General Chamber of Commerce Circular of the 7th October, 1903.

The entire business to date as compared with the corresponding circular of last year is estimated as under:—

	1903. ½-chests.	1902. ½-chests.
For London, America, and European Continent	194,632	147,105
„ Russia ...	532,140	507,000
	726,772	654,105

The export to 3rd instant, as per Customs Returns stands thus:—

	lbs.	Re-Exports. lbs.
Season 1903 × 1904	38,833,287	12,719,331
„ 1902 × 1903	37,181,491	13,403,529
„ 1901 × 1902	33,387,833	11,933,941
	1903-04.	1902-03.
	lbs.	lbs.
To Great Britain	6,174,516	4,743,794
„ United States and Canada	4,180,377	5,526,231
„ Continent	1,884,381	1,582,682
„ Russia in Europe	13,210,167	18,014,712
„ Russia via North	21,023,373	11,206,411
„ Shanghai	4,950,627	7,399,800

**Tea and the New Fiscal Policy.**—Writing on 16th ultimo the London correspondent of the *Times of Ceylon* says:—Since I last wrote on the position and prospects of tea, a new factor, of far-reaching importance, has come into the case. Mr. Chamberlain, while yet Colonial Secretary, wrote as follows in the preface to Mr. Vince's pamphlet:—"Lastly, our free food friends will have to be a little more definite and a little more accurate. They will have, for instance, to explain why a transfer of taxation, say from tea to bread, would be disastrous; even though it benefited our industries and restored them to something like the relative position which they enjoyed twenty years ago." Speaking at Glasgow this month, in a position of greater freedom and less responsibility, he incorporated in his proposals a reduction in the tea-tax of three-quarters of the existing amount. This, naturally enough, gave a handle to his adversaries which they were not slow to lay hold of. They pointed out that the last twopence put on was for the purposes of the war, and would, in any case, be remitted at an early date. But this is not the view of the Chamberlains, *père et fils*. Mr. Austen Chamberlain, speaking at Acocks Green on Monday, said "he wished to register an earnest and respectful protest against a passage in the late Chancellor of the Exchequer's speech. Mr. Ritchie was talking of the proposal to compensate for any new food taxes which might be put on by removing some portion of the existing taxes on tea and sugar and other articles of common consumption, and he said that of these taxes on tea and sugar eight millions were raised for war purposes." After quoting Mr. Ritchie's words, he went on:—"It is not correct to say that these new taxes were imposed solely for the purposes of the war," and so on. Now, what does this mean? Well, it apparently

means this, that the two Chamberlains have talked the matter over and have seen, what indeed is clear enough, that it would never do for the son to steal the father's thunder. If these taxes are whittled away by petty reductions next year, a considerable part of Mr. Joseph Chamberlain's case is gone. Assuming then that Mr. Austen Chamberlain is responsible for the next Budget, there is no reason to suppose that it will necessarily include a reduction in the tea duty.

**IGNORANCE ABOUT TEA.**—I have often had occasion to point out that the ignorance displayed by statesmen and politicians when they come to deal with matters connected with our industry is very great. Only the other day Mr. Lyulph Stanley, in treating of the new Russian duty, made the astounding statement that the trade in Indian tea with Russia (the direct trade) amounted to £16,000 only per annum. Speaking this week at Glasgow, Sir Henry Fowler, an exceptionally well-informed and temperate man, spoke as follows:—"A tax on tea or tobacco, whether it went up or down, affected the consumer; the Chinaman or the American did not pay the tax; every consumer had to pay the tax; and no portion of the tax went into any other pocket than that of the Chancellor of the Exchequer." Perhaps we could hardly expect Sir Henry Fowler to know, especially as it would knock the bottom out of the Free Trade argument, that the whole of the last increase in duty was not paid by the consumer; but he surely might have remembered that to speak of "the Chinaman" now-a-days when treating of the consumption of tea in the United Kingdom, is an anachronism. Liberal politicians please note that the tea drunk in the United Kingdom is now a British not a Chinese product. There is reason to fear that

**EVEN THE CALCULATIONS OF MR. CHAMBERLAIN** are not wholly without flaw. In all the estimates I have seen of the working man's weekly budget under the new conditions he is credited with the saving of the whole or three-quarters (as the case may be) of the existing impost on tea. So long as the price in bond of tea remains stationary this is all right. But can anyone suppose that you can sweep away the heavy tax on tea without putting up the price? If tea was duty free, or even if the tax was reduced from sixpence to twopence, the consumption and the wastage—a very important item—would be increased enormously, and I for one believe the price would rise appreciably. To the extent of the rise the calculations then would be vitiated.

All this, however, is mere theorising. We have got to look at facts, and the fact that stands out most clearly to-day is that Mr. Chamberlain's cause is gaining ground. One after another the organs of metropolitan opinion are becoming more favourable to him. The *Daily Telegraph*, which since the days of "the People's William" has always loved to sit at the feet of some Gamaliel, has elected him its special idol. The *Times* and the *Morning Post* give him a support less qualified every day. The *Empress* has supported him from the first. The *Mail*, which keeps its fingers closely on the pulse of "the man in the street," is in a painful state of wobble, and seems to be seeking an excuse to come round altogether. I am told that another Harmsworth organ, the *Weekly Dispatch*, has already done so. All these things show how the wind is blowing, and I think every impartial person must admit that the replies hitherto put forth in answer to Mr. Chamberlain are singularly weak. They consist chiefly in constant asseveration of the fact that the volume of our trade is increasing. This is very much as if a man added his income and expendi-

ture together and boasted of the amount. Or, as if a tradesman sold his goods for what they would fetch, and then called attention to the volume of his sales. We want to know a great deal more about our trade than can be gathered from a mere adding together of total imports and exports.

Living, as I am doing, fifty miles from London, I have been trying to pass the daily hours in the train by reading up the case. I am simply saturated with figures and exude "special exports," "quinquennial periods," and the rest of it from every pore; but I shall not inflict these on your readers.

**WHAT THE TEA-PLANTER WANTS TO KNOW**, I take it, is what will be his position when the duty is taken off tea, for that time is coming, and, perhaps, in the not distant future. The line of cleavage in political parties has been diagonal, as Lord Rosebery said it would be—and Lord Rosebery's instincts, as we know from Mr. Chamberlain, are always right. People in this country are rapidly grouping themselves into two camps—that of Protection, including Mr. Balfour's half-way house of Retaliation, and that of Free Imports. Whether Mr. Chamberlain is right or wrong does not affect the question. History teaches us that the Opposition, sooner or later, gets its lease of power. If the omens are worth anything at present it will be sooner; but the question of the effect on the tea industry of the abolition of the duty is a large one and cannot be dealt with to-day.

\* \* \*

**Colombo Tea Sales.**—On the 4th instant 10,690 packages = 863,886 lbs. were offered, of which 8,722 packages = 700,871 lbs. were sold. Messrs. Somerville & Co. report:—Demand was strong for all grades of leaf tea, but brokers were irregular as a rule. Quality showed a slight falling-off in some cases. Medium Pekoes were the kind most sought after, and these may be quoted as higher in price. Green teas were in poor demand and rather lower. Our private wire reads: "Ceylon teas at current rates are much enquired for and the sales have passed off with spirit."

\* \* \*

**The U. S. Tea Market.**—The tea market is fairly active and fairly firm, says the *Tea and Coffee Trade Journal* of 13th ultimo. No large orders have been placed the past week, buyers seemingly only caring to come forward with orders that will suffice for current needs. Teas of better grade continue in request and command fairly full values. This is especially true of Formosa, Pingsueys, Country Greens, and Japans. Lower grades are abundant and easy. India and Ceylons are firm and unchanged, and the demand for Ceylon green continues steady; they are gradually being taken into consumption. Congous are unchanged; more than 2,000 packages were last week exported to England, which is disposed to take the low grades whenever a reasonable inducement is offered. Despite the large exports of this tea from this port the grade seems not the least susceptible to firming-up. It would appear that the entire stock will eventually be placed in England. Foochows are in no request at all, and so far relatively few packages have been imported. Large cargoes of tea are expected to arrive this month.

Canada reports a market rather barren of tea: indeed, so small a quantity as now in stock, has not been known in five years. Low-grade Japans are in special request, and are hard to obtain. High-grade Japans, of course, scarcely at all. Ceylon and Indias are active at firm rates.

The London markets are unchanged, but fair business is being done. Imports for the nine months ending September 30 were 181,000 pounds, against 189,000,000 pounds one year ago, and deliveries respectively 210,000,000 and 217,000,000 pounds. Stocks on that date were: Indias, 38,000,000 pounds, against 40,000,000 pounds in 1902; Ceylons, 22,000,000 and 25,000,000 pounds; Chinas, 14,000,000 pounds and 18,000,000 pounds; totals, 76,000,000 and 84,000,000 pounds.

\* \* \*

The following figures of tea exports taken from the Calcutta Customs daily entries and received periodically from Chittagong are issued by the Indian Tea Association:—Quantity of tea entered for export to United Kingdom for the second half of October, 1903: Calcutta, 10,017,274 lbs.; Chittagong, 1,300,746 lbs. Quantity entered during the corresponding period last year: Calcutta, 9,517,274 lbs.; Chittagong, 1,689,900 lbs.; total from 1st April, 1903, to 31st October, 1903: Calcutta, 86,663,015 lbs.; Chittagong, 17,095,995 lbs. Total 103,759,010 lbs.; total from 1st April, 1902 to 31st October, 1902 96,446,413 lbs.

\* \* \*

The rise of exchange in China has its effect on the price of teas there, which in consequence rises or falls as exchange vacillates. The rise at present keeps the markets there firm.

\* \* \*

Tea, like coffee, finds great difference in the national taste. The kinds that will please one part of the Union will not please all other parts. Besides the difference in popular taste there is a difference in the quality of the water, and a variation of that character will always affect the flavour of tea made with the water.

Tea-drinking in Russia is almost as universal and continuous a performance as breathing. The kinds of tea preferred there are chiefly China Souchongs and Congous, and these teas are also, or used to be, preferred in Great Britain. So-called "English breakfast tea" is a mixture of these two classes of leaf. It is noticeable that in Russia, as in England, where tea is also very popular, blended teas are preferred. Indeed, it is probable that the large consumption of tea in Great Britain is principally due to the skill of the tea-blenders there.

\* \* \*

**Indian Tea Prospects**—A Report from Calcutta, dated 4th instant, says that the following telegram has reference to the tea crop of the various districts, despatched by the Tea Association there to the Association in London:—

ASSAM—Outturn last month good; immediate prospects fair; cold weather set in generally.

CACHAR—Outturn last month good; immediate prospects good.

SYLHET—Outturn last month normal; immediate prospects fair.

DOOARS—Outturn last month good; immediate prospects fair.

TERAI (sic)—Outturn last month normal; immediate prospects fair.

DARJEELING—Outturn last month good; immediate prospects good.

\* \* \*

According to U. S. Government statistics, the importation of tea during August was 12,723,243 pounds, of which 6,843,151 pounds came from Japan, 5,018,025 pounds from China, 355,739 pounds from the East Indies, and 288,439 pounds from the United Kingdom. The exports during the month were 298,565 pounds. Importations during the eight months ending in August were 50,355,961 pounds, against 47,172,874 pounds in the same period in 1902.

## NOTES.

### Preferential Tariff.

A member of the Tea and Produce Committee of the Ceylon Association in London is bringing forward the question of preferential duties for British teas, and the Committee will shortly consider the matter.

### Tapioca.

Increased cost of exchange and higher cost of labour have caused a number of tapioca factories to shut down in the East, says a New York paper. The product consequently tends to advance in price.

### Spices in the United States.

Imports into the United States of spices in August last were 3,855,844 pounds, Government statistics say. Included were 175,604 pounds of nutmegs and 1,852,949 pounds of pepper. Of the total 123,723 pounds were exported.

### U. S. Cocoa Importations.

Cocoa importations into the United States in August were 5,131,582 pounds, against 4,439,099 pounds in August, 1902. The total for the first eight months of the year was 44,775,096 pounds, against 36,749,564 pounds in the same period in 1902.

### Amsterdam Cinchona-auctions.

The ten auctions to be held at Amsterdam in 1904 will take place on the following dates:—

January 28	July 28
March 3	September 1
April 7	October 6
May 19	November 10
June 23	December 15

## GENERAL ARTICLES.

### PRODUCE AND PLANTING.

In considering the general outlook of the tea market at the present time, a noticeable fact has to be taken into account. Grocers who were at one time in the habit of keeping large stocks of tea have for some time accustomed themselves to buying just sufficient to cover their immediate requirements, trusting, no doubt, to those distributors who, in large centres, have made a specialty of supplying the trade with certain teas suited to the requirements of their customers. So long as the supply of tea has been adequate for immediate purposes the old custom of stocking a quantity has fallen into disuse, and the majority of retailers seem content to buy sparingly on the hand-to-mouth principle. The situation has not yet led to any movement in favour of accumulating stock, the idea being, it would seem, to trust to Providence in the form of the blender should any pinch come.

As previously pointed out, the tea duty question is in a fair way towards reduction or removal. Whether Mr. Chamberlain or the "Free Traders" prevail in the contest, there is hope that the obnoxious duty, or the greater portion of it, will go. Lord Goschen, speaking on Friday night at the Passmore Edwards Settlement on the taxation of food, said, with reference to the proposed reductions in the tea and sugar duties, that these were war taxes which the working classes might well expect to be removed in any case. Sir John Gorst, M.P., also spoke in general concurrence with Lord Goschen's views.

A correspondent of the *Westminster Gazette* sees in Mr. Chamberlain's proposal for the reduction of the tea duty something sinister. The consumer, according to this correspondent, would only benefit for a short time, and the "result of reducing the cost of tea by 4d. per lb. would be to encourage the importation of cheap China teas again, in competition with Indian and Ceylon teas, Preferential tariffs being the policy of the country, the Indian and Ceylon tea-planters would claim to be protected from China—a claim it would be impossible to resist. A higher duty being then placed on China tea, up would go the price of tea generally, and the benefit now held out as a bait by Mr. Chamberlain would disappear." According to this correspondent's argument Mr. Chamberlain is merely holding out a bait to the consumer by which ultimately tea-growers alone would benefit. We have had this story before. It is simply another version of the imagined "corner" in tea which growers in India and Ceylon are supposed to be yearning after.

In the *Review of the Trade of India* in 1902-03, just issued by the India Office, attention is called to the fact that the marked increase in the exports in 1901-02 to the highest value till then recorded was followed by a further rise in value last year of 3·8 per cent. Though the quantity of tea exported last year was slightly larger than the much diminished exports of 1901-02, and nearly nine million pounds below the exports of the previous year, the results were, both as regards the actual minimum and the general average of prices, the worst of the recent years of depression. The early closing of the season belied the unfounded anticipations of a large crop, which, owing to the overloaded state of the market, had unduly depressed prices, and the total production in India as now ascertained is less by 2·7 million pounds than in the previous year; but the advance of prices consequent on the certainty of a moderate crop did not take place till too late in the season to raise the average price. The diminished productiveness of the crop owing to unfavourable weather and shortness of labour cannot, in itself, be a subject of congratulation, but it is entirely a healthy sign that large additional areas are not coming into bearing, and this with fresh and expanding markets available warrant the belief that equilibrium has been established between supply and demand.

In coffee, owing to the anticipation of smaller supplies, better prices were realised than in the previous year, the average price in London for East India plantation coffee in 1902 being 60s. 1½d. per cwt., compared with 47s. 3½d. in 1901. The over-supply of Brazilian coffee, which depresses the prices of all descriptions, does not, however, give signs of any permanent diminution. Improvement is noticeable in the quantity exported last year, but not in the declared values, which is probably due to the absence of a local market and a quotation of Indian prices. The last season appears to have been favourable, but it is impossible to ascertain the real position of the coffee industry in Southern India, owing to the withholding of statistical information and the inaccuracy of estimates of the yield, which, in 1901, gave a total of the reported and estimated production amounting to little more than half the quantity exported. About one-fourth of the exports is taken by France, and the conclusion of an arrangement, by which Indian coffee is to continue to be assessed at the minimum rates of French tariff, removes the menace of differential treatment, which at one time threatened the Indian industry.

The local tea market, says the Sydney correspondent of the *Grocer* has just passed through a season of excitement over the annual Government tea tender. The price fixed this year for the supply of Government institutions is 6½d. for a blend of Indian and China tea. As this price is below the present landed cost of clean, sweet, wholesome leaf, the event naturally presented an opportunity for clearing the market of low, common, undesirable stocks. The whole business, together with the acceptance of the tender entirely outside of the tea trade, has given rise to a good deal of scandal.

At the opening course of lectures to be delivered to grocers' assistants by Dr. R. Stewart MacDougall, M.A., during the ensuing Winter, at the Heriot-Watt College, Edinburgh, last week, Mr. John Wilson, of the firm of Honeyman & Wilson, and ex-M.P. for Edinburgh, gave an account of "Tea-Planting in Ceylon,"

as seen by himself during a recent visit to the island. After a long and interesting description of tea-growing, manufacture, and packing in Ceylon and Northern India, the lecturer, speaking of the growth of the tea trade, recalled the time when, as a boy, he was sent to pay a duty of 2s. 2½d. at Leith on the commonest Bohea, the price of which in bond was 1s. 3d. per lb.; now the duty was 6d., and the average price of Ceylon tea on the London market 8d. When they considered the 250,000,000 lbs. of tea imported last year from Ceylon, and that it was grown by British industry, he thought it needed neither a Prime Minister nor an ex-Colonial Secretary to point the moral. Moreover, they must remember that the Anglo-Saxon race was the largest tea consumer in the world. In this country the yearly consumption was 6½ lbs. per head, in New Zealand the same, in Australia 7½ lbs., and in Canada 4½ lbs. Russia consumed 1 lb. per head—the bulk of the population, of course, was very poor; Holland 1½ lbs., and Germany and France 2 oz. and 1 oz. respectively. Owing to the enterprise of Ceylon growers, the exports to France were increasing, however, and "afternoon tea" was becoming a feature.

With regard to green tea Mr. Wilson said this tea, which was merely tea unfermented, was only seen in the low country of Ceylon. Unlike the green tea of China, it had no colouring matter added, and perhaps did not on that account present so attractive an appearance; but there was a growing demand for Ceylon green tea in America and Canada, and he thought there was an opening for enterprising English growers in this respect; to his taste it was very agreeable, and preferable to the Chinese product.

The coffee-growers of Porto Rico know how to push their coffee: the St. Louis World's Fair Commission of Porto Rico has decided to send to the Exposition 200,000 or more quarter-pound packages of coffee for free distribution. These packages will be tastily prepared, and will be imprinted with the arms of Porto Rico and with a copy of a letter from President Roosevelt to Governor Hunt, in which the President warmly praises Porto Rico coffee sent to him by the Governor.

## THE RUBBER SUPPLY AND DEMAND.

Any material decline in crude rubber prices must result from a wider margin than now exists between supply and demand, says the *India Rubber World* of 1st ultimo. In other words, there must be (1) a check to the rubber industry, or (2) an increased production of the raw material. The first condition, of course, no one wishes to see, besides which no reason is apparent for predicting its occurrence in the near future. Then what is the outlook for more rubber?

An encouraging fact is that the production of Pará rubber has been steadily progressive from the beginning. The total exports from the Amazon river amounted in 1864 to only 7,840,000 pounds, and in the 38 years since only in eight cases has it happened that the output in any one year failed to show an increase over the preceding crop. In 1902 the figure was 62,809,500 pounds, and the trade in general looks for as much rubber this year. To take the last ten crop seasons (July to June) the rate of increase or decrease in the yearly arrivals at Pará has been as follows:—

1893-94	... + 3·9 %	1898-99	... + 14 %
1894-95	... — 1·3 "	1899-00	... + 5·2 "
1895-96	... + 7·8 "	1900-01	... + 3·5 "
1896-97	... + 6·4 "	1901-02	... + 8·5 "
1897-98	... — 0·03 "	1902-03	... — 0·35 "

No study of statistics or conditions has yet revealed any law of increase or decline in production in this field, or a basis for prediction in any year. Two years ago an important Liverpool firm staked their reputation on a prediction that the next Pará crop would show a shortage of 20 per cent., and that the price would go to 4s. 6d. The crop actually showed a gain of 8½ per cent., and at the end of the season Pará rubber was selling at about 3s. The general attitude of merchants and traders on the Amazon is that of never expecting short crops, the reasons for which are well set forth on another page of this Journal by a Pará merchant of long experience.

Some criticism has been elicited by the article by Mr. Paul Cibot, reprinted in the last *India Rubber World* from a French

source, relative to the extinction of wild *Hevea* rubber, which he regards as an ultimate, though not imminent, certainty. Mr. Cibot has been a careful observer, for the last seven years, of rubber conditions on the rio Bénì, and his views are entitled to respect, though the experience of the state of Pará would suggest that in Bolivia, as in the lower Amazon region, the collection of rubber will continue even after the period of the richest yield of the trees is past. Long as the rubber fields of Grão Pará have been worked, they now yield more rubber than ever before. The annual increase was rapid until, in 1893, the crop reached 8,000 and some hundred tons, at which figure it remained for six years, the upriver output, from virgin fields, meanwhile increasing 25 per cent. Latterly the exports from Pará state have increased to over 10,000 tons, due probably to some extension of the area worked, as well as more judicious treatment of the trees. The Pará output is now being increased some by the discovery in that state of Caucho, the receipts of which last season were 310 tons, against 85 tons the year before, and almost nothing previously.

A correspondent at Pará writes, bearing upon the continuous yield of old rubber estates: "Only a comparatively small percentage of the rubber trees on any estate are worked. There are always plenty of fresh trees near the *estradas*, and if the manager of the *seringal* is a man of enterprise (which is by no means likely to be the case) he will search out and tap new trees as fast as the old ones die out, and this will keep up his quantity for an unlimited time. The life of a rubber tree which is tapped every season will not be more than 40 years, and when the work is not carefully or judiciously done, the tree will die out in less than half that time. For this reason it is plain to be seen that new rubber fields must be opened from time to time."

The Amazon exports include of course, the grades of rubber known as Caucho, obtained from other trees than the *Hevea* species. From all accounts it appears that the collection of Caucho involves the destruction of the tree, so that new fields must constantly be sought by the *caucheros*, for which reason a falling-off in the supply has long been looked for. The *India Rubber World* (October 1, 1901) has published an exhaustive study of the rubber production of Colombia, which, after reaching a very large figure, has declined to almost nothing. That rubber is of the class marketed as Caucho. The *caucheros* moved from Colombia to Ecuador and thence to Peru, everywhere exhausting the sources of supply. The trade in this rubber in Iquitos for awhile was very large, but it has now declined untill business generally at that port is in a depressed condition. And yet Caucho continues to come to market, because of new areas being opened to exploitation. The decline so long expected has not yet begun, unless it is to be seen in the fact that the export through Pará last year was smaller than in the preceding year; the totals for several years having been:—

Years.	United States.	Europe.	Total.
	Kilos.	Kilos.	Kilos.
1888	643,902	423,200	1,067,192
1892	930,225	735,067	1,665,292
1897	858,839	1,214,173	2,073,012
1901	1,325,290	2,638,599	3,963,889
1902	1,133,155	2,057,222	3,190,377

Certainly the limit of this large production must be reached in time, for the whole of the Caucho producing district, just as has occurred already in Colombia, Ecuador, and an important portion of Peru, after which the reliance for uncultivated rubber in America must be the *Hevea* trees of the Amazon region—the only rubber species that, in the wild state, is not destroyed in the extraction of its product.

The falling-off of the rubber output of every important field thus far worked in Africa has been referred to often in the *India Rubber World*, and though new fields are opened from time to time, the total output is smaller now than it was a few years ago. The statistical summaries supplied by Hecht, Levis & Kahn (Liverpool) indicate that the yearly receipts of rubber at the leading markets of the world have been distributed as follows:—

Season.	Pará sorts.	Other sorts.	Total.
	Tons.	Tons.	Tons.
1898-99	23,329	26,818	50,147
1899-00	24,422	26,655	51,077
1900-01	25,255	25,224	50,479
1901-02	27,171	22,888	50,059
1902-03	27,446	25,713	53,159

It would thus seem that the yearly receipts of Pará sorts have increased at a steady, though not regular rate, the figure being larger by 17.6 per cent. last year than for 1898-99. On the other hand, the highest figure for all other sorts combined was reached five years ago, since which time the yearly average of such receipts has been about 1,700 tons less than for the season 1898-99.

There was a time when the world's consumption of rubber was supplied almost wholly from Pará. Then the Indian and African sources were developed, until their production exceeded that of the Amazon regions. During five years past, however, according to the figures in the preceding table, the percentage of other than Pará grades in the combined receipts in the markets, has been as follows:—

1898-99.	1899-00.	1900-01.	1901-02.	1902-03.
53.4 %	52.1 %	50 %	45.7 %	48.3 %

To sum up: Pará grades again form the larger half of the world's supply. The rate of increase in the Pará output seems likely to be less rapid in future, especially as that output comprises Caucho—a grade destined to practical extinction. Madagascar and Assam sorts are practically gone, as are several West African sorts, and even the Congo output grows less rather than larger. It is possible that some of the unworked districts may be opened more speedily than now seems likely, but it now appears entirely safe to regard the limit of the world's rubber production, as a whole, as more nearly reached than at any time in the past. This condition does not inspire any hope of lower prices, to say the least.

## THE C. P. A. CARDAMOM COMMITTEE.

### FURTHER INTERIM REPORT.

A Meeting of the Ceylon Cardamom Committee was held on the 2nd November, 1903, at the Victoria Commemoration Buildings, Kandy, at 1-30 p.m. in the afternoon.

A statement of accounts was submitted showing receipts Rs.1,909.18, against expenditure Rs.547.68, leaving a balance of Rs.1,361.50 at date.

### RESOLUTIONS PASSED.

After consideration of correspondence and connected papers and data the following Resolutions were passed:—

I. That the Chairman communicate with Russian merchants regarding introducing cardamoms into Russia direct.

II. That the Ceylon Chamber of Commerce be communicated with to obtain the views of the Chamber regarding the advisability of holding regular public sales of cardamoms.

III. That a Report by an Agent employed by Mr. Renton be published.

IV. That the Commissioner at St. Louis Exhibition be supplied with samples of cardamoms of different grades up to the value of Rs.500, if required for distribution to the trade.

V. That Mr. Renton be thanked for his letter.

The Cardamom Committee then adjourned.

### THE AGENT'S REPORT.

The Agent's report referred to in the Resolutions is as follows, names being omitted for obvious reasons:—

I now beg to give you the result of my enquiries into the cardamom trade in Germany.

From enquiries made at all the principal sausage manufactories, as, for instance, to mention only one—in Brunswick, I was informed that these manufactories employ a very minimum quantity of this article; spiced meat preparations are not nearly so much in favour as formerly. In Gotha and the south you may be able to do more. Enquiries made at the oilmanstore-dealers' in Brunswick and Hanover convinced me of the truth of this statement, and, further, I was assured that pastry cooks, confectioners, bakers, and private families only use cardamoms in really infinitesimal quantities. Here, again, I found this fact confirmed by personal enquiries in the confectioners' shops. These respective businesses find one or two pounds more than enough in one year.

A very important firm in Hanover referred me to the large firms owning spice mills in Bremen, Hamburg, Leipsic, and Hanan, which certainly use the largest quantity of cardamoms. But for these the inferior sorts suffice, as the less good or somewhat damaged qualities only are ground up. The full perfect capsules are never milled. In Bremen I visited, amongst others, the largest spice firm—who admitted that they buy large quantities of cardamoms. They get these from firms in Ceylon, who consign the goods to Bremen. One of their principal places, where they make good

sales, is *Russia*, where spice is consumed in larger quantities than in Germany. But I do not consider it advisable to work in Russia, unless you have trustworthy and direct representatives. Other representative firms in Bremen spoke in the same way, so that, as far as Bremen is concerned, the article is entirely in the hands of the importers, who have their own mills, who sell to dealers, who in their return supply the retail with very minimum quantities. The demand by the last is so small, it would not pay to supply them direct; then the carriage on the small packets of one or two pounds would only pay if sent with other goods.

The representatives in Bremen of—are in daily touch with all the important houses, as they meet always on the exchange. I have asked them to make more enquiries, obtain more precise information, and let me hear from them. They themselves would not be indisposed to take up the article themselves on commission.

Hamburg is for cardamoms, as for all Colonial produce, by far the largest market on the Continent. The article is imported in very considerable quantities, as the statistics, which I obtained at the Bureau for Trade and Commerce, show:—

Imports in 1900	106,000 lbs.	460,000 marks	£23,000
„ 1901	64,800 „	280,000 „	£14,000

The returns for 1902 are not yet available. The shortfall in 1901 is astounding. This must be a result of the outturn of the crop for that year, and consequently the crop for the following year must be all the bigger. For cardamoms have never been so cheap and depressed as at present, in consequence of large offerings from so many quarters.

On the other hand, the consumption does not appear to have decreased, though at the same time it has not increased—as confirmed by the opinion of the largest spice firm in Hamburg. This firm buys 1,000 chests of 70 lbs. yearly, and principally cardamoms in capsules, as the so-called cardamom seed finds less employment. The first is ground with the skin and distributed in this way through second and third hands to the consumers—by confectioners, pastry-cooks, and private families in small doses at a time. The quality and prices vary much; and what is remarkable is that the fruit with the skin is often dearer than the pure seed. Russia especially provides a large field for disposal of the article. Prices depend upon the quality, and run from 4 to 6 marks per kilo—draws some of his supplies direct from a firm in Colombo.

Malabar cardamoms seem to be preferred to Ceylon. Two large firms of spice dealers in Hamburg confirmed the report that cardamoms are an important article in the Hamburg trade, and are often sold 100 chests at a time. One buys generally at auction in London: he had just bought 200 chests of 70 lbs. each. The price at present fluctuates between 3 and 4 shillings per lb. (?) all depending on quality. There are other firms in Hamburg and Altona interested in cardamoms. A London firm says it can buy 100 lbs.-chests at 200, 220, 250, and 300 marks, but these must be damaged or inferior quality. They can sell in *small quantities* to the consumers—the seed at 2'85; the better fruit in capsules at 5 marks per lb. (?) This firm manufactures special preparations for confectioners, etc., and carries cardamoms and cinnamon as accessories to their regular trade.

My private opinion is that it will be exceedingly difficult to increase the consumption of cardamoms by any outside or artificial means. The only possible way would be to advertise in a large way, in order that the article—which is known only by name in certain circles—may awaken further interest and become more enquired for. Cardamoms are a spice which outside of North Germany are hardly known in the trade, and it may be possible, by suitable advertisements, to create a real increase in the consumption. I cannot, though, conceal the fact that a very large sum will be required, and that the return in increased consumption on the capital thus employed for advertisement will be very slow in coming back.

BREMEN, *And June*; HAMBURG, *13th June*, 1903.

## TEA IN EUROPE.

(From *Capital*.)

### I.—INTRODUCTION.

The series of articles to appear under the above heading will embody the main results of personal observation by the writer during special tours recently made by him in the interests of Indian tea.

In these tours most of the principal Continental States were visited, and, as will be seen, the conditions in individual countries were found to vary greatly. But, with the solitary exception of Turkey, one feature at least was common to them all, *viz.*, the insignificance of the share yet secured by India in their total Tea trade.

The use of tea as a beverage is admittedly growing in almost every European country; private enterprise has already done a

little, as by opening tea-rooms, etc., in the larger towns such as Paris, Rome, Hamburg, to foster the demand; while the Indian and Ceylon tea-stalls at various Continental exhibitions have also helped in some degree. But it cannot be expected that the tea-habit can make any substantial progress until some method is devised of enabling the Continental consumer to procure better tea at less cost,—say good Indian teas at moderate rates—in place of the mostly inferior China kinds at high prices, generally his only resource.

So far (excepting the very recent action of Russia) the duties levied on tea, though often high, are not differential; India, therefore, has a fair field, if no favour. But more than this is needed: a proper share in the tea-markets of Europe should not be beyond India's reach.

An impression seems to have grown up of late that the problem will solve itself—that the merits of Indian tea must tell; and that it will soon find its way by the natural trade channels into Continental favour.

To some extent, perhaps, this may be so; and it is true that the shipments to Continental ports are yearly increasing. But to the Continental consumer—and the consumer after all is the final arbiter in trade—Indian tea *as such* is still practically unknown. It does no doubt reach him occasionally in blends; but as these are usually supplied under Chinese or Russian names, India derives but little benefit.

Moreover, the conditions—fiscal, social, and commercial—are so difficult in many parts of the Continent, and differ so widely from those of Great and Greater Britain, that he would be a sanguine man indeed, who should expect to see repeated abroad the history of British-grown tea in England, where, for instance, between 1877 and 1900, Indian and Ceylon teas, in 22 years, grew from being only 19 to over 90 per cent. of the total consumption. That Great Britain which had long been a tea-drinking country should readily welcome the excellent produce of her own great dependencies was only natural. But the Continent for the most part has the tea-drinking habit still to acquire: such taste for tea as does exist has been educated largely upon China kinds, while neither fiscally nor sentimentally can India of course claim any special favour.

The conditions abroad being thus practically reversed, it is difficult to believe that the policy of *laissez faire* or *laissez aller* can have any rapidly successful results. Even in Great Britain, time, as we have seen, was a considerable factor: under the less favouring circumstances on the Continent it must be a far greater one unless counterbalanced by the energy of an active propaganda.

It would really seem as if there were only one way in which to secure for India its merited share in Europe's tea trade, *viz.*, by creating a demand among the *consuming public itself*. This can only be done by an organized plan, well-backed and steadily pursued—by a policy of “push” in fact. Unless some such active policy be soon, and vigorously, set in motion, it is likely that the time required for Indian tea to find its own level in Europe may be so long as to place the whole problem beyond the range of “practical politics,” for the present generation of Indian planters.

Still, unpromising though the untilled field may look, it is not infertile, and would repay the tillage. In other words, actual experience has shown that, wherever pains have been taken to introduce the right class of Indian tea, the Continental consumer has usually proved a ready convert. It would, therefore, seem as if it were chiefly a question of making Indian tea better known—of bringing it more directly under the consumer's notice—to induce the desired demand. In this direction Ceylon, it is generally admitted, has worked more effectively than India; with the result that in the larger part of Europe Ceylon tea is far more widely known than is Indian. It is true, of course, that Ceylon's energy has also indirectly benefited India, and we venture to think that the Indian planters should not only regard their Ceylon fellow-workers as their best allies, but should take a lesson from them and do their fair share of pushing British-grown tea abroad.

That there is plenty of room for work, a few figures will show. We may take the population of Europe, excluding the British Isles and including European Russia, as about 340 millions. The total weight of tea consumed within this area at present, as far as can be ascertained, is some 166,000,000 lbs. annually. Of this about 36,000,000 lbs. only are British-grown leaf, or little more than 20 per cent. of the whole. Now there appears to be no good reason, except absence of effort, why at

least a considerable portion of the other 80 per cent.—a trade of 130,000,000 lbs.—should not, if properly attacked, be captured for India, and this is not all.

In spite of high tariffs which might be modified, and of generally poor quality—which is easy of remedy, the use of tea on the Continent is distinctly increasing. Thus, for example, Russia and Germany, together show an advance from 98,000,000 lbs. consumption in 1895 to 132,000,000 lbs. in 1900—a growth of some 34 per cent. Of the total for 1900 about  $21\frac{1}{2}$  was British-grown tea, but it is doubtful whether as much as one-third of this come from Indian gardens. The figures for all Europe given above show a present annual consumption of rather under  $\frac{1}{2}$  lb. of tea of all kinds per head of population, against some 6 lbs. in the United Kingdom. It does not seem beyond reason to imagine that, by an active policy—facilitating the supply of good tea to the consumer whilst cheapening its cost—European consumption might within an appreciable time, be increased to, say, 1 lb. per head. This, were it accomplished, would mean a demand for, say, 170,000,000 lbs. more tea. If only a portion of this were drawn from India—and the amount of the portion would depend largely upon the energy expended in Continental “pushing”—it should go far towards absorbing India's surplus of production. According to Messrs. Gow, Wilson & Stanton's interesting tables, the world's entire surplus—i.e., excess of production over consumption—was in 1900 under 30,000,000 lbs.

It is thus evident that even a little stimulus judiciously applied to Europe's taste for tea might have far-reaching results for the great tea industry of India.

In subsequent papers the problem will be dealt with in the several countries individually, beginning with Italy, then Turkey, Austria, etc.

### COFFEE AND TEA.

*American Medicine* says:—

“Whatever one may think as to the physiologic action of caffeine it is agreed that it is not ‘a food,’ and that the amount of money thus wasted by the poor could and should be spent in buying real health-bringing and strength-giving foods. This economic aspect of the question also becomes doubly important both as a medical and financial matter when one finds these articles [tea and coffee] on the dietaries of all our public institutions. Should so much of the public money be spent on articles of drink, non-foods? And the custom has many bearings on health. The more coffee and tea drunk, the more tobacco is used. The national consumption of coffee and tea, moreover, rises almost accurately *pari passu* with the amount of alcohol used. Is it not true, as a rule, that intemperance in the one co-exists with intemperance in the other? Is not the temperance problem closely bound up with this of the use of coffee, tea, and alcohol? If so, and even if not so, coffee and tea are unnecessary and peculiarly harmful to children.”

We cannot let so strange an attack upon coffee and tea pass without comment, notwithstanding that the peculiar views of *American Medicine* are not very likely to make many converts. The absurdity of this attack must indeed defeat the object of the author.

The talk about caffeine—what does it amount to? Nothing, absolutely nothing. People do not drink tea and coffee in order to obtain a dose of caffeine, and in the case of coffee at least there is pretty good evidence that the article, as usually prepared, has important food value.

What sense is there in the parallel between coffee and tea-drinking and the consumption of tobacco? Millions of women here and in Europe drink both beverages freely, yet touch no tobacco, and in the Orient, where tea is practically the only drink, tobacco is not a universal favourite.

What if alcohol does increase in popularity with coffee and tea? Is it not reasonable to believe that alcoholic drinks would have been much more freely consumed if there had been no general use of tea and coffee? Common-sense teaches that coffee and tea have made the nations sober, as compared with the extravagance in drinking in our grandfathers' or great-grandfathers' days. People interested in the growth of temperance can only regret that tea's consumption *per capita* is practically stationary.

It is possible that tea and coffee are harmful to children; we believe they are harmful, and we would debar their use when the

child has not nearly completed his growth, except when the food ration is scant and innutritious. In such cases children probably benefit by the use of tea and coffee, if the liquor is made quite weak, as it generally is in the poorer families.

As for the economical question, perhaps nobody can understand how great a blessing a cup of tea or coffee can prove, unless one has lived the life of a half-starved denizen of the poorest quarters of a great city. The spirit and comfort to be derived by the ill-fed inhabitant of the slums from coffee or tea, and especially the latter, cannot well be estimated by the student who absorbs either of the drinks as the concomitant of a plentiful meal of rich and nutritious meats, etc., and considering that a pound of 50-cent tea furnishes from 200 to 250 cups of beverage, he must be poor indeed who must go without tea because of inability to buy it.

In connection with this economical side of the question is to be considered the direct nutritive value of coffee and the indirect nutritive value of both coffee and tea. It is late in the day to point out how a cup of either beverage has the undoubted power of causing food to be not only more thoroughly relished but also more nutritious, and therefore we forbear to dwell upon this point, but we urge all medical papers and the lay Press also to put no obstacles in the path of either tea or coffee, until the millennium is near at hand, and poor, tired, weak-willed, self-indulgent, and self-pitying humanity has finally said good-by to all travail, all bitterness, all sorrow, and all disappointment. Until then, leave us our coffee and our tea, and raise not out of the imagination horrible phantoms and chimeras dire for the destruction of two harmless products, when so much remains to be done to bridle the demon alcohol and chain the imps that the indulgence in cocaine, opium, and other deleterious drugs have let loose in the land.

### CEYLON TEA OUTTURN FOR 1904.

We are now near enough to the end of the year, says the *Times of Ceylon* of 5th instant, to arrive approximately at the total output of Ceylon tea for 1903. The monthly exports for 1902 and 1903, according to Chamber of Commerce figures, with additions roughly estimated by ourselves to complete the remaining months of the present year, stand thus:—

#### MONTHLY EXPORTS OF BLACK TEA.

	1902.	1903.
	lbs.	lbs.
January	11,050,212	11,032,667
February	10,018,071	11,203,362
March	11,777,143	10,625,890
April	12,782,715	11,895,390
May	12,637,046	13,671,944
June	17,660,676	15,597,676
July	15,671,431	13,615,076
August	11,384,929	11,315,637
September	10,628,487	8,706,170
October	9,707,260	9,300,000 *
November	9,400,936	9,100,000 *
December	12,181,529	11,500,000 *
Total	144,900,435	137,563,812

The black tea totals for the various countries to the 2nd instant are as follow:—

#### BLACK TEA DISTRIBUTION FOR TEN MONTHS.

	1902.	1903.
	lbs.	lbs.
United Kingdom	85,898,518	79,613,480
Russia	10,376,411	6,714,727
Rest of Europe	1,156,472	1,488,398
Australia	16,141,368	16,602,611
America	3,968,002	5,002,619
All other ports †	5,275,584	6,978,520
Total	122,816,355	116,400,355

The quantity of green tea for which certificates have been granted from the 1st January to the 31st October, 1903, is 9,272,986 lbs.; but the Chamber of Commerce (and the Customs)

\* Estimated.

† Including 3,830,380 lbs. and 5,931,958 lbs. for China in 1902 and 1903, respectively.

know of 6,958,429 lbs. only, to November 2nd, as properly declared when shipped, and this quantity has been distributed as follows:—

GREEN TEA DISTRIBUTION FOR TEN MONTHS.

	1902.	1903.
	lbs.	lbs.
United Kingdom ...	554,570	838,145
Russia ...	106,435	120,527
Rest of Europe ...	...	31,139
Australia ..	...	400
America ..	1,110,085	5,940,189
All other ports ...	26,931	28,029
Total ...	1,798,021	6,958,429

The P. A. estimate at the beginning of the year was 154,000,000 lbs., inclusive of 12,000,000 lbs. of green tea; and the probable distribution of the crop then given is appended:—

	lbs.
United Kingdom ...	96,000,000
Russia ...	14,000,000
Rest of Europe ...	2,000,000
Australia ...	21,000,000
America ...	14,000,000
All other ports (India, 1,000,000; Africa 1,000,000; Far East, 5,000,000 lbs. =)	7,000,100

Total 154,000,000

The indications are a total outturn of 3,000,000 lbs. less than last year, and 8,000,000 lbs. less than this year's estimate. This 8,000,000 lbs. shortage on the estimate may be divided into 6,500,000 lbs. black and 1,500,000 lbs. green if calculated by manufacture, but if by ships' manifests then 4,500,000 lbs. black and 3,500,000 lbs. green tea. In other words, the Chamber's totals of export will figure out at about 137,500,000 lbs. black and 8,500,000 lbs. green, against the P. A. estimate of 142,000,000 lbs. black and 12,000,000 lbs. green, and against true shipment figures of, say, 135,500,000 lbs. black and 10,500,000 lbs. green. In the distribution table for the whole year—the ten months' figures appear on our "Overland" cover issued with to-day's paper—the chief variations will be, approximately, 8,000,000 lbs. increase for America (including 6,500,000 lbs. of green tea); and 6,000,000 lbs. decrease for Russia, largely explained by an additional 4,000,000 lbs. for China, of which 2,000,000 lbs. may be set down as due to the sudden diversion of shipments from Odessa to Dalny for the last quarter of the year. Of minor items there will be improved figures for Malta, France, and various countries of Northern Europe; and smaller shipments to India and South Africa than were expected. The estimated export to the U. K. will be found remarkably close to the actual figures. Regarding the arrangement of the Chamber's export table, the Secretary might make a note, for use from the beginning of next year, that Malta, being part of Europe, should come in the middle of the list of countries instead of at the foot.

TEA IN CANADA.

(From the *Canadian Grocer*.)

TORONTO, October 8, 1903.

A very good movement is reported for tea just at present. The demand on spot for good common Indian and Ceylons is quite active, but supplies barely exist. Pan-fired Ceylon greens are also good sellers. China greens are selling rather freely notwithstanding that prices are very high, values having recently advanced in Shanghai, owing to the scarcity of fine teas and the very unfavourable rate of exchange for export. There is not much change in local prices, but it is worthy of note that the stocks in this country are lighter than for years.

MONTREAL, October 8, 1903.

Trade during the week has shown no special features. Japans are in fair demand and a few shipments of common have been turned over at 16½ to 17c. Ceylon blacks are a shade easier for low grades. In Ceylon greens cable advices to hand show a firm market, with good demand. Auction prices this week were firm. In China teas the advance in Chinese exchange added to a higher first cost, is enhancing the value of importations shipped since middle of August about 1c. to 1½c. per lb., according to grade. Indian blacks are ruling easier; but to offset this, the teas coming forward are said to be distinctly inferior in quality. The statistical position in both Ceylon and Indian is very strong, being fully 5,000,000 lbs. under last year at same time.

RUBBER PROSPECTS IN THE AMAZON COUNTRY.

Being asked to favour the *India Rubber World* with his views on the future of the supply of Pará rubber, Mr. Rudolph A. Zietz, of Pará, who is at present in New York, expressed himself as follows:—

"I do not believe, as far as human judgment can foresee, that the output of rubber of all species, from the territory drained by the Amazon river and its tributaries, will ever be permanently 'short.' On the contrary, I believe more in estimating an average yearly increase, though not at the same ratio as in the last 25 years, during which it has risen from about 7,000 to 30,000 tons. It is likely that in some years the crop may show a small shortage, but it will be counterbalanced by a larger crop in the following years. This gradual and steady—but from now on slower—increase will be the natural consequence of the constant opening up of new regions, the extension of facilities for transportation, and improving sanitary conditions along the Amazon. The quicker and better means of communication are enabling people to protect themselves more against the climatic conditions, and to hurry away in case of sickness

"In a good many of the rubber districts permanent settlements of rubber collectors have developed, and they are becoming acclimated and learning to brave the peculiar hardships of life there. The work of collecting rubber can be done with comparatively fewer people to-day than formerly. I do not believe that the supply of new rubber hunters by immigration will be larger than heretofore. It is claimed that the material available from the north Brazilian states, willing or able to endure the privations of life in rubber gathering, cannot be materially increased, and as to the Indians, the principal reliance in the remote districts, I do not think that additional forces worth speaking of can be obtained. However, this question of labour, in view of the sanitary and other improvements stated above, will not to any extent interfere with the natural increase of the annual output.

"I do not doubt that in the course of time enthusiastic prophets will arise, predicting all sorts of things about very large or small crops, to further their own speculative ideas and interests, and by doing so disturb the course of the consuming markets. I may for instance cite the prophecies for the crop year of 1901-02. Some people predicted a very small crop—as much as 20 per cent. shortage. These prophecies were plausibly based on the presumption that the severe financial crisis at that time existing in Pará and Manáos (a natural reaction following senseless overtrading and other commercial errors) would interfere with supplying the necessities of life to the rubber gatherers, to the extent that work in some districts would have to be abandoned. Well, it turned out that the 1901-02 crop surpassed the previous crop by about 8 per cent. Those prophets had not taken into consideration that a great portion of none too honest rubber gatherers, who had been working under masters, apparently abandoned their territory without delivering to its owners the rubber they had gathered, but in some way the rubber found its way to market.

"The proper control of the labour at some interior points is an impossibility. Many of the poor ignorant gatherers cannot withstand the temptation of making what they consider a fortune in a short time, without paying any attention to the wrong they do to their masters, who advanced the necessities of life to them in good faith. Many *aviadores* (merchants who do the trading in the interior) who were largely indebted to the Pará and Manáos merchants were, in consequence of not getting the expected rubber, unable to meet their obligations, and thus assisted in causing the financial crisis. I feel convinced that all available rubber trees, worth tapping, were tapped, and will always be tapped.

"After the time, many years ago, when rubber ceased to be exported in the shape of shoes, the state of Pará was the first to inaugurate the collecting of rubber on a large scale and exporting it in its present shape. In the course of time Pará has been far surpassed in the quantity of output by the state of Amazonas and other upriver districts. Almost the whole state of Pará has now been explored, and consequently the output of rubber from this quarter will remain more or less stationary, though it may yet show a slight increase, independent of the fact that the year 1902 showed an exceptionally large output for Pará state. But the

upriver districts will be the great factor in the gradual general increase of the output of rubber from the Amazons. In a good many districts in Pará the rubber trees have become exhausted and abandoned, but as the Almighty is the best friend of Brazil, I suppose that new trees will appear in time, and that the now abandoned districts may be re-opened.

"When the whole rubber area of the upriver regions, undoubtedly containing many virgin districts, has been fully developed and explored, many trees will be abandoned or exhausted, just as is the case in the state of Pará. One hopeful feature is that people are endeavouring to take better care of the trees and give them a 'rest' now and then, and introduce better systems of rubber gathering. Whether rubber plantations will ever be successfully established or whether the Brazil's paternal government will try, in its own interest, through wise and practical advice, to stimulate the slumbering energy and good common sense of its obedient and docile, but intimidated subjects, is hard to say. The good people on the Amazon are too much accustomed to shutting their eyes and trusting in Providence.

"You might quote the opinion of a clever and patriotic Brazilian politician, expressed at Rio de Janeiro many years ago, of the character of his own countrymen:

Comquanto nós estejamos accordados o paiz atraze 2 passos, no nosso somno Deus, mesmo contra a nossa vontade, nós puxa para deante 3. [meaning in English: Whilst we are wide awake during the day, our country goes back two steps, but when asleep God pushes it against our own will three steps ahead.]

"Thus nature will push the rubber output of the gigantic, beautiful, and marvelously favoured Amazonas, and if it fails in one corner it will be made up in another, and with it the whole rubber business will go ahead in Brazil, giving to everybody concerned a chance to make money, or lose it. In any event, I am convinced that for many years to come Brazil will be able to furnish large quantities of rubber, unsurpassed in quality by the product of any other country and perhaps not approached by any."

### SOME CONCLUSIONS REGARDING RUBBER CULTURE.

BY ORATOR F. COOK.

The concluding chapter of a late publication by the United States department of agriculture contains the following:—

The culture of the Central American rubber tree has passed the experimental stage in the sense that the practicability of the agricultural production of rubber has been demonstrated, but, on the other hand, it has been ascertained that the tree may thrive where it will yield little or no rubber. Under favourable natural conditions the culture of *Castilla elastica* bids fair to become very profitable, but the experimental determination of the factors which influence the production of rubber has scarcely begun. [The spelling *Castilla*, instead of *Castilloa*, has been adopted at Washington, on account of its being the original form.]

In Southern Mexico and Central America the regions well adapted to the culture of *Castilla* are much more limited than has been supposed. The presence of wild *Castilla* trees is not a sufficient evidence that a locality is suited to commercial rubber culture.

Differences in the yield of rubber are not due merely to the existence of different species and varieties of *Castilla*, but are also controlled by external conditions.

The functions of the rubber milk in the economy of the plant are not well understood or agreed upon by botanists, but there are numerous reasons for holding that in *Castilla* and many other plants it aids in resisting drought.

A continuously humid climate is not necessary to the growth and productiveness of *Castilla*; the indications are rather that the quantity of milk and the percentage of rubber are both increased by an alternation of wet and dry seasons.

In its wild state *Castilla* does not flourish in the denser forests, but requires more open situations. It is confined to forest regions only by the perishability of its seeds.

*Castilla* thrives better when planted in the open than in the dense forests; even young seedlings are not injured by full exposure to the sun, providing that the ground does not become too dry.

The planting of *Castilla* under shade or in partially cleared forests is to be advised only on account of special conditions or as a means of saving labour and expense.

The loss of the leaves in the dry season may be explained as a protection against drought, and does not indicate conditions unfavourable to the tree or to the production of rubber.

The falling of the leaves of *Castilla elastica* in the dry season renders it unsuitable as a shade tree for coffee or cacao. In continuously humid localities where the leaves are retained shade trees are superfluous and the yield of rubber declines.

The desirable features of shade culture, the shading of the soil, and the encouragement of tall upright trunks, are to be secured by planting the rubber trees closer together rather than by the use of special shade trees. Planting closer than 10 feet, however, is of very doubtful expediency.

The percentage of rubber increases during the dry season and diminishes during the wet. The flow of milk is lessened in dry situations by inadequate water-supply, but at the beginning of the rains such trees yield milk much more freely than those of continuously humid localities. The claim that more rubber is produced in the forest or by shaded trees seems to rest on tapping experiments made in the dry season.

Continuous humidity being unnecessary, the culture of *Castilla* may be undertaken in more salubrious regions than those to which rubber production has been thought to be confined; the experimental planting of *Castilla* in Porto Rico and the Philippines becomes advisable, but extensive planting in untried conditions is hazardous.

No satisfactory implement for the tapping of *Castilla* trees has come into use. Boring and suction devices are excluded by the fact that the milk is contained in fine vertical tubes in the bark, which must be cut to permit the milk to escape.

In British India it has been ascertained that the Pará rubber tree may be repeatedly tapped on several successive or alternate days by renewing the wounds at the edges. The yield of milk increases for several tapplings and the total is unexpectedly large. It is not yet known whether multiple tapping is practicable with *Castilla*, or whether this new plan may not give the Pará rubber tree a distinct cultural advantage over *Castilla*.

The gathering of rubber from trees less than eight years old is not likely to be advantageous; the expense of collecting will be relatively large, and the quality of such rubber is inferior, owing to the large percentage of resin.

The rubber of *Castilla* is scarcely inferior to that of *Hevea*. The supposed inferiority is due to substances which can be removed from the milk by heat and by dilution with water.

### A BRANCH TEA-HOUSE IN CANADA.

The consumption of the teas of India and Ceylon, both in Canada and the United States, has, says the *Canadian Grocer*, grown during the last decade to such proportions that many of the London and Eastern tea-houses have found it expedient to pay steady and close attention to the requirements of the Trans-Atlantic markets, and agencies have been established in nearly all the larger cities on this side. This action on the part of the English tea-houses is an indication of the value placed on the Canadian and United States trade by the more progressive English houses and the planters of India and Ceylon. When it is considered that of the 100,000,000 lbs. of tea imported into America last year 25,000,000 was produced by India and Ceylon, it is not to be wondered that London, Calcutta, and Colombo are giving thought and consideration to this trade, and that branch houses are being established in the larger distributing centres. Of those tea-merchants who have studied and watched this particular trade the house of Harrisons & Crosfield, London, and its Eastern branches, Crosfield, Lampard & Co., Colombo, and Lampard, Clark & Co., Calcutta, have taken a step which will undoubtedly be of great moment, not only to their respective houses but to the tea trade of Canada and the United States as well. Mr. A. Lampard, of the London house, some few months ago visited this country and the United States, and made a thorough canvass of the various tea-distributing centres of the continent. His investigations and experience led to the opening in Montreal of a branch house under the name of Crosfield, Lampard, Clark & Co., and offices and sample rooms were opened in the Coristine Building. Mr. A. J. Williams, who was for many years

on the London tea market, has been appointed General Manager for North America. Mr. Williams is an experienced and expert tea-man and his appointment is a tribute to his ability. Associated with Mr. Williams is Mr. A. Suter, who has also passed through the London tea market with many years experience. It is the intention of the firm to branch out and develop the trade in Indian and Ceylon teas, and agencies will be opened in the larger American cities as the trade requires. Owing to the growth of the trade in Indian and Ceylon teas in the United States, which trade, rapidly as it has developed in the past few years, is but in its infancy, it will no doubt be found necessary to open up further agencies. It will be the province of Mr. Williams to cultivate and stimulate the demand for Indian and Ceylon green teas in this market and to supply the grade of tea suitable for same.

A representative of the *Grocer* visited the offices and sample rooms this last week, and through the courtesy of Mr. Williams a description of same was furnished him. The sample room is large, airy, and well-lighted, with every modern convenience for tea sampling and drawing, well and systematically arranged shelves, canisters, tea-drawers and tasting counters, and desks and tables for the clerks and typewriters. The private office is also fitted up conveniently and is on a smaller scale a duplicate of the larger one, so far as it contains a tea-sampling counter and appliances. All the supplies in connection with the sampling outfits were secured in London, and everything is of the latest and most convenient types. Counters, desks, and tables are of finely-polished quartered oak, and it is indeed one of the best equipped and handsomest tea sampling rooms on the continent. Mr. Williams is to be congratulated on having secured such splendidly equipped offices. The location is right in the centre of the tea and wholesale grocery trade of Montreal, and that city is favoured in being selected as the headquarters for the American branch of such an old and well-established tea-house as Harrisons & Crosfield. The *Grocer* is pleased to find another evidence of the importance of Canada in the eyes of its English friends in the establishment of such an important branch house in this country.

## RUBBER CULTURE AND FINANCE.

From an important source at Chicago the following information with reference to rubber culture has been issued, and is published in a financial contemporary:—"That the rubber industry will soon become a most important one admits of no doubt. As yet it is comparatively new; for it was only about the year 1840 when Goodvear discovered the process of vulcanising rubber, giving it its varied and almost innumerable uses.

"Since then the commercial value of rubber has enhanced rapidly, until now fortunes await those who can raise this precious product successfully. The rubber bicycle tyre alone doubled the demand for rubber, and the many new uses, such as tyres for automobiles and other vehicles, electric insulation, and ocean cables, are doubling and trebling the demand. With this increased demand the supply of rubber is constantly decreasing, owing to the destructive methods used in gathering. As the rubber tree is a tropical growth, and the native of the tropics is often a slothful worker, he destroys where no easier method is found, cutting down the tree or ringing it with cuts, and millions of trees are thus destroyed, which will require the planting of thousands of acres to replace. So, with the demand increasing and the supply decreasing, the present price of rubber will not only be maintained, but will surely advance. The cultivation of the rubber tree will never be followed extensively; for rubber is grown in the tropics where few civilised white men can be induced to go, irrespective of the prospect of great fortunes which are being made there now, and will be made there in the future.

"The natives of Africa, Brazil, and the Indies are indolent and slothful, an example of which was shown when the French Government in Central Africa supplied the natives with seeds and young shoots of rubber trees to plant and cultivate; but no planting or cultivating was ever done, they preferring to carry on their destructive methods of gathering the rubber milk, having neither the patience nor energy to plant and cultivate trees, which require time and attention before the young seedlings will bear. The Pará rubber tree of Brazil is another instance; while it produces a very fine grade of rubber, it is a swamp growth. It requires twenty years of growth before yielding its rubber, which is no inducement for cultivation.

The Mexican rubber tree requires only six years of growth before yielding, and grows under climatic conditions more favourable for cultivation than the jungles of Africa or the swamps of the Amazon. These advantages have been brought about by a peculiar condition of the country physically, which condition lies largely in the arrangement of the mountain ranges lying north and east of Soconusco, keeping out the cold winds of the north and condensing the moisture of the Pacific into rain. From this condition there has been formed a very limited district from which the yield of rubber will never form more than a comparatively small part of the entire output of the world.

"While many rubber companies have been started up in the past few years, encouraged by the large profits in rubber, most of these have simply turned out stock-selling schemes, with apparently little thought of the duty of proper selection of land for the cultivation of rubber, and with seeming disregard of contracts with shareholders for conscientious planting and cultivating of rubber trees. Again, there are other rubber companies backed by men of good reputation; but many of these men, unfortunately, know nothing of rubber culture, and their lack of knowledge and experience can only be followed with unsatisfactory results. To La Zacualpa Rubber Plantation Company belongs the credit of being the most successful company now engaged in the culture of rubber trees; for their plantation has been producing rubber commercially for many years. They have now a grove of 5,000 trees, planted in 1889, producing on an average over £3 to the tree—a production of 50 per cent. in excess of the amount the company's figures of future profit are based upon. These are facts no other rubber company can show, and, with the plant of the past three years, the company has over 1,000,000 trees under cultivation and 2,000,000 trees in the nursery. The Zacualpa plantation is situated in the department of Soconusco, State of Chiapas, Mexico—a locality where, as rubber experts have expressed it, 'the rubber tree grows spontaneously'—which is largely accounted for by the splendid arrangement of the mountain ranges, as before stated. Conservative management and nearly four years conscientious work on this plantation have placed La Zacualpa first on the list of plantations devoted to the cultivation of rubber, it being the only one that has solved the problem by actually producing rubber in commercial quantities from cultivated as well as wild trees. Their trees are planted in squares of some 28 acres, each containing 10,000 trees, with roads 24 feet wide between the squares. This plan allows of the most careful supervision, and the actual number of trees planted can easily be ascertained.

"On September 8, 1899, La Zacualpa Rubber Plantation Company was organised under the laws of the State of California, and purchased from Mr. O. H. Harrison 18,791 acres of land in the department of Soconusco, State of Chiapas, Mexico, the title to which is perfect and free from all encumbrance, Mr. Harrison becoming one of the company and its resident director. At the time of purchase Mr. Harrison was shipping many thousand pounds of rubber yearly from La Zacualpa to Cotesworth and Powell, 148, Leadenhall-street, London. The company at once made plans for the systematic development of the land, and set apart 12,000 acres suitable for rubber cultivation. Mr. Ashmore Russan, the English rubber expert, who paid a visit to this plantation, states in a letter to this company as follows: 'As regards the suitability of your land for the cultivation of the *Castilloa* (or Mexican rubber tree), I can only say that it is black alluvial of a very great depth, and I know of none better. The location is all that could be desired for rubber cultivation, having all the conditions necessary as to elevation, depth of soil, rainfall, and climate; the general surface is level, but sufficiently rolling for good drainage, and is intersected by a number of sanjones, or ditches for carrying off the surface waters. The titles to La Zacualpa Rubber Plantation were thoroughly investigated before the purchase of the property, and passed upon by the best legal authority, everything being found in order and the chain of title perfect.' Since acquiring title the company has been shipping rubber regularly in commercial quantities from its own cultivated and wild trees.

"Its success has not only attracted the eyes of President Diaz, of Mexico, but likewise the Secretary of Agriculture at Washington, D. C., the Hon. James Wilson, who has appointed Mr. O. F. Cook, botanist in charge, Department of Agriculture, and his chief assistant, Mr. G. N. Collins, to study rubber cultivation on La Zacualpa. These gentlemen have spent some time on the plantation, making a careful study of the situation, and have returned

with full material for a report to be made to the Department, which will be published in due time and illustrated with photographs taken during the trip. From letters received, their report, when issued, will be one of the most interesting bulletins published by the above Department. The management of this plantation have it all times courted a personal investigation of their work, with the result that they are able to present an array of testimonials and endorsements regarding the merit of their plantation. It is the purpose of La Zacualpa Rubber Plantation Company to interest the outside public in their work. Shares in La Zacualpa Rubber Plantation are not capital stock of a corporation, and carry none of the responsibilities and obligations, or liability to assessment of capital stock, but represent an undivided interest in the plantation itself. The 12,000 acres comprising the plantation are divided into 12,000 shares, each share representing one acre of land, and the holders of shares in La Zacualpa Rubber Plantation are the actual owners of one undivided acre of land for each share held, with a guarantee expressed upon the certificate by La Zacualpa Rubber Plantation Company, under its official seal, to plant 200 (300 trees to the acre have been planted, and belong to the shareholders) or more rubber trees per acre for each share sold, and to care for same for a period of five years, and at the expiration of that time to gather the first harvest and deliver the net proceeds thereof to the shareholder.

"In other words, La Zacualpa Rubber Plantation Company sells to each shareholder one undivided acre of land in La Zacualpa Rubber Plantation, with 200 or more rubber trees five years old, and their profits for all time, for each share sold, and agrees to plant so that the first harvest belonging to a shareholder is the one to be gathered from La Zacualpa Rubber Plantation during the sixth year from the date of the certificate. After the delivery of the first harvest La Zacualpa Rubber Plantation Company will care for the plantation, and harvest and market the crop for 10 per cent. of the net proceeds therefrom. Out of this commission the company agrees to pay all costs of administration, including maintenance of its home and branch offices."

## DISTRICT ASSOCIATIONS

### INDIAN TEA ASSOCIATION.

#### LOUISIANA PURCHASE EXPOSITION.

The following is from an abstract of the proceedings of a Meeting of the General Committee held on the 27th October:—

The following members were present:—Messrs. T. McMorran, *Vice-Chairman*; G. Kingsley; Geo. A. Ormiston, and T. Traill.

**Louisiana Purchase Exposition.**—The principal subject dealt with was the Louisiana Purchase Exposition. Particulars of preliminary arrangements in connection with the Association's exhibit were given, and attention was drawn to the desirability of preparing the ground at St. Louis by advertising, and in other ways before the opening of the Exhibition.

In connection with this matter it was decided to inform the London Committee by telegram of the amount guaranteed, but indicating that the whole sum was contributed exclusively for the purposes of the Exhibition. The London Committee were also to be informed that the Tea Cess Committee were in communication with Mr. R. Blechynden regarding the advertising of Indian Teas in America.

The amounts subscribed for the purposes of the exhibit were as follows:—

	Rs.
The Government of India	75,000
The Government of Bengal	10,000
The Assam Administration	10,000
The Government of Madras	5,000
The Government of Mysore	5,000
The Indian Tea Cess Committee	50,000
The Indian Tea Association	20,000
The United Planters' Association of Southern India	10,000
Total ..	1,85,000

With this sum it was considered that a very attractive and successful exhibit should be possible. A sum of £2,000 for preliminary expenses was to be placed to the credit of the London Committee with the National Bank of India in accordance with their request.

**Industrial and Arts Exhibition, Madras.**—Read letter dated 17th October from the Acting Secretary, Bengal Chamber of Commerce, forwarding papers in connection with this Exhibition. The project, it appeared, was being promoted by private enterprise and was intended to comprise articles of Indian manufacture and art, Natural products of India of commercial value, implements and machinery useful for the promotion and development of indigenous industries, and generally, all things tending to assist in the agricultural and industrial development of India. It was considered that the Exhibition was of more particular interest to Southern India, and it was decided to pass on the papers to the United Planters' Association of Southern India for information, and any action they might consider advisable.

**Sale of Waste Tea.**—Read a note from the Chairman with reference to the question of the disposal of Waste Teas. From information received, it appeared that Waste Teas were being largely bought by natives in Cachar and Sylhet on a guarantee that they were to be used exclusively for chemical purposes, but were actually being resold for human consumption to the detriment of the tea industry generally. The Chairman suggested issuing a circular drawing attention to the imperative need, in the interests of the Tea Industry, of every care being taken to prevent tea waste getting into the hands of unscrupulous dealers.

It was decided after some discussion to ask the Chairman to endeavour to obtain, if possible, further particulars in support of the general statements of his correspondent.

## THE CEYLON PLANTERS' ASSOCIATION.

### COMMITTEE MEETING.

Extract from minutes of proceedings of a Meeting of the Committee of the Planters' Association of Ceylon, held at the Victoria Commemoration Buildings, Kandy, on Monday, the 2nd November, 1903, at three o'clock in the afternoon (3 p.m). Mr. A. C. Kingsford, *Chairman*.

#### GUARANTEE FUND AGAINST FRAUDULENT LOSS OF TEA FROM TEA FACTORIES.

Submitted letter from Mr. Frank S. Vowler mentioning that nothing further has been done in the matter so that it need not be pressed in Committee.

#### CEYLON GOVERNMENT RAILWAY, WEIGHT AND QUALITY OF TEA CHESTS TENDERED.

Submitted correspondence with Honorary Secretaries of the various District Associations drawing attention to the accompanying copy of letter received from the General Manager of the Ceylon Government Railway on the subject of weight and quality of Tea Chests tendered to the Railway for transmission by train.

Read letters on the subject from the Honorary Secretaries, Balangoda Association, Nuwara Eliya Association, Pussellawa Association, Kalutara Association, Haputale Association, the opinions recorded being that the change advocated is impracticable, not desirable and unnecessary.

#### PRIZE ESSAY ON PRUNING OF TEA IN CEYLON.

Intimated that the Judges were not yet prepared to give their award.

#### RUBBISHY TEAS IN COLOMBO HARBOUR.

Intimated that no progress could be reported.

#### SPECIAL LEGISLATION RE CACAO-STEALING—CACAO THEFTS COMMISSION.

Read correspondence with Government in forwarding the following

**Resolution:**—"That pending Special Legislation, Government be asked to invite the Government Agents in the various Cacao Districts to use special influence in getting the headmen and Police to try to check robberies and sales of cacao in the open thoroughfares, during the coming crop. The Committee would point out the success attending the personal efforts of Government Agents last year in the Matalé District."

SPECIAL LEGISLATION FOR CACAO DISEASE—PLANT SANITATION  
ORDINANCE NO. 5 OF 1901. PROPOSED REGULATION FOR  
THE PREVENTION OF CACAO DISEASE.

Read correspondence with Government with regard to the proposed Regulation for the Prevention of Cacao disease, and again enquiring whether the Planters' Association has any suggestions to offer on the Regulations for the prevention of Cacao disease which it is proposed to promulgate under Section 3 of Ordinance No. 5 of 1891.

TEA PESTS SPREAD OF "SHOT-HOLE BORER."

Read correspondence with Government transmitting copy of the following Resolution:—"That the Planters' Association of Ceylon is now of opinion that the majority of the District Associations are in favour of Legislation on the lines indicated by the Government Entomologist (Mr. Green), and that Government be asked to legislate accordingly against the spread of Shot-hole Borer pests in Tea.

Read letter from the Pussellawa Association intimating that the Resolution of the Committee of the Planters' Association of Ceylon on the subject has been unanimously approved of.

Read letter from the Honorary Secretary, Balangoda Association, transmitting the following Resolution:—"That this Association, has much pleasure in supporting Legislation on the lines indicated by Mr. Green."

Read letter from the Honorary Secretary, Haputale Association, stating that in the opinion of this Association, it is desirable that, in addition to Legislation on the lines suggested by the Government Entomologist, the burying or burning of prunings upon those estates attacked by the Shot-hole Borer be made compulsory.

*Resolved*, "That the Resolution as follows: 'It is desirable that in addition to Legislation on the lines suggested by the Government Entomologist, the burying or burning of prunings upon those estates attacked by the Shot-hole Borer be made compulsory—passed by the Haputale Association on the subject be circulated to the various District Associations for consideration and that in the meantime Legislation be proceeded with on the lines already adopted'."

ST. LOUIS EXHIBITION, 1904.

Submitted letters from the various District Associations on the subject of Exhibits for St. Louis Exhibition, 1904.

Submitted letters received from the Honorary Secretary, Passara Association, Rangella Association, Maskeliya Association, Maturata Association, Hewaheta Association, Dimbula Association, Kurunegala Association, Kelani Valley Association, Pussellawa Association, Balangoda Association.

Submitted letter from the Secretary, Exhibition Committee, Colombo, transmitting the following notification:—

Notification *re* exhibits of Black and Green Teas.

Two leaded packets (weighing 2 pounds each) of the different grades should be forwarded, one for exhibition and the other for the use of the Juries.

Manufacturers of Green Teas are specially requested to send in samples for Exhibition.

BURYING OF PRUNINGS.

Mr. Kelway Bamber addressed the Committee on the burying of prunings and answered questions of Members. *Resolved*, "That a cordial vote of thanks be recorded to Mr. Kelway Bamber."

PROTECTION OF COCOANUT TREES FROM THE RAVAGES OF CERTAIN  
BEETLES.

Read letter from the Government Agent, Western Province stating that his views on the subject were communicated to Government about four years ago, when he was Government Agent of the Eastern Province.

Read letter from the Government Agent of the Eastern Province, suggesting that copies of the Ordinance passed in the Federated Malay States be procured and circulated.

Read letter from the Government Agent, North-Western Province, asking for more copies of the Malay States Ordinance.

Read letter from the Government Agent, Central Province, stating that he was aware from experience in the Eastern Province that Black and Red Beetles do much harm to young cocoanut estates there, adding that if Section 3 of Ordinance No. 5 of 1901 provides for the repression of indigenous insect pests and not merely of imported insect pests, all that is wanted is Regulations under that Clause for the punishment of persons allowing their trees to be infested with the Beetles, which in the Eastern Province generally spread from carelessly-kept gardens to adjacent well-kept estates with serious results.

Read letter from the Government Entomologist stating as follows:—"That the only means of satisfactorily checking the continuous increases of these pests is to systematically destroy all dead palm trees and rubbish heaps liable to afford breeding ground for the beetles.

"This fact has been fully appreciated by the Cocoanut Planters of the Federated Malay States, who have called for and obtained an Ordinance for their protection."

"The Ordinance makes compulsory (1) the proper treatment of all infested trees; (2) the destruction of all dead cocoanut trees; (3) the removal or destruction of such refuse heaps as would be liable to harbour or become breeding places for the beetles.

"A periodical inspection is provided for. A European Inspector of cocoanut trees has been appointed with native assistants under him. The Inspector assumed his duties on the 1st October, 1902, and in his report for the three months ending 31st December, 1902, states that the means adopted have undoubtedly checked the ravages of the Beetles in a marked degree."

The Entomologist adds that "I am of opinion that it will be impossible to secure the adequate carrying out of the requisite pressures, except by means of an Ordinance framed on the lines of that now in force in the Malay States, and that in consideration of the increasing havoc caused by the pests in question, such an Ordinance is not only advisable but most necessary. Its practicability has already been proved by experience in the Straits."

Read letter from the Government Agent, Sabaragamuwa Province, acknowledging receipt of the letter.

Read letter from the Government Agent, Uva Province, mentioning that there are no cocoanut estates in the ordinary sense of the term and he regrets his inability to offer any views on the question at issue.

Read letter from the Government Agent, North-Western Province, asking for copies of the Ordinance referred to.

Read a second letter from the Government Agent, Eastern Province, stating that in his opinion it would be an excellent thing if some plan could be devised for the destruction of the two kinds of cocoanut beetles, but that he fears the Malay States Ordinance would be too drastic and too expensive in its operation, and generally doubting whether the result would be commensurate with the expenditure, while all cocoanut planters would be expected to pay a heavy cess to meet the expenditure.

*Resolved*, "That the Batticaloa Association be informed that the replies from the various Government Agents are favourable to Legislation, the only exception being that of the present Government Agent of the Eastern Province."

PRESERVATION OF BIRD LIFE ON TEA ESTATES.

Read letter from the Honorary Secretary, Pussellawa Association, stating that the correspondence has been laid before the General Meeting of the Pussellawa Association, but that no remarks were passed.

CEYLON ASSOCIATION IN LONDON.

Submitted letter copy from the Secretary, Ceylon Association in London, to the Secretary of State for the Colonies, and his reply on the subject of the announcement that the Russian Government has by a recent Ordinance, increased the duty on Indian and Ceylon teas imported by the European frontiers on the Black Sea by one and a-half roubles per pood, equivalent to about one-eighth per pound. From this increased duty China and Japan teas will, it seems, be free.

Read letter from the Secretary, Ceylon Association in London, asking for the information of members the state of the Tea Cess Account made up to the latest date and an estimate of how the accounts is likely to stand at 31st December, 1903, further in addition a statement showing the probable amount of Cess to be collected in 1904, the amounts already are marked and the estimated balance to be allocated, adding that the question of either continuing, reducing or allowing the Green Tea Bonus to lapse is of the greatest importance to the Tea Industry both of India and Ceylon.

ANNUAL REPORT, NOMINATING OF SUB-COMMITTEE.

*Resolved*, "That the Chairman of the District Associations, Messrs. Jas. Westland, W. D. Gibbon, T. C. Huxley, Edgar Turner, Hon'ble Mr. J. N. Campbell, the Hon'ble Mr. E. Rosling, the Chairman, Planters' Association of Ceylon, the Secretary, Planters' Association of Ceylon, with power to add to their number, do form a Sub-Committee to draft the Annual Report, two to form a quorum. (2) That a Sub-Committee be appointed to edit the

compilation of the Year Book for 1904, and that the following members be asked to act:—Messrs. W. D. Gibbon, Edgar Turner, the Chairman, Planters' Association of Ceylon, the Secretary, Planters' Association of Ceylon."

#### THE THIRTY COMMITTEE.

Extracts from minutes of proceedings of a Meeting of the Thirty Committee appointed to administer the Proceeds of the Export Duty on Tea levied under Ordinances No. 4 of 1894 and No. 13 of 1902 for increasing the consumption of Ceylon Tea in Foreign Lands, held at the Victoria Commemoration Buildings, Kandy, on Tuesday, the 3rd November, 1903, at half past seven o'clock (7-30 a.m.) in the morning. Mr. A. C. Kingsford, *Chairman*.

#### MISCELLANEOUS.

Read letter from Mr. Robert Wardrop, Wellington, New Zealand.

*Resolved*, "That in view of the fact that Ceylon already enjoys half the tea trade in New Zealand, the Thirty Committee is unable to entertain the application."

Read letter from Messrs. Gow, Wilson & Stanton in reference to correct figures for Green Teas Grant from commencement.

INCREASE OF THE TEA CESS, LOAN FROM GOVERNMENT OF RS.150,000.

Read correspondence with Government regarding the Loan of Rs.150,000 and the remittance of a further sum of Rs.20,000 being the fourth instalment of the Loan sanctioned by His Excellency the Governor.

Read correspondence with Government in reference to the arrangements regarding the repayment of the Loan.

*Resolved*, "That the matter be left in the hands of the Planting Member in Council on the lines of recoupment in seventeen months commencing from 1st January, 1904."

#### CEYLON TEA ON THE CONTINENT OF EUROPE.

Submitted correspondence between the Ceylon Association in London, and the Colonial Office drawing attention to the announcement that the Russian Government has by a recent Ordinance increased the duty on Indian and Ceylon Teas imported by the European Frontier on the Black Sea by 1½ roubles per pood equivalent to about 1½d. per pound. In Messrs. Gow, Wilson & Stanton's Tea Report of September 11th the position was described thus:—The following telegram sent from St. Petersburg through Reuter's Agency is of some importance to those interested in the production of Indian and Ceylon Teas: "A Government Ordinance is published, increasing the import duty on Ceylon and Indian Teas imported into Russia by the European Frontier on the Black Sea from 31 roubles 60 kopecks per pood to 33 roubles. The import duty on China Teas is not changed but fresh regulations are enforced for the purpose of certifying the origin and place of despatch. This means that a preference of 1½d. per lb. is given to China over British-grown tea.

*Resolved*, "That the thanks of the Thirty Committee be conveyed to the Ceylon Association in London for the cordial support given in the matter of the increased Russian Duty."

Read letter from Mr. J. H. Renton, dated Copenhagen, 9th October, 1903, to Mr. Kingsford, reporting on a trip to Norway, Sweden, and Denmark.

#### MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated October 23rd, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ...	561,831	465,005	42,698
1902-1903 ...	588,397	524,703	34,599
44,454 pkgs. INDIAN 15,009 " CEYLON 3,299 " JAVA	Total 62,962 packages were offered in public auction this week.		

The usual Autumn trade which commenced somewhat late this season has been in strong evidence during the last week or two, and has caused bidding to extend over a much wider area, resulting in a generally better market for all descriptions.

North America continues to take increasing quantities of British-grown Tea, as shown by the result of the first six months working of the year 1903, viz.:—

	1903.	1902.	1901.	1900.	1899.	1898.	1897.
Lbs.	12,029,417	8,624,299	8,336,017	6,820,884	5,134,914	6,245,443	6,580,336

Indian and Ceylon Tea taken in North America from 1st January to 30th June.

Total lbs. ...	3,436,540	4,290,404	3,442,394

The exports from Colombo include 2,717,501 lbs. of Green Tea, and 372,595 lbs. for 1902.

From the 1st January to 30th June 3,819,150 lbs. of tea were exported from the U. S. A. to Great Britain, but this consisted almost entirely of China Tea.

INDIAN.—The strong tone noticed during the last two or three weeks has further developed, and an advance has taken place in common teas of ¼d. per lb. and medium teas about ½d., good and fine liquoring kinds continuing to attract strong competition. The quality of many of the Assam Marks has shown a distinct falling-off—a frequent feature at this time of the year. Exports to U. K. first half of October 14,320,000 lbs., against 10,600,000 lbs. in 1902; total from 1st April 92,392,000 lbs., against 85,220,000 lbs. Averages:—"Darj. Con. Balasun," ½; "Tara T Co.," 1/1¼; "Rungmook" and "Amal T Ests. Chong Tong," 1/0¾.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 39,178 pkgs., av. 7-94d. 1902, 43,489 pkgs., av. 7-09d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 399,081 pkgs., av. 7-90d. 1902, 407,953 pkgs., av. 7-18d.

CEYLON.—Another moderate auction imparted further strength to the market, all teas up to 9d. per lb. showing a further advance of from ¼d. to ½d. per lb. Exports to U. K. first half of October 3,500,000 lbs., against same quantity last year. Averages:—"Nuwara Co. Con.," 11½d.; "Wanarajah T Co. W.," 11d.; "Ass. Silver K.," 10¾d.; "Demodera," "S T Co. St. Leonards," "S T & L Alnwick" and "Brookside," "Waltrim," 10½d.

Average for week 7-96d., against 7-31d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 836,589 pkgs., av. 7-47d. 1902, 948,079 pkgs., av. 6-71d.

JAVA.—A good selection was brought to auction and sold at rather dearer prices, the best averages being made by "Goalpara," "Perbawattee," and "Tanawattee."

#### COFFEE.

Messrs. C. J. Leech & Co. write:—"The speculative markets have worn an attitude of expectancy this week, and have been guided by the movement of Santos receipts. Saturday's total of only

26,000 bags at that port were encouraging; but the following days gave large figures again, and hopes waned. Rio receipts have also been on a very large scale; but it is possible that the explanation of the full Santos receipts may equally apply to Rio. On Tuesday Mr. Karl Krische cabled that the *Brazilian Review* of that date reported that the 'heavy receipts were due to want of money on the part of the planters, to the high prices obtainable, and the very favourable weather, which had facilitated the picking and preparation of the crop. Half the crop has already been received.' It may be, and if the last statement should prove correct. Santos receipts would point to about 7,000,000 bags for the season—the estimate we personally adopted some time ago. The New York market was strong last Saturday, and advanced to the highest point yet reached, due to purchases by outsiders and a rumour that Mr. Brown, of New Orleans, who brought off the most successful bull movement on record in cotton recently, was considering a bull movement in coffee. We may point out that the success of the bull campaign in cotton was entirely due to the fact that the consumption of the staple had undoubtedly exceeded the production, proved during four seasons by the inability of the United States to raise sufficient cotton for the wants of the world, and this, despite ever-increasing acreage. Granted similar conditions in coffee, and remembering that we are almost solely dependent upon Brazil now-a-days, a sensible rise in the price of the bean, would be assured with or without outside intervention; in a word, it is merely a question of supply and demand.

### TEA.

Messrs. Wm. Jas. & Hy. Thompson, in their Report, October 22, say:—The tone of the market continues good; the features of last week have been accentuated, demand again running on the lower grades up to 7½d. per lb., which mark a further advance, while medium teas above that price continue steady—a good sign, as hitherto a rise in quotations for common has been usually followed by a decline in the price of the better qualities. Fine teas continue to realise satisfactory rates. The position is an interesting one: consistent and regular weekly offerings of Indian Tea at a time when Ceylons are so short has resulted in improved quotations, the supply available falling for the moment below requirements. The rapidity with which a large proportion of the sales is cleared from the warehouses supports the opinion we have previously expressed, that the stocks of tea held both by the trade and in the country are much below the average. News comes to hand that the Manager of Galaha Estate, Ceylon, claims to have discovered a method of treatment whereby green tea dust may be converted into black. Commanding as the latter does a much higher price, further details will be awaited with interest, as, should the scheme prove practicable, the result would be of material benefit to producers. The sales have comprised 44,600 packages, against 53,700 packages last year, so that the total offerings of this season's tea to date now amount to 432,500 packages, against 481,600 packages a year ago. A buoyant feeling characterised the auctions on Monday last, and prices generally showed a further upward movement, especially for teas up to 7½d. per lb., which sold at advances ranging from ¼d. to ½d. per lb. on late rates. This tendency was further emphasised at the succeeding sales, and the market closes firm. Prices for good medium and fine teas continued satisfactory, though with but little change in rates. It is interesting to note that towards the end of October, 1902, prices for common tea touched the lowest point of last season, ordinary Cachar Pekoe Souchongs selling at 4½d. per lb. and Pekoes 5d. per lb., while medium Assams, of the types now realising 7d. to 7½d. per lb., were to be had for 6d. to 6½d. per lb.; the quality, on the whole, perhaps shows some little improvement over last year's but with due allowance for this the difference in price is still considerable. For next week about 40,000 packages are advertised. Common tea was quoted dearer at the sales in Calcutta last Friday, the 22,000 packages offered selling at an average of 5s. 9p. Shipments during the first half of October were 14,300,000 lbs., making the total exports to date 7 millions in excess of last year.

### COCOA IN THE U. S.

Business in cocoa has been moderate on steady buying by manufacturers, who are, however, only attending to their wants for the day. On limited offerings prices have held firm. Quotations: African, 12½ to 13c.; Angostura, nominal; Bahia, 13¼ to 13½c.; Caracas, 14 to 15c.; Cauca, 16 to 17½c.; Cuban, 10½ to 11½c.; Guayaquil—Ariba, 15 to 16½c.; Baloa, 14¼ to 14½c.; Machala, 13¾

to 14c.; Caraquez, 13¾ to 14c.; Grenada, 13¼ to 13½c.; Jamaica, 10½ to 12½c.; Maracaibo, nominal; Pará, 13½ to 14½c.; Manchez, 11 to 11½c.; St. Domingo, nominal; Savanilla, nominal; Surinam, 13¾ to 14c.; Trinidad, 13¾ to 15c.; Ceylon, good, 16c.; prime red 17½ to 18c.; superior, 19 to 20c.; Java, 21 to 22c.

### CINCHONA.

At the periodical auction on Tuesday there was a good demand for the small quantity offered, and practically everything was disposed of at and since the sale, at firm prices. The average unit may be placed at from 1½d. to 1½d. per lb., although in some instances the higher figure was exceeded for some parcels of manufacturing bark. This result compares with 1½d. at the previous London sale, and an equivalent of 1½d. at the last Amsterdam auction. Altogether about 122,500 oz. of quinine were offered in bark form.

The following table shows the quantity of bark offered and sold:—

	Packages Offered.	Packages Sold.
East Indian cinchona	567	197
South American cinchona	541	453
African cinchona	508	411
Java cinchona	133	107
Ceylon cinchona	61	61
	1,810	1,229

The following were the approximate quantities of bark purchased by the principal buyers:—

	Lbs.
The American and Italian factories	40,900
Messrs. Howards & Sons	34,300
The Frankfurt-on-Main and Stuttgart factories	22,500
The Imperial Quinine factory	17,100
The Mannheim and Amsterdam factories	9,300
The Brunswick factory	4,700
Druggists, Brokers, etc.	48,500
Total quantity sold	177,300
Bought in or withdrawn	120,000
Total quantity offered and sold	297,300

The prices paid for sound bark were as follows:—

EAST INDIAN.—Officinalis, original stem chips and shavings, 2½d. to 3d.; good, 6½d.; renewed chips and shavings, 7½d.; good sort, 7½d. to 7¾d.; branch, 3¾d. Succirubra, original stem chips, 2¾d. to 3¼d.; branch, 3½d.; renewed, 4½d. per lb. Hybrid, stem chips, 2¼d.; and branch, 3¼d.

CEYLON.—Ledgeriana, good natural stem chips and shavings, 7½d.; renewed ditto, 5½d.; and twigs, 4¼d. Succirubra, stem chips and shavings, 3½d. to 3¾d. per lb.

JAVA.—Good Ledgeriana stem chips, 11¼d.; branch chips, 6¼d.; root, 9d.; and red dust, 3¾d. to 4d. per lb.

SOUTH AMERICAN.—A parcel of 62 bales soft Columbian (ZO) imported in January, 1885, sold at 2½d. for sound, and of Bolivian cultivated Calisaya 479 packages were offered, comprising some good testing quality. Nice bright sound quill brought 8¾d.; fair to good quill, 6¾d. to 7½d.; and quillings, 7½d. to 8¼d. per lb.

WEST COAST AFRICAN.—A parcel of 508 bales Succirubra quill, imported last month, *via* Lisbon, was mostly sold, including fair stout dark quill at 5d.; fair bright quill, part rusty, 4¼d.; and chips and quillings, 3½d. to 4¼d. per lb.

The next bark auctions at Amsterdam will take place on November 12, and is expected to consist of about 8,200 packages.

### QUININE.

A new brand of Dutch quinine has appeared on the market. The maker was formerly with the Bandong quinine factory in Java, and his unexpected competition is reported to be the reason why an advance in the makers' price (warranted as a result of the last Amsterdam auction) was not made. The new maker has evidently obtained a slight foothold on this market, the Customs Bill of Entry of October 20 showing a consignment to London of 35,840 ozs. of this make from Holland. We understand the bulk of it was sold at 11½d. per oz., or 1½d. below the official price of German quinine, but it ought to be explained that it is inferior in appearance to the German make. The market for German quinine in second hands has been quiet, with small sales of December delivery at 1s 0½d. per oz.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, NOVEMBER 21, 1903.

[No. 46.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 27th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Coorg.

POLLI BETTA, 11th November.—

*Weather*—It has been overcast and dull and heavy rain has been falling here since the 5th instant. Wishes are expressed that it might “dry up.” It turns out that this excessive wet at this time is even bad for the paddy fields. *Plant diseases*—Though there is some leaf-disease about, coffee generally is looking grand, and the prospects for next year are simply splendid. *Crop*—Crop promises to be late in ripening this season. There is only a tree here and there at long intervals that is showing up red. These are some of those on which the blossom opened early. *General health*—Plague seems to have been suppressed both at Gonicopal and Veerajpet. On the estates, except for a little fever and colds, the health of the coolies is very fair. *Labour*—Ample for all requirements. *Works*—Mostly weeding and some handling. *Interesting item*—A team of hockey players has gone up to Mercara to play a team there. The game comes off at 4 p.m. to-day. It is to be hoped the weather will be favourable.

#### Yercaud.

SHEVAROY, 12th November.—

*Weather*—Excessively damp—rain heavy from anywhere, instead of N.-E. sun wanted to ripen coffee. *Plant diseases*—Leaf-disease showing up badly in poorly-cultivated estates. *Works*—Weeding—which is heavy. *Health*—Fair, colds and coughs from too much damp. *Labour*—Sufficient, more coming up shortly after reaping in low country.

### ADULTERATED PEPPER.

AN interesting legal decision is reported from the United States. The main facts are stated by our contemporary, the *Spice Mill*, in words to the following effect :—New Jersey has a pure food law, which, presumably, is very much the same as the laws of other States. The State Board of Health caused the arrest of a number of retail grocers in Jersey City for selling “adulterated” black pepper, which was sold for less than the “pure” article. The chemists who analyzed the pepper sold by the dealers declared that it was a mixture of black pepper and pulverized buckwheat. A test case was made and the dealer was fined \$50. An appeal was taken to the Court of Common Pleas, and when the case came up for trial the defence contended that black pepper was not in any sense a “food,” but a condiment. It was further contended that while the Act prohibits impure “ingredients” in food, pepper is not an ingredient in food, but a condiment used on food. A further argument was that the law provides that black pepper mixed with buckwheat is not “injurious” in the sense contemplated by the law. The outcome of the trial was that the trial judge set aside the penalty imposed and ruled that the Act does not cover adulteration of spices, such as pepper, mustard and other condiments. The exact wording of the main part of the decision appear to have been as follows :—“The complaint must be dismissed : First, because the Act does not cover the case of pepper, as above argued, pepper being a ‘condiment’ and not a ‘food ;’ and the complaint here being an impure ‘food.’ Second, because, if pepper is to be regarded as a ‘food,’ and governed by the Act, then there has been under the evidence here, no violation of the Act.”

Without in any way questioning the soundness of a decision based upon an Act, the exact terms of which are not before us, we are led to believe that the arguments of Counsel for the defence had much influence upon the judgment of the Court. Where these arguments related to the Act we have little to say about them, but here and there they branched off into general questions that are of very considerable interest to every producer of food-products or condiments. That

pepper is not a food, we admit. That it is a condiment no one will doubt, but whether food or condiment the main point to be considered is whether, when pepper is asked for, pure pepper is meant, or adulterated. It is unsafe to regard pepper and mustard as on the same level. The fact is well known that pure mustard is too powerful for the ordinary human palate. When a label bears the words "Table Mustard" the more intelligent among the public are probably aware that what is offered to them is not pure mustard. But people who ask for pepper generally expect to get it, for pure pepper is not too strong for daily use. It was argued that if a food is to be regarded as adulterated in terms of the New Jersey Act it must contain an admixture of something "injurious" or "deleterious" to the consumer's health. If this be so, the Act needs revision. What producers urge in regard to foods and condiments alike is that the article sold shall be what it purports to be—either pure or adulterated. If the label clearly shows that it is the latter, the buyer may at least acquaint himself with the fact that he is not purchasing a pure article. If it is labelled simply "pepper" or "coffee," he presumably buys it in the belief that it is pure. The fact that something mixed with it is not injurious to health or even that this something makes the mixture more palatable is quite another story. Whether a man asks for "black pepper" or "pepper," that, and that alone, is what he has a right to expect to receive in the absence of a definite meaning from the seller.

Now Counsel, in the case under notice, argued thus:—"This W—— black pepper is cheaper and takes the place of pure black pepper in ordinary consumption. If a man goes to the ordinary grocery store and asks for pure black pepper, he will either have to pay a higher price than this W—— black pepper is sold for, or he will be referred to a drug store. The purchasing public is not deceived in any way. The low price alone tells that the article is not pure black pepper." There is but one word that aptly meets statements such as this, and that word is 'Bosh.' In the first place, the average consumer cannot be supposed to know the real market value of pepper. Then, again, the fact that one supplier charges a lower price than another does not necessarily point to any adulteration on the part of the former: it may be the simple result of keener enterprise, of a desire to follow the principle of low price and a large turnover. We quite acknowledge that there is no standard whereby the purity of pepper can be gauged with accuracy. But this is not the point in the case under reference. The point is that it was clearly shown that there was an admixture of buckwheat and, to our minds, under circumstances such as this, no supplier should have the right to sell the mixture as "pepper." If it were called "Table Pepper," it might rank with such doubtful commodities as "French Coffee." The buyer would at least have reason to suspect its purity; and if he did not trouble to ask questions, that would scarcely be the fault of the seller. In regard to all food-products, condiments, drugs, etc., a claim that every buyer has a right to expect to receive that which he asks for, and that if he is put off with some compound that contains ingredients for which he has not asked, the law should protect him. We are well aware that in many cases, in England as well as in other countries, the law does not do so; but our point is that this is a strong argument in favour of an amendment of the law, not in defence of dishonest trade practices.

## COFFEE NOTES.

**Court Decision in Coffee Contracts.**—The Supreme Court has decided in favour of W. H. Crossman & Bros. in the suit against the firm by J. H. Labaree Company, to compel the Crossmans to deliver in New York coffee in November, 1899, brought to this port by the steamer J. W. Taylor, the landing of whose cargo was prohibited by the Board of Health because the bubonic plague prevailed at Santos and vicinity when the steamer sailed. By the terms of the contract the coffee was to be delivered into a regularly licensed coffee warehouse in this port. A part of the coffee cargo of the steamer was permitted by the Board of Health to be landed at the pier of Arbuckle Bros., and roasted at the Arbuckle roasting plant under supervision of the Sanitary Superintendent of the Board of Health. The Board refused to permit the coffee sold to Labaree Company to be unloaded at any place in the city of New York under any other conditions than the Arbuckle coffee. The decision of the Court was that there is no arrival of coffee when the Health Board will not permit it to be landed from steamship, and there being no arrival, there is no sale. The Labaree Company insisted on standing on the express terms of its contract, and so refused whatever accommodations the rules of the Health Board permitted.

Coffee shipments from Porto Rico to the United States during the eight months ending August, 1903, were 4,706,210 pounds, against 253,501 pounds during the same period in 1902. The values were \$526,324 and \$29,016 respectively.

**Upturn in Coffee Values Analyzed Favourably.**—Well informed interests, in discussing the situation (coffee), expressed the opinion that there appeared to be more legitimate reasons for the present upturn in values than was the case in any of the advances in prices in the past few years. The outturn of the present Brazil crop, says the *New York Journal of Commerce*, is quite generally believed, was considerably over-estimated early in the season, and there are comparatively few who expect that the outturn of the crop will be as large as the 1902-03 crop. The prospective poor yield from the 1904-05 Brazil crop, however, seems to be the bull factor that is having the greatest influence upon the market, especially in speculative circles. The Santos representative of a prominent New York coffee house, who is now visiting in this city, was quoted as saying that it is not only the drouth which is being experienced in Sao Paulo during the actual blossoming of the coffee trees that makes the prospects for the next crop unpromising, but the fact that during the months early in the calendar year dry weather was experienced in Brazil, thus putting the coffee trees in a poor condition to carry them through the ordinarily dry season in Brazil of June—August, making the prospects of a good flowering and a subsequent development of the berry unpromising, even if good rains do set in during October, as the trees are in too weakened a condition, owing to the prolonged drouth for the flowering to set well.

**Porto Rico and its Coffee.**—As the people of Porto Rico blamed the United States for the hurricane that devastated the island not very long after we assumed its sovereignty, it is not surprising to find the people holding the United States responsible for the price of coffee and appealing to the general Government to do something in the interest of

what is, or at least was, their principal crop. As the price of coffee is much lower than it was before the island was appropriated by the United States, and persons of whom more might be expected than can be expected of the Porto Ricans get very much confused in reasoning from effect to cause, we ought not to be surprised to find the Porto Ricans attributing the low price of coffee to their separation from Spain.

For a time after the annexation of the island its coffee came into this country in small amounts, but now that the people are complaining of the low price of coffee the exports to the United States are increasing in an enormous ratio. In the fiscal year 1902 the Porto Rican coffee sent to the United States amounted to only 227,560 pounds; in the fiscal year 1903 it amounted to 6,314,686 pounds. What more do the people of the island demand?

Porto Rican coffee has simply suffered from the competition of Brazilian coffee. The enormous increase of production in Brazil sent the price down like a shot and necessarily affected the coffee markets of the world, though of course it took a little time to do this. The over-production of coffee in Brazil did not begin till two or three years before our war with Spain, and its full effects were not felt until after the war. It is perfectly natural, therefore, that the Porto Ricans should imagine it was annexation to the United States that hurt them, whereas it was Brazilian production, and they would have fared no better had they remained subject to Spain.—New York Commercial Bulletin.

\* \* \*

A circular on the New York Coffee Exchange, asking signers, requests the Board of Managers to request the abolition of the Revision Committee and that the present differences between grades of coffee of 50 points remain.

\* \* \*

Cables from Rio say that the *Brazilian Review* publishes: "Crop damaged by drouth; crop sustaining damage by insufficient rains."

\* \* \*

**Porto Rico Coffee.**—OFFICIALS SAIL TO PRESENT RESOLUTIONS THEREON TO PRESIDENT ROOSEVELT.—A San Juan, P. R., correspondent writing on 14th ultimo to the *Tea and Coffee Trade Journal* says:—

Secretary Hartzell and Commissioner of Education, Lindsay, have sailed for New York to present to President Roosevelt Resolutions adopted by the coffee-growers here, asking for all possible aid from the Federal Government to assist in obtaining a market for Porto Rico coffee by effecting commercial treaties with France, Spain, Italy, Germany, and Austria.

"Porto Rico coffee will come to have the same vogue in the United States it one time had in Spain, and its people will be lifted out of poverty and ignorance." This is the prophecy made by James Struthers, grower of Bayamon, Porto Rico.

"The coffee of Porto Rico will soon make itself felt in the United States market," he added. "There is no better coffee in the world outside of Arabia than that grown in our island. Millions of Americans who believe they drink coffee three times a day would not know coffee if it were poured out to them. Tons of chicory, roasted beans and peas are being drunk for coffee, while the Porto Rican berries go to waste. Porto Rico's coffee is strong in tannin, and the American palate will not tolerate this. The berry is shipped green to the United States and roasted by the American or

'light' process, which does not remove the tannin. This astringent quality is overcome by the French or 'dark' roasting process, and plans are evolving to give Porto Rican coffee this treatment and build up a demand for it in the United States by the distribution of samples. Before the American occupation the island's coffee found a market in Spain, but this market was closed when the mother-country put a heavy tariff on Porto Rican coffee. Within a few years, though, the United States will buy every pound of coffee that Porto Rico can grow for export."

\* \* \*

The very finest Jamaica coffee rarely goes to the United States. In Great Britain it is considered the peer of any coffee.

\* \* \*

The longer that coffee is kept in the green state, within a reasonable period, the better should be its flavour. It mellows with age.

\* \* \*

Brazil coffee usually loses about one per cent. less in roasting than Java or Maracaibo, perhaps because the Brazilian bean is less spongy than the other kinds.

\* \* \*

The glazing process is recommended by no less an authority than the late Baron Liebig, who gave considerable study to coffee and its preparation for the table.

\* \* \*

Roasting not only brings out the good qualities of coffee, but neutralizes the bad ones. It is a most important process. Upon the roasting depends the satisfaction of the consumer.

\* \* \*

Porto Rico coffee used to have a rather "hidey" flavour, that is, the ordinary grades, but the better qualities were free from fault and much esteemed by coffee-drinkers, especially in Spain, Italy, and Cuba.

\* \* \*

Pole-cat coffee is a grade of the Brazilian bean, and despite its sinister name and its dark colour and muddiness in the cup, it is highly appreciated by many good judges of coffee. It is a dark bean, almost black.

\* \* \*

Messrs. Karl Krische & Co., Rio, cable on coffee: "Receipts will soon be smaller. They will, however, still be large during this week (last week). Commissarios have bought large quantities of coffee in the interior. Receipts will probably turn out 100,000 bags larger than estimated."

\* \* \*

Messrs. Karl Krische & Co. cable that *Brazil Review* reports of the Rio coffee crop: "Large receipts due to high prices and need of money; half of crop in."

\* \* \*

**The U. S. Coffee Market**—Prices are firm in coffee, says the *Tea and Coffee Trade Journal* of 20th ultimo, but business is scarcely more than fair. The advance naturally has arrested buying somewhat on the opinion in the trade that supplies so far are too large to warrant the firming-up that has occurred, and that nothing had best be done until it is definitely known that the Brazil crop now being marketed is going to be much smaller than thought early in the Summer. In the past week the Brazil receipts have been rather full, but it is thought that coffee has been rushed to market to meet the advance in prices, and that from now on actual

smaller receipts will disclose themselves. The prediction is freely made by conservative sources that a little later on the Coffee Exchange will witness the liveliest times in its history, and that March or May will go up to 7c. Such an advance will naturally affect the price of actual coffee, which must rise proportionately in sympathy with the influence. Reports are insistent that interests for a long time bears in the market were purchasing options last week; anyway, while their reports are still inclined to show gloom, a distinct change in the tone is noticed as though preparing the way for a change on their part in the market. On the Exchange there has been a fairly aggressive market, in which the arbitrage house chiefly figured. The close was rather listless.

Brazil prices are unchanged and steady. A sale record in the latter part of the week included 2,500 bags Santos No. 2 at 7½c. c. & f.; 750 bags Rio No. 4 at 6.40c. c. & f. Spot invoice has ruled firm and prices closed firm at 5½c. for Rio No. 8, 5½c. for Rio No. 7, 6½c. for Rio No. 4, and 6½ to 6¾c. for Santos No. 4.

There was fair amount of buying, and especially of coffees that showed good cup quality, for which there is always a demand in the market and a scramble when found, so scarce are they. This applies to any kind of coffee; it is wonderful that these much-desired grades should be so scarce. Jobbing has been only fairly active, buying being retarded by the advance in prices.

Mild coffees are firm and unchanged. Importers, as a rule, have a higher opinion of the values that should be obtained than the buyers and trading in consequence meets checks. Coffees good in cup quality are always in request and command premiums. Good Cucuta is 8c. East India coffees are steady.

Receipts at Santos last week were 211,000 bags, against 265,000 bags at same time last year; at Rio 137,000 bags and 100,000 bags respectively; total, 348,000 bags and 365,000 bags respectively.

Total stock in United States October 1, 2,465,686 bags against 2,771,000 bags October 1, 1902. Brazil stock in the United States October 17, in store and afloat, 2,516,737 bags against 2,818,585 bags at the same time last year. Other than Brazilian, 382,039 bags, against 241,767 bags last year.

Brazil coffee in New York October 17, 1,898,542 bags. Stock in other coffees, October 12, 320,851; in San Francisco, 54,782 bags and in New Orleans, 6,406 bags. Visible supply in the world of all coffees, October 1, 13,770,429 bags.

Brazil stock in Baltimore, October 17, 52,816 bags; in New Orleans, 128,195 bags.

"Grocery" gives some reasons for the steady decrease in the imports of coffee which has continued for some years. "In the first place, people in England do not know how to make coffee, and in the second place few people know how to roast coffee. In the third place coffee loses a very large percentage of weight in roasting, and that, together with the duty ('Free' Trade, remember) makes coffee-selling far from the profitable concern it is supposed to be."

Coffee imports at the port of New York, September, 1903, according to Custom House: France, 275 lbs.; Germany, 16,990 lbs.; Netherlands, 11,420 lbs.; England, 18,051 lbs.; Guatemala, 60,879 lbs.; Nicaragua, 50,316 lbs.; Mexico, 69,670 lbs.; British W. I., 2,126 lbs.; Haiti, 193,530 lbs.; Brazil, 43,282,998 lbs.; Colombia, 8,510,645 lbs.; Ecuador, 410 lbs.; Venezuela, 4,276,188 lbs.; Aden, 142,984

lbs.; Dutch E. I., 173,339 lbs.; Turkey-Asia, 85,214 lbs. Total, 56,895,034 lbs.

Exports of coffee at the port of New York during the month of September, 1903: Belgium, 67,552 lbs.; France, 80,958 lbs.; Germany, 67,144 lbs.; Netherlands, 15,800 lbs.; England, 78,173 lbs.; Bermuda, 4,235 lbs.; British West Indies, 8,833 lbs.; Cuba, 1,146,196 lbs.; Danish West Indies, 1,263 lbs.; Dutch West Indies, 803 lbs.; British Guiana, 5,260 lbs.; Australia, 22,000 lbs.; British South Africa, 33,000 lbs.

## TEA NOTES.

**Tea in New York.**—The feature of the present tea year so far as the trade in New York is concerned, is, says the *Tea and Coffee Trade Journal*, the demand for the better grades of tea, and the reduced call for the grades of inferior quality. Although the former has in consequence risen in value, or at least remained firm in price, and the poorer article has depreciated because of the neglect in inquiry, there seems to be no let-up in the sales of the former, and no more activity in the disposition of the low tea. This situation may be regarded with no little satisfaction, and we are sure it is so accepted by the tea trade that is wont to give some thought to the quality of tea Americans should drink. Apart from the profits realized by some in commissions, a procedure usually sought in the placing of low-grade teas, we are sure the tea dealers at large will find the better grades of teas as most satisfactorily money-making, to say nothing of the pleasure found in selling only an article that recommends itself from the point of view of excellence. Of course one swallow does not make a Summer, and it may be that next year we shall find Americans inclined to retreat from fine tea-drinking, but it would seem that fine tea, once tasted, will make that of inferior quality intolerable, and so good ground gained become permanent. And a good thing is apt to find popularity, and, even supposing that for the time the growth of tea-drinking is arrested by the general use of a high-priced leaf, it would indeed be a feather in the cap of this country to be known as the consumer of 100,000,000 pounds of high-grade teas rather than the consumer of 200,000,000 pounds of inferior grade. We can leave that to the United Kingdom, the European continent and our Canada, countries in which poor trash seems to have the right of way. The call here for the better grades is explainable on the theory that dealers are personally urging the use of better grades of tea, and are succeeding. Not a little praise also is due to those firms which are advertising their blends extensively. As a rule, they sell only teas of a very good grade, and utterly shun meretricious methods. We have in mind one firm, extensively known on this side of the water and abroad, which makes it a special point to offer only teas of high grade, although abroad a business in inferior tea is chiefly dealt in. This is quite a compliment to the American people, and it is gratifying to note that we are responding, showing that we are susceptible to uplifting influences just as we were obdurate in refusing tea some years ago poured down upon us by unscrupulous men, who thought we could be fooled in buying any old weed and twisted dry mud so long as it was labeled tea.

**The U. S. Tea Market.**—More life is reported in the tea market; says the *Tea and Coffee Trade Journal* of 20th ultimo, trading has broadened and values are very steady; the

undertone is especially strong and throughout there is a general return to confidence. Teas of higher grade are especially in demand and very firm. Particularly is this true of country and Pingsueys; good Moyunes are very hard to find in the market, and are thought good to hold for investment, a decided advance in them as the season advances being entertained. For low-grade teas the market, too, has improved in the week. Not long ago the market looked very discouraging, but since the consuming trade has learned that it cannot get all the good teas that there is a demand for, it is inclined to inquire for what remains, and that naturally is of the lower grades. Besides, export demand is steadily and surely cleaning the market of old stocks of this class of tea. More than 1,000 packages of Congous were sold last week, and the bidding now has advanced to 8½c.—an advance of one cent in the course of the month. Even at this price holders are slow to come forward, expecting even higher bids from across the water. In London the situation, which creates this demand for our Congous, continues strong. Supplies of Indian and Ceylon teas are less than last year, while demand and consumption are greater, so much so that stocks are diminished by several million pounds, and in consequence these teas rule relatively high. The Congous here have been called upon to fill the breach, which appears to be a very wide one. Still another circumstance, now a prospective one, but of considerable importance to this market in view of its effect should it become an event, is the repeal of the tea duty in England. It is thought that this will occasion such a demand for tea of low price that our market, which has them, will be altogether denuded of them. We have yet not a small quantity of Congous of this description, and then many Foochows of low grade remain unsold. So the situation for America should be improved throughout; the incubus of the low-grade Congous and other teas of this kind can be well got rid of; if London can absorb them, well and good. London has also been buying some high-grade Congous; it is assumed here that the Englishmen have been caught short in the market in China, and have come to America to make good their shortage, even at the prices ruling here. All the more is the tone here for Congous strengthened.

Foochows, too, are improving. From China news has come of the settlement there recently of some 20,000 packages for this market. The teas are mostly of the 12c. kind. Such samples as have arrived have given satisfaction in the matter of quality, something which has not ruled in Foochows lately. It has been thought in view of the large stocks of this tea remaining unsold, that this tea would find no encouragement in the market, but apparently conditions have changed. Indias and Ceylons remain very firm, greens included. A large sale last week was that of more than 1,200 packages of Indian black. Formosas, too, are strong in the better grades, and now that the Amoy market has practically closed the lower grades have picked up, also, independently of the general improved condition for low-priced teas. Japans are firm all along the line, and, again, especially for the superior grades.

Canada reports a rather quiet tea market on the whole, and a scarcity in low-priced teas. Japans are firm and some fairly good sales have been made at 17½c. There is free demand for Ceylon greens, which sell readily at 16 to 16½c.

In Indian blacks the low-priced sorts find a ready market: Ceylon blacks at 20½c. have also found purchasers. There is little doing in either China greens or blacks.

\* \* \*

**Japan Teas.**—The Japan Tea Exporting Co., September 30, writes:—

"Arrivals show a material decrease. The decrease in the production of low-grade teas being particularly great—about 100 piculs less as compared with last year. Prices again advanced at the end of last month, and continue to be maintained. Should prices undergo more or less of a decline it would in all probability still lead to a fair demand for the low grades. The stocks now on the market consist of undesirable descriptions. There are some quantities of fine and higher grade teas retained in the producing districts, but holders are not at all anxious to quit their holdings as long as prices remain low."

Total shipments to September 26 are 34,764,942 pounds against 28,535,032 pounds at the same time last year.

\* \* \*

Many of our readers will doubtless read with interest the following remarks made at the last General Meeting of the Shareholders of the Associated Tea Estates of Ceylon on October 28th by Mr. Fraser:—On my first visit to the estates, over two years ago, I recommended a somewhat bold policy, at a time, too, of stress and strain, and at the present juncture it seemed to require from me a few remarks justifying its continued adoption. So far the financial result is not quite satisfactory. This, however, will gradually improve, as soon as the effects of the liberal manuring policy now adopted become manifest. The yield will increase and the cost will be reduced per lb. of tea. On all your properties the soil was seriously exhausted, and on Chesterford and Doragalla the bushes were small, stunted, and hidebound, and will require continued careful treatment to bring them up to a strong healthy standard. The capital in the soil had largely been carried off the land by cropping and percolation loss, and the bushes had ceased to form rootlets to a large extent, and were unable to secure even the limited supply of food available. This, with the heavy rainfall of 120 to 200 inches per annum, rendered it difficult to restore fertility, develop the bushes, and show satisfactory financial results with the low prices ruling during the past two years. Distinct progress has been made from the agricultural standpoint, your properties having decidedly improved, especially Silverkandy and portions of Chesterford. It appears to me, when your estates were purchased, it was not by any means realised to what extent the soil and bushes were exhausted. When this became apparent there were two policies open to the directors, either to continue the process of exhaustion, combined with cheap methods of cultivation, or adopt a liberal building-up one. The Directors have wisely adopted the latter. Your capital in this way will be preserved, and in due course moderate dividends will be secured. If the alternative had been carried out it meant gradual exhaustion beyond a paying level, even with the cheapest methods, and ultimate abandonment and an almost entire loss of capital. Doragalla is the main difficulty in regard to the general improvement, owing to practically the whole estate being covered with a most troublesome weed, "oxalis violacea," impossible of eradication and that grows all the more readily the more highly the estate is cultivated by using up a considerable portion of the manures applied. The estates are gradually being planted up with a leguminous tree, "Albizia Moluccana," that collects the atmospheric nitrogen by the aid of

noduli bacteria, that grows on the roots of the plant. The trees when cut down and incorporated with the soil increase the stock of organic nitrogen at small cost. Nitrogen is the most essential and expensive ingredient required by tea, and very readily lost in many soils where the rainfall is heavy. I fully hope, however, to see the cost per lb. of tea gradually reduced by the aid of nitrogen-collecting trees and shrubs, and the fertility of the land built up and maintained.

The falling off in yield the past season on Doragalla and Chesterford was owing to the cessation of artificial manuring in 1901-02 and to a distinctly unfavourable season. Manuring was fully maintained on Silverkandy during the year referred to, and there the yield was increased, cost reduced, and prices improved.

**Calcutta Tea Sales.**—At the Calcutta auction on the 6th instant, 20,105 packages were sold. There was a fair steady demand for all grades. Russian and Bombay buyers were keen operators. Quantity was said to be without any great change but the average was no doubt a trifle higher, attributable chiefly to improvement noticeable in Dooars and Assam kinds. Of really good teas there were practically none, but an improvement in this respect may be looked for shortly. Sylhets and Cachars remain much as previously, perhaps a little better in cup here and there, but nothing very much. Darjeelings are again in moderate supply and quality is fair without any invoices that call for special comment.

**Mr. Larkin on Indian and Ceylon Teas.**—Mr. P. C. Larkin, who is styled in the United States "the Tea King of America," has recently visited Chicago, and the newspapers of that city have published his views about the future of the tea market. The *Chicago Daily Tribune* says:—"In talking of trade conditions between the United States and the eastern tea-producing countries, Mr. Larkin declared the time is not far distant when teas grown in Ceylon and India will take the place of the Chinese and Japanese products. The teas from India and Ceylon have only been introduced in America within the last few years, but the rapidity of the growth of their use since has been so great that it only is a matter of time until we must cease to import the Chinese and Japanese article."

To a representative of the *Chicago Journal* Mr. Larkin, on behalf of his firm, said:—"We believe that with the advent of Ceylon and India teas in the United States the consumption *per capita* will increase rapidly, as it has done in England and elsewhere. This because the teas are much more delicious and very much more healthful."

We understand that Mr. Larkin has signed a contract with an advertising agency in New York, engaging to spend 40,000dols. (£5,000) in advertising British-grown tea next year, in sixteen papers in the United States. He already advertises in all the Canadian papers, and he looks forward to doing the same in all the United States papers in the course of a few years.

**Needle-Leaf Teas.**—A NEW CEYLON INVENTION.—It may be remembered, says the *Times of Ceylon*, that nearly a year ago "T Gossup" sent us samples from New York of Japan needle-leaf teas, and urged that, if planters could turn out these a field of 30,000,000 lbs. lay open to their ingenuity and enterprise. A prominent firm of brokers expressed to us the opinion that no machinery could imitate this hand-

rolled leaf; but some months back, we now learn, Mr. A. H. Ayden, of Messrs. Whittall & Co.—having known from his own experience the value of imitating the basket-fired teas of Japan, and of an invention, which would achieve this—began experiments which have been continued ever since, and with such encouraging results that samples are now before us of Ceylon leaf rolled lengthwise by a machine which he has taken adequate steps to patent both in Ceylon and in India. The machine was made by Messrs. Brown & Co., Ltd., of Hatton; and the principal features of it are that an outer cylinder, with blades, revolves slowly in one direction, while an inner cylinder, similarly fitted, rotates more rapidly in an opposite direction. The leaf is thus constantly moving, with air freely circulating through it. It is also twisted entirely in its length, and not rolled in a mass as in the existing machines. It is cooled in the process, and comes out at a lower temperature than it went in; and there is an exceptionally small percentage of dust and fannings. The machine which has been experimented with takes 70 lbs. of leaf, but it is expected that better results can be obtained from machines taking 300 lbs., and further tests are to be made on this larger scale. The finishing process now carried on in Colombo for practically all the teas for the United States will also be used. There is a considerable saving of fuel, and the machines, when put on the market, will be obtainable at half the present price of black tea rollers. We congratulate Mr. Ayden on the success that has hitherto attended his efforts. The invention, while adding another to those made in Ceylon, is apparently, unique, and will, we trust, open up an entirely new branch of machine-made teas.

**The "Corner" in Tea.**—A correspondent of the *Westminster Gazette* sees in Mr. Chamberlain's proposal for the reduction of the tea duty something sinister. The consumer, according to this correspondent, would only benefit for a short time, and the "result of reducing the cost of tea by 4d. per lb. would be to encourage the importation of cheap Chinese teas again, in competition with Indian and Ceylon teas. Preferential tariffs being the policy of the country, the Indian and Ceylon tea-planters would claim to be protected from China—a claim it would be impossible to resist. A higher duty being then placed on China tea, up would go the price of tea generally, and the benefit now held out as a bait by Mr. Chamberlain would disappear." According to this correspondent's argument Mr. Chamberlain is merely holding out a bait to the consumer by which ultimately tea-growers alone would benefit. We have had this story before. It is simply another version of the imagined "corner" in tea which growers in India and Ceylon are supposed to be yearning after.

Sam Houston Park has been made an experimental station for tea-growing in Texas. A. R. Moore has presented the park management tea-plants sent him by the Agricultural Department of the Federal Government.

**Ceylon Tea for Russia.**—A BLOCK ON THE TRANS-SIBERIAN RAILWAY.—Owing to the recent heavy rains, a part of the Trans-Siberian Railway which, in any case, as is known, was none too well laid, has been washed away, says the *Times of Ceylon*. In consequence about 3,000 tons of tea have been blocked; and Russian buyers in Colombo have reason to believe that a good deal of Ceylon tea is included in this.

As is known, the greater part of the tea exported from Ceylon to Russia is now sent *via* Dalny and not *via* Odessa, owing to the recent increase in the customs charges at the latter port. From Colombo to Dalny occupies 22 days, and it takes a steamer about the same time to travel from Colombo to Odessa. It is, therefore, in the overland journey that the difference lies. The tea can be put on the Russian markets from Odessa in five days; but it has to travel from Dalny for 25 days. On the other hand, Dalny has the advantage in that a duty of only 25·50 roubles is charged per pound (36 English lbs.) as against 33 roubles in Odessa. When tea is wanted urgently it still has to be sent *via* Odessa, and one Russian firm despatched 30,000 lbs. of Ceylon tea by this route the other day.

**Calcutta Tea Sales.**—Messrs. A. W. Figgis & Co's report dated Calcutta, November 6, 1903, says quantity brought to auction to date:—

1903.	1902.	1901.
440,437 pkgs.	411,978 pkgs.	379,811 pkgs.

Quantity.—At this week's auction 20,675 packages were offered from the following districts:—

	Packages.
Darjeeling ...	1,492
Dooars ...	4,155
Terai ...	772
Assam ...	5,633
Cachar ...	4,259
Sylhet ...	4,039
Other districts ...	325

Total ... 20,675

Of this quantity some 570 packages were withdrawn under bid or did not arrive in time. The rest sold, about 20,105 packages passing the hammer. There was a fair steady demand at this sale. Common kinds, here and there, show a very slight drop, but medium teas, with any approach to improvement in liquor were well competed for and sold at somewhat higher prices. There was hardly any "stand out" invoices, except a few Darjeelings, which realized fair rates. Quality shows very little improvement, except occasionally an invoice from the Dooars. The demand for teas, suitable for outside markets, continues very strong.

**Calcutta Tea Sales.**—At the tea auction at Calcutta on the 13th instant 23,129 packages was offered and 22,450 sold. The market firmed up, and the keen competition at the previous rate was fully maintained. Buying for outside markets was keen, and a large quantity of suitable teas was taken.

**Dust or Tea?**—An interesting experiment was made on October 27, according to the *Daily Mail*, to test the assertion of the Chairman of the Central Tea Company that cheap teas sold in this country must either consist of the rubbish discarded by the American Customs as below standard, and of too low a grade for consumption, or be the sweepings and refuse from China for which no other market could be found.

At a shop which supplies the needs of a crowded neighbourhood, "a quarter of tea" at 1s. a pound was purchased on the understanding that it was good tea for which there was a large demand. This was immediately placed before an expert, who buried his nose in it, and pronounced it to be Chinese grown. It was then infused, when the "quality" was at once apparent. The first cup was acrid, and the

second infusion of the same leaves gave off a slightly coloured liquid almost tasteless.

"That", said the expert, is what we want to teach the public. They do not get an economical article by buying cheap tea. The Russians, now, are more ingenious. They are poor, and a spoonful of tea must necessarily be made to go a long way. So they buy Indian tea, which would go twice as far as this. And he pointed to the sample quarter.

The cheap teas are usually China grown, but a really drinkable Indian tea can be obtained for 1s. 6d. or 1s. 8d., the lowest possible limit at which a good article is to be had. That bad tea finds its way into this country at all is due to the fact that England has no Pure Tea Law like America, where a standard is adopted below which no tea must be imported into the country.

Last year consumers in England suffered very heavily from the fact that cheap and good teas were impossible to obtain, and a large quantity of rubbish was shipped from over the Atlantic to be blended here and sold broadcast. To quote the expert again "the remedy lies in our own hands."

**The Tea Trade and Mr. Chamberlain's Proposals.**—A *Times* correspondent writes:—

Mr. Chamberlain's proposal to reduce the duty on tea from 6d. to 1½d. per lb. is of considerable importance to the proprietors of tea estates in India and Ceylon. The question which is occupying the attention of planters at the present moment is this: How will this affect us?

It has often been argued that to abolish the duty on tea would not be an advantage to India and Ceylon, as it would encourage the importation of China tea, which is of inferior quality, but of which there is supposed to be a vast quantity sufficient to glut the London tea market. This China tea is of too low a quality to induce merchants to import it with a duty of 6d. a lb. to be paid. Will China tea, therefore, be largely imported if the duty be reduced to 1½d. per lb.? We believe that Indian and Ceylon tea proprietors and planters need not be alarmed on this ground.

There is such a vast difference in the care used in cultivation, the plucking of the leaf, the withering, the rolling by the best machinery, the fermenting, the firing, the sifting into different grades of Orange Pekoe, Broken Pekoe, Pekoe, Souchong, etc.—in fact, in the whole process in Ceylon—as compared with the antiquated hand-made China methods, that, apart from the natural qualities of the leaf itself, Ceylon must of necessity produce as much better tea. Only those who have lived on a Ceylon estate can possibly realise the exceeding care which is enforced. As a body the tea-planters are a hardy, resourceful, intelligent, courageous body of men—all English, Scotch, or Irish—and proud of the fact that there is no adulteration or trade trickery of any description whatsoever in their business. It may be asked who will really get the benefit of the 4½d. reduction in duty. As the British public has had to pay the duty of 6d. a lb., so will it get the benefit of the reduction, but the tea industry will also assuredly benefit through an increased demand for tea caused by its cheaper price. The present average price of all the Ceylon teas is about 7½d., to which must be added 6d. a lb. duty, thus bringing the cost to 1s. 1½d. per lb. If, in accordance with Mr. Chamberlain's proposal, the cost be reduced to 9d. per lb., surely this will cause a fairly large increase in the consumption of tea. If we add 3d. a lb. for the retail dealer, it should then be possible for the public to purchase really good Indian and Ceylon tea for 1s. a lb. The tea industry for the past few years has been in a most unsatisfactory condition, and the heavy duty of 6d., which is equal to an *ad valorem* duty of 80 per cent., has been a severe handicap in checking consumption.

Well may planters say, as they have so often said, "Here are we, an English colony in which we have spent millions of money in opening tea estates and in machinery for our factories, every penny of it British capital, our industry not getting 5 per cent. interest, and still the old mother-country imposes a duty of 80 per cent. *ad valorem* on our tea. Why so much talk of free trade when there has never been free trade for us. Free trade is for the benefit of the foreigner, not for loyal colonists." The tea-planter's life of

to-day is very different to the palmy coffee days of twenty-five years ago. The life of a planter in those days was a perfect paradise compared with tea-planting of to-day, when the utmost and unceasing care is required and the cost of working expenses has to be reduced to the finest point of economy.

Tea is grown in Ceylon at sea-level and at every elevation ranging up to 6,500 ft.; the higher the elevation the more delicate the flavour of the leaf. Lucky are estate proprietors who have properties at 5,000 ft. elevation and upwards, because jungle land cannot now be purchased from the Government at above that elevation. Twenty years ago the Ceylon Government was warned that if the mountain tops were denuded of jungle growth it might seriously affect and cause a decrease of the rainfall of the island, and in consequence of this warning an Act was passed by the Ceylon Legislative Council to stop the sale of all Crown jungle land at elevations of 5,000 ft. and upwards. It was a wise act undoubtedly.

There are no crop seasons in Ceylon as regards tea, as the trees go on "flushing" all the year round. This, no doubt, is in consequence of its being an island having a hot, moist atmosphere. Almost any climate may be had, from the hot, moist heat of Colombo to the cold, frosty air of Newara Eliya, which is 6,200 ft. above sea-level. For beauty of scenery and richness of vegetation Ceylon stands unrivalled, and financially it is thoroughly sound. This latter fact is in some measure due to its highly paying State railway, for which its rulers claim credit; but it is, perhaps, doubtful statesmanship to run a railway at high rates, which give large immediate profits, but which hamper commercial industries, and conduce to careless and expensive management.

Tea is of such absolute necessity to the work-people of this country that Mr. Chamberlain could not have selected a more suitable article for reduction of import duty. At the same time he is doing only an act of justice to an industry which is entirely British, and to a body of British subjects who have during the past twenty years gone through greater vicissitudes (owing to coffee leaf-disease) than almost any other colonists. We trust that the British workman, the Indian and Ceylon planters and proprietors, and even the poor Tamil coolies, whose wage is about 5d. per day of ten hours, may all derive benefit by the lower cost and consequent increased consumption of tea.

If, when prosperity does return, the planters will avoid coarse plucking—which produces inferior tea and which greatly increases the weight of production and gluts the market—they may reasonably look forward, not to temporary, but to permanent cheery days, should Mr. Chamberlain's proposal become an accomplished fact.

\* \* \*

**The Tea Trade.**—"J. D. H." writes to the *Pioneer*:—"For years past the "pushfulness" of the Ceylon tea-planter and his readiness to adapt his style of manufacture to suit the requirements of new markets, has been held up as a model for the Indian planter. This particular trait in his character is admirably illustrated in a letter in your issue of the 1st instant from Messrs. Brooke, Bond & Company, Limited, in which the following occurs: "Therefore, Ceylon planters have taken up the manufacture of green tea, and turn out blends equal to the best Japanese production. As it is found that the same kind of tea does not suit all parts, samples of water from all the great cities of North America are sent out and tea is manufactured to suit them." There must be many who, like myself, are interested in the manufacture of green tea, and who would like to know how this is done. Perhaps Messrs. Brooke, Bond & Company will give some particulars in their next letter. Presumably different days are set apart for the manufacture of tea to suit the water of each city, but the passing of so many kinds of tea through the market without some confusion arising occasionally, must in itself be no small task. One wonders what would happen if a chest of tea made specially for Boston should by any chance find its way among others intended for Buffalo. Then, again, there are the many smaller towns, samples of the waters of which may not happen to be in the factory; how do they fare? Possibly they have to be content with the style of tea manufactured to suit one of their larger neighbours, although this can hardly be very satisfactory for them. Another point on which some information would be interesting is with regard to the samples of water. Are they like American meat sent out in a frozen state or in liquid form, and, if in the latter, in what condition do they arrive? So far as I am aware, no Indian state has yet reached this state of perfection in the manufacture of

tea, the manipulating of which to suit the waters of the different towns at home has hitherto been left to the large advertising dealers. The Americans rather object to their tea being interfered with by middlemen, and doubtless also find that the various styles and flavours are more pronounced when the manipulation is all done on the estate, and the Ceylon planters with their usual acuteness have, as has been shown, taken the matter up. Doubtless the Indian planters will follow their example when once the secret of manufacturing tea to suit different samples of water becomes more generally known.

\* \* \*

Tea exported from New York during September, 1903: England, 236,039 lbs.; Nova Scotia, 2,109 lbs.; Colombia, 315 lbs.; Bermuda, 280 lbs.; British West Indies, 145 lbs.; Venezuela, 35 lbs.; Cuba, 25 lbs.; Ecuador, 18 lbs. Total, 238,966 lbs.

\* \* \*

**Tea and Coffee at San Francisco.**—Tea imports at San Francisco during September:—

	Pounds.
England ... ..	2,500
Chinese Empire ... ..	495,618
British East Indies ... ..	97,609
Japan ... ..	1,071,100
Total ... ..	1,666,827

Coffee imports:—

	Pounds.
Costa Rica ... ..	19,400
Guatemala ... ..	413,016
Nicaragua ... ..	68,028
Salvador ... ..	81,300
Chinese Empire ... ..	33,200
British East Indies ... ..	81,020
Total ... ..	695,964

\* \* \*

Tea imported during September, 1903, according to Custom House reports: Hankow, 1,711,090 lbs.; China, 1,094,315 lbs.; Yokohama, 914,519 lbs.; British East, other, 594,807 lbs.; Shanghai, 1,093,834 lbs.; Tamsni, 483,172 lbs.; Kobe, 381,793 lbs.; Foochow, 337,268 lbs.; England, 329,185 lbs.; British India, 46,071 lbs.; Hong Kong, 30,919 lbs.; Nova Scotia, 24,075 lbs.; Muroyama Islands, 22,470 lbs.; Scotland, 111 lbs.; France, 20 lbs. Total, 7,063,649 lbs.

\* \* \*

**Telegraphic Weather and Rainfall Reports for week ended 3rd November, 1903:—**

**CACHAR.**—Hailakandi P. O.—Beneficial rain has fallen, and the temperature, though variable, has not been unfavourable for growth. Crop prospects are moderately good. Week's rainfall 0.43 of an inch. Total to date 92.51 against 104.24 inches last year.—**Katlicherra P. O.**—The rainfall has been beneficial, and crop prospects are moderately good. Manufacture has been conducted under difficulties owing to adverse weather conditions. Week's rainfall 2.62 inches. Total to date 106.89 against 117.53 inches last year.—**Kumbhir P. O.**—The weather has been cold and wet since the 29th October and crop prospects are fair. Week's rainfall 8.10 inches. Total to date 122.57 inches against 133.80 inches last year.—**Kalain P. O.**—There have been irregular and unusually heavy showers since Thursday evening, but a change for the better has now set in, and crop prospects may be said to be moderately favourable. Week's rainfall 8.19 inches. Total to date 184.15 inches against 187.66 inches last year.—**Barkola P. O.**—Good rain has fallen during the week and the weather has suddenly become dull and cold. Week's rainfall 8.41 inches. Total to date 159.35 against 158.05 inches last year.

**ASSAM.**—Chabwa P. O.—The weather has been favourable, being exceptionally warm for November, and crop prospects continue satisfactory. Week's rainfall 0.80 of an inch. Total to date 121.40 inches against 132.22 inches last year.—**Bindukuri P. O.**—Crop prospects are moderately favourable. Rainfall to date 68.85 inches against 83.26 inches last year.—**Dibrugarh P. O.**—Weather is seasonable and immediate prospects fair. The days are warm but nights cold.—**North Lakhimpur P. O.**—Weather is seasonable and prospects good.—**Nelli P. O.**—With the exception of the last two days, which have been cold and cloudy, weather on the whole has been favourable and crop prospects for November are fair.

Week's rainfall 1.38 inches. Total to date 65.38 inches against 69.18 inches last year.

**SYLHET.**—Chandpur Bagan P. O.—Weather has been wet and cold in consequence of which manufacture has had to be conducted under difficulties. Crop prospects are moderately good. Week's rainfall 5.56 inches. Total to date 92.89 inches against 112.72 inches last year. —Munshi Bazar P. O.—Too much cold rain and a low temperature have retarded growth and crop prospects are fair. The rain gauged during the week was 5.35 inches, and there is every indication of more falling.

**DOOARS.**—Alipur Duar P. O.—Weather is seasonable, the days being fine and bright, but nights cold with heavy dew. Rainfall to date 177.40 against 200.74 inches last year. —Chalsa P. O.—Bright warm days with cold nights. Rainfall to date 166.69 inches against 178.82 inches last year.

#### Tea or the Cup?—

On a September day I heard a mournful wail  
It was Sir Thomas whining for a *Shamrock* sort of gale,  
And this he got,  
But not the pot.  
We dined him to the fill, we wined him night and day,  
And fancied that the gallant knight in time would go away,  
He said: "Not I,  
More 'ads' I'll try."  
*Refrain.*

Won't you go home, Sir Thomas, won't you go home?  
List to our native cries,  
We'll drink your Oolong, darling, we'll eat your jams,  
We'll buy your cheap pork pies.  
Everything has a limit, you have reached yours,  
Isn't it time to roam?  
All of us see through the "sportsmanship" now.  
Sir Thomas, won't you please go home?

—Town Topics.

#### NOTES.

##### Age.

Coffee improves with age. Tea loses with age.

##### Preference.

In the New Zealand Parliament the Rt. Hon. R. Seddon, the Premier, has proposed that after next March British-grown tea shall be duty free, while the duty on foreign teas shall be increased by twenty per cent.

##### Entomological Circulars.

The three latest Circulars on Agricultural Economic Entomology prepared by Mr. E. P. Stebbing for the Trustees of the Indian Museum deal with the large field cricket, the cotton-boll sapper, and the crop-eating noctuid caterpillar.

##### Java Planters in Ceylon.

Messrs. Bamber and Herbert Wright, in charge of two Java tea plantations, a few days ago arrived in Ceylon. Another planter, Mr. J. G. E. G. De Dleu Stierling, has been sent by the Java Planters' Association to study the growth and manufacture of Ceylon tea. They are not to visit India.

##### Cinchona.

The auction held at Amsterdam on November 12 consisted of 7,569 bales and 637 cases, weighing 702,829 kilos. The stock in first hands at Amsterdam on October 23 consisted of 2,940 packages Government bark and 9,062 packages private bark, including the quantity to be offered above.

##### Rubber in Burma.

The efforts of Government to encourage rubber cultivation in Burma are being attended with a certain amount of success. A Burmese

Municipal Commissioner of Shwegyin has taken up the cultivation there and the wife of a Forest Officer has a large rubber plantation and recently obtained about 100,000 plants from Ceylon.

##### London Tea Sales.

Messrs. Gow, Wilson & Stanton report that in London on the 12th instant buyers were operating very cautiously. The market price for medium liquoring Pekoes and common Pekoes and broken Pekoes was weak. The average prices of Assam and Indian Tea sold on garden account are 8½ and 7½d. respectively.

##### Locusts.

Mr. Maxwell Lefroy, Entomologist to the Government of India, has been making various experiments to combat the locust pest at Surat, where swarms have been damaging the crops in several places. Strenuous efforts have been made to destroy them and keep them continuously on the move so as to prevent them from depositing eggs; but so far with little or no result.

##### Manurial Experiments in Ceylon.

At last week's Agricultural Committee Meeting at Peradeniya it was announced that the Government had secured, separately, twelve-acre plots of tea at Ambalangoda, Peradeniya, Dessford, Haputale, and Portswood to carry out a thorough scheme of manurial experiments in these representative parts. The experiments last for three years free of freight for all manures.

##### Obituary.

We are sorry to hear that a telegram has been received, intimating the sudden death on the night of the 3rd instant, of Mr. James Petley senior, at Toungoo. Mr. Petley was originally in the Mercantile Marine, but for very many years had settled in Toungoo where he was a Municipal Commissioner, and took great interest in the affairs of the town. He at one time owned large coffee estates in the Leiktho Hills in Toungoo District, and cultivated coffee successfully. Some years ago his trees were attacked with disease, and they all died off in a single season. Mr. Petley, however, started a large coffee roasting business in Toungoo itself, and acquired a high reputation for the article he turned out, his coffee commanding the highest prices in the Burma market.

## LETTERS TO THE EDITOR.

## VAGARIES OF THE BORER.

THE EDITOR,

*Planting Opinion.*

DEAR SIR,—Lately I have noticed a curious feature of the vagaries of the borer, it would be interesting to learn if planters elsewhere—notably in places where coffee is allowed to grow up—have observed anything of the kind, if it is—as to me—a new departure.

Having adopted the Leeming system, my coffee is left unpruned, and so the trees are thick below, with strong suckers above. Some of these for about 6 to 8 pairs of primaries, *from the top*, are drooping, certainly not from want of moisture, for rainfall is above the average. I have bent these affected suckers nearly double but they do not break, and, on closer examination, I found the usual rough bark betokening the borer. This bark on being peeled off, shows that the borer has been round the stem, but for some reason did not enter the wood, for I have split that in search of the enemy; the lower part of the tree is quite healthy; elevation 3,700 to 4,500 feet.

I am told the affected parts will recover so I am leaving them alone, the spike on these is much more advanced than on the rest of the suckers.

SHEVAROYS,  
12th November, 1903. }

Yours faithfully,  
COFFEE.

## GENERAL ARTICLES.

## PRODUCE AND PLANTING.

## Too Much Dr. Johnson.

Advocates of the "Free Breakfast Table" have suddenly discovered that Mr. Chamberlain's proposals as regards tea are to be condemned, not on the score that only the larger portion of the duty is to be removed and not the whole of it, but for the reason that tea, according to Dr. Johnson, "is a barren superfluity." The *Westminster Gazette*, for instance, not only gives us the opinion of the great lexicographer about tea, but tells us the old story about lunacy in Ireland. It says: "Mr. Chamberlain is likely to be challenged by students of our social life for his sedulous endeavours to make it appear that tea-drinking is a custom to be encouraged beyond its present stage. Those who know the result of official investigations a few years ago into the cause of the increase of lunacy in Ireland will not accept Mr. Chamberlain's theory with readiness; and the greatest authority on tea-drinking in all our literature would have vigorously denounced it. Tea is not a food, and no one acquainted with the habits of the people ought to place it on a parity with bread." Any argument is doubtless useful if it can be used to refute Mr. Chamberlain, and for the moment tea is flouted by some of its former friends, who not so long ago were insisting on its importance, especially to the labouring classes. But the lunacy argument is rather stale. Strange to say, Mr. Labouchere, apropos of Mr. Chamberlain's exemption of maize from his food-taxing scheme, says that in Northern Italy, where maize is a staple food of the people, this article of diet produces a sort of madness, and that "a large percentage of the lunatics in the great asylums in Lombardy and Venetia are the victims of this maize-madness." "Can it be," says the *Daily News* apropos, "that the very alarming increase of lunacy in Ireland during the last fifty years—that is, since the introduction of maize—is due to the same cause?" As for Dr. Johnson, that great man may in some of his moods have

railed against tea "as a liquor not proper for the lower classes of the people," but he was inordinately fond of it himself, and to quote his views of the tea of his day in support of a theory that tea-drinking at the present time should be denounced seems a very belated method of attack.

## The Close of the Tea Season in Assam.

An expert correspondent of the *Financial Times* in Sylhet writes as follows:—"Tea-planters in Assam are just now very much concerned as to what the wind up of the season, on which so much depends, will be like. As far as one can see at present, there will be no great increase over last year—at any rate, not more than your market is quite in a position to deal with. Lately the weather has been most unfavourable, and probably there never was a poorer September for outturn in the annals of tea. This applies not only in one district only, but generally, and the result is reflected in the exports, which have been very slowly rising recently, and now exhibit an increase of roughly 6,000,000 lbs. To counterbalance this, however, Ceylon shows a diminution in shipments to the United Kingdom of 7,000,000 lbs. We shall be much astonished if exports, on the whole, show a great increase in spite of new area or maturer tea. Speaking generally, therefore, prospects may be said to be at 'set fair.' The quality of tea made will not be so desirable as one could wish for September, as there has been far too much rain and too low a temperature at night. It is not though that the extra duty put on by Russia on tea consigned through the Euxine ports will affect the Calcutta price average or export, and as some confirmation of this the first direct steamer, *Edward Bury*, left the other day for Odessa with something approaching 10,000 chests. The increase of duty is so small that it is not regarded as having been imposed in a retaliatory spirit, but more with a view to encouraging traffic on the Siberian Railway, *via* Dalny. The outside markets at the Calcutta weekly auctions are now taking quite a recognised place and are becoming a factor to be dealt with when calculating the amount of exports to the United Kingdom. They, no doubt, are largely responsible for a stiffening of prices. Altogether we consider the outlook hopeful if sales are regulated in London. There is some talk of doing the same thing in Calcutta, but as yet no one has come forward with a cut-and-dried proposal."

## Tea Sweepings.

A warning was given to the buyers of cheap tea at the Meeting of the Central Tea Company of Ceylon. The Chairman said "that such tea could only be rubbish discarded by the American Customs as below standard and of too low a grade for consumption, or be the sweepings and refuse from China for which no other market could be found. He suggested that Ceylon and Indian producers should continue to induce the Customs authorities to stop the importation of these adulterated and spurious teas." The *Daily Mail*, with reference to the remarks quoted above, announces that it has made "an interesting experiment to test the assertion that cheap teas sold in this country must either consist of the rubbish discarded by the American Customs as below standard, and of too low a grade for consumption, or be the sweepings and refuse from China for which no other market could be found. At a shop which supplies the needs of a crowded neighbourhood, 'a quarter of tea' at 1s. a pound was purchased on the understanding that it was a good tea for which there was a large demand. This was immediately placed before an expert, who buried his nose in it and pronounced it to be Chinese-grown. It was then infused, when the 'quality' was at once apparent. The first cup was acrid, and the second infusion of the same leaves gave off a slightly coloured liquid, almost tasteless.

"That," said the expert, "is what we want to teach the public. They do not get an economical article by buying cheap tea. The Russians, now, are more ingenious. They are poor, and a spoonful of tea must necessarily be made to go a long way. So they buy Indian tea, which would go twice as far as this." And he pointed to the sample quarter. The cheap teas are usually China-grown, but a really drinkable Indian tea can be obtained for 1s. 6d. or 1s. 8d., the lowest possible limit at which a good article is to be had. That bad tea finds its way into this country at all is due to the fact that England has no Pure Tea Law like America, where a standard is adopted below which no tea must be imported into the country. Last year consumers in England suffered very heavily from the fact that cheap and good teas were impossible to obtain, and a large quantity of rubbish was shipped from over the Atlantic

to be blended here and sold broadcast. To quote the expert again, 'the remedy lies in our own hands.'

### Tea v. Rubbish.

Our New York contemporary, the *Tea and Coffee Trade Journal*, discussing the question of better-grade teas versus rubbish, is justified in pointing a moral. It says: "The feature of the present tea year, so far as the trade in New York is concerned, is the demand for the better grades of tea and the reduced call for grades of inferior quality. Although the former has in consequence risen in value, or at least remained firm in price, and the poorer article has depreciated because of the neglect in inquiry, there seems to be no let up in the sales of the former, and no more activity in the disposition of the low tea. This situation may be regarded with no little satisfaction, and we are sure it is so accepted by the tea trade that is wont to give some thought to the quality of tea Americans should drink. Apart from the profits realised by some in commissions, a procedure usually sought in the placing of low-grade teas, we are sure the tea dealers at large will find the better grades of teas as most satisfactorily money-making, to say nothing of the pleasure found in selling only an article that recommends itself from the point of view of excellence. Of course one swallow does not make a Summer, and it may be that next year we shall find Americans inclined to retreat from fine tea-drinking; but it would seem that fine tea, once tasted, will make that of inferior quality intolerable, and so good ground gained become permanent. And a good thing is apt to find popularity, and, even supposing that for the time the growth of tea-drinking is arrested by the general use of a high-priced leaf, it would indeed be a feather in the cap of this country to be known as the consumer of 100,000,000 lbs. of high-grade teas rather than the consumer of 200,000,000 lbs. of inferior grade. We can leave that to the United Kingdom, the European continent and our Canada, countries in which poor trash seems to have the right of way."

### Tea in the Caucasus.

The cultivation of tea in Russia is reported as progressing satisfactorily. On the Crown estate, Tschakira, there were, according to recent reports, fifty-five dessjatines of land under tea cultivation. The first harvest, in April and May, gave a yield of 76,323 lbs. raw leaves. The second, in June, gave 62,430 lbs.; the third, in September, 37,412 lbs.; and the fourth, in October, 116,165 lbs.—all last year, of course. The aggregate output of dry tea was about 1,000 pood. The private tea-growers delivered a smaller quantity of raw leaves to the Tschakira establishment. Of raw tea leaves,  $4\frac{1}{2}$  lbs. yield 1 lb. of tea. As the tea has met with a ready sale, and as the cultivation is comparatively low, great hopes are entertained by those interested about the future of this industry.

### The Tea Trade of Japan.

M. Bure, the Consul-General of Belgium, points out that the tea trade of Japan is passing through a very severe crisis. In fact, Japanese tea is hardly exported anywhere, except to the United States and Canada, where it is threatened by Ceylon competition. There are no large tea plantations in Japan. Agents buy the tea from the small planters and sell the lot to exporters, usually foreigners, at the free ports. According to statistics, the number of families of growers in 1895 was 737,000, and the cultivated area of 50,500 chos (the cho is equivalent to 2.45 acres), and a production of 8,698,000 kwan (8.2 lbs.). At the present day the number of families is only 586,000, the cultivated area 49,200 chos, and production 7,643,000 kwan. Annual exports do not exceed 22,000 metric tons, valued at about £920,000, in which total 17,000 tons go to the United States, and over 4,000 to Canada and British America. Yet Japanese tea is good.

### Tea Cultivation in Persia.

The United States Vice-Consul-General John Tyler, at Teheran, says of the cultivation and preparation for consumption of tea in Persia that in the different stages of the enterprise great difficulties and obstacles had to be overcome. He adds that with a sufficiency of capital to insure scientific direction and the acquirement of the best implements and machinery for the work, the undertaking should be not only profitable but of economic advantage to Persia.

### Antwerp Rubber Sales.

At the Antwerp Rubber sales last Friday 454 tons of rubber were offered, of which 417 tons were Congo descriptions and 37 tons of sundry origin, nearly the whole of which found buyers at prices

which practically covered the brokers' average estimates, which had been made when the market was at the recent highest point. The quantities sold were 407 tons of Congo and 27 tons of other descriptions. On the basis of the prices realised, the value of the various quantities of Congo rubber is about as follows:—Red Kassai firsts and seconds, 10.35f.; Lopori, Yengu, Ikelemba, Lulonga, etc., 10.15f.; black Kassai firsts, 10.10f.; ordinary Upper Congo, Sankuru, and Lomami, 10.10f.; Mongalla, 9.90f.; Uelle, 10.00f.; Aruwimi, 9.75f.; red Kassai Loande seconds, 9.55f.; Lopori seconds, 8.75f.; and Lower Congo, Thimbus, 5.70f. The sales since the first of the month aggregate 444 tons, and the stock is 626 tons. The import of rubber into Belgium during the first nine months of this year has amounted to 5,184 tons, against 5,296 tons last year and 5,349 tons in 1901.

### A Useful Visit.

In his report upon his six months stay in Mauritius, the Chairman of the Anglo-Ceylon and General Estates Company refers to the fears which were entertained in the island lest the countervailing duties on sugar in India might not be renewed when the arrangements of the Brussels Convention came into force in September. The Governor allowed Mr. Crichton to place certain figures and statements before him, and took up the matter warmly. In the result, the continuance of the duties for an adequate time was secured, and, as the company's Mauritius properties depend so largely on the Indian market, it will be seen that the interests of the undertaking have been safeguarded so far as the present position will allow.—*H. & C. Mail.*

## COOLY CHILDREN IN CEYLON.

The London correspondent of the *Manchester Guardian* writes:—

"I hear that the subject of the education of cooly children on the tea estates in Ceylon, which Mr. Schwann raised in the House last session, is to be forwarded by a meeting in London on December 7, at which Lord Reay will preside and Mr. A. G. Wise will read a paper. Lord Reay's presence will be welcomed by the friends of the movement. I am told that Mr. Schwann's questions in the House have borne much fruit already. The matter is under the consideration of a Royal Commission in Ceylon, and the report for which Mr. Chamberlain asked Sir West Ridgeway has been furnished. Mr. Schwann's contentions are amply confirmed, and two special reports are worth particular notice. Mr. A. C. Kingsford, the Chairman of the Planters' Association, recommends that the Government of Ceylon should increase the grants in aid of the State schools, and Mr. J. Harward, the Director of Public Instruction, admits that it is quite fair to say that there is no provision for the education of cooly children on tea estates. I believe that certain despatches on the subject have not been made public. It is said that despatches are extant from Mr. Chamberlain discouraging much expenditure on education in Ceylon, and I have heard that Sir West Ridgeway actually advised that Mr. Schwann and others interested should turn their attention rather to supporting the missionary schools, which is hardly a discreet way of meeting the movement."

## COFFEE TALK.

Coffee pays best when bought in bulk? We put this opinion of many good grocers in the form of a question, says the *Merchants' Review*, because it is far from certain that a bulk trade is best for all grocers. If a dealer knows coffee and how to buy it, also how to handle it and pack it, and, in order to instruct the consumer, how to grind and infuse it, he will do well enough with bulk coffee, but how many dealers know how to select coffee, how to taste it and compare the various samples, and how to pack it for sale? Grocers who send ground coffee home to the consumer in a thin paper bag, or even treat whole roasted coffee in that way, are not likely to find that bulk coffees pay. Those who take such risks as we have mentioned had better stick to the package brands of some large wholesaler or roaster.

It is a rather far cry from the act of packing loose ground coffee in a flimsy sheet of paper to the task of selecting coffee in a big sales-room among strangers, but there is usually a close connection between the two acts, for the reason that so many grocers

buy coffee because it is so nice in colour, so brown and polished, without waiting for some of the article to be infused and properly tasted in the cup.

Depend upon it that the dealer who is careful enough to buy by cup test will not risk the loss of his trade by allowing his coffee to go out in a package not air-tight, and he will not be willing to have it go out in a ground state, if he can avoid it. It is a good thing to have a few small hand-mills on hand, in order that customers may be induced to buy one and avoid any further risk of loss on ground coffee. As coffee not only rapidly loses strength and flavour after grinding, but also is very absorbent of foreign odors and flavors, the point we urge is one of no small importance.

Coffee can be called anything you please—the name deceives nobody with any experience—it is the flavor and aroma that count; therefore, in buying, the grocer takes care he does not pay a fraction of a cent for a trade-name like "Java" or "Mocha," for of a surety he will never recover the excess, if he does.

Some persons like one kind of coffee and some like another kind. Therefore it is safest to find out the tastes of a community before stocking up with high-priced grades. The dealer's public may prefer common Rio and Santos coffees to high-grade Java. It is usually found that blends give better and more general satisfaction than a single kind.

It is not advisable that a public should be allowed to continue in its infatuation for poor coffee, and by degrees the grocer should educate his people to use a more profitable grade or grades. It is, however, necessary that the grocer should learn before he attempts to teach. We remember how an ambitious grocer of our acquaintance once started out confidently to make coffee a specialty and capture all the coffee trade in sight. He procured what he thought was a good grade (it was a strong, pungent, thick, heavy beverage) and offered it at 25c., demonstrating it and employing all the usual expedients. Being introduced to the article by the grocer himself, the writer found that right in the neighbourhood there were grocers selling far superior coffees, at but slightly higher prices, which prices the neighbourhood seemed perfectly willing to pay. Soon the first grocer learned, to his chagrin, that he had made no headway. We question whether he had not lost trade, owing to his challenge causing people to give some attention to the coffee supply of the neighbourhood naturally the discovery that there were grocers nearby who were furnishing really meritorious blends, and making no fuss over the fact, did not tend to make the situation of the ambitious dealer very pleasant. His mistake was in permitting himself to remain ignorant of the general status of the coffee question thereabouts, and he was also to blame when he allowed his coffee to get so low in grade not long before he started out to revolutionize the trade. When he finally raised the standard, on the eve of his effort, his ignorance caused him to flatter himself that he had the best coffee in the district, merely because he had raised his own standards considerably.

Similar results often follow the house-to-house canvassing by tea and coffee agents. Time after time the writer has investigated and found the pretensions of these gentry based upon a grade of tea or coffee actually inferior to the corresponding grades in the nearby grocery stores. Doubtless the agents believed their samples were the best, the consumers often believed so, and possibly some of the grocers may have thought the same, but certainly none of the grocers had done any boasting, nor had they called attention to their teas and coffees.

We candidly recommend grocers to look into the coffee question. Quite likely they have brands that would pay well, if pushed, and they will stand grievously in their own light if they refuse to take aggressive action if their blends will warrant it.

Where there is much smoke there must be some fire, and there are certainly some grounds for the accusations which certain interested parties hurl at the Arabian berry. Still, it is extremely doubtful if any person in health is ever the worse for drinking coffee properly prepared. The coffee that disagrees is the coffee that is badly made. Of all the sins by which the reputation of coffee suffers the worst are committed in the kitchen. The strong, percolated infusion, with not too much milk, is digestible, nutritious, cordial and tonic, whereas the weak infusion that so many people drink in their ignorance, thinking its weakness a safe sign, is absolutely harmful, being difficult of digestion and lacking in the wholesome qualities of the properly prepared beverage.

Grocers need not waste time on the blending and roasting, on the buying and selling, if the coffee bean is not to have a fair show in the kitchen. For this reason we have always advocated the use of wrappers bearing explicit instructions for making coffee, and we would advise in addition the use of little slips bearing the same information, to be placed among each customer's purchases from time to time, because this form of the receipt is more apt to be read, marked and inwardly digested than the stereotyped formula on the wrapper.

October is as good a month as any to begin a movement for the reform of coffee-making in the home. Why not join with the grocers who have been doing the same thing for some time? Why cannot the trade papers join a movement to rouse the trade to the importance of the work? Surely it is not of less moment than the free sugar scheme which one paper has been subsidized to undertake, or the stereotyped proceedings of grocers' meetings which other papers find room for, or the picnics and excursions, garnishment bills and similar matters to which other papers devote their active mental and muscular energies!

There is some excuse for poor results from infusing coffee, for there is such a variety of counsels that the most careful cook could easily go wrong. There is also a considerable difference in the tastes of consumers, some liking very strong coffee, and some liking weaker infusions.

It is said that the finest coffee in the world is made in the Cuban style, by half filling a coarse flannel bag with finely pulverized coffee and suspending it from a nail over the vessel which is to contain the beverage. Cold water is poured over the bag at intervals until the coffee is well saturated, when the first drippings into the vessel are poured again over the bag, until the liquor has become quite thick and very black. To make a cup of coffee a teaspoonful of the drippings is poured into the cup, which is then filled to the brim with boiling milk. The coffee bag hangs continually on the kitchen wall in Cuba, and the pouring of the cold water and the resultant drip are incessant.

In Brazil the finely ground coffee is placed in a muslin bag, which is then put into the pot and boiling water is poured over it, the coffee in the bag being allowed to infuse for a quarter of an hour. The beverage thus made is strong, the entire strength of the coffee being in fact extracted. It is drunk without milk.

## COFFEE-GROWING IN THE PHILIPPINES.

There are many theories to support the belief that American capital and enterprise will find its principal scope in these islands in the coffee-growing industry. There are obvious reasons why the cultivation of this plant will soon receive serious attention in the Philippines. Latitude, altitude, climate and all qualities of the soil necessary to the raising of coffee combine to attract investors. Lastly, an amount equal to twice the value of our trade with China, goes to Brazil annually to purchase this commodity; exports from the United States to Brazil are infinitesimal by the side of this importation. If this demand can be supplied from the Philippines, the coffee trade alone will amount to as much annually as our aggregate imports and exports at the present time.

The immense hilly areas of the Philippines, where the ground is at once friable, well drained and enriched by the washing down of new soil by frequent rains, assuredly offer special inducements to the cultivation of coffee. The islands lie within the region of the tropics best adapted for this industry. The mountain slopes ranging from 1,000 to 4,000 feet above sea-level, in latitudes lying between 15 degrees north and 15 degrees south, offer the most favourable inducements, although it is successfully cultivated from 25 degrees north to 30 degrees south, where the temperature does not fall below 55 degrees Fahr.

An attractive feature of coffee cultivation is the short time required for returns on capital invested. The plants begin bearing in the second year, and by the third year will produce a remunerative crop.

Sufficient coffee is grown throughout the islands at the present time to demonstrate that it is already beyond the experimental stage. There is no reason why as high-grade coffee may not be produced in Mindanao and many of the southern islands as that which has made Java famous. Mindanao being the same distance north of the equator as Java is south. Neither is there any reason to assume that the insect pests with which cultivators will have to

contend will be more formidable in the Philippines than in other regions of the tropics in the same latitude.

There are wonderful possibilities in the outlook for this industry in the Philippines.

The cultivation of coffee should receive more than ordinary attention.

Every pound produced will find an open market in the United States. The investor in this line will rest secure from the thought of adverse tariff legislation. The same may be said of cocoa, copra, rubber and the forest products.—*Manila Times*.

### A PLANTER'S FARM.

This, remarks the Ooty paper, is one of the most impracticable suggestions that has been made and emanates from Mysore. A central farm is wanted somewhere that shall serve the interests of planters everywhere, to show them how to grow tea, coffee, pepper, cardamoms, rubber, cinchona, etc., according to the most approved methods. Considering that each of these products has its own requirements of soil, climate, elevation, and other natural conditions, how is it possible to have a farm that shall combine each and all? Coffee districts are not all suited to tea, and tea to cinchona or cardamoms, so that if the centre is in the tea district, it cannot serve for any or all the others.

Nor does the proposal tell us exactly what it is intended to accomplish that is not already within the purview of our existing botanical and experimental parks and gardens. Here on the Nilgiris, we have these scattered over the district under varying conditions of elevation, aspect, and rainfall. In the Mysore Province similarly, there are gardens and parks in the city and in Bangalore town, under a scientific expert who is doing all that he is permitted to do by his controlling agency and within the funds allotted to him. In the Western Presidency, we have an Agricultural Department not unmindful of exotics and products, that the planter might cultivate as bye-products if not as his staple. What will a central farm do under impossible conditions that these institutions cannot do in theory, and are prevented from carrying out in practice from not being allowed a free hand and having to work on a limited budget provision?

Rather than multiply our agencies, it would be wiser if we extended their spheres of usefulness, increasing their resources and generally developing them.

Again, it must be borne in mind that, in Southern India, we have five separate Governments, the Madras, the Mysore, the Travancore, the Cochin, and the Government of India. Which of these five is to take the initiative and by what means is its co-operation to be ensured? Each will wish to know what the benefit to itself is to be from a central planter's farm, and will see and measure its contribution by the extent of that benefit. Will not this prove the old rule that what is everybody's business is nobody's, and will it be possible to apportion the cost rateably to advantages derived? We thus fail to see one single feature in the scheme that renders it practicable or even possible, and shall not be surprised to hear that it is consigned to oblivion.

### THE NATURAL HISTORY SOCIETY.

The latest number of the *Journal of the Bombay Natural Society* has many papers of very considerable living interest in its table of contents. It deals with insect life in India, with the birds of Travancore and other districts, with the malicious anopheles mosquito, with the Gaur and the Gayal, with certain trees and shrubs, with batrachians, and gives some interesting details of "kills" by carnivorous animals, besides "Miscellaneous Notes" recording some late singular experiences of observant sportsmen. The illustrations, up to the usual excellent standard, are, we note, increasing in number.

The first article on "Insect Life and How to Study It," is by Mr. E. P. Stebbing, who shows what an immense part insects play in the economy of the world and of India in a special manner. While proving that the subject is attractive and will repay close observation, Mr. Stebbing lets the reader know that as insects form the largest division of the animals of the world, it is practically impossible for us to make acquaintance with all the species that exist. It was Huxley who made the apparently wild scientific

statement that the produce of a single Aphis, the rose-enemy, would in the short course of ten generations, supposing all the green insects survived, "contain more ponderable substance than 500 millions of stout men, that is more than the whole population of China." That being granted, in a few years they would, following the destructive path that nature has marked out for them, leave no plant food for other animals except of those kinds they do not care to eat. Man would be cleared off the earth by their depredations, too, says Mr. Stebbing but for the fact that the Aphis is only one of many which are opposed to one another in sufficient measure to ensure mutual consideration. The rate at which insects may multiply can be calculated from the capacity of the maddening house-fly, one of which may have in a season the respectable number of 25,000,000 descendants. Let no novice in the study of insects be disheartened by the minute details of their lives which must be followed with patience and exactitude, and in the most apparently unlikely places, for the pursuit is full of interest, and Mr. Stebbing's papers lead by the well-known sign-posts of familiar insects through pleasant roads into nature's insect-strongholds. Sir G. F. Hampson's supplementary paper on "The Moths of India" adds to the lists of the Endotri-Chinæ, the Pyralinæ, the genus *Lamacha*, the Hydrocampinæ, the Scopariinæ, the Pyraustinæ, the genus *Cybolonia*, Cornifrons and Teratausta with scientific detailed description. Mr. Young, the Entomological Honorary Secretary to the Society, has a much-needed paper on "The Classification of the Lepidoptera Papilionina," in which he urges the necessity for carefully grouping the genera and families of the Indian section of these insects. He tabulates them, giving schemes of the principal genera in family-tree fashion, with their characteristics and points of resemblance. The Anopheles receives considerable attention, that of Ceylon is written on by Major N. Manders, that of Karwar by H. Cogill. Surgeon at Sholapur. Both papers describe minutely the manners and habitats of this mosquito, and follow it from the egg through all its stages to its grave in the test tube.

Mr. G. A. Gammie discourses on "The Trees and Shrubs of the Lonavla and Karla Groves," five of which were examined. The local vernacular names as well as the botanical are given of all the shrubs and trees observed. Mr. Gammie says of these woods that they teem with absorbing lessons to a field botanist and they furnish an endless series of botanical problems. He does not believe in the tradition that the Deccan was once covered by forests of which these sacred groves are but the remnants. The climate and soil of the region must, he thinks, have been vastly different in former times if forests did abound in the district. Yet we have heard the story that a trustful administrator, with immense belief in the altruistic and economical spirit of the people, gave them over charge of the forests, certain that once their own property they would preserve them carefully. The result disappointed him, for in a year naught remained but the groves that still exist guarded by the Forest Department from further destruction. This is the tradition, but it may not be true. "The Birds of Travancore" are being studied and written about by Messrs. H. S. Ferguson and T. F. Bourdillon, who are dividing the province into four divisions and describing the bird-life therein, the Jungle Crow beginning a list in Part I. of thirty-five birds; more papers will follow. Many varieties of Duck and Teal are classified in another article by Mr. C. M. Inglis, the seventh instalment of whose contribution is in this number. Mr. E. C. Stuart Baker, gives his experiences with the Gaur and the Gayal during the thirteen years he has been trying either to prove their identity or to establish the theory that they are distinct individuals. The result is a most interesting paper which all sportsmen who have been or may be lucky enough to shoot the animals in Assam, North Cachar, or Chittagong, or any other picturesque spot where they abound, will welcome. This article is illustrated with heads of different degrees of horn development. We are glad to observe that early next year—now close at hand—a series on "Indian Snakes" by Captain F. Wall, I.M.S., will appear in the *Journal*, with coloured illustrations. Later it is hoped that a series on the "Common Butterflies of India," also with coloured plates, will find a place, as well as another on the "Orchids of Western India" with coloured illustrations. The *Journal*, already sufficiently interesting and attractive, will, we should think, through these additions in such varied directions, attract an ever-widening circle of readers. It is a publication that chronicles facts in regard to the fauna and flora of India, inexhaustible fountains of absorbing interest in which if the observer once turns his attention to them

seriously he will find unceasing occupation for his leisure. If Anglo-Indians, instead of railing at the climate and their hard work, would look round them when fate—either in guise of a holiday or of Government orders—takes them into what first seems the dry and arid jungle, they would find Nature at hand with myriads of subjects worthy of their closest study. Their moments of leisure would prove doubly valuable, and they could fill their diaries with records of the doings of the wild things that people the jungle. These items would be important links in the chain of natural history that interests every one who has once taken up the study seriously. Those who go out into the mofussil either to kill or to preserve might intelligently jot down what they see for the benefit of others. The paper on "Kills" by Mr. W. A. Wallinger in this volume of the *Journal* is a fine example of what can be done in this direction to inform and interest. The "Miscellaneous Notes" are other items that will be read with pleasure. There is no reason why these should not expand *ad infinitum* if those who are lucky enough to come through unusual experiences send them to the Editor for insertion.

### LECTURE ON "TEA-PLANTING IN CEYLON."

At the opening course of lectures to be delivered to grocers' assistants by Dr. R. Stewart MacDougall, M.A., during the ensuing Winter, at the Heriot-Watt College, Edinburgh, Mr. John Wilson, of the firm of Honeyman and Wilson, and ex-M.P. for Edinburgh, gave an account of "Tea-Planting in Ceylon," as seen by himself during a recent visit to the island. After a long and interesting description of tea-growing, manufacture, and packing in Ceylon and Northern India, the lecturer, speaking of the growth of the tea trade, recalled the time when, as a boy, he was sent to pay a duty of 2s. 2½d. at Leith on the commonest Bohea, the price of which in bond was 1s. 3d. per lb.; now the duty was 6d., and the average price of Ceylon tea on the London market 8d. When they considered the 250,000,000 lbs. of tea imported last year from Ceylon, and that it was grown by British industry, he thought it needed neither a Prime Minister nor an ex-Colony Secretary to point the moral. Moreover, they must remember that the Anglo-Saxon race was the largest tea consumer in the world. In this country the yearly consumption was 6½ lbs. per head, in New Zealand the same, in Australia 7½ lbs., and in Canada 4½ lbs. Russia consumed 1 lb. per head—the bulk of the population, of course, was very poor; Holland 1½ lbs., and Germany and France 2 oz. and 1 oz. respectively. Owing to the enterprize of Ceylon growers, the exports to France were increasing, however, and "afternoon tea" was becoming a feature.

With regard to green tea Mr. Wilson said this tea, which was merely tea unfermented, was only seen in the low country of Ceylon. Unlike the green tea of China, it had no colouring matter added, and perhaps did not on that account present so attractive an appearance; but there was a growing demand for Ceylon green tea in America and Canada, and he thought there was an opening for enterprising English growers in this respect; to his taste it was very agreeable, and preferable to the Chinese product.

### COTTON CULTIVATION IN CEYLON.

A CHAT WITH MR. J. C. WILLIS.

Mr. J. C. Willis, Director of the Royal Botanical Gardens, Peradeniya, returned recently from India, whither he had been to study the question of cotton growing as a likely industry for Ceylon. Mr. Willis told a correspondent of the *Times of Ceylon*, who called on him, that 20 acres of land had been planted in the Anuradhapura district, by way of experiment, with the Tinnevely variety. In India the

#### AVERAGE CROP PER ACRE

was about 75 lbs., which, at 20 cents a lb., amounted to Rs.15. From the sale of seed another Rs.6 or Rs.7 was added, so that the estimated income per acre in India was about Rs.22. The Tinnevely variety was, Mr. Willis said, the best cultivated in India, and the crops were, as a rule, sold to Messrs. Volkart Brothers or Messrs. Ralli Brothers, who had machinery, worked by steam, for separating and ginning the cotton. The figures, Rs.22, had to be received with one reservation—the Indian cultivators did not count their labour as expenditure. Proceeds from the sale of the crops were all clear profit to them. That could not well be the

same with the European cultivators in Ceylon, however large their acreage. A small profit might be possible with one cooly for every two acres; but profit would entirely disappear if a cooly were set apart for every acre.

The Indian cultivators, also, went in for a

#### ROTATION OF CROPS,

and generally raised a crop of grain for their food after their cotton crop. Mr. Willis saw no reason why in Ceylon gingelly should not be planted in the same way, although, for some unknown reason, gingelly was very little grown in Ceylon just now. It was mostly affected in the North-Central Province, where, on almost every patch of chena, gingelly was grown and formed one of the best-paying crops there, as also in the Northern Province. Speaking of

#### THE GINNING MACHINERY,

Mr. Willis said there were hand-machines which could turn out about 50 lbs. a day. The natives of India used a hand-machine, called *churka* in Tamil, with which a woman ginned about 4 lbs. a day. Ginning was indispensable before export, unless freight was of no consideration, and separation of cotton would do away with the importation of cotton seed for cattle from India. The requisite soil for cotton was fairly well known,—all dry parts of the island being considered suitable.

#### VARIETIES AND COMPARATIVE PRICES.

In America there were over a hundred kinds of cotton grown. The Uplands variety, which gave three-fourths of the entire yield of the world, and sold at 6d. to 7d. per lb., and the South Sea Islands variety, from 11d. to 1s. per lb., were among the best known. The price of the Tinnevely variety was 5d. per lb. and that of Bengal 3½d. The Egyptian cotton sold at 10d. per lb. While twice the price of the Tinnevely cotton, the Egyptian variety yielded a crop three times as much in quantity as the former. It was doubtful whether Egyptian cotton would thrive well in Ceylon; but, if it could be made to grow, the island would profit both in the quantity and quality of its cotton. The South Sea Islands variety grew only on the coast. It had been tried in Ceylon, but was not a success. The American and Egyptian varieties, Mr. Willis added, would be tried in Ceylon next year. The cotton crops at the Anuradhapura gardens would be worked from February to July. The American and Egyptian varieties would also require irrigation. In planting them, the two kinds would be separated from each other by a tract of jungle, so as to prevent all possibility of mixing up the varieties.

### TEA IN EUROPE.

In dealing with the tea problem on the Continent we have to bear in mind that there are two lines of exploitation, which have often to be separately considered:—

- (1) The substitution of British-grown for China tea in those countries where the tea-drinking habit already exists;
- (2) The creation of a taste for tea, where at present there is little or none.

Italy is a country typical of the latter condition, and is in fact, relatively to population, one of the smallest tea-consumers in Europe. Many causes contribute to this state of affairs. In general, we find throughout the Continent that the Latin, and more especially the Southern Latin, races are the best addicted to tea-drinking. And in Italy itself there exists in this respect a wide difference between the Southern and the more Northern portions of the Kingdom. Climate of course has much to do with it; the economic conditions in the vine-growing Sicilies being much less favourable to tea-consumption than those of the more commercial and industrial North.

But the two greatest barriers to real progress in the use of tea in Italy are, firstly, the high duties levied both by the Customs and the Municipalities, and secondly, the poverty, more especially in the South, of the mass of the people, to whom tea at its present prices is an unattainable luxury. Tea in Italy has, in fact, hitherto remained an "article de luxe," like champagne, and has consequently been maintained at the artificially high level of cost usually imposed upon fashionable beverages.

But of late there are signs of a change for the better; and the support recently afforded by the Indian Tea Association to the English Tea-Rooms at Rome is an important step in the right direction. These tea-rooms are energetically managed by two

English ladies, who are under contract to supply only pure Indian tea at moderate prices. In 1902 some 23,500 persons were served in the cup with this tea, several thousand small packets of which were also sold in dry form at prices much below those current for China and other kinds far inferior in quality. This Indian tea has been advertized as widely as funds would permit, both by newspaper and placard, with the result that in three years the "dry" sales have increased over 300 per cent. and are still growing. Thus, by advertisement, and by means of the Parcel Post, these teas are now made available to any Italian desiring even a pound or two of good tea, while any inhabitant of Rome can, for a few pence, taste a cup of good Indian tea properly prepared. And it is an encouraging fact that all who have tried these teas—which have been most carefully chosen to meet local requirements and taste—tend to become permanent consumers.

Though one or two agencies have been started in other Italian towns and sales of packets are also made by post, it is naturally in Rome itself that most business is done. Fashionable Society is in most countries rapidly adopting "afternoon tea" as an agreeable form of entertainment, and Rome is the centre of Society in Italy. And as almost everywhere fashions percolate gradually from the upper to each successive lower social stratum, there is good reason to hope that at least the middle classes of Italy will presently take more kindly to tea-drinking. If only it could be made cheaper to the Italian consumer tea would undoubtedly become a more popular beverage. In the larger northern cities, such as Milan, Turin, etc., it is already used to some extent, and the custom is said to prevail of taking cups or glasses of tea—mostly with rum or lemon in lieu of milk—late at night, say after the theatre, especially in Winter. And here we are reminded of one of the many difficulties of the tea-trader in Italy—that of season. It is practically only in Winter that tea is much used. During the long hot Summer Italians prefer their *sherbets* and other cooling drinks, and take little or no tea, which they regard rather as a "tisane" for the cold weather. Thus the above-mentioned Tea-Rooms in Rome have usually been closed from the end of June till early in October. But in 1902, they were for the first time kept open right through the Summer, the result being sufficiently encouraging to induce a repetition of the experiment this year, though business naturally falls to a minimum at that season.

There are in Rome several other places for the consumption of afternoon tea, and the visitors include many Italians of the upper classes. Wholesale tea-houses there are in Italy practically none. Tea is principally retailed by grocers and provision dealers, mostly China or so-called Russian blends, in very small packets which are generally high in price much overkept. On these lines any large expansion of the trade seems improbable. But it is hoped that the new departure at the English Tea-Rooms in Rome may lead to a better knowledge of, and taste for, good tea.

*Tea Duties*—It has already been said that these are high in Italy. The official tariff is lire 250 per 100 kilos., or about 11d. per lb.

But in practice, allowing for careless weighing at the Customs, irregular tare and inevitable "sundries," the duty comes to much nearer 1s. Then there is the "dazio comunale," or town-tax, which varies in different Municipalities, but which averages about 2d. to 2½d. per lb. We thus have a burden of some 14d. on each lb. of tea, or say 100 to 150 per cent. on the prime cost of the article. The rate will vary somewhat according to the port or city, and particularly according to the size of the shipment. The two following test cases, in which Rome was the destination, may thus be of practical interest. The duties and charges on the tea (excluding "c. i. f." altogether) worked out as follows:—

	s.	d.
On 20 kilos. by Parcel Post, per kilo., Lire 3.06 = per lb.	1	1½
„ 350 „ „ Sea „ „ „ 2.92 = „	1	0¾

These results were below rather than above the average.

It is much to be regretted that no means have as yet been found of approaching the Italian Government with a view to negotiating some reduction of these rather crippling duties. The matter has indeed already been mooted, but has unfortunately not been pursued.

The total gross revenue raised from tea by the Italian Government cannot at present amount to £6,000 annually—a sum quite insignificant in the Italian budget of over £72,000,000 sterling. Were the tea duty reduced by half—say to 5d. or 6d. per lb.—it is not improbable that the nett revenue drawn from tea would be actually increased. The effects of such a reduction might thus be threefold, conferring benefits alike on the Italian Government, the Italian consumer and on the tea-planter of India.

*Statistics.*—The population of Italy in 1902 was about 32 millions. The total nett tea imports in that year were 48,700 kilos., or about 107,000 lbs., which would give an average consumption per head of 1½ grammes, or say 0.05 of an ounce.

As, however, the great mass of the Italian people drink practically no tea, the *per capita* figures are very little guide to progress. Looking further back we find that in the 11 years, 1887—1898, the consumption increased from some 33,000 to over 45,000 kilos. per annum, or about 40 per cent. In the last 5 years, 1888—1902, the progress has been much slower, *viz.*, only from 45,600 to 48,700 kilos. The following table shows the total nett imports of tea into Italy:—

In 1887 ...	33,300 kilos.	In 1900 ...	49,000 kilos.
„ 1898 ...	45,600 „	„ 1901 ...	47,500 „
„ 1899 ..	41,600 „	„ 1902 ...	48,700 „

The Italian statistics generally specify only the "country whence imported" and not the kind of tea; it is thus difficult to state accurately what proportions of Indian, Ceylon, China, etc., are included in the above totals. It may be doubted, however, whether British-grown tea forms at present more than 25 per cent. of the whole.

Roughly speaking, nearly one half the tea imported into Italy comes from Great Britain, about one-sixth from Germany, and less

## THE BRITISH TEA DUTY AND MR. CHAMBERLAIN'S POLICY.

### INDIA AND THE CROWN COLONIES.

The *Times of Ceylon* remarks:—This week's London letter appeared in our Thursday's issue, wherein our correspondent dealt with the subject of tea and the new fiscal policy, and referred to Mr. Chamberlain's calculations as crediting to the working man's budget the whole of the proposed reduction. "A. B." had written to the ex-Colonial Secretary, and we append his letter and the reply received. Our correspondent has not "drawn" Mr. Chamberlain—that was not his desire—but the point raised will receive the latter's attention and the attention of those working with him. When a duty is increased or decreased it takes time, which probably varies greatly for different commodities, and influenced by supply and demand, before a precise division of the amount is finally arrived at between producer and consumer. In forwarding the letters our correspondent remarks that a prominent Ceylon man, in conversation, expressed the opinion that the Government would never take off the whole of the tea duty, and that this is not to be desired, as letting in a lot of China. There is certainly some division of belief on the point; but we see no reason to alter our policy of "total abolition." The letters are as follow:—

The Right Hon. Joseph Chamberlain, M.P.

SIR, In all the calculations I have seen going to show what the position of the consumer would be under the new fiscal conditions you are so ably advocating, the consumer appears to be credited with the full reduction in the tea-duty whether it is entirely removed or reduced to one-third of the present amount.

It appears to some of us who have had long experience in the production of British-grown teas that the effect of abolishing or greatly reducing the duty would so greatly stimulate the consumption and wastage of tea as to raise the price in bond by perhaps a halfpenny or a penny a pound.

That would be of enormous benefit to the important tea-growing interest in India and Ceylon which has for some years been in a depressed condition. At the same time it would seem that the consumer would not get the full benefit of the reduction, at any rate for a time, as it takes about five years to bring a tea plantation to the bearing stage and thus increase the amount of tea available. To the extent of the rise in price then, the calculation would be falsified.

It is true that there is an almost unlimited supply of tea to be obtained from China, but the tea drunk in the United Kingdom is now almost entirely British-grown, and it is at least doubtful if the public will ever again drink China tea in any quantity.

I should esteem it a favour if you would give me your views on this aspect of the subject. I need hardly say that the question is raised in no captious spirit, for British tea-growers are almost to a man in the deepest sympathy with your aims.—I am, Sir, your obedient servant,

A. BETHUNE.

London correspondent, *Times of Ceylon*, October 13th.

A. Bethune, Esq.

SIR,—I beg to acknowledge receipt of your letter of 13th instant addressed to Mr. Chamberlain. Owing to the great pressure upon him at the present time it is impossible for him to reply personally to the many thousands of letters which have reached him on the subject of Tariff Reform, or to amplify his public speeches in private correspondence.

Mr. Chamberlain is most grateful to those of his friends who have sent him their good wishes in the arduous task in which he is engaged, and he takes note of all the suggestions made to him.

He has already stated that, in sketching broadly the policy he advocates, he cannot commit himself to further details without consulting the repre-

sentatives of all the trades interested and without the opportunity of referring to the Governments of the British Colonies and Possessions.

He hopes to deal with some of the questions raised, both by supporters and opponents of his policy, in future speeches; but, for the reasons already given, he is quite unable to reply separately to all of his correspondents.—I am, yours obediently,

S. BOWERS.

Highbury, Moor Green, Birmingham, October 14th.

Another point, which is not embodied in the letter to Mr. Chamberlain, is the fact that he has said nothing in his speeches hitherto to show that he favours a preferential tea-duty against China and Java; but Mr. Bethune writes to us that "to be consistent he must surely go in for that; or are the Crown Colonies to be less favourably treated than self-governing ones?" It is a coincidence that in to-day's telegrams Reuter records that Sir M. Hicks-Beach complains that Mr. Chamberlain ignores India and the Crown Colonies, whereas a London telegram re-wired from Bombay announces Mr. Chamberlain's attitude towards India as described in a letter to Sir M. Bownaggee. This may result in a further declaration on the question on the 20th instant at Cardiff, which apparently is Mr. Chamberlain's next platform engagement. In any case to-day's announcement by telegraph is important, as showing that the reformer is anxious to learn India's views; and, by the argument of analogy, he will also desire to know the opinions of the various Crown Colonies, including Ceylon. When the Tea and Produce Committee of our London Association has discussed the subject of differential duties we trust to see a keener desire both in Ceylon circles at home and in our local public bodies to discuss the whole subject.

## THE LANGUAGE DIFFICULTY.

The most fruitful source of contention between individuals is failure to comprehend each other's meaning. Such error arises, more often than not, from different individuals attaching different meanings to the same word. And this being true of people employing their common language in domestic negotiation, how vastly greater is the danger of misunderstanding between people ignorant of each other's language! Interpretation and translation are not exact sciences. A political dispatch written in one language may be rendered in another, so as to soften it, or make it appear more stringent, at the will of the interpreter; and that, too, without any indefensible departure from the original. Some years ago, there was almost a rupture between the United States and France, owing to an American minister, imperfectly acquainted with the French language, attaching a dictatorial meaning to the very innocent word *demandeur*.

Nations are more widely divided by difference of language than by colour of skin, rivers, mountain chains, or even oceans. The Englishman and the Australian, born at opposite points of the world, converse like brothers, while a Chinaman of Swatow and a Chinaman of Canton, natives of the same country and both supposed to speak Chinese, find it convenient to talk together in a barbarous sort of English which they acquire from British and American sailors at their ports, so greatly does the Chinese language differ in various parts of the Celestial Empire.

Some of the world's greatest thinkers hold the opinion that a time must surely come when there will be but one language spoken throughout the world. They base their belief upon the obvious facts that every year transit becomes cheaper and more rapid, and education more diffused and of a higher standard. Trade, by bringing all nations together, and uniting their interests, is another great factor that must not be lost sight of. Enter a good drug store in any country you please, and ask, by its English name, for a bottle of Mother Seigel's Curative Syrup, and it is a thousand to one but you will be immediately supplied with what you desire, so universally is that great remedy known and esteemed. Writing 9th June, 1903, Mr. J. McJohnns, F.C., of Vogel Vlei, Mossel Bay Division, Cape Colony, says: "A few weeks ago a coloured man came into my store who appeared a mere skeleton, and complained of pain in his chest and lungs. He asked my opinion, and I recommended him to try Mother Seigel's Curative Syrup and a Seigel Plaster. He accepted my advice and the result was astonishing. The man is now perfectly well, and gratefully acknowledges the cause of his good health."

Another letter, dated 17th June, 1903, from Mrs. W. Smith, of Graham's Town, Cape Colony, is equally satisfactory. Mrs. Smith says: "Three years ago I was much troubled by pains in the head, which were so severe at times as to cause me to vomit and badly affect my eyesight. To add to my misery, my teeth would frequently ache for days and nights continuously, until I thought I must go mad. Yellow patches appeared on my chest and back, caused, I was told, by an affection of the liver. I obtained medicine from several physicians, but without experiencing the slightest relief, I had abandoned all hope of being cured when a doctor advised me to try Mother Seigel's Curative Syrup. After taking a few doses of that remedy, there was a change for the better. I continued to take the Syrup for a time and was soon completely cured. All of my ailments have disappeared and I now enjoy the best of health."

The remedy of which Mr. McJohnns and Mrs. Smith speak so highly is the standard medicine of the sixteen principal countries of the world; but there is no nation by which it is not known and esteemed, and no language in which its use has not been commented upon with gratitude.

## MARKET REPORT.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated October 30th, 1903, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904	603,908	481,580	44,089
1902-1903	632,836	546,790	35,251

42,077 pkgs. INDIAN } Total 60,043 packages were offered in public auction  
16,575 " CEYLON } this week.  
1,391 " JAVA }

The general buying noticed last week has again been conspicuous in the sales and tended, if anything, to a further hardening of prices, the better feeling extending now to pretty nearly all grades of tea, although medium kinds still continue to be relatively very cheap.

New markets appear to have shown some progress up to the end of September, although the chief increase, as far as can be ascertained at present, seems to be due to the manufacture of Ceylon Green Tea.

Quantity of Indian and Ceylon Tea re-exported from U. K. from 1st January to 30th September.

INDIAN.—With another moderate auction bidding was decidedly animated and last week's firm tone was fully maintained, common teas being, if anything, a trifle harder, while medium Pekoes and Broken Pekoes were also in more demand.

SOUTHERN INDIA has become an important factor in the market. From the 1st June to date 29,264 packages were brought forward, against 24,114 packages last year, while many of the teas are now showing very fair quality, especially among the higher grown estates. Averages:—"Margarets Hope" and "Kharjan T. Co.," 1/2 $\frac{3}{4}$ ; Amal T. Co. gardens "Kalej" and "Dooteriah," 1/1 and 1/0 $\frac{3}{4}$ ; "Brit. Darj. Co. Thurbo," 1/0 $\frac{1}{2}$ ; "Deamoolie," "Doorja," and "Jungpunnah," 1/-.  
Week's av. of New Season's Tea sold on Garden Acct. 1903, 36,924 pkgs., av. 7.96d. 1902, 37,237 pkgs., av. 6.87d.  
New Season's Tea sold on Garden Acct. 1st June to date 1903, 436,005 pkgs., av. 7.90d. 1902, 445,190 pkgs., av. 7.16d.

CEYLON.—The auctions were again small, whilst for next week only 12,807 packages are catalogued, and it seems unlikely that supplies can be more than very moderate, at any rate to the end of this year, as recent advices from Ceylon show that the weather still continues unfavourable to flushing.

The market was, if anything, rather stronger than last week, more especially in teas up to about 8d. per lb. Averages:—"S. T. & L. Co. Brookside," 1/4 $\frac{1}{2}$ ; "Caledonia," 11 $\frac{3}{4}$ d.; "Balmoral Co. Clydesdale," 11 $\frac{1}{2}$ d.; "Talawakelle," 11 $\frac{1}{2}$ d.; "Nuwara Co. Concordia" and "Diyanilakelle," 11d.; "C. T. P. Co. Waverley," "Demodera," and "Ferham," 10 $\frac{3}{4}$ d.

Average for week 8.25d., against 7.12d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 851,408 pkgs., av. 7.48d. 1902, 969,719 pkgs., av. 6.72d.

JAVAS sold very steadily with good competition, the tendency being rather in favour of sellers.

## COFFEE.

Only limited quantities have been brought to auction during the week, which have met a fair demand, and been mostly disposed of at firm prices, viz.:—1,070 bags East India Plantation, very ordinary at 33s. to 33s. 6d., low middling and middling at 44s. to 55s., peaberry at 52s. 6d. to 60s.; 1,000 bags Costa Rica and Guatemala, small to low middling, at from 30s. to 47s. 6d., middling to good middling at 55s. 6d. to 62s., peaberry at 45s. to 72s.; 1,990 bags Colombian, low quality, at 26s. 6d. to 27s. 6d., good to fine ordinary and low middling from 36s. 6d. to 44s., middling to good middling at 46s. to 60s.; 630 bags Salvador, good to fine, fine ordinary at 36s. 6d. to 40s., good middling and bold at 54s. to 64s., peaberry from 36s. to 68s. 6d.; 1,500 bags Nicaragua, Mexican, and other Central American sorts, on similar terms, and some extra fine blue Jamaica (late last Friday) up to 120s. per cwt. There were also offered 1,630 bags Washed Dumont Santos, small at 30s. to 33s., medium at 36s. to 40s. 6d., bold at 41s. to 46s. 6d., peaberry at 39s. 6d. to 51s.; and 2,600 bags Unwashed ditto, small and medium at 29s. to 33s., with bold and peaberry at 38s. 6d. to 42s. 6d. Conflicting advices from abroad have had their usual effect on the market for Futures, which has been in constant agitation, with prices pointing upwards and downwards every day. At one time good Santos, deliverable between now and September, 1904, fetched 29s. to 31s. 9d., but at another it was obtainable at 28s. to 30s. 6d., and lately the quotations have been steadier. The next monthly sale by the Dutch Trading Company is declared for Tuesday, the 27th instant, when 27,350 bags Java Coffee will be put forward, and the valuation for good ordinary quality is fixed at about 28 cents, against 35 cents in October last year.

## INDIAN TEA.

Messrs George White & Co., in their Report, October 29, say The improved demand recently noted has been fully maintained and prices for the more useful lines under 7d. and fine tippy Broken Pekoes have again often favoured sellers. Compared with the strong market for the grade below, Pekoes have ruled quietly, the advance in the former causing them to look relatively cheap. This is especially noticeable in fair Assams, in which class Pekoe Souchongs have frequently realised within a  $\frac{1}{2}$ d. of the Pekoes, and in some instances made the same quotation. It is interesting to note that in spite of the value of ordinary consuming qualities being 1d. to 2d. above that of a year ago, actual consumption, as gauged by deliveries, has not been checked, and the price of tea would now appear to be a comparatively minor factor in determining the flow of the latter, under the new conditions of much smaller stocks being held in the country. The action of growers in feeding the trade to the approximate extent of its current requirements is proving beneficial, the former method of pushing forward supplies

as soon as landed having been a costly one, as the trade was naturally unwilling to carry more than needed for immediate use except at a heavy discount. For 36,700 packages on estate account 8d. per lb. was realised versus 7d. per lb. for 35,900 and 8½d. per lb. for 35,600 in the two foregoing seasons. Totals printed for importers in October, 1903, 176,600 packages; 1902, 188,300 packages; 1901, 189,700 packages; which will make 489,000 packages of this year's crop passed through the Mincing Lane sale rooms, versus 516,200 and 470,700 to the end of this month in 1902 and 1901 respectively. Telegrams from Calcutta state that 5a. 11p. per lb. was obtained there for 22,000 packages on the 23rd instant, prices tending to the advantage of growers. For to-morrow (Friday) 21,000 packages are declared. Assam growths are reported to show an improvement in quality.

### CINCHONA BARK.

Offered, 3 bales. Sold, 0. For these 3 bales of cultivated flat yellow 1s. 3d. was bid and refused, the price being 1s. 9d. per lb., at which it had been sold before.

(AVERAGE FOR ALL INDIA 7-96d., OCTOBER 30TH.)

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them here described, for the relief of pain among the poor and needy, and although in those days St. Jacobs Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of medicine in the world.

## CURES

RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,

And all Aches and Pains usually treated by outward application.

IT HAS NO EQUAL ON EARTH AS A PAIN RELIEVER.

It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed for by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, NOVEMBER 28, 1903.

[No. 47.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 4th proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*November 18th.—Weather—North-East monsoon has been very heavy this last week, daily storms of one to two inches; the sky seems clearing now, and the coffee looks as if it will ripen fast. Coffee—very fair after its drenching, estates generally very weedy. Little leaf-disease and leaf-rot about, also some of the green coffee has gone black from the rain. Works—Weeding, handling, shade. Health—Good. Labour—Plenty, will soon be scarce on account of the paddy.*

#### TEA AND MR. CHAMBERLAIN.

DURING the last few days Reuter has announced the passing of a new Tariff Bill in New Zealand. In itself the measure is important, yet its chief interest lies in the relation it bears to the current discussion of British fiscal policy. New Zealand is a market for British-grown teas, and imports also a small quantity of China teas. The new Bill should cause a cessation of the trade in the latter and a corresponding increase in the trade in the former. Perhaps, also, it will stimulate the general consumption of Tea in the Colony; but, even allowing for developments, this is not likely to make any serious change in the value of Indian and Ceylon teas. What most impresses us is the example set under the auspices of Mr. SEDDON. If the New Zealand Premier's example be followed in the Colonies generally, the position of British-grown teas will be greatly changed, and this for the better. The most absorbing question is, however, what effect New Zealand's example will exercise on the fiscal policy of the United Kingdom. By itself Mr. SEDDON's manifestation of approval of Mr. CHAMBERLAIN's programme may not influence the British electorate to any marked extent. Followed by other Colonies, the action of New Zealand would constitute an emphatic declaration of

the wishes of the British Colonies, and could not fail to impress electors throughout the Home country. It would at least show that the Colonies are not merely ready to meet Preference with Preference, but are prepared to make the first overture towards the introduction of a system of reciprocity.

Mr. SEDDON has gone "the whole hog." He has not advocated reduction of duty, but the elimination of any impost on British-grown teas. Now, if the same course were taken in England, what would be the probable result? The question appears a very simple one, but it is not. We have advocated abolition of British duties on Tea, and at first sight the suggestion that these duties should be removed solely from teas produced in British dominions may seem to be one that would yield still more satisfactory results to Indian and Ceylon planters. That this is the right view is, however, by no means certain. At the present time the number of wholesale importers and dealers in tea in England is limited. The main element that restricts an increase is the fact that a large capital is essential, and a great deal of this capital is solely required for the payment of the heavy duty now levied. Remove that duty *in toto* and the position is entirely changed. The field of competition becomes almost unlimited. Tea ranks with other duty-free products, and trade rivalry increases. We regard this as entirely in favour of the planters. When, however, the field is thrown open solely as regards the teas grown in British dominions the situation changes, and we are not satisfied that such a change would benefit British planters. The ground of our doubt is this: there are certain established importers and wholesale dealers whose influence is very powerful. They are the chief "middlemen" of the day in regard to tea. Their connection is wide-spreading, their hold over retailers very great. It is at present equally to their interest to push Indian and Ceylon teas. If the duties on all teas were removed, their interests would remain the same. No matter whether they pushed British or foreign teas they would have little reason to give a preference to the one or the other. Patriotism would give the scale an impulse in favour of British teas; the patriotism of consumers could be so played upon as to assure the same preference being given by retailers and by the actual consumers. Generally speaking, it would probably be found more advantageous to devote special attention to British teas than to foreign. All dealers would have one level, and while the old-established firms

would no doubt have to face new competition they would do so upon a basis that would afford the former no special ground for differentiating between British and Foreign growths.

If, however, Foreign teas remain dutiable, while British are admitted free, the position becomes very different. The old-established firms would probably find it more advantageous to push those teas of which they had a practical monopoly instead of those that were open to all. The duty would keep most of the new rivals from taking up foreign teas, their attention would naturally be given to the duty-free sorts. Met with keen competition here, the established firms might prefer to try to make better profits out of foreign teas, and their existing connections and influence would be powerful aids to them. Under circumstances such as these, it is quite possible that the abolition of duty on British teas, while that on foreign teas was retained, might result in greater benefit to the latter than to the former. Paradoxical as this may appear, it is a logical deduction. Individual traders, and groups of traders, in possession of a practical monopoly may be reasonably expected to work that monopoly for all it is worth, rather than to neglect it and work up articles in regard to which there is almost unlimited competition. And the power of the old-established firms and companies that are capitalised for working a trade in dutiable teas is not to be despised. It is thought by some that the throwing open of the tea trade to almost unrestricted rivalry would not benefit the producer. That is not our view; but we confess to some scepticism as to the result of any system that would put a premium upon the work of the wealthy firms in connection with dutiable teas, while leaving the field open for all manner of competition in respect of the duty-free article. Perhaps this is the view of the pessimist, but it is one that appears to us to demand careful consideration.

#### U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

#### CEYLON TEA.

In the course of a Review of the Administration of the Affairs of Ceylon, 1896—1903, Sir West Ridgeway, who has now retired from the Governorship of the island, said a few days before his departure:—

Turning now to some of our exports and imports in detail, the article that has, of course, paramount claim on our attention is tea, but this our staple product, the foundation of our prosperity, deserves the full and separate notice which I will give to it later in this review.

When we reflect on the obligations of the Colony to this great industry, the question naturally arises, Are we now wholly dependent on the tea industry? Would ruin necessarily overtake the Colony if—which God forbid—tea were to perish? This is a wide question—a question which seriously affects our credit in the money market, and by the decision arrived at the policy of progress and development—to a great extent with borrowed money—must stand or fall. In 1898 the question was raised in an acute form, for many men of light and leading contended that, in view of a depression in the tea industry which possibly might deepen

and become chronic, we were not justified in embarking on a large expenditure in public works. Some of my Councilors took this view, and questioned the wisdom of a progressive policy under conditions so unfavourable. The situation was critical, for if the Secretary of State had accepted these cautious views progress must have been checked, and the Colony would have had to stand still or mark time, as in the years 1877—1883.

Tea still holds, and I hope will long continue to hold, the pre-eminent position in our exports. It shows no sign of decay, but rather of increasing vitality. The total export of tea has risen from 110,095,000 lbs. in 1896 to 150,829,000 lbs. in 1902, the increase in value being from Rs.51,337,388 in 1896 to Rs.54,298,694 in 1902. The export of tea has thus increased nearly 40 per cent. in quantity, and, in spite of lower prices, 6 per cent. in value. But—and this is the point I desire to emphasize—other Ceylon products have advanced in still greater proportion. Thus, in 1896 the total value of all exports of Ceylon produce was Rs.76,275,472, two-thirds of which was represented by tea: last year the total value of exports of Ceylon produce was Rs.96,771,467, to which tea contributed Rs.54,300,000, or only 56 per cent., the value of “other articles” being now Rs.42,472,773, as against Rs.24,938,084 in 1896. In other words, while the value of tea exports has risen 6 per cent., the value of “other articles” exported has risen more than 65 per cent., and whereas eight years ago tea formed about two-thirds, it now forms little more than half of your exports. Even this does not fully indicate the rapid expansion and development of your general trade. In 1902 the value of exports other than tea exceeded the *total* exports from the island in 1890, when tea was already a firmly-established industry and formed 44 per cent. of the exports.

I have told you that the value of tea exported has risen about 6 per cent. during the years of my administration. Compare with this the increases in other directions. The produce of the cocoanut palm shipped to other countries has increased 86 per cent., cinnamon 90 per cent., cacao 130 per cent., while plumbago has advanced over 200 per cent. It is especially gratifying to note a marked increase in the values of the various articles produced from the cocoanut palm. In 1896 the figures were Rs.11,178,000, and, with the exception of a slight falling-off in 1899, each year has seen an increase over the figures of the preceding year. In 1902 the value had risen to nearly Rs.21,000,000. The articles which chiefly contributed to this large amount are cocoanut oil (Rs.10,000,000), copperah (Rs.4,000,000), desiccated cocoanuts (Rs.2,900,000), and poonac (Rs.1,300,000). I may remind you that the last two articles are comparatively new, desiccated cocoanuts—so largely in request for confectionery—being an unknown product twenty years ago. It is instructive to note also that the exports of these two articles alone are equal in value to the total exports of the products of the cocoanut palm in 1882. The most marked advance since 1896 has been in the export of copperah, which has increased in value more than seven-fold, *i.e.*, from 5½ lacs to 40 lacs of rupees, and in quantity from 57,500 cwt. to 377,000 cwt. Cocoanut oil has risen from 60 to 100 lacs, and the value of poonac exported has increased more than 100 per cent., reaching 12 lacs in 1902. Coir fibre has risen from 2½ lacs in 1896 to over 7½ in 1902, and the exports of desiccated cocoanuts also showed a substantial advance.

# TEA.

In my comments on your trade returns and again in the foregoing estimate of the prospects of your staple products I expressly reserved one product for separate notice, and accordingly I proceed very briefly to review the fortunes of the great tea industry, on which the prosperity of this island still mainly depends. The eight years of my administration have seen vicissitudes in the prospects of our staple industry: many and gloomy have been the forebodings from time to time, but the planters of Ceylon, by their energy and enterprise, their care in cultivation, and their wise appreciation of new conditions, have successfully surmounted the many adverse circumstances and effectually maintained the flourishing condition of the industry. It is true that the prices realized to-day are appreciably lower than the prices of eight years ago, and it is unlikely that those prices will again prevail; on the other hand, recent years have seen a very marked expansion of the trade in the development of new markets, and, judging from the latest reports of the state of the oldest and richest plantations in the island, I am glad to think that I leave the tea enterprise, both in the field and in the market, in a healthy and vigorous condition.

When I arrived in the Colony early in 1896 the tea-planting industry was in a very prosperous and promising condition. The average price in London was over 8d. per lb., and the utmost activity prevailed in the island in planting up additional areas.

I have referred to the manufacture of "green tea." This manufacture, originally recommended by the planters' agent in the United States, is a new and very promising branch of the industry, and the numerous inventions of machines to prepare the pure green tea with which Ceylon and India can compete in America with Japan and China reflect great credit on planters and machinists in this island and the neighbouring continent.

This rapid expansion of the field of activity is chiefly due to the practical and successful manner in which the proceeds of the "cess"—the small export tax on tea—have been administered by the Committee of the Planters' Association and Chamber of Commerce and the Commissioners appointed by the Committee. Government on its part contributed Rs.120,000 towards an adequate representation of Ceylon products, more especially tea, at the Paris Exhibition, and a considerably larger amount will be spent on the forthcoming exhibition at St. Louis. There can be little doubt, I think, that the results of a judicious representation of the Colony's staple industries at International Exhibitions like those of Paris and St. Louis must well repay the comparatively small expenditure which they entail.

That the tea industry has continued to flourish in spite of many untoward circumstances during the past eight years is mainly due, as I have said, to the enterprise and foresight of the planters, but I think they will be the first to admit that they have derived very considerable advantages of late years from the expansion of the scientific staff of the Botanic Gardens Department.

The dangers which beset the cultivation of tea in the field, *viz.*, attacks of insects and fungi, are to a great extent kept in check by the methods of cultivation. The pruning of the bushes at intervals of about one to two years, involving the removal of most of the leaves, gives the opportunity to burn or otherwise destroy all diseased leaves and branches, and experience seems to show that tea bushes are not so liable to

diseases and pests where high cultivation is carried on. Tea-planting has through the stress of competition become more scientific, and the majority of planters now use means to keep their plants healthy and to prevent the spread of any disease that occurs. The attacks of leaf fungi which in 1897, 1898, and 1899 caused some anxiety to those interested in tea cultivation have to a great extent decreased. This is largely due to the fact that the publications of the Botanic Gardens Department and the tours of the staff through planting districts have spread a knowledge of the nature of these diseases and the best methods of combating them. During the last two or three years a disease of the tea root, a more insidious enemy than the leaf blight, has been in evidence, but it is perhaps chiefly noticed because of the knowledge that a specific disease now exists, and because deaths due to this evil were previously attributed to some unknown cause. The attacks of a boring insect, the "shot-hole borer," have in certain districts seriously reduced the production of tea, and the Government Entomologist has for some time been working with a view to preventing the spread of this injurious insect. Intelligent means are being taken to keep this evil in check, and though in some few places it causes a serious amount of damage, in others the measures taken have reduced it to a minimum. It is considered desirable, however, either by passing regulations under Ordinance No. 5 of 1901, or if necessary by introducing further legislation, to provide for the compulsory registration of all estates on which the pest occurs, and for the absolute prohibition of the distribution of tea-plants from affected estates until such estates have been certified by the Government Entomologist as free from the disease. A proposal to introduce such legislation has been approved by the Planters' Association, and the matter is now receiving the careful consideration of Government.

In agreeing to more stringent legislation against plant diseases I think the Planters' Association is wise, but it was evident from the lengthy discussions which preceded the decision that much hesitation was felt in many quarters as to the policy of legalizing a restriction on the freedom of estates. A similar hesitation was at first evinced in the United States, where such legislation is now very general, and it is interesting, therefore, to find that in practice all opposition has been disarmed.

To sum up: the cultivation of tea, which gives employment to some 350,000 Tamil coolies, is now carried on in a more efficient and intelligent way than probably any other agricultural industry in the island. The crop is generally in a healthy condition, and owing to the stress of competition cultivation is conducted at the least possible expense, every means being used to reduce the cost of production and improve the quality of the tea.

As regards the future, I can only repeat the words I have used on more than one occasion already. Colombo is clearly destined to become a great market and distributing port for tea. How far its trade and importance might be increased by the removal of certain restrictions, together with the imposition of safeguards against the import and export of what is known as inferior or "rubbishy" tea, it is for those chiefly concerned to say. It has been repeatedly urged in certain quarters that the duty of 25 cents a lb. on all tea imported into the island is inimical to the real commercial interests of the Colony, inasmuch as it operates against the expansion of trade and tends to foster a feeling of resentment

among the planters of India, where the corresponding tax is only 5 per cent. *ad valorem*. The Planters' Association and the Chamber of Commerce, however, have consistently opposed the abolition of the duty on the ground that it would involve a danger to pure Ceylon tea which it is impossible to estimate. I have recently received from a local firm a request for blending facilities similar to those granted in London, the proposal being that the firm should be allowed to import free of duty Indian and other teas to be blended in a private warehouse, but under the supervision of a Customs official; that they should furnish the Customs authorities with particulars of the constituent portions of the blend, and that when these teas are re-exported the packages should be plainly marked with distinct indications of their contents. In my opinion this proposal deserves very careful consideration, as the possible solution of what may prove to be a very troublesome question. In the meantime, confidently trusting in the judicious management of plantations, practical experience being aided by science, I see no reason to doubt the continued well-being of the great planting industry of the Colony.

### FRENCH IMPORT TARIFF ON COFFEE.

The following are the terms of the Convention recently concluded between Great Britain and France:—

#### CONVENTION.

His Majesty the King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, Emperor of India, and the President of the French Republic desiring to facilitate the commercial relations between France and India, have resolved to conclude a Convention to that effect, and have named as their respective Plenipotentiaries:—

His Majesty the King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, Emperor of India, the Most Honourable Henry Charles Keith Petty Fitzmaurice, Marquess of Lansdowne, Principal Secretary of State for Foreign Affairs; and the President of the French Republic, Monsieur Paul Cambon, Ambassador of the French Republic at London, who having reciprocally communicated their full powers, found in good and due form, have agreed as follows:—

#### ARTICLE I.

The following colonial products: coffee, cocoa, pepper, pimento, amomums and cardamoms, cinnamon, cassia lignea, nutmegs, mace, cloves, vanilla, and tea, produce of India, shall enjoy on importation into France, Algeria, French Colonies and Possessions, and the Protectorates of Indo-China and Tunis, the lowest customs duties applicable to similar products of any other foreign origin.

#### ARTICLE II.

Reciprocally, the natural and manufactured products of France, Algeria, French Colonies and Possessions, and the Protectorates of Indo-China and Tunis, shall enjoy, without restriction or reserve on importation into India, the lowest customs duties applicable to similar products of other foreign origin.

Further the duties on vinegar in casks and copper as produced in France, Algeria, French Colonies and Possessions, and the Protectorates of Indo-China and Tunis, and imported into India shall not exceed  $2\frac{1}{2}$  per cent. *ad valorem*.

#### ARTICLE III.

The certificates of origin which may be required for the admission of goods to the preferential conditions stipulated in the present Treaty shall be *vide* by French Consuls and by British Consuls without levying Consular fees.

#### ARTICLE IV.

The privileges and engagements comprised in this Convention shall extend to Native States of India which, by Treaty with His Britannic Majesty or otherwise, may be entitled to be placed with regard to the stipulations of the Convention on the same footing as British India.

His Majesty's Government will communicate from time to time to the Government of the Republic a list of these States.

#### ARTICLE V.

The present Convention shall be ratified by the two Governments as soon as possible, and the ratifications shall be exchanged at London.

It shall come into effect immediately after the exchange of ratifications, and shall remain in force until the expiration of a year from the day on which one of the High Contracting Parties shall have announced the intention of terminating it.

In witness whereof the above-mentioned Plenipotentiaries have signed the present Convention and have affixed thereto their seals.

Done in London, in duplicate the 19th day of February, 1903.

(L.S.) LANSDOWNE.

(L.S.) PAUL CAMBON.

This appears to secure India against any preferential treatment in favour of Brazilian or other coffee.

### COFFEE NOTES.

**September Coffee Movement in the U. S.**—The coffee movement during September is notable for an increase of 622,229 bags in the visible supply of the world; deliveries in Europe and the United States 159,205 bags above the monthly average during 1902-03; heavy receipts at Rio and Santos, never exceeded for the same time but once; moderate speculative operations and a spot market that fluctuated within a range of five-sixteenths of one cent per pound.

The following statement shows the September movement in detail:—

	Bags.	Bags.
Stocks September 1, 1903:		
United States ..	2,547,936	
Europe ..	7,186,814	
		9,734,750
Receipts during September:		
United States ..	509,779	
Europe ..	957,146	
		1,466,925
Total supply September, 1903 ..		11,201,675
Less stock October 1, 1903:		
United States ..	2,465,686	
Europe ..	7,246,243	
		9,711,929
Deliveries, September, 1903:		
United States ..	592,029	
Europe ..	897,717	
		1,489,746
Deliveries, September, 1902 ..		1,396,975
Increase over September, 1902 ..		92,771
Deliveries, July, 1903 ..		1,339,679
Deliveries, August, 1903 ..		1,217,438
Deliveries, September, 1903 ..		1,489,746
Average per month, 1902-03 ..		1,330,541
Average per month, 1903-04 ..		1,348,953
Total 1902-03 ..		15,966,498

The visible supply of the world, October 1, was 13,770,429 bags, against 13,148,200 bags September 1; 13,005,325 bags October 1, 1902, showing an increase in September of 622,229 bags, and 775,104 bags more than in October, 1902.

Transactions on the Coffee Exchange were 588,000 bags, with 3·80 cents the lowest price for September deliveries; highest, 5·50 cents, for July.

The spot price of No. 7 Rio fluctuated between  $5\frac{1}{8}$  @  $5\frac{7}{16}$  cents, as the official quotation.

The total deliveries in September in the United States were 509,779 bags, of which 413,345 bags were of Brazil

sorts, 96,434 bags all other kinds. Mild sorts constituted 19 per cent., Brazil sorts 81 per cent. of the total receipts last month.

The total receipts during September at Rio were 1,617,000 bags; at Santos, 3,192,000 bags; both ports, 4,809,000 bags, against 4,567,000 bags same time in 1902, 5,555,000 bags in 1901.

The outlook is favourable for a continuation of low prices. Coffee is unusually cheap, and the consumption grows, but not as fast as the productive capacity of coffee-growing countries. There is no longer the stimulus of high prices to encourage an extension of the producing area, although there are large tracts of coffee-producing land in Mexico, Central America, Venezuela, Brazil, Cuba, Porto Rico, and Africa. Until there is some marked check to production through adverse crop influences coffee must rule low. Reports from São Paulo, Brazil, are to the effect that a drouth of several weeks' duration has injured the trees, and that the succeeding rains were insufficient to bring the trees up to full bearing capacity.

—*American Grocer.*

\* \* \*

Mr. C. E. Bickford, San Francisco, reports that the coffee market was quiet up to the middle of September, after which a better demand, largely confined to low-priced descriptions, the inquiry continuing into October. He quotes, Costa Rica, strictly prime to fancy washed,  $12\frac{1}{4}$  @ 15c.; common to ordinary, 4 @  $6\frac{3}{4}$ c.; fair to prime, 7 @ 10c.; good to prime washed Peaberry,  $9\frac{1}{2}$  @  $11\frac{1}{2}$ c.; Guatemala and Mexican,  $13\frac{1}{2}$  @ 15c. for fancy washed, 11 @ 13c. for prime to strictly prime washed,  $8\frac{1}{2}$  @  $10\frac{1}{2}$ c. for fair to prime washed Peaberry; Salvador, 4 @ 12c.; Nicaragua,  $7\frac{1}{2}$  @ 13c.

\* \* \*

The coffee-growers of Porto Rico know how to push their coffee: The St. Louis World's Fair Commission of Porto Rico has decided to send to the Exposition 200,000 or more quarter-pound packages of coffee for free distribution. These packages will be tastily prepared, and will be imprinted with the arms of Porto Rico and with a copy of a letter from President Roosevelt to Governor Hunt, in which the President warmly praises Porto Rico coffee sent to him by the Governor.

\* \* \*

Messrs. G. Trinks & Co., Rio, cable as follows: "Estimate this Rio and Santos crops 11,000,000 bags; prospects for next Rio and Santos crop unfavourable."

\* \* \*

The Directors of the Paulista Railroad, Brazil, estimate the present Santos crop at 7,000,000 bags.

\* \* \*

The *Brazilian Review* (September 22nd) reports the Santos coffee crop as follows: "Information about the flowering is contradictory, reports from the various districts being variable, some people saying it has been very good and others pretending that the higher situated plantations are without leaves, and therefore the flowering of these no good at all. It is altogether too early to estimate the next crop and we have to wait for the second flowering, which is to come out in about another fortnight. The weather so far for the second flowering has been favourable."

\* \* \*

On the Pacific Coast.—Messrs. Hills Bros., extensive dealers in coffees and teas, report that they are shipping large orders of Kona coffees to the East at present. Kona coffees

are rapidly increasing in popularity where a strictly high-grade article is wanted. This firm also reports that they are sending to Eastern points large quantities of low-grade non-descript ash coffees. On the whole, the coffee market is stronger than it has been for some time, being affected by the unfavourable crop reports from Brazil.

\* \* \*

The future coffee market was to be installed on the New Orleans Board of Trade, November 2.

\* \* \*

The U. S. Coffee Market.—The market in coffee is buoyant in futures and materially broadened in demand in the actual with fractional advances in Brazil grades, says the *Tea and Coffee Trade Journal* of the 27th ultimo. In the option market the trading has been very large in volume, totaling for the week more than 600,000 bags. Large financial interests have entered the market and almost daily some new and substantial Wall Street house is reported purchasing. Harris, Gates & Co. are the latest to try the market, the well-known cotton bull operator seemingly is becoming active, and it is no longer a whispered secret that the Messrs. Crossman are purchasers on the bull side, where they operated so long before the entering of the metal interests, and even this interest is a purchaser, but content to follow rather than to lead. The trade on the street is the seller usually and mostly to realize profits. Crossmans are making considerable of their purchases in the Havre market. In consequence of the activity, option prices have advanced in the week from 10 to 30 points. May is the month now chiefly traded in with March a close second. From the present trend it is by no means an unreasonable expectation to see March or May presently at 7 cents. They have not been that in some years, and to that extent has the market turned for the better. It is all very encouraging for the bull side.

Apart from the desire of financial interests to buy coffee for investment, the market has been encouraged by the continuation of unfavourable crop reports in Brazil. The receipts have fallen greatly, and now hover around the figures usually cabled in January and later, thus prognosticating a smaller, instead of a larger crop. It is now estimated at 11,000,000 bags, and even 10,000,000 bags. Unfavourable weather, too, is reported for the crop now blossoming, and this may prove as small and even smaller than the one now being put on the market. The only bearish point is the

large world's visible supply, which is to-day considerably more than 14,000,000 bags, the largest in the history of coffee. But with diminishing crops and an augmenting increase in consumption this should melt fast enough.

The Brazil market is firm and on a higher basis of values than that ruling in New York. The refusal of bids from this side is not an infrequent occurrence. Samples of transactions are the sale of 2,000 bags Rio No. 2 at 7.60 cost and freight for immediate shipment, and 3,000 bags Rio or Santos for No. 2, November shipment at 8c. store terms. An offer was Santos No. 3 at 7.5 1/16c. c. and f. The spot market for invoices closed firm, and there have been some fair-sized transactions during the week. The close was at 5 3/4c. for Rio No. 8, 5 15/16c. bid and 6c. asked for Rio No. 7, 6 3/4 to 6 7/8c. for Rio No. 4, and 6 7/8 to 7 1/8c. for Santos No. 4.

The advancing prices tend to hold buyers in check in the jobbing world, but a broadening demand is reported generally and a satisfactory volume of business. Buyers are prone to see what is going to happen, being rather disposed to view the advance that has occurred with suspicion in view of the large world's visible supply. Of course, the price of actual coffee is certain to be affected by the price of coffee on the Exchange. This has advanced a cent and one-half in the last two months, and actual coffee is not now so cheap as it once was, although it has not advanced a cent and one-half. The Arbuckles added one-half cent a pound to their package coffee during the week.

It is not now thought that the Revision Committee of the Coffee Exchange will order any change in the grading of coffee. Matters in price in the actual coffee world and the optional have returned to normal conditions, and a change is not justified. The difference between November and December has already narrowed down to 20 points; it was 35 points not very long ago. There has been considerable speculation on the possibility of a change, and those have lost who assumed it would come off, and speculated accordingly. The deliveries of November coffee on the Exchange will be very heavy.

Mild coffees are firm, but the volume of business is restricted. Holders are entertaining too high views in the opinion of intending buyers, and in their failure to reach a common basis transactions are few and far between. Good Cucuta closed at 8 1/4c. East Indias are firm.

**Brazil Coffee Receipts Reviewed.**—The *Brazilian Review* of September 26, says:—

"With the exception of a few rainy days in early September, everything has favoured early and rapid entry; the crop was unquestionably an early one, while the long spell of peculiarly dry weather not only favoured harvesting, curing and drying, but kept the roads in good order and facilitated delivery. Besides, all the railways, including the Sorocabana, have been working without a hitch, while planters are more pressed than ever for money and less able to hold back their produce. All these circumstances make unquestionably for early entries so that it would be natural, even if the present crop were smaller, that entries should be larger at first than last year. When, therefore, they begin to show a positive falling off it is quite possible that the shrinkage may be as rapid as the expansion was at the commencement of the crop, and entries should be carefully watched. The abnormality of the conditions upsets confidence in deductions founded on mere comparisons with other and more normal seasons, but, even so, it seems likely that, as occurred in 1899, by the September 11 entries, which amounted to 3,759,187 bags, will represent one-third of the whole current crop, that, in this case will not exceed eleven and a quarter millions for Rio and Santos, say 7 1/4 for Santos and four millions for Rio and

Minas. There are, in fact, many who stoutly maintain it will not exceed ten millions, at most. Another circumstance that will make for a smaller crop is the tardiness of this year's flowering and consequent backwards of next year's harvest.

"We do not pretend to draw positive conclusions, but merely to point out the danger signals we note along the route and counsel caution. Should entries fall below twelve millions, they will be insufficient to satisfy consumption; the 'visible' will fall off and, if, as seems quite possible, next crop is a poor one, we shall see prices decidedly on the upward track."

**Coffee Prospects Bullishly Viewed.**—Messrs. Henry Nordlinger & Co., New York City, in their October circular on coffee, say:—

"About the middle of the month the market became a little unsettled on account of a cable from one party reporting favourable progress of the growing crop. Our own information from Rio, Minas, and Sao Paulo is to the effect that very dry weather has been experienced in those States for from three to five months. In many places no rain at all is reported to have fallen in all that time until quite recently. The trees therefore lack nourishment at the roots, and in many sections this is apparent by the condition of the leaves, which are shrivelled and dried up. The blossoming may be luxurious, as the cable above cited stated, as was the case last year after freezing temperature had been experienced; but that the fruit cannot develop properly when the trees are affected and weakened is shown by the experience we are undergoing this crop year. During last Spring, and even as late as last July, it was generally believed that the 1903-04 crop would be equal to, if not larger than, the bumper crop of 1901-02, which produced something like 17,000,000 bags, of which 15,500,000 reached shipping ports during the crop year. The receipts during last July were very heavy, about the same as 1901-02 (this helped to fortify the general belief in a large crop), but the present crop began to arrive at shipping ports as early as May, while ordinarily new crop does not come into sight until the end of June or the beginning of July, therefore we must set down the present crop as being fully four weeks early, and the July receipts ought to be compared with the August receipts of former years, the August with the September receipts, the September with the October receipts, and so on.

"If we take the basis of 11,500,000 bags for the current crop, and add to it a reasonable estimate of 4,000,000 for all other coffee-producing countries, we would have a total production of 15,500,000 bags, which appears to us to be very little, if any, below the amount now consumed in Europe and the United States; therefore, this year's production alone is not a sufficiently safe basis on which to work the market up. Speculation, however, looks further ahead, and it is possible, nay even probable, that we have reached the period when we will not see excessive crops produced again for a number of years to come. Should this be assured (a matter which can only be determined later on), then a sound basis would have been reached for an ascending tendency of the article; but even then the advance from now on ought to be only a gradual one, until a considerable reduction of the large stocks existing in consuming markets can be safely calculated on.

"Central American countries have pretty well disposed of the big supplies accumulated during revolutionary times. For this reason, we look for a better tone from now on, especially in good washed, which are already difficult to obtain in an invoice way."

**Brazil Coffee Flowering.**—"O Café," Brazil, September 13, says as follows:—

"The month of August, as almost all the preceding six months, was very dry. In some districts budding was early, and in August there was a poor flowering that promised badly. The first rains fell during the first week of September, and were general and abundant. The trees at once changed aspect, and after the rains the flowering was beautiful and uniform. For the last few days the aspect of plantations along the Mogyana and Paulista lines has been enchanting, and although there was no flower in August, the drought lasted long enough to aid the September flowering, which, still further stimulated by the rains, and by the mild temperature that followed and entire absence of southerly winds seems to promise excellent conditions for the coming crop. The September

flowering cannot, however, be considered decisive. Results must depend on climatic conditions, and the way the fruit is developed. Should a drought like that of August supervene from November to December, after the fruit is formed, the crop would suffer severely. The September flowering so far signifies that conditions up to now are favourable, but does not guarantee that they will continue so. The flowering this year was very late. Last year when the frost of August 19 and 20 fell the trees were in full flower; this year the buds only commenced to open in September, fifteen days later. The coming season will, therefore, be tardy, and little coffee can be expected until July, thereby curtailing entries for the current season.

"Many people think that the rains were not sufficient to reinvigorate the trees weakened by the drought and insure an average yield. Trees of all descriptions, badly cared, half-leaved and even leafless, burst into bud, it is true, but cannot resist, and their yield will be but small."

A correspondent writes us from Pocos de Caldas, under date of September 13, as follows:—

"The present crop seems to be mostly harvested in this neighbourhood and to be smaller than last. Flowering is very profuse and a shower or two of rain this week will presage a large crop for next year. The weather has been damp and cold, but want of rain is general."

The Santos correspondent of the *Brazilian Review* writes September 19:—

"Information about the flowering is contradictory, reports from the various districts being variable, some people saying it has been very good and others pretending that the higher situated plantations are without leaves, and, therefore, the flowering of these no good at all. It is altogether too early to estimate the next crop, and we have to wait for the second flower forming, which is to come out in about another fortnight. The weather so far for the second flowering has been favourable."

### TEA NOTES.

**Colombo Tea Sales.**—On the 18th instant the market was very active, and the demand strong for all Pekoes and Pekoe Souchongs, particularly for common kinds, prices of which were firm to advancing. Orange Pekoes were dearer in most cases, but broken of all descriptions were irregular, with an easier tendency. Green teas were in better demand and were firmer.

**Japan Tea in Paris.**—It is understood, says the *Japan Times*, that the Central Chamber of the tea guilds now proposes to abolish its Paris office by the end of this year. It was established in 1900, just after the close of the Paris World's Fair, but owing to the inadequacy of funds and to the keen competition challenged by Indian tea, it has been unable to realize the object for which it was established, *i.e.*, the extension of the field for our product. Should this proposal be carried out, the business of the office will be entrusted to a French merchant at Paris.

**The U. S. Tea Market.**—Jobbers report the market in tea as very satisfactory, says the *Tea and Coffee Trade Journal* of 27th ultimo, and in the matter price of and supplies affairs are certainly improved over conditions prevailing several weeks ago. The undertone beyond question is strong and the outlook encouraging to those who look for realization of sales on the present basis at least. The country is reported as buying more tea, responsive to the needs of supplies, which, although plentifully provided for last season, are beginning to run low. During the week not a few fairly large-sized transactions were made public. Also large cargoes arrived for the market here. For tea of superior

quality prices are very firm and especially so for greens, which remain very scarce, even those of low grade feel the influence. These are after all not so abundant here. The grades were rather neglected on the other side, and the tea still remains there. Japans are firm.

Now that the Formosa market has closed, that tea is in a better position locally. Full values are being obtained for the better grades and the lower kinds are recovering from the weakness which characterized them a little while ago. Reports of settlements, of fair-sized quantity, for this market are reported from the East. The market is still burdened with last year's importations of this tea which consequently continue to hover around low values. Indias have gone up one-half cent in Calcutta, and in all have advanced one cent in the last fortnight. The market here, while firm, remains unaffected. It is probable that the quality of the India teas has improved and they are therefore reaping better prices. In the Spring and Summer this fell not a little, with corresponding slump in value. The interest here in Congous continues growing. Several thousand packages were sold for export to England last week and the price jumped to 9½ cents, remaining at that figure at the close. The tea is concentrated in a few hands and there is a suspicion that most of the large surplus here has been exported. Those who still have some are holding on expecting with some justification 10 and 11c. later on. They will probably get it. It is even thought that the market here is running short of Congous. There is a certain fixed demand for this tea in this country and it is thought we are no longer in a position to supply it. All the more will the tea find itself in a more satisfactory place as to value, and this is a good thing for all teas, for Congous for some time have been a bad incubus to bear.

\* \* \*

**Tea in the United States.**—It is apparent from the Government report of imports that British-grown tea is steadily gaining ground in the United States. The total imports of tea for the first eight months of 1903 were as follows:—

	From	Pounds.	Per Cent. of Total.
Japan	...	23,569,824	46.8
China	...	17,339,054	34.4
United Kingdom	...	3,704,825	18.8
East Indies	...	3,698,386	
British North America	...	1,660,850	
Other Countries	...	333,022	
Total	...	50,355,961	100.

It is safe to say that about 15 per cent., if not more, of this year's import is of British-grown tea, which had little or no foothold here not many years ago. The sale of packet tea is growing, and as the consuming public come to understand that the same quantity of Indian and Ceylon tea as of Japan or China will make double, if not thrice, the quantity of beverage they will use them more freely. Nine out of ten consumers use just the same quantity as they have been accustomed to use of Formosa, Oolong, or Japan, and the result is a heavier-bodied beverage than is generally liked.

\* \* \*

**Chinese Tea.**—The Hankow tea export continues to decline, and it is officially reported that unless the native growers improve their teas the trade will go over entirely to India and Ceylon. The Siberian railway route, which was used for tea during the year 1902 for the first time, can hardly fail to work considerable change in the conduct of the trade

in Russia, enabling as it does supplies to be placed on the consuming markets at a much earlier date than before. During the season some 3,000,000 lbs. were forwarded by this means, which in former years would have been sent *via* Odessa. It is also noted that 23,056 piculs of tea dust were imported into Hankow from Ceylon in 1902, and practically the whole of this importation left the port mixed with China dust, in the form of brick and tablet tea.

The tea consumed in Canada in the last fiscal year was 16,760,287 pounds; the population being 5,338,883, the average consumption per head in 1903 is 3.139 pounds.

**U. S. Imports of Tea.**—The imports of tea into all ports of the United States for eight months ending August, and the exports, were as follows :—

				Pounds.
Imports eight months	...	...	...	50,355,961
Exports	...	...	...	4,011,207
Net imports	..	...	...	46,344,754
Net imports same time 1902	...	...	...	47,084,254

Of the 1903 imports, Japan furnished 23,559,824 pounds, or about 48 per cent.; Chinese Empire, 17,399,054 pounds, or about 34 per cent.; the balance, 18 per cent., came from the United Kingdom, British North America, and the East Indies. It is evident that British-grown tea is making good headway in finding a market in the United States.

**Calcutta Tea Sales.**—On the 20th instant demand was again strong for leaf teas, and prices were firmer, particularly for common kinds, which were fully one cent per lb. dearer. Broken Pekoes, with the exception of the better kinds, were irregular with an easier tendency. Green teas were in better demand and advanced slightly in price. Reuter's London telegram on Thursday quoted the market there for Indian teas as follows :—"Common qualities firm—Mediums rather easier." In the face of this information it was thought possible the Calcutta market might also mark a weakness for the medium classes. Such however was not the case, and the room again showed a firm tone for all descriptions, competition continuing keen and previous prices being fully maintained except for the lowest leaf grades which, although exhibiting a downward tendency, cannot be quoted lower. Leaf in the range of 5 to 6 annas however, notably Assams and Dooars, marked a slight advance. Other descriptions were without alteration, but where improved quality was noticeable rates were correspondingly increased. The feature of the sale was the excessive keenness displayed by native operators to secure the neat leaf Pekoe kinds so much appreciated for the Bombay and Persian Gulf demand which, from the lowest to the handsome tippy Orange Pekoes, were eagerly competed for and mark a substantial advance. The quantity secured by those buyers must total close upon 6,000 packages. Green teas were in request and some nice quality being on offer, these realised somewhat full rates.

Offerings at Calcutta on Friday totalled about 20,000 packages and very few of these remain unsold. Quality from Assam showed, in some cases, a tendency to improve, but supplies from other districts were again generally speaking plain. The market, though rather irregular, can be quoted fairly steady; common grades were a point or two easier and low quality brokens were also lower, but all good liquoring

kinds sold readily at full rates. Stylish tippy sorts were again much wanted and further advances were paid for this class of tea. As usual, a large business was done for outside markets. About 600 packages of Green Tea were offered and sold under a strong demand at appreciably higher prices.

**London Tea Sales.**—Messrs. Ewart, MacCoughey & Co., Ltd., wire that the Indian tea auctions in London postponed from Monday, the 9th instant, were held on Wednesday, the 11th, when 38,503 packages were put up. The market was steady. The quotation for common whole leaf tea was 6½d. Quality generally good. Messrs. Ewart & MacCaughey's Tea Report, dated the 16th instant, says that 36,452 packages were offered at the tea auctions, which opened rather slowly. Holders were very firm and a good deal was taken out, only about a farthing generally separating buyers and sellers. The chief weakness was felt in teas between 6d. and 8d. Fine teas made good prices.

**Indian Tea Prospects.**—The latest weather reports received at Calcutta state that cold is setting in in most districts and manufacture is being restricted. The flushes are coming on slowly, and there is a good deal of brown leaf.

Messrs. A. R. Robertson & Co. (New York) report as follows :—Indias and Ceylons have received very steady inquiry the past few months, in comparison to other teas, but this can be accounted for by the explanation that when buyers stocked in January with duty-free teas they did not take so largely of those meeting a limited demand.

Prices have remained steady from 12c. for good Pekoe Souchongs to 15c. for Pekoes and Orange Pekoes selling 18@19c.

The Home market did not respond to advances in London and abroad; stocks here in black teas consequently are limited, while greens are rapidly increasing in consumption and the finished leaf becoming a factor in the consumption of tea in the United States.

The Indian Tea Cess Committee paid the green tea bonus of half-an-anna a lb. on 288,631 lbs. of tea from the 1st to the 31st October. The bonus has been paid on a total of 1,248,237 ½ lbs. of green tea.

The tea exports from the Calcutta Customs figures issued by the Indian Tea Association show that the tea entered for export to the United Kingdom during the first half of November was: from Calcutta, 10,508,547 lbs.; from Chittagong, 1,573,210 lbs. In the corresponding period of 1902 the figures were: Calcutta, 10,207,950 lbs.; Chittagong, 1,759,900 lbs. From the 1st April to the 15th November the exports from Calcutta were 115,840,767 lbs.; and in the corresponding period of 1902, 108,414,263 lbs.

The Report of the South Travancore Tea Co for the year ended the 30th June last states that the profit was £3,085, against £599 last year and £1,294 the year before. After providing £250 for the debenture sinking fund and writing off £250 for depreciation of machinery and £100 lost coast advances, there is shown a net profit of £1,653, which, after deducting the debit balance of £57 brought forward, leaves a credit balance of £1,596, out of which the Directors are

paying one year's preference interest, leaving to be carried forward £771. The average price of the tea was 5.47d. per lb., as against 4.82d. the previous year.

During the first half of November 302,534 lbs. of green tea were made in Ceylon. The total to date is 9,575,520 lbs. The three-cent bonus is still available for 2,573,575 lbs.

**Tea Cultivation in Persia.**—Vice-Consul-General John Tyler at Teheran, says of the cultivation and preparation for consumption of tea in Persia that in the different stages of the enterprise great difficulties and obstacles had to be overcome. He adds that with a sufficiency of capital to insure scientific direction, and the acquirement of the best implements and machinery for the work, the undertaking should be not only profitable but of economic advantage to Persia.

**A Great Tea Business.**—As showing how gigantic the Lipton interests in tea are, this firm is now selling over one million packets weekly in Great Britain alone, or over 52,000,000 per annum. As the population of Great Britain according to the last census numbers 41,952,510 and as according to official figures the consumption of tea is about 244½ million pounds per annum, this firm is actually selling about one pound out of every five pounds consumed annually in packet form alone. When it is borne in mind that Liptons have an enormous trade in bulk teas in the United Kingdom, that they have by far the largest packet trade in India, and have very extensive ramifications in Australia, America, and South Africa, some idea may be formed of the immense tea interests which they control.

In the Proceedings of the Indian Tea Association, which we publish on another page, will be found some interesting references to the Russian Import Tariff on Tea. The remarks about the Persian tariff are less happy. The Committee refer to a statement in a tea-broker's circular to the effect that the Persian duty on Indian tea had recently been raised by 95 per cent., and add that they had heard nothing of this reported increase. It is now many months since the new Anglo-Persian Commercial Treaty was ratified, and the unfavourable treatment of Indian tea under that Treaty was the subject of much comment in the Indian Press, and was certainly referred to more than once in the columns of the *Times*.

The following figures of tea exports taken from the Calcutta Customs daily entries and received periodically from Chittagong are issued by the Indian Tea Association:—Quantity of tea entered for export to United Kingdom for the first half of November, 1903: Calcutta, 10,508,547 lbs.; Chittagong, 1,573,210 lbs. Quantity entered during the corresponding period last year: Calcutta, 10,207,950 lbs., Chittagong, 1,759,900 lbs. Total from 1st April, 1903 to 15th November, 1903: Calcutta, 97,171,562 lbs.; Chittagong, 18,669,205 lbs. Total 115,840,767 lbs. Total from 1st April, 1902 to 15th November, 1902, 108,414,263 lbs.

According to a London cablegram, Messrs. Ewart and McCaughey's Tea Report, dated the 23rd instant, says that the market was steady, except for medium kinds, and prices for common clean whole leaf tea were quoted at 6d. The public sales next week are likely to be about 38,000 packages. Duty payment was good, the exports declining.

Further competition is threatened at Colombo to reduce the tea freightage. The steamer *Fortunatus*, due at the end of December, will carry tea at 30 shillings per ton, but the Conference of Shipping lines threaten another drastic reduction in rates, temporarily, to kill competition.

**The Russian Duties on Tea.**—Says the *Times of India*:—Russia is a large and increasing buyer of Indian and Colonial teas. Last year she took four million pounds from India alone, of the value of fifteen lakhs of rupees. But, in retaliation against Great Britain's action over the sugar bounties, the already high duties of 31½ roubles per pood of 40 lbs. are to be raised to 33 roubles in the case of Indian and Colonial teas imported through the European frontier or the Black Sea. The impost on Chinese and Japanese teas is to remain unchanged, so the Indian and Ceylon product will be at a disadvantage to the extent of a rouble and a-half a pood. This is as clear a violation of our commercial treaty arrangements with Russia as were the strangulating methods France adopted in Madagascar or those Cuba proposes to take in order to secure preferential treatment in the sugar market of the United States. But Great Britain is no more likely to secure redress by negotiation than she has in similar cases. Is not this pre-eminently a case for the employment of the only fiscal arguments which protectionist countries understand? If Great Britain had reserved to herself and her dependencies and Crown Colonies the power of bargaining which every protectionist country enjoys it is extremely doubtful if Russia would ever have proposed to differentiate against tea in this cynical manner. And the threat of a differential duty upon Russian petroleum imported into India, for example, would be more efficacious than whole books of argument. If Russia were convinced that unjust treatment of Indian tea would be met by a differential duty on Russian petroleum imported into this country, there would probably be no necessity to proceed to these lengths. But assuming that she was not amenable to reason, a differential duty on petroleum would cause a minimum of disturbance. The competition between Russian and American oil is so keen, and Burma oil, which pays no duty, is making such rapid strides that a rigging of the market is out of the question. Any moderate measures the Indian Government may take in this matter will meet with general support.

The manner in which our tea market is being influenced by conditions present and to come in London, is noteworthy and even significant, says the *Tea and Coffee Trade Journal* of 27th ultimo. Our dealings have heretofore been so dominated by China or Japan that what London thought or did concerned us little. But times have changed. In the first place we are larger, much larger buyers of British-grown tea, and, therefore, brought in closer touch with English tea-men, who naturally are more concerned with India and Ceylon tea than the Chinese and Japanese variety. But there is even another phase: the Englishmen are to-day buyers here, and there is every reason to believe that they will be such for not a little while, and in a manner that will help much to improve our market. For several years we have been weighted down with low-grade teas that had been acquired by us in China in large quantity, because they looked cheap, only to ascertain by hard experience that they were practically unsaleable here, because we had overstocked ourselves. Not even the later rise in the prices here served to budge the Congous a quarter of a cent until on a sudden the British-grown teas experienced an advance, and London in despair, lest the United Kingdom would thirst in vain for low tea, finding there were plenty here that Americans would not have bid for them, and in the first half of the year diminished our stock by some 4,000,000 pounds. Even this diminution did not serve to alter the situation; the tea remained a drag on the market, but now comes the Chamberlain scheme and other tariff changes with the prospects that an advance in teas in England must occur, and that we shall be depleted of all our teas unsaleable here. The orders are coming from abroad thick enough, and there has been an advance in this tea, here now more than two years, of more than one cent—nine cents a pound and more being demanded. We have, too, a good lot of Foochow of low grade, but costing a little more, and they may be attacked when all the Congous will have been disposed of. We are quite sure that we feel much indebted to the London market, which is relieving us of a situation which was becoming embarrassing.

In other respects, the American market is meeting with attention on the part of London and other English tea marts. The agitation for a pure tea law, an idea derived from the United States, is growing there, and there is study of our Tea Standard Act, which is being printed for general edification. The agitation was started by the importation into England of the Foochow teas rejected at New York. The prices obtained were so low that they nettled not a little the general market, which had, of course, viewed with approval the recovery from the low prices, at which Ceylons and Indians had been selling. It might be here observed that this same tea was brought to New York by an English firm, and so we are in no way concerned as a nation with the manipulation that this depreciated tea has met. Let it be stated also that the leaders here of those opposed to the Tea Standard Act were not born in the United States. They hail from England. It is well that the probity and the honesty of the American tea-man should be generally understood.

**Formosa Tea Market.**—Messrs. Smith, Baker & Co., writing from Taipeh, Formosa, September 25, say that the market there is well cleaned up of desirable teas, and that the green leaf to arrive, estimated at 50,000 half-chests is inferior. They report that the exports of Formosas will amount to 20,000,000 lbs. this season, two million pounds in excess of that exported last season. Total receipts to September 25 are 451,000 half-chests, against 411,116 last season, of these 40,000 are fair, 160,000 good, 190,000 superior, 40,000 fine, 15,000 finest, 5,000 choice and 1,000 choicest. The settlements were 438,658 half-chests against 402,599 last year; total exports to the U. S. 12,500,462 lbs. against 10,144,757 lbs. last year corresponding time.

Messrs. Tait & Co., writing on September 22, say: "Arrivals to Tamsui market total some 440,000 half-chests, against at even date last year 405,000 half-chests; total settlements to date 420,000 half-chests. Receipts to date are some 35,000 half-chests in excess of last year at same time, but we do not look for this to last, and we see no reason to alter our first estimate of a total crop of 500,000 half-chests."

Tea imported at Chicago during September last, as reported by the Custom House of that port was 1,284,109 pounds, valued at \$229,740. Coffee imported was 25,603 pounds, valued at \$2,396.

The cultivation of tea in Russia is reported as progressing satisfactorily. On the Crown estate, Tschakira, there were, according to recent reports, fifty-five dessjatines of land under tea cultivation. The first harvest, in April and May, gave a yield of 76,323 lbs. raw leaves. The second, in June, gave 62,430 lbs.; the third, in September, 37,412 lbs.; and the fourth, in October, 116,165 lbs.—all last year, of course. The aggregate output of dry tea was about 1,000 pood. The private tea-growers delivered a smaller quantity of raw leaves to the Tschakira establishment. Of raw tea leaves,  $4\frac{1}{2}$  lbs. yield 1 lb. of tea. As the tea has met with a ready sale, and as the cultivation is comparatively low, great hopes are entertained by those interested about the future of this industry.

### NOTES.

#### Cacao; Experiments in Drying at Dominica.

It is reported that by the aid of a dryer maintained at the temperature of 110 to 120F. cacao was successfully dried within 24 hours.

#### Java Coffee.

Excessive rain seems to be injurious to the coming crop. A moderate crop at the best may still be looked for, if, during November, the weather should improve. The present Government crop is now being estimated at 282,000 piculs.

#### Coffee-stealing.

Under Section 16 of the Madras Coffee-stealing Prevention Act VIII. of 1878, as amended by Act II. of 1900, His Excellency the Governor of Madras has amended the rules framed under

this Act as follows:—In rule (ii) and in note (b) to form B appended to the rules *substitute* the words "1st April" for "1st March."

#### Java Quinine.

The exports from Java during August amounted to 214 cases, shipped in one consignment to the United States. From January to August, inclusive, the exports have been:—

	1903.	1902.	1901.	1900.	1899.
Cases ...	1,262	834	1,222	1,059	1,337

#### Cinchona Auction.

At the auction to be held at Amsterdam on November 12th 702,329 kilos. of Java bark, containing 31,879 kilos. of quinine sulphate, was to be offered. The manufacturing bark contains an average of 5.30 per cent. quinine sulphate, against 5.42 per cent. for the October auction, and 5.51 per cent. average for the ten auctions of 1902.

#### The "Agricultural Ledger."

The latest numbers of the "Agricultural Ledger," just published, contain papers by Dr. J. W. Leather on Indian Food Grains and Fodders; Mr. Burkill on the Diffusion Process of Extracting Sugar from Sugarcane; Mr. J. Mollison on the Cotton-seed Oil Industry; Professor W. R. Dunstan on Bimlipatam Jute; and papers relating to Rubber from *Willughbeia Edulis* and *Urceola Escalenta*.

#### An Experimental Farm.

The *Madras Mail* approves of the suggestion that an Experimental Farm should be established in Southern India, but carefully eschews the question of locality, and other difficulties that must be faced when the suggestion is considered for the light of what is practicable. We would ask our contemporary to outline a definite scheme. Then we shall be able to judge how it is proposed to reconcile practice with theory.

#### Sulphur Imports at Tuticorin.

Section 17 of the Indian Arms Act is amended as follows: "Licenses to import or export arms, other than cannon or rifles, ammunition, or military stores, by sea, may be granted at the ports of Calcutta, Madras, Bombay, Rangoon, Calicut, Karachi, Aden, and for no other ports, except Akyab and Moulmein. Licenses for the import of saltpetre and lead only may be granted, and at the port of Tuticorin only for the import of sulphur if it be proved to the satisfaction of the local Government to be intended for *bonâ fide* agricultural purposes."

#### Java Cinchona.

The shipments from Java during October were as follows:—

Year.	Amst. lbs.	Year.	Amst. lbs.
1903 ...	2,012,000	1897 ...	735,000
1902 ...	1,700,000	1896 ...	862,000
1901 ...	1,577,000	1895 ...	1,100,000
1900 ...	1,100,000	1894 ...	952,000
1899 ...	959,000	1893 ..	349,000
1898 ...	969,000		

#### January—October.

Year.	Amst. lbs.	Year.	Amst. lbs.
1903 ...	11,529,000	1897 ...	6,717,000
1902 ...	11,054,000	1896 ...	8,280,000
1901 ...	10,301,000	1895 ...	9,929,700
1900 ...	8,190,000	1894 ...	7,577,000
1899 ...	9,421,800	1893 ...	6,225,000
1898 ...	8,895,000		

**Coffea stenophylla.**

Mr. P. von Romburgh reports that the difficulties surrounding the cultivation of Arabian coffee have led Java planters to turn to several means of relief. Hybrids between the Arabian and Liberia coffees have been tried with some success and the methods of grafting the Arabian coffee on Liberia stock have been perfected. But the author thinks there is room for improvement, and to this end suggests *Coffea stenophylla*, by some considered as a variety of *C. arabica*. *C. stenophylla* has been grown at the Buitenzorg gardens and has fruited. It gives promise of being valuable, and further trials are under way.

**Agricultural and Entomological Museum for Colombo.**

Mr. C. Driberg, Superintendent of School Gardens in Ceylon, has the idea, in connection with his particular department, of opening an economic museum wherein will be exhibited articles pertaining to agriculture in Ceylon in all its phases, as also entomology, so far as it is connected with agriculture, which connection is very extensive. There will, therefore, be in the museum, besides exhibits of all agricultural implements and products, specimens of the various and numerous pests which wage war in fruit-garden and field-crop, which should prove very interesting. The museum will be attached to the office of the Superintendent of School Gardens at Thurston Road, and it will be opened in the new building which has just been commenced at the Colombo stock-gardens. The building is expected to be completed by the end of next month, when the museum will be opened. Specimens will be obtained from the various school gardens in the island, and they will be duly named and grouped in Colombo. It is thought probable that in time the agricultural museum will be attached to the Colombo Museum, like the mineralogical department which is now being opened there.

**GENERAL ARTICLES.****PRODUCE AND PLANTING.****Central African Tea.**

According to an official report on the British Central Africa Protectorate, the cultivation of tea has been continued, and has received greater attention. It is, however, in an experimental stage, and the tea produced varies greatly in quality. The quantity produced is only small at present. The tea plantations are confined at present to the slopes of Mlanje Mountain, situated in the south-east corner of the Shiré Highlands. Here the average rainfall is 107 inches, nearly double that of the rest of the Protectorate. The tea, when brewed, can scarcely be said to reach the usual standard of ordinary tea; but in this respect doubtless improvements will be made. At present the Mlanje tea would be useful for purposes of blending with others, as it possesses a pleasant and characteristic taste of its own. The progress made by the tea-plants during the past year shows that there is little difficulty in the successful cultivation of this product on deep black soils at Zomba. The question of the success of tea at Zomba is therefore not one of cultivation, but depends on rainfall. It is only a very limited area of the Protectorate that has a suitable rainfall—that is, approaching 110 inches annually. With an altitude of 3,000 feet above sea-level, and an annual normal rainfall of 50 inches, such as Zomba obtains, and also the greater part of the Shiré Highlands, it is only from two such districts as South-East Mlanje and North-West Nyassaland that tea may ever be expected to become a successful commercial product. The altitude of the latter district is from 1,500 feet to 2,500 feet, and obtains an annual normal rainfall of 76 inches.

**Bad for Hankow.**

Indian and Ceylon tea-growers are, by their persistent efforts to capture the tea markets of the world, making things very unpleasant for their Chinese rivals. The Hankow tea export continues to decline, and it is officially reported that unless the native growers improve their teas the trade will go over entirely to India and Ceylon. It is pointed out that the Siberian railway route, which was used for tea during the year 1902 for the first time, can hardly fail to work considerable change in the conduct of the trade in Russia, enabling as it does supplies to be placed on the consuming markets at a much earlier date than before. During the season some 3,000,00 lbs. were forwarded by this means, which, in former years, would have been sent *viâ* Odessa. It is also noted that 23,056 piculs of tea dust were imported into Hankow from Ceylon in 1902, and practically the whole of this importation left the port mixed with China dust, in the form of brick and tablet tea.

**Consumption of Indian Tea in America.**

The *American Grocer* makes the following interesting remarks in the column under the head of tea:—"Blended tea having a touch of British-grown tea grows in favour much faster than straight Ceylon or India. The imports of tea into all ports of the United States for eight months ending August and the exports were as follows: Imports, eight months, 50,355,961 lbs.; exports, 4,011,207 lbs.; net imports, 46,344,754 lbs.; net imports same time 1902, 47,084,254 lbs. Of the 1903 imports, Japan furnished 23,559,824 lbs., or about 48 per cent.; Chinese Empire 17,399,054 lbs., or about 34 per cent.; the balance 18 per cent. came from the United Kingdom, British North America, and the East Indies. It is evident that British-grown tea is making good headway in finding a market in the United States." The New York correspondent of the *London Grocer*, writing on this subject, says: "The sale of packet tea is growing, and as the consuming public come to understand that the same quantity of Indian and Ceylon tea as of Japan or China will make double, if not thrice, the quantity of beverage they will use them more freely. Nine out of ten consumers use just the same quantity as they have been accustomed to use of Formosa, Oolong, or Japan, and the result is a heavier-bodied beverage than is generally liked."

**Consumption of Tea in Canada.**

The population of Canada, according to the last census, was 5,338,883. The average consumption of tea per head for the fiscal year ending June 30, 1903, was 3.139 lbs., the net tea consumed in Canada amounting to 16,760,287 lbs.

**How Rubber is Prepared at Lagos.**

At their last Meeting the Committee of the African Trade Section of the Liverpool Chamber of Commerce had under consideration a letter from the Secretary of Lagos Stores, Limited, who said that the preparation of rubber for the market in Lagos seemed to have been neglected, and it occurred to the Company that the time was opportune for the Government of the colony to adopt measures to have the state of things greatly improved. The rubber, he says, is of excellent quality, but the method of preparation considerably reduces its value. Something might be done to teach the natives the methods of collection and preparation used particularly in the French colonies. The Company believed that in French Guinea some time ago a similar class of rubber was shipped, but the producers were taught by a neighbouring tribe to manufacture what were called "Red Niggers," and now show an advantage in price of about 50 per cent. The French Government prohibited the export of rubber in any other form. The Company do not propose the British should do the same, but express their conviction that if the natives were taught they would not be slow to recognise and reap the advantage offered. Small quantities of rubber were made up by some of the Company's employes and brought 3s. 2d. per lb., while the "Lagos Lump" sold at 1s. 10d. per lb. It was decided to offer prizes of the value of £7 for the best exhibits, and the Section cabled this offer to the Governor, Sir William Macgregor.

**Cocoa and Rubber from the Gold Coast.**

Last year cocoa of the value of £94,944 was exported from the Gold Coast, as compared with £42,837 in 1901, an increase of 121 per cent., and thereby hangs a tale, which is set forth in the annual report of the colony. This industry was founded in 1879 by a native of Accra, who brought some cocoa plants and pods from Fernando Po, made a small plantation and, four years later, sold the cocoa pods in the neighbouring villages. The first consignment of 12 lbs. of cocoa was shipped to England in 1895, and

realised £6 1s. No more cocoa was shipped until 1901, since when the industry, fostered by the Government, which distributed large quantities of cocoa seeds from the botanical station at Aburi, and, at one period, shipped crops to England for the native growers, and also by the Basel Mission Stations, has advanced with rapid strides, fully 6,000,000 plants having been planted in one district alone. The chief port of shipment is Accra, which is now connected with market towns in the districts in which the greater portion of the cocoo exported is grown, by excellent roads. Now the Gold Coast gets practically as much for its cocoa as for its gold. With reference to rubber, it is pointed out that although 5 per cent. more was exported than in 1901, 15 per cent. less value was realised. The wholesale destruction of trees and vines by the natives, due to the unskilful methods employed by them in the extraction of the latex, and the low prices now realised in Europe, are the factors which have conduced to the decline of this one staple product. An effort is being made to teach the native how to tap the trees and vines without injuring their vitality or growth.—*H. & C. Mail.*

### SILK CULTURE IN SIAM.

The Report of the Acting Financial Adviser in Siam writing of silk culture, says:—The efforts of Government are directed towards the establishment of an agency for the investigation of the best methods of silk production, as suited to Siam, and the scheme has outgrown the purely experimental stage at which it stood last year. The observations and experiments of the Japanese expert engaged for this investigation, have been attended with a most satisfactory measure of success, and it is now the purpose of the Government, by the establishment of model nurseries in suitable localities and the adoption of modern methods of warm raising and silk reeling to provide centres of instruction for the classes already engaged in this industry. Siam at present exports a fair quantity of raw silk, in addition to the large amount employed in the hand manufacture of *phanungs* and other articles of clothing, but the quality is in all classes poor owing to unskilful methods and, as a consequence, the prices obtained are very low compared to those of other silk-producing countries. This defect it will now be the endeavour of the Sericultural department to remedy by practical demonstration of the advantages to be derived from the scientific selection and cultivation both of worms and mulberry trees, as well as from adoption of proper mechanical means for preparing the raw silk for the market. With this end in view, model stations will be established at Bangkok, Korat and Phrapathom, and a system inaugurated for the training of apprentices belonging to the cultivating classes. In the present year it is proposed to entertain twenty of these. If the scheme here briefly outlined proves successful, it would not be long before the silk of Siam, by reason of its improved quality and increased output takes its proper place as an important addition to the staple products of the country—thus adding to the material wealth of the people, as well as to the Government.

### PEPPER IN THE NILGIRI DISTRICT.

Pepper is yearly growing to be one of the most important by-products of the Wynaad Taluq of the Nilgiri District, says the *Hindu*. Planters find it far more reliable than coffee and much less expensive to cultivate. It is grown under shade either supported by poles, or by trees planted for the purpose of trailing the vines upon. It is a perennial, climbing shrub a wild variety, abounding on the Nilgiris and forming a handsome decorative plant with its yellow clusters of fruit at one time, and red at another, when fully matured.

Black pepper is obtained from miniature berries, gathered as soon as one or two in the cluster turn red. The berries are removed from the stem and dried in the sun or over a mild fire. When the drying is complete, the berry is shrivelled up, hard, and either black or brown. For the drying, a bit of ground is carefully prepared. It is made smooth and operated till quite hard. The berries are then filed on it to dry, which is known to be the case by their turning brittle, the inside becoming stony and the cortex wrinkled. This method of preparation for market has the disadvantage of coating the berries at times with earth from the mere

fact of lying on the ground. But this is not the only cause of black pepper being dirty. The clusters are often so low down in the vine, that they trail on the ground while still immature. Whatever the cause the marketable article is depreciated in value from the circumstances, and growers are advised to see that what they send away is perfectly clean. Besides Malabar and Wynaad the black pepper of commerce comes from Singapore, Alleppey, and Acheen. Some Mangalore pepper is known as that pepper, and its preparation is by floating the berries in water and separating the floaters from the sinners, the former being so named. The heavy kind of Mangalore pepper is large, of a deep black colour, very clean and of uniform size. When powdered it is of a greenish black appearance. Singapore pepper is from the Johore State and forms a very large proportion of the spice. It also is of large size and of fairly uniform quality, but as pepper powder it is not much esteemed owing to the manner of drying, giving it a smoky flavour. Indeed it is by this smoky flavour, that buyers can distinguish Singapore pepper from peppers from elsewhere. Tellicherry and Alleppey pepper are much alike in appearance, both being light brown in colour. They too, like the Malabar peppers, are sundried. The pepper shipped from Penang is called Irang pepper, and is grown in Sumatra. From East end of the same island comes the Lampong pepper, but this lacks uniformity, and is light in colour. It is also sundried.

White pepper is only the same article but with the outer shell or pericarp removed. The manufacture of white pepper is a distinct business. Some plantations go in for it and the black shell is removed by friction after the berries are soaked in water. There is white pepper from Singapore, Tellicherry, Penang, and Siam. Ground pepper should be nothing but the pepper corns of either the black or white pepper reduced to a proper fineness by passing through a suitable spice mill and over sieves. In this form, the pepper is sometimes adulterated, and the adulteration is hard to detect. Almost anything is ground up with the pepper, such as pepper shells, wheat rice, cocoanut shells, almond shells, mustard husks. Cayenne adulterated pepper is sold as such. In the choice of his adulterants, the manufacturer seems to be guided by the colour alone. Cayenne, when used in this way, gives the mixture pungency.

### SILK WEAVING IN BURMA.

A Mandalay correspondent writes to the *Rangoon Gazette*:—I read with interest the article under the above heading which appeared in your issue of 2nd instant, and hope the attention which is being given in the Bengal Presidency to Mr. N. G. Mukerjee's report will also lead to new life to a profitable industry in Burma. Notwithstanding the religious prejudices which stand in the way in Burma the silk industry in Mandalay for instance is making some headway. The representative of a firm which deals in Burmese silks assures me that orders from ladies for silks of Burmese manufacture from all parts of the world are rather on the increase than otherwise. From the principal centres of India, the orders for Burmese silks are extensive and the taste has been caught on in England and America. The drawbacks of the Burman craftsman are not few. He is indolent and slow to improve upon his old style of working. Burmese hand looms are of the most primitive description. Because their ancestors have not made silk of any width above twenty-four inches, they keep within that limit. In order to get them to manufacture silks of greater width, special looms will have to be constructed, and the weavers must be taught how to handle them. The Burman is too fond of taking his own time and of allowing pleasure to interfere with his work, and the production is very slow. Ordinarily it takes a weaver thirty to thirty-five days to complete a piece of silk measuring twenty-five yards in length exclusive of dyeing, spinning, looming, etc. To complete a piece of 1,000 yards it takes about three months. At present the Burmese silk in vogue is not more than twenty-one inches in width. From time immemorial the Burman is in the habit of mixing his dyes by rule of thumb, and hence there is always a liability of shades of colour to differ. Then again one man is prone to spin his thread a little thicker than another, and one weaver is quite as likely to weave his silk a little closer than another. Amongst the Burmese uniformity is considered to be grotesque. If a Burman makes some approach to a model or pattern he is quite satisfied, and he does not trouble himself as to exactness.

## TEA IN EUROPE.

The tea-trade of Turkey is considerable, but very difficult to gauge with accuracy. In the first place it is necessary to decide what is Turkey.

The whole dominions of the Sultan cover an area of more than 1,700,000 square miles and contain a population estimated at nearly 20,000,000. But these figures include Tripoli and other tributaries—though not Egypt which still pays a large tribute—and some of the European Christian provinces which are nominally independent. As, however, the figures relating to tea imports into Turkey certainly do not include all these countries, it may be well to take as the trade meaning of Turkey, or the Turkish Empire, the two main divisions, of

(a) Turkey in Europe, with about 6,000,000 inhabitants

(b) " " Asia " " 17,000,000 "

for a total population of say 23 millions, of whom some 1,000,000 are congregated in and around Constantinople.

The next obstacle confronting the enquirer is the fact that the tea-trade of Turkey is inextricably mixed up with that passing in transit for Persia. How much of the tea annually arriving at Constantinople, for instance, remains there or passes into Turkish consumption, and how much proceeds to Trebizonde, for despatch thence by camel caravan to Tauris, the great trade centre of Northern Persia? And what proportion of the tea entering Asiatic Turkey by the Persian Gulf is actually consumed on Turkish territory, and how much of it finds its way into Southern Persia? Tea, in fact, reaches the Turkish Empire from so many different countries and enters it at so many different points, and the local statistics or records are so meagre and unreliable, that all estimates as to the volume of the trade can at best be only approximations. From information carefully gathered at Constantinople among tea merchants and officials, and by comparison of the figures thus obtained with those recorded by the exporting countries, it is, however, possible to arrive at a rough working estimate.

Taking first the trade of Constantinople: A British Foreign Office report for 1901 states that "the annual importation of tea is estimated to average 8,000 to 10,000 cases of 100 lbs. each." This would give something under 1,000,000 lbs. for tea cleared at the Stamboul Customs, but it says nothing as to "other Turkish ports": the transit trade for Persia, probably another 2½ million lbs. is of course also not included. Other figures (based on the Turkish Customs statistics for 1895-96) supplied by the British Chamber of Commerce at Constantinople, gave the annual imports here as 588,863 kilos., or 1,295,388 lbs. Yet another set of figures was obtained by careful enquiry among Stamboul merchants and others, which may be tabulated thus:—

### AVERAGE ANNUAL TEA IMPORTS.

		lbs.
via "Constantinople	... 12,000 chests of 80 lbs. each =	960,000
" "Other Turkish Ports"	... 3,000 " " " =	240,000
" "Transit for Persia via		
Trebizonde	... 25,000 " " " =	2,000,000
	40,000 " " " =	3,200,000

As the trade is growing and these figures were admittedly under rather than over the mark when obtained in 1900, it would probably be safe to say that Constantinople's annual imports for home consumption are to-day fully 1½ million lbs.

Turning to "Other Turkish ports" the quantity, 3,000 chests given above, was the average opinion at Stamboul, but is obviously much too low if taken to include all ports of Asiatic Turkey. The difficulty is that figures relating to Asiatic Turkey, especially those dealing with imports direct from the Indian side of the Suez Canal, necessarily include large quantities of tea entering the Turkish Empire via the Persian Gulf. On the other hand, it is probable that statistics of exports to Asiatic Turkey from the United Kingdom, Hamburg, etc., refer chiefly to Mediterranean ports. An additional trouble is the evident overlapping of statistical years in some cases. Making due allowance for all uncertainties, however, it seems fair to assume that the total tea imports from all sources into Asiatic Turkey are at present some 4 to 4½ million lbs. annually. Adding to this the 1½ million lbs. for Constantinople given above, we get a total annual import for all Turkey of 5½ to 6 million lbs. This divided among the population of 23,000,000 gives very nearly 1 lb. per head annually. It was locally believed at Constantinople

that of this total 6,000,000 lbs. about 75 per cent. was Indian tea, 20 per cent. China, etc., and 5 per cent. Ceylon. Later evidence tends to show that the Ceylon figure is much underestimated. In this connection the subjoined tables may be of interest:—

(a) Quantities of Tea (in lbs.) exported from U. K. to Turkey, 1900—02.

EUROPEAN TURKEY.				
		1900.	1901.	1902.
China tea	...	98,674	68,744	135,242
Indian tea	...	295,733	96,083	125,818
Ceylon tea	...	65,284	38,302	76,110
Other Countries	...	58,225	21,329	31,487
Total lbs.	...	517,916	224,468	368,657

ASIATIC TURKEY.				
		1900.	1901.	1902.
China tea	...	...	...	...
Indian tea	...	57,219	148,164	227,570
Ceylon tea	...	...	...	...
Other Countries	...	12,948	22,534	28,086
Total lbs.	...	100,304	208,774	345,193

(b) Direct Exports of Indian Tea from India to:—

		1900-01	1901-02.	1902-03.
Asiatic Turkey	... lbs...	3,240,000	2,626,000	3,273,000
European Turkey	... " ...	618,000	144,000	390,000
Persia	... " ...	2,429,000	2,530,000	3,254,000

The tea-trade of Persia, it has already been said, is intimately connected with that of Turkey. The united tea consumption of the two countries is given by a good London authority as 11 million lbs. in 1900. That of Persia alone is probably 5 to 6 million lbs. annually, drawn hitherto almost wholly from India. The new (1903) Anglo-Persian commercial treaty, imposing as it does an extra 95 per cent. duty on British-grown tea entering Persia direct, may, however, seriously affect this trade, and throw it more largely into Russian hands. As shown in a recent *Board of Trade Journal* tea is already being sent in increasing quantities into Persia from both Moscow and Odessa, via Baku. Some 400,000 lbs. annually (mostly packet teas, containing a proportion of Indian and Ceylon leaf) are said to go from Odessa alone. Moscow figures are also stated to be "large," but are not given.

This Russian trade via Baku is favoured by the new Russo-Persian treaty (made public 5 days after the Anglo-Persian) which is reported to bristle with "hostile discriminations" against British trade what the British treaty has done for Indian tea we have just seen.

Returning to Turkey, it is satisfactory to find that the fiscal conditions there are not unfavourable. The Customs duty on tea is the same as that on general merchandise, viz., 8 per cent. *ad valorem*. In practice, this means considerably less than 1d. per lb. on the mass of tea imported. The bonding regulations are also accommodating to merchants, thus facilitating the transit trade for Persia handled at Constantinople. At Trebizonde no duty is charged on tea destined for Persia, whilst the tax levied at the Persian frontier is said not to exceed Rs.3 per chest. There are thus no serious hindrances to the growth of trade from the Turkish side.

As regards types of tea required, teas are selected at Constantinople hardly at all by liquor or flavour, but chiefly by appearance. A long wiry leaf is most liked, especially for the Persian trade where camel transport tends to break up the tea. For the local retail trade plenty of white and tippy leaf is essential. The public fears that black-looking tea may be adulterated with the so-called "Turkish tea"—a coarse black leaf having a disagreeable taste, which grows wild in Asia Minor and is extremely cheap. It is often palmed off in blends upon the native public, which is, therefore, particular to buy its tea open, by weight—not in packets—and demands a tippy appearance. The teas most wanted for Turkey are Indians of large wiry leaf and low cost—say five to seven annas in Calcutta. Cheapness is of the utmost importance, and to this end further facilities are needed by the trade—for instance, more direct Steam communications between India and Constantinople, and a larger stock there of Indian teas for buyers to select from. In the latter direction something has lately been done, but further attention to this market is desirable.

In conclusion, it may be said that the outlook for tea in Turkey is distinctly encouraging. The taste for it already exists, espe-

cially for Indian varieties, and the demand is steadily growing. In so poor a country as Turkey a consumption of  $\frac{1}{4}$  lb. per head is not inconsiderable and already far exceeds the *per capita* rate in France or Germany for instance. There are practically no fiscal obstacles; and the retail prices of tea, both in leaf and in the cup, are already on a popular basis, whilst both in Turkey itself and in Persia Indian teas enjoy a natural preference.

With a little aid and attention in directions indicated above it seems most probable that an already promising field for British-grown tea might be considerably further developed.—*Capital*.

## THE ROYAL BOTANIC GARDENS, CEYLON.

From Sir West Ridgeway's review of the Administration of the Affairs of Ceylon, 1896—1903, we take the following interesting report on the Royal Botanic Gardens:—

### THE ROYAL BOTANIC GARDENS.

The Royal Botanic Gardens Department has developed in a manner equally striking and gratifying. So wide indeed has been the range of this development that its title, which used to indicate fairly accurately the scope of its activities, now very inadequately describes the varied functions of one of the most useful branches of the public service. Very shortly after assuming the administration of the Colony I was struck with the great possibilities of the department as an aid to agriculture in Ceylon; valuable services had been rendered in the past in the introduction and diffusion of such plants as cinchona and cacao, but, comparatively, the day for important work of this kind was past, new possibilities of usefulness called for recognition, and the history of the gardens as a modern institution for affording scientific aid to agriculture practically recommences in 1896.

Botanical and horticultural work had been carried on since the foundation of the gardens in 1821, but when I took over the reins of Government in 1896 the department was entirely different in its size, scope, and activities to that which exists at the present day.

On Dr. Trimen's retirement, four months after my arrival, the present Director, Mr. J. C. Willis, then Assistant in Botany in Glasgow University, was appointed. He had not been long in the Island before he reported that an immense amount of scientific work remained to be done in Ceylon botany, the study of the fungi of Ceylon, especially of the disease-producing parasitic fungi, being almost untouched. He pointed out that there was much to be learnt about the physiology of tropical plants (on which knowledge the application of science to practice is mainly founded), their modes of life, the chemistry of soils, manures, etc., the principles of tea-making, rubber-curing, and such subjects, and innumerable other questions. It was obvious, however, that Mr. Willis could not find time for more than one such investigation at once, and provision was therefore made for a scientific assistant from 1898 onwards. The first appointment under this scheme was that of Mr. J. Parkin, who devoted attention to the best ways of collecting and preparing rubber: his method, modified as subsequent practice has shown to be advisable, is now largely used, and Ceylon rubber is obtaining the highest market prices at the present time. This proved the first of a series of appointments of experts who have been of the greatest possible value in the scientific examination of the many practical problems which confront the planters of the Island. In fact, no other department in the administration has received such a notable accession to its strength. The European staff, which in 1895 consisted of the Director, with the Superintendent of the hill garden and a head gardener at Peradeniya, now includes six trained scientific men and two skilled horticulturists. Thus, besides the Director, there are now the Government Mycologist and Assistant Director, the Government Entomologist, the Government Chemist, the Controller of the Experiment Station, the Scientific Assistant, the Superintendent of Hakgala Gardens, and the Curator, Peradeniya Gardens. The duties of each of these officers vary, but they are all engaged in investigating from a scientific point of view different questions in relation to the botany, entomology, and agriculture of the Island, with a view to communicating the knowledge gained to the planting and agricultural communities. The department, in short, now exercises the functions of a bureau for information and advice on questions relating to botany, agriculture, horticulture, entomology, plant pathology, chemistry,

and other subjects. The Government Mycologist and Entomologist frequently tour through the planting and other districts to study the appearance or condition of any pests by which the Island's crops are attacked. They attend Meetings of planters in various centres, where discussion takes place on planting questions, and are always ready to give technical information.

As in the case of most new departures, many criticize or even deny the value of the appointments and of the work of the Mycologist and Entomologist. Their reasons usually prove on analysis to be more or less personal; they do not receive the undivided attention of these officers, or the cultivation in which they are most interested does not receive it, or, as is not infrequently the case in diseases of plants as in those of mankind, no simple or practicable remedy can be found for the particular disease in hand. Few people realize that the diseases of plants are as common, as insidious, and at least as infectious as those attacking animals or mankind. A disease is not infrequently allowed to spread over an estate until it becomes a serious epidemic; the aid of the Mycologist or Entomologist is then invoked, and because he cannot at once eradicate the disease at little or no cost to the estate his work is condemned as useless. As reasonably might one expect a solitary medical officer, unhelpt by sanitary legislation, to deal single-handed with malaria or enteric fever in Ceylon, and blame him because those diseases still claim their numerous victims. But the best justification of these appointments lies in the fact that so many applications for aid are made to the two officers mentioned that they are almost too much occupied in attending to them, to the detriment of the work of studying the life history of diseases and methods of prevention. Only by the most rigid economy of time is it possible for them to secure the necessary opportunities for this, the more important section of their work. Gradually, no doubt, public opinion will become more awake to the importance of early and proper treatment of disease and to the danger of allowing uncared-for patches of cultivation to become nurseries of disease, continually re-infecting the neighbourhood. Under the stimulus of competition it will be recognized that it pays to have clean and healthy cultivations.

In my review of the trade of the Colony during the past seven years I drew your attention to the fact that the Colony is slowly but surely becoming less and less dependent on one staple, and in my previous addresses to you I have frequently emphasized the importance of encouraging new products. The Royal Botanic Gardens Department affords admirable opportunities for experiments in this direction.

Turning to new products in detail, probably the most important is Pará rubber. The rubber industry is increasing rapidly, and large areas in various parts of the world are being planted with this valuable product.

Rubber may now be looked upon as a firmly-established industry, and it is estimated that from 10,000 to 12,000 acres are already planted with the product. The best methods of procuring the rubber and preparing it for the market have been especially investigated by the department and the results published. The estates which have already come into bearing are yielding large and steady profits. During last year several tons were exported to England and sold at a price of about 4s. per lb. The export for the first three quarters of this year was 30,000 lbs. Ceylon rubber is considered to be of the best quality in the market, and if care continues to be taken in preparation there is no reason why the present position should not be the beginning of a trade which may well expand during the next five or six years to annual shipments of from one and a-half to two million pounds, worth perhaps between £300,000 and £400,000. It is evident, moreover, that instead of being limited to 10,000 acres, as was calculated a few years ago, rubber (in its several ready-growing and remunerative species) may yet cover as great an extent as cacao, i.e., 35,000 to 40,000 acres, and the trees on such an area ought, when in full bearing, to yield from six to eight million pounds a year of the crude product, which is so much in demand in Europe and America.

Camphor, introduced by the Royal Botanic Gardens Department, has succeeded well in many places where it has been planted, and bids fair to be a useful and profitable minor product. The price of camphor is exceedingly high (from 140s. to 150s. per cwt.), it being of great value in the manufacture of celluloid and for many other purposes.

Tobacco cultivation has not greatly increased during the last seven years.

Experiments have been tried by the gardens and by planters which demonstrate the possibility of growing good rhéa in Ceylon. Owing to the lack of good machinery for dealing with this fibre, and the recent extension of mercerised cotton, which competes with rhéa on its own ground, there seems, however, but little hope of this fibre becoming a profitable industry at present.

Vanilla has been planted in many districts during recent years, but the severe fall in price that has lately occurred will probably be somewhat discouraging.

Pepper has been planted in a few localities, and continues to expand slowly, but there seems little likelihood of any considerable export trade springing up at present.

Attempts have lately been made to resuscitate cinchona, once our largest staple, by the introduction of the very rich Java varieties; it is as yet, however, too early to speak as to the prospects of this industry.

Coca, the source of cocaine, introduced years ago through the Botanic Gardens, is now cultivated in some districts, and Ceylon leaf frequently appears upon the London market, obtaining the highest prices.

Cardamoms have proved a remunerative cultivation in recent years, and the area under cultivation, as well as the exports, have continued to increase. It is estimated that nearly 10,000 acres are now planted with this product, as compared with about half that extent in 1896. The export has risen from 415,585 lbs. in 1896 to 615,922 lbs. in 1902. Latterly there has been a fear of over-production of cardamoms as of tea, but it may be hoped that the steps taken to interest new markets in Australia and America, as well as in Europe, will prevent any further lowering of price, though caution is necessary not to extend cultivation until a steady market is assured.

The export of citronella oil has until recently continued to increase, but there has been a decline in price, owing partly to over-production, but chiefly to inferior quality and adulteration. Lately also the Java planters have taken up the industry, producing a first-rate pure oil which has recently been selling at 2s. 1d. per lb. in Europe, as against 10d. for Ceylon oil. The problem of how best to rescue our industry from the dangers threatened by this competition is now engaging the careful attention of the Botanical Department.

Among other products which have also received attention lately may be mentioned guttapercha and ebony, with its allied timbers calamander, etc.

A possible new industry—or perhaps, more correctly, revival of an old one—which has been considerably canvassed in the Press of the Colony this year is cotton cultivation. It has been pointed out that the present is a peculiarly opportune time for reviving cotton-growing in Ceylon. Determined efforts are being made in Lancashire to make the Empire independent of foreign countries for its cotton supply, and any colony, therefore, which possesses suitable land for cotton cultivation has a chance of initiating a new and profitable industry. Now, it was demonstrated some years ago that certain parts of Ceylon are adapted for this cultivation, and they are moreover the very parts which stand most in need of development. I have already given you some idea of the productiveness and capabilities of the country through which the Northern railway will run, and there is no doubt that there is a considerable amount of land which will grow cotton if sufficient rainfall or water-supply is available. The chief question is whether Ceylon cultivators can grow a good staple, better than the inferior Indian staple which was formerly cultivated in the Island, and which, as at present grown in India, yields a poor return in price. I have recently sanctioned an experiment on carefully-considered lines under the supervision of Mr. Willis. It has been decided to set apart an area of some 80 to 90 acres in the North-Central province, and make a fair trial not only of Indian, but also of American and Egyptian cotton. Efforts will also be made to induce private enterprise to take up the cultivation by grants of land on easy terms, while it is also proposed to encourage the industry among natives by a distribution of cotton seed on credit. We must be prepared for a certain amount of unremunerative expenditure for a time, but the sum involved is comparatively trifling, while, if the experiment is successful, the results should prove of far-reaching importance.

There seems to be a probability that Ceylon may in course of time become the home of a small silk industry. So far back as 1873

successful but isolated experiments were made by private persons, and last year some silkworms were raised from Italian seed imported by the department and were kept for stock purposes. The resulting eggs were submitted to a cool temperature for six months, after which they were allowed to hatch, and the worms were raised at the Royal Botanic Gardens. Some of their cocoons were sent to England to an expert, who reports that the silk produced therefrom is of very good strong quality, comparing favourably with that produced in Cashmere. Large nurseries of mulberry plants are now being raised, and plants are being distributed throughout the Island with the assistance of the Government Agents. When the trees have become established and have sufficiently grown it is proposed to issue silkworm seed to the various recipients of plants for more extended experiment.

Cacao cultivation has shown a most welcome vitality in the face of grave danger. The extent of land planted with cacao has risen from 21,000 acres in 1896 to about 35,000 acres in 1903, while the export of the product has expanded from 31,000 cwt. to 60,000 cwt.: that is to say, the production of cacao has almost doubled during the last seven years, and it is still increasing. Yet in the beginning of my administration a mysterious disease, the cause of which was unknown, seriously menaced this important industry, and in 1897 a Plant Pathologist was sent out from Home and paid partly by Government and partly by the cacao planters. As the result of his investigations the cause of the evil was ascertained, and the measures which he proposed have since been generally adopted and have prevented the threatened extinction of this plant, which grows and produces in Ceylon better than in the great majority of cacao countries. The Government are at present considering whether means cannot be taken to protect the majority of cacao growers from the shortsighted policy of a small minority, who do not take proper precautions to prevent the spread of the canker, and who are consequently a constant danger to the rest of the cacao estates.

The successful issue of the combat with the cacao canker is gratifying testimony to the practical utility of the Botanic Gardens Department, and is a striking illustration of the change which has taken place of late years. Since 1896 the planter, both European and native, has had created for him a Government Advice Bureau, where he can and does apply for information on all matters affecting his crops and their profitable cultivation. He also has had provided for him a State Station, where experiments are made in improving the plants already cultivated and in introducing new plants which may prove of economic value, and he can consult experts who, by their knowledge of the nature of the evils causing plant diseases, can suggest means for fighting these enemies and reducing the losses caused by them to a minimum. In a word, the Royal Botanic Gardens Department not only possesses some of the most instructive and beautiful gardens in the world, but, by virtue of its remarkable influence on our great agricultural industries, may well promise to be the mainspring of of the Island's prosperity.

## DISTRICT ASSOCIATIONS

### INDIAN TEA ASSOCIATION.

#### GENERAL COMMITTEE PROCEEDINGS.

The following is from an abstract of the proceedings of a Meeting of the General Committee held on the 10th instant. There were present: Mr. T. McMorran (*Vice-Chairman*), Messrs. G. Kingsley, Geo. A. Ormiston, R. R. Toynbee, T. Traill, and W. Warrington.

Letters dated 16th and 23rd October from the Secretary, Indian Tea Association, London, having been previously circulated were brought up for final consideration and disposal. The principal subjects dealt with were—

#### THE LOUISIANA PURCHASE EXPOSITION.

The London Committee advised that arrangements had been concluded with Mr. R. Blechynden to act as Commissioner for the Association's exhibit, and that he had been deputed to proceed to

St. Louis to interview the Secretary to the Royal Commission regarding space for the exhibits.

It was proposed to place these in the Agricultural Building and to erect a Pavilion in which Indian tea and coffee could be served on the same conditions granted to Ceylon.

In connection with Mr. Blechynden's engagement, application had been made to the Government of India by the General Committee that he should be accorded an official standing at the Exposition.

#### INCREASED DUTY ON BRITISH-GROWN TEA IN RUSSIA AND PERSIA.

The London Committee drew attention to a report appearing in one of the Tea Brokers' circulars to the following effect:

"Following upon the recent increased duty put upon British-grown tea imported into the European Ports of Russia comes the information that the duty upon Indian tea taken into Persia, which has had almost the control of that market, has just been practically doubled by the addition of 95 per cent. upon what has hitherto been levied. To make matters still less palatable, very heavy additional duties have also been placed upon all other British goods brought into Persia, whilst those of Russia are said to be admitted either free or at very much reduced rates."

The London Committee suggested that it would be advisable if the General Committee could approach the Government of India on the subject and endeavour to get some pressure brought to bear with a view to remove the hindrances placed in the way of Indian teas in the countries in question.

The matter of the increase in the duty on British-grown teas entering Russia by way of the European frontiers and Black Sea Ports was referred to in the proceedings of the Meeting held on 13th October. As the London Committee had themselves addressed a representation to the Secretary of State for India in connection with the matter, the General Committee were of opinion that it would be well to await the result of the reference before taking any action.

The Committee had heard nothing of the reported increase in the Persian duty. The last reported instance of preferential treat-

ment of Russian goods entering Persia which had reached the Committee was referred to in the proceedings of the Meeting held on 7th April last and was to the effect that it was understood that the Russian Government had obtained a concession under which the duty on Russian goods was payable in *paper* roubles instead of in coin, the value of the paper rouble being about thirteen pence less than the silver rouble.

An inquiry had been addressed to the Government of India in connection with the matter, but beyond an acknowledgment of the letter stating that it would be laid before Government, nothing further had transpired.

It was now decided to send a reminder and at the same time to communicate the substance of the London report and ask whether the Government of India were in receipt of any information regarding the matter.

#### MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 6th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ..	645,710	494,147	46,755
1902-1903 ..	668,720	562,985	35,847
41,595 pkgs. INDIAN 12,567 " CEYLON 2,666 " JAVA	Total 56,828 packages were offered in public auction this week.		

The statistical position is good because although we have imported six million lbs. more tea than at the same date last year, stock in London is six million pounds less. Deliveries of Indian Tea have increased five million lbs., probably indicating a reduction of buyers' stocks, rather less having so far been auctioned.

**"All Sorts and Conditions of Men"**

USE

**ST. JACOBS OIL**

**F**OR RHEUMATISM, Gout, Sciatica, Neuralgia, Cramp, Pleurisy, Lumbago, Sore Throat, Bronchitis, Soreness, Stiffness, Bruises, Toothache, Headache, Backache, Feetache, Pains in the Back, Pains in the Shoulders, Pains in the Limbs, and all bodily aches and pains,

**IT ACTS LIKE MAGIC.**

SAFE, SURE, and NEVER FAILING. Price 1/1½ & 2/6.

**CONQUERS PAIN**

**INDIAN.**—The recent activity noticed in the bidding was not quite so pronounced, buyers apparently having to some extent filled up their immediate requirements. The auction consequently passed with a quieter tone, and a somewhat large proportion of tea was withdrawn owing to the general firmness of holders. Exports from Calcutta and Chittagong to U. K. second half October 11,320,000 lbs., against 11,190,000 lbs. same period, 1902; 1st April to end October 103,712,000 lbs., against 96,410,000 lbs. Averages:—"Selimbong,"  $1/3\frac{1}{2}$ ; "Kan. Dev. H. Co. Teok,"  $1/1\frac{1}{4}$ ; "Amal. T. Ests. gardens Dooteriah" and "Kalej,"  $1/1\frac{1}{4}$  and  $1/1$ , respectively; "Con. T. & L. Bloomfield" and "Am. T. Est. Moondakotee,"  $1/0\frac{1}{2}$ .

Week's av. of New Season's Tea sold on Garden Acct. 1903, 35,705 pkgs., av. 7'84d. 1902, 28,588 pkgs., av. 6'87d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 471,710 pkgs., av. 7'90d. 1902, 473,778 pkgs., av. 7'14d.

**CEYLON.**—The exceptionally small auction proved hardly adequate to buyers' requirements, consequently bidding was animated and very steady prices were general, the recent advance being fully maintained for all descriptions. Exports to U. K. for October 7,000,000 lbs., against 6,623,444 lbs. same month, 1902; to 31st October 81,500,000 lbs., against 87,271,469 lbs. Estimate for current month 7 millions, against  $6\frac{1}{2}$  millions shipped November, 1902. Averages:—"Henfold,"  $1/1$ ; "Wanarajah T. Co. W.,"  $11\frac{3}{4}$ d.; "Demodera,"  $11\frac{1}{4}$ d.; "Talawakelle," 11d.; "Troup,"  $10\frac{3}{4}$ d.; "Sutton,"  $10\frac{3}{4}$ d.

Average for week 8'38d., against 7'12d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 861,763 pkgs., av. 7'49d. 1902, 984,934 pkgs., av. 6'73d.

**JAVA.**—A fair selection was offered comprising 16 estates. The teas met with a ready sale at firm rates.

### COFFEE.

The Dutch Trading Co.'s sale of 27,340 bags Java Coffee at Amsterdam on Tuesday last—being the concluding one of the 1903 series—passed off satisfactorily, when good ordinary quality realised about 29 cents, which was nearly 1 cent above the valuations, and two cents higher than at the September auction. In October, 1902, the price was 35 cents, the same as in 1900, as compared with 38 cents in 1901 and 29 cents in 1899. The next public sale by the Netherlands' Co. is fixed for January 26, 1904, and will be held at Rotterdam. Here a good demand continues to prevail, and the stinted supplies by auction have gone off readily at firm prices. The parcels put forward have consisted of 1,070 bags East India Plantation, 1,840 bags Costa Rica and Guatemala, 480 bags New Granada, 310 bags Columbian, 317 bags Salvador, and 570 bags Mexican, etc., besides 2,090 bags Dumont Santos, chiefly Washed, which went at 30s. 6d. to 34s. for small, at 34s. to 40s. 6d. for medium, at 36s. to 47s. 6d. for bold, and at 43s. 6d. to 50s. 6d. per cwt. for peaberry. 84 barrels Jamaica fetched stiff rates—small and middling 58s. to 75s., good middling to good 86s. 6d. to 102s. 6d., and fine blue 107s. to 113s. 6d. The tendency of the market for Futures has mainly been upwards during the week, advices from abroad having, on the whole, been more favourable, and transactions in good Santos, for delivery between November and September next, have latterly resulted at 29s. to 32s. 3d.

Messrs. G. Duuring & Zoon's Monthly Market Report dated Rotterdam, October 31st, 1903, states:—Unfavourable crop reports and speculative buying in New York favourably impressed neighbouring markets, scarcely so our own; past experience has made dealers cautious, who are now attaching more importance to receipts than to crop reports.

The Dutch Trading Company held its last this year's sale October 27th. Values have been dearer, good ordinary selling at 29cts. against 27cts. in the September sale, Tagal, Passaroeang, and Probolingo advanced 2 to  $2\frac{1}{2}$ cts., brown Preanger and Liberian only 1ct.

Next sale to be held January 26th.

Importers met the market freely, sales consisted chiefly of Java Plantation, which sold well at ruling values. However at the close the trade appears to be holding off more or less. Offerings next month will again be on a liberal scale.

There was more enquiry for Santos Coffee on the spot, values closing 1 to  $1\frac{1}{2}$ cts. dearer, being still too much below cost and freight parity to admit of much business in that line. Brazilian holders are not likely to give way and so the trade ultimately will be obliged to pay more money. African is 1ct. dearer.

Arrivals have been rather extensive, both from Java and from Santos, viz., 72,000 bags and 98,300 bags, deliveries were also satisfactory and our stock of Santos Coffee has been reduced by 9,200 bags.

Terminal quotations are  $1\frac{1}{2}$ cts. higher for the month, but dealings were not in proportion to the advance, buying orders being scarce, whilst many holders preferred to sell out at the unexpected advance. It is another question, whether a higher range of values may be warranted by less favourable crop reports. Closing quotations are  $18\frac{1}{2}$ cts. per December,  $18\frac{1}{2}$ cts. per March,  $18\frac{3}{4}$ cts. per May, and  $19\frac{1}{4}$ cts. per September. Dealings only amounted to 105,000 bags or 778,000 bags since 1st January. October contracts 11,500 bags, tenders 9,500 bags.

New York decidedly is taking the lead and European markets are following suit. New York quotations are 0'75\$cts. dearer and judging by the volume of contracts, a strong hand must be at work, guided by present unfavourable crop reports. Further developments of some interest may be anticipated. Stocks in the interior of the Brazils are very much reduced, which will soon be telling upon receipts. Estimates of the present Santos crop are now admitted to be 7 to  $7\frac{1}{2}$  million bags. This means daily receipts of only 13,000 bags from 1st November until 30th June and would point to a sudden and substantial falling off. Going by present estimates, the running Rio and Santos crops would totalize 11 to  $11\frac{1}{4}$  million bags, against 12,300,000 bags last year. Receipts being about equal to last years' the deficiency of 1,300,000 bags would entirely fall on the coming eight months. Next crop is also reported less promising, the continuous drought must have done a certain amount of injury.

The visible supply augmented another 38,780 tons, now having surpassed 800,000 tons and being even 50,000 tons in excess of last year's. This does not seem to be an obstacle to a rising tendency.

Total 2,7344 bags and 429 chests.

### TEA.

Messrs. Wm. Jas. & Hy. Thompson, in their Report, November 5, say: Although some of the trade look for lower rates in consequence of the larger yield from India for the season and a cessation of the continued unfavourable weather in Ceylon, sales this week have passed without material alteration, and prices have been fairly maintained. Shipments from India continue on a large scale, the total exports from Calcutta and Chittagong showing an increase of 7 millions over last year, and crop returns for October as cabled point to a good outturn in Assam, due to exceptionally favourable weather—it would seem now that we may expect 10 or 15 million lbs. more than last year from Northern India—sufficient for trade purposes, but not more than can be satisfactorily handled in view of the shortage in Ceylons and the improved statistical position. The week's sales have comprised 41,800 packages, against 34,400 packages last year, the total auctions of this season's tea to date thus amounting to 516,400 packages, against 560,000 packages a year ago. We have but little change to record in prices, the only noteworthy feature being somewhat better rates for good medium Broken Pekoes from 10d. to 1s. 2d. per lb.; other grades sold chiefly without much animation, occasionally with a slightly easier tendency—Calcutta-bought teas being particularly hard to move. The large quantity of plain ordinary tea now coming forward doubtless accounts to a great extent for the lack of spirit in the bidding. From inquiries made in various quarters it seems that

the weight of packages coming forward this year is heavier than before, and we think it possible that a rather larger proportion of the crop has been disposed of than might be inferred from the actual number of chests passed through auctions. For next week about 40,000 packages are advertised. Shipments from Calcutta and Chittagong during the past fortnight were 11,320,000 lbs., the total export to date being 103,712,000 lbs., against 96,410,000 lbs. a year ago. October deliveries were  $15\frac{1}{2}$  millions against  $14\frac{1}{2}$  millions last year. Calcutta auctions passed without much change last Friday, the average price realised for the 20,000 packages sold being 5a. 10p.

### TEA IN AUSTRALIA.

SYDNEY, *October 27th.*—Transactions in tea were almost exclusively confined to the auction sale. Private inquiries were made, but buyers evinced no disposition to advance to sellers' limits. Apart from sales of Ceylons at the previous day's quotations, there is little or nothing to report.

MELBOURNE, *November 3rd.*—A fair business has been done in Ceylon, sales reported covering 160 chests at  $7\frac{1}{2}$ d. to 8d. Large sales of Indian Tea, mostly out of last Friday's catalogue, have been made, amounting to over 400 chests, at prices ranging from  $6\frac{1}{2}$ d. to  $9\frac{1}{2}$ d., but mostly up to  $7\frac{1}{2}$ d.—*Australian papers.*

### PEPPER

continued dull for the first part of the month, says Messrs. G. Duuring & Zoon in their report dated October 31st, 1903, for want of trade demand, but since recovered to the extent of 2cts. A marked change for the better is distinctly observable and the market closes firm on favourable statistics and small shipments. Terme business has also been more active and a further fall of  $\frac{3}{4}$ ct. was not only promptly recovered, but values advanced  $2\frac{3}{4}$ cts., now being  $2\frac{1}{2}$ cts. dearer for the month and buyers at  $34\frac{1}{4}$ cts. per November, December,  $34\frac{3}{8}$ cts. per January, February,  $34\frac{1}{2}$ cts. per March and  $34\frac{5}{8}$ cts. per April, May.

Near months are particularly in request and offering very sparingly. Dealings amounted to 17,400 bags or 231,000 bags since 1st January. October contracts 9,600 bags and tenders 600 bags.

Stocks of all kinds on the principal markets of Europe.

### QUININE.

Previous to the heavy October bark-shipments from Java being known, there had been a fairly active demand at dearer prices, December selling up to 1s. 1d. and March up to 1s.  $1\frac{1}{4}$ d., with purchases of moderate quantities from the factories at 1s. 1d. The declaration of the shipments on Monday, however, came like a thunderclap on the market, and there was an immediate decline of  $\frac{1}{2}$ d. in second hands. The next day there was a recovery to the extent of  $\frac{1}{4}$ d., speculators coming forward and purchasing some 150,000 oz., including spot at 1s.  $0\frac{1}{2}$ d., December at 1s.  $0\frac{3}{4}$ d. to 1s.  $0\frac{1}{2}$ d., and March 1s.  $0\frac{3}{4}$ d. to 1s. 1d. Subsequently a much quieter feeling prevailed, with further sellers at 1s.  $0\frac{3}{4}$ d. for December and 1s. 1d. for March. To-day the market is quiet, with sellers at 1s.  $0\frac{1}{2}$ d. for December and 1s.  $0\frac{3}{4}$ d. for March.

The landings during October were 992 oz., and the deliveries 31,472 oz., making the stock on October 31, 3,078,976 oz., against 3,382,032 oz. in 1902.

# PLANTING

# OPINION.

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, DECEMBER 5, 1903.

[No. 48.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 11th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*December 2nd.*—*Weather*—Abnormally heavy showers from the North-East, very little sun. *Works*—Weeding, preparing for crop. *Crop*—delayed by the rain, a few places starting fly-picking, but nothing to speak of being gathered. *Health*—Fair. *Labour*—Abundant. *Interesting item*—The rain is doing much damage to the paddy. Deputy Commissioner and officials to puja at Subramania temple, the great snake-worship shrine.

#### Coorg.

*POLLI BETTA, 2nd December.*—*Weather*—After a short spell of fine weather, the wet has set in again. *Plant diseases*—The effect of this weather will be to increase leaf-disease which, with East wind, will prevent the even ripening of the berries. *Crop*—Owing to the wet nearly in all cases all hands are engaged in fly-picking. Quantities picked will be small and samples a good deal partially unripe. *Labour*—Sufficient. *General health*—Except that there is an isolated case of plague on estates here and there, the health on the whole is very fair.

### PLANTERS AND CONSULAR REPORTS.

THE British merchant has often been charged with inattention to the annual reports issued by His Majesty's consular representatives abroad. He has sometimes excused himself by disparagement of these reports. By those who have studied them it will be generally admitted that the general standard of British Consular reports has been raised of late years. In particular at certain ports there are commercial attachés; in some countries special commercial representatives have been deputed to make a study of local trade and to report fully upon it. Valuable information has been forthcoming as a result of this system; but such

cases constitute the exceptions. In far too many countries and ports reports are still drawn up by men who have but the vaguest idea of what business-men need. Some Consuls have gone the length of making charges against British traders and commercial travellers, and in a certain number of instances these charges are well founded. That there are faults on both sides, must be acknowledged; but what we propose to do here is to refer to British consular reports from the standpoint of the planters in India. Here again in a few cases the reports are admirable; the one defect in some of them is that they are too long in being made available to the public. Much too numerous, however, are the instances in which there is little or no information given that is of use to the producer of tea, coffee, indigo, cardamoms, pepper or cinchona in this country. The suggestion was thrown out long ago, that every consular representative should be directed to pay special attention to local trade in such important staples as tea and coffee. Customs returns are not reliable at all ports, in many cases, possibly, they make no separate mention of the products we have referred to. In the latter case, a formal request from the British Consul might bring about a change. In both the cases cited the Consul should be able to obtain general information, even though statistical details are beyond his reach. This would involve extra work no doubt; but it is eminently desirable that British Consuls should realise, as their American and German prototypes do, that an important part of their duty consists in obtaining all information that may be of service to producers, merchants, traders and industrialists in any part of the British Empire.

We take up for special notice a batch of "diplomatic and consular reports" that arrived in India but recently. They are not specially selected, but it should be said at once that the batch includes not one report of the type that has been referred to above as really useful. That is a matter of chance, and we mention it simply to guard against any imputation of unfairness. It is with reports of an undesirable class that we have to deal, but we repeat that there are others to which nothing but praise could be accorded. With this brief explanation we turn to No. 3096, Borneo. This deals, or professes to deal, with the trade of Brunei, Sarawak and British North Borneo in 1902. There is in it a line showing the imports of Coffee (Liberian). This is purely a coasting trade and is represented by very small figures. There is a similar line about Tea. Exports of these products are dealt

with in the same fashion. Nothing is said about where the tea comes from or the places to which it is expected. No information is given as to whether it is British or Foreign. Passing on to No. 3099, Siam, we see the title "Trade of Bangkok for the year 1902." There is a pithy little paragraph about Pepper, which is grown in Siam. Total imports of tea are given in one statistical table, total exports of cardamoms find mention in another. Coffee is not referred to at all, nor is any further information given about tea, etc. Yet the report goes into such minute detail as to say how many "coffins (wooden)" were exported, and even chronicles the export of hemp to the value of £4 in the year! The next report before us is No. 3100, Turkey, which treats of the trade of Salonica in 1902. This touches upon imports of coffee and pepper and indigo, but leaves us in doubt whether there is any local trade in tea. The Trade of Reval in 1902 is reviewed in No. 3102, Russia. This affords a little information about tea, and further states that coffee was imported to the value of £184,581, tea to the value of £123,940. Lastly, No. 3103, Morocco, discussing the trade of Tangier and District in 1902, gives some meagre particulars of imports of coffee and tea, and states in a general sort of way whence supplies are obtained.

Now, none of these reports deals with a port of the first importance. Nevertheless, in these days the British trader must not be content with ports of the first magnitude. The Germans, it is remarked, have begun to supply tea to Tangier. They have intruded upon ground previously held by the United Kingdom alone. Unless further information is forthcoming with respect to trade at minor points, the probability is that the Germans will make headway there while the British will fall back. This is what British Consular representatives should endeavour to help their countrymen to prevent. It is unnecessary that they should repeat year after year practically the same information, with merely a change of figures. Our assertion is that in the majority of cases figures are given, and figures alone, and these in such a form as to convey the minimum of information. At least once in five years or so in the case of minor ports, and every year in reports on important ports or countries, such figures ought to be accompanied by notes that afford some idea as to the quality in greatest demand, the proportion imported from each of the countries that have a share in the trade, and other points that are necessary to stimulate British enterprise and that are likely to be of use to British traders. Though we have written with special reference to certain Indian "planting products," we regret to say that many of our remarks as to the deficiencies of consular reports are equally applicable with respect to other commodities of quite as much importance to British trade.

#### COFFEE NOTES.

**Coffee Soils.**—In a report on analyses of the soil of coffee plantations, Mr. J. G. Kramers discusses the subject under the following heads: (1) The origin and nature of coffee soils in Java; (2) the relation between the soil and the plants; (3) the chemical analysis of the soil, and (4) the samples and the methods of investigation. Following the text is a long table, in which are given detailed analyses of all the soil samples, together with the reagents used in

making the tests. The soils on which Java coffee is planted belong to the volcanic formation of the Tertiary and Quaternary periods, and consist of volcanic andesite and basalt or their decomposition products. Most of the cultivated soils of Java are underlaid by a hard pan which often prevents free drainage and ruins the soil for coffee culture.

On the first of October the world's visible supply of coffee was reported to be 13,770,429 bags, the largest monthly total ever reached, says the *Merchants' Review*. It is 765,104 bags larger than the visible supply on October 1st, 1902.

During the three months of the crop year beginning July 1, 1903, the warehouse deliveries amounted to 3,975,686 bags, an average of 1,327,562 bags a month, as compared with 3,918,607 bags for the corresponding three months of 1902—an average of 1,306,202 bags a month. These deliveries are for the United States and the eight principal ports of Europe. These are large figures. The figures they are compared with are also large. They show that there is nothing wrong with the consumptive outlet—that low prices are inducing a phenomenal consumption, providing that the warehouse deliveries do not go partly towards swelling the already full invisible supply.

Notwithstanding the marked gain in the visible supply of coffee of late, the price of coffee has shown considerable elasticity, and to-day it is fractionally higher than a month ago, the difference being more marked on No. 3 Rio than on No. 7.

The market for Brazilian coffee derives its strength from the manipulations of speculators, who use unfavourable crop reports as a lever to raise prices, but as little dependence can be placed in crop news so far ahead of the harvest it is not surprising that the market does not rise far, and generally loses part of its gain very soon. The wonder is that the bull interest has been able to score a single point with a possible 14,000,000 bags looming up as the visible supply for November 1st.

Messrs. Prado, Chaves & Co., Santos, cable "Rio coming crop is reported to be badly damaged; estimated 2,750,000 bags." In response to an inquiry the same firm cabled on Friday: "General opinion in Santos that the market must advance owing to estimate of crop being reduced."

#### Notes from the "American Grocer"—

Coffee is now a speculative commodity.

To bull coffee with a visible supply of over 14,000,000 bags is a pretty big job. It will be well for the Wall Street and Cotton Exchange manipulators to study the history of the Arnold speculation of 1869 and in later years.

At present prices coffee is one of the cheapest commodities in general use. It would be cheap at a 50 per cent. advance. The wonder is that the speculators have not been more active in past years.

Four pounds of a choice blended coffee for one dollar seems to be the popular thing with New York consumers. The rivalry between leading distributors insures good quality and making coffee more than ever the popular beverage.

A Philadelphia correspondent of the *Journal of Commerce and Commercial Bulletin*, "Veritas," sends the following, *à propos* of the present coffee market :—

A liar there was in Brazil,  
Who said the next crop would be nil,  
That the frost and the drought  
Had knocked the trees out,  
And Americans footed the bill.

\* \* \*

**Dutch Sales of Java Coffee.**—Although not quite the same importance as in former years is now attached to the Dutch Trading Company's periodical sales of Java coffee in Holland, they are nevertheless watched with peculiar interest by the trade on this side, says the *Grocer*, and the market here as often as not is governed by the tendency in prices which is first developed in the coffee centres at Amsterdam or Rotterdam. Sometimes it is the other way, when the London market takes the lead, and this year it so happens that neither in Holland nor in Mincing Lane have the movements in quotations in favour of buyers or sellers been very pronounced. For the last 6 years the average rates ruling at public sales in the Netherlands have seldom been more than moderate, coming between 31 and 37 cents for good ordinary Java coffee, and ranging frequently low, from 29 down to about 25 cents for similar quality. Within the nine years ending with 1897 the prices of "good ordinary" of the usual type were undoubtedly high, rarely below 50 cents, and in extreme cases running up to 60 or 61 cents, imparting to the London market on those occasions a strong feeling of speculation to which it had for a time been a comparative stranger.

It has also been a peculiarity with the Dutch coffee market in recent years that while prices have touched their lowest points, the quantities offered at each auction have been a very great deal lighter than they were formerly, proving that the Java description of coffee is not held in such high estimation by Continental consumers as it was in the latter part of the nineteenth century, through the introduction of superior growths of a plantation kind, with colour, style, and richness of flavour. Prior to the period when these what are called "fancy" coffees came into wider use in Eastern Europe, both the weight of supply regularly offered in public sale and the sort of price then obtained were completely the reverse of what they are now. They present some striking comparisons when placed side by side, as in the statement given at the end of this article in tabular form. In 1884, when the crop of Java coffee reached nearly 1,000,000 bags—one of the largest on record—and plantation Ceylon coffee, to say nothing of the native growth was in abundance, quotations were exceedingly depressed, even with an excellent assortment of clean, wholesome, and useful, qualities, far preferable to those that of late years have been thrown upon our market for prompt disposal; and a return of those prosperous times would be much welcomed by most home dealers in the United Kingdom.

			Quantities in	Prices per Cwt.	
			Public Sale.	Lowest.	Highest.

## TEA NOTES.

**Infusing Tea.**—The Japanese treat tea much as we treat coffee. They grind the leaves in a portable mill, reducing them to a fine powder, which is then mixed with hot water to about the consistency of Turkish coffee or a fine pulp. The Chinese and Japanese methods of infusing or drawing tea prevent the tannic acid or astringent principle from forming part of the beverage, but extract all of the more volatile and stimulating properties of the leaves. Tea should never be boiled. Tea is the drink of drinks to the real connoisseur, the tea-lover who is most competent to judge of merits of the world's beverages. Nothing can take its place, and it soothes, refreshes, and strengthens. Good tea, properly made and drunk in moderation, never does harm. Strange that coffee is attacked by owners of coffee surrogates while tea's virtues are taken for granted.

\* \* \*

**Japan Tea.**—Sir William Mitchell saw a good deal of green-tea manufacture on his journey through Japan, but he is keeping all his observations for his own use. However, he said: "My own opinion of the Japanese tea-industry is that it is on the wane, and that the cultivation of the mulberry tree will gradually take its place."

\* \* \*

A necromantic sort of feat is to be tried on a commercial scale in Ceylon, says the *Merchants' Review*, namely, the turning of green tea dust into black tea dust. A patent has been applied for by the inventor of one process—there are two processes, it appears—and it is declared that the price of the treated tea is increased about 20 @ 25c. per lb.

\* \* \*

Deliveries in the U. K. during October were excellent, comprising 15,581,750 lbs., in contrast with 14,477,000 lbs. in the corresponding period of last year. Trade in the country has evidently been more active, and as buyers generally are not overstocked it seems reasonable to anticipate a steady market, if weekly supplies continue to be properly regulated. Imports for the past month were 27,403,600 lbs., against 24,508,300 lbs.; and the stock on the 31st October was 50,132,150 lbs., against 50,250,850 lbs. in 1902. Shipments from India to the United Kingdom during the latter half of October were 11,320,000 lbs., against 11,190,000 lbs., and the total from April 1 to October 31 now amounts to 103,712,000 lbs., as compared with 96,410,000 lbs. in the same period of last year.

\* \* \*

The total landings of tea at the port of London during October were heavy, amounting to 35,879,800 lbs., against 32,780,150 lbs. in the same month last year; the deliveries in the aggregate were 27,879,000 lbs., in comparison with 27,031,150 lbs., and the stock on the 31st October presented a large deficit as before, and this comprised 6,027,050 lbs. as above shown.

\* \* \*

More progress has been made in the tea industry since the British took up tea-planting in India than during the previous two thousand years of Chinese control of the industry, says the *Merchants' Review*. Improvements have been made in drying, rolling, firing and sorting the leaf, with the result that the price has been much reduced and the beverage placed within the reach of the very poor in Europe and America,

and these improvements have not ceased. There is every reason to believe that they will continue until the cost of producing tea is still further reduced. Such is one of the consequences of the introduction of Western enterprise in the East. It is noticeable that the Indian and Ceylon tea trade is not one of the fruits of protection. Indeed, as protection leaves little room for the play of the inventive faculty, the consumers of tea may be thankful that the production of their favourite has not been dependent upon import duties and bounties.

\* \* \*

**The Ceylon Green Tea Bonus.**—Mr. William Forsythe lately urged that, after the expiry of the present bonus on green tea, the industry is fostered by a further bonus, green-tea producers will revert to black tea, to the detriment of the black-tea market. A representative of the *Times of Ceylon* asked the Hon. Mr. E. Rosling for his views on this particular point. "We dispute that entirely," he said. "The position is this. There is a direct trade to-day in Ceylon green tea of eleven to twelve million lbs. per annum. The actual bonus paid this year, on the average, was 3½ cents—4 cents for the first six months, and 3 cents for the second six months. That is practically a half-penny per lb. I hold that the existing trade of 12 million lbs. does not depend on that half-penny a lb. It is absurd to suppose that it can. The probabilities are that, if at the present moment we took the bonus off green tea, we should lose perhaps one-third of the existing trade—that is to say, we might make only eight million lbs. of green tea, but we shall certainly keep the larger percentage of our trade. When we started this business, it was not our intention to bolster it up for ever. There must be some finality. Buyers can now afford to pay a higher price for green tea, but, as long as we keep on paying the bonus, they will not pay that higher price. Originally it was necessary to pay a bonus, but now green tea buyers have made their trade they must have tea to keep that trade."

\* \* \*

**The Russian Tea Industry.**—The cultivation of tea in Russia is reported as progressing satisfactorily. On the Crown estate, Tschakira, there were, according to recent reports, 55 dessjatines of land under tea cultivation. The first harvest, in April and May, gave a yield of 76,323 lbs. raw leaves. The second, in June, gave 62,430 lbs.; the third, in September, 37,412 lbs.; and the fourth, in October, 116,165 lbs.—all last year, of course. The aggregate output of dry tea was about 1,000 pood. The private tea-growers delivered a smaller quantity of raw leaves to the Tschakira establishment. Of raw tea leaves, 4½ lbs. yied 1 lb. of tea. As the tea has met with a ready sale, and as the cultivation is comparatively low, great hopes are entertained by those interested about the future of this industry.

\* \* \*

**Colombo Tea Sales.**—Regarding the sale on 25th ultimo Messrs. Somerville & Co., Brokers, report:—Prices although rather irregular at first, hardened as the sale went on and taken as a whole were very firm for all grades. Medium Broken Pekoes were in rather better demand as there was more buying for Australia than of late. Quality was as a rule poor, but the few fine teas offered were well competed for and sold at full rates. Greens teas were firmer. Our private wire reads: "Indian teas are now in larger supply and are depressing the Ceylon market, all kinds were distinctly

weaker and some parcels showed as much as ¼d. to ½d. decline.

\* \* \*

Messrs. George White & Co., in their report of November 5, say:—The statistical position, as disclosed by the monthly figures just published, is interesting, in that the landings establish a record, and the deliveries, while not equalling some of the excessive clearances resulting from duty scares are also the heaviest registered for a normal month, and this, bearing in mind the advance that has taken place in prices, is a remarkable feature.

\* \* \*

The *American Grocer* remarks:—Some years ago a sample of tea which cost \$5.00 per pound in Japan was submitted to an expert buyer for valuation. He stated that he wouldn't give over 50 cents per pound for it. He was totally unfamiliar with the flavour of tea which commands fancy prices at point of production, for Home use.

\* \* \*

**London Tea Market.**—Messrs. Gow, Wilson & Stanton telegraphed to Colombo on 26th ultimo that the average was down a farthing, to 7¼d. This was confirmed by Reuter who wired that the Indian average had fallen even more—from 7¼d. to 7½d. The market appears to have given way all round. Of Ceylon tea 19,000 packages were offered and 17,000 sold, while of 37,000 packages of Indian tea put up 33,000 sold.

\* \* \*

**New Tea Invention.**—Application in respect of the under-mentioned invention has been filed: Robert Simpson Hamilton, tea-planter of the Central Dooars Tea Estate, Imperial Tea Company, Limited, Dooars, Jalpaiguri, a tea cultivator for use in the cultivation of tea-gardens.

\* \* \*

The following figures of tea exports taken from the Calcutta Customs daily entries and received periodically from Chittagong are issued by the Indian Tea Association:—Quantity of tea entered for export to United Kingdom for the first half of November, 1903, Calcutta, 10,508,547 lbs.; Chittagong, 1,573,210 lbs. Quantity entered during the corresponding period last year: Calcutta, 10,207,950 lbs.; Chittagong, 1,759,900 lbs. Total from 1st April, 1903, to 15th November, 1903: Calcutta, 97,171,562 lbs.; Chittagong, 18,669,205 lbs. Total 115,840,767 lbs. Total from 1st April, 1902, to 15th November, 1902, 108,414,263 lbs.

\* \* \*

**Calcutta Tea Sale.**—In the face of the less satisfactory state of the London market, as advised privately and also through Reuter's on Friday morning, it is gratifying to note that instead of a marked decline having to be quoted there was only a further slight easiness noticeable on this side. This cannot but be interesting and instructive to all concerned in the industry and willing to learn, as a proof of the tremendous strength of the out-markets buying at the present day. Time was when Calcutta was entirely dependent on the state of the London market; this is now all changed, and the rulers here are the out-markets, whilst London, except for a few grades, can but look on. There is no doubt that if this were not so the report of the sale on the 27th ultimo would be considerably more depressing than the one given below. The sale was heavy, and common leaf kinds up to 5 annas may be quoted about a pie cheaper; the better grades up to 6-3 were in a good demand retaining their level of

prices. Medium broken kinds, however, marked a slight decline in rates, and were generally irregular, but the finer descriptions met with more competition, and in most cases realised fair prices. Bombay and Gulf buyers continued to operate with freedom, but slightly less animation for the lower sorts, and secured a fair quantity chiefly of the better tippy kinds, though for these classes they had to compete with the buyers for America, who evidently had strong orders and purchased the best lines. As was anticipated, an invoice of Fine Green teas on offer was fully appreciated and changed hands at what may be considered very satisfactory rates, which cannot but prove encouraging to makers of teas equal to those referred to, and if such point and general quality is maintained and more produced, it is practically certain that the demand for such styles of manufacture will be increased greatly in volume, leading to the opening up of newer markets, and creating more competition and a better average of prices even than those offered on the 27th. Another report states:—There was extensive buying for the Colonies and Russia, and the latter took every pound of good green teas offering. These sold well at good prices; and large orders in the market were held over for want of suitable tea to fill them.

\* \* \*

The enormous value of the tea industry to Assam is proved by the fact that last year tea represented no less than 63 per cent. of the total value of exports from that Province, and this in spite of the fact that the value of the total quantity of tea exported decreased by about twenty lakhs of rupees owing to the fall in prices. Indeed, it is wholly due to the tea-industry that Assam holds the very satisfactory position of a Province in which the exports are far larger than the imports. Last year, for instance, there was a decrease of 14 per cent. in the value of imports and an increase of 52 per cent. in the value of exports, the total of the former being 362 and of the latter 629 lakhs of rupees.

\* \* \*

The grocers may not be aware of the fact, and the import tables do not reveal it, says the *Merchants' Review*, but there is at least one house in the British tea trade, and a large one it is true, that has discovered that the American taste in tea-drinking has veered from the Chinese and Japanese teas to the leaf grown in India and Ceylon. It is in this fashion that the news is made known:—

“Until lately America has been a coffee-drinking country, and of the small quantity of tea she consumed, the black came almost entirely from China and the green from Japan. Now tea is becoming popular, and imports of British-grown tea have risen in a few years nearly 100 per cent. Two clubs in New York make a feature of afternoon tea. Men who drink it are not laughed at, even by their enemies. There are very few villages, no matter how small, where it is not possible to get good tea. These changes are owing almost entirely to the enterprise of certain tea-producing firms in India and Ceylon. The utmost pains, assisted by wonderful machinery, are devoted to preparing tea, particularly green tea, for the American market. Green tea has always been more drunk in America than black. Therefore Ceylon planters have taken up the manufacture of green tea, and turn out blends equal to the best Japanese productions. As it is found that the same kind of tea does not suit all parts, samples of water from all the great cities in North America are sent out, and tea is manufactured to suit them. The sale of the tea is also vigorously pushed by good advertising and by demonstrations. Both in the United States and in Canada people are learning that a pound of British-grown tea produces two or three times as much beverage as a pound of China or Japan tea, and also that the strong Indian and Ceylon teas are as sustaining as coffee, which the weaker growths

from China and Japan are not. The removal, in January, of the 10-cent (5d.) tax on tea doubtless increased the demand in the United States.”

It is gratifying to hear that in almost every village it is now possible for our people to get good tea. It is true that tea is sold less for price and more for quality, and the change has not yet been explained, unless our theory of the direct importation by wholesale grocers hit the mark, but the London tea firm has not the slightest doubt on the subject. That's the beauty of coming to a decision three thousand miles away from the scene of one's inquiry.

\* \* \*

**Untaxed Tea.**—Since writing the article that appeared in our editorial columns last week we have seen the following in a letter from the London correspondent of the *Times of Ceylon*:—

In considering what would be the effect on the tea-growing industry of the adoption of Mr. Chamberlain's fiscal policy, one is at once brought up sharp by the question—Is the duty to be reduced or abolished on all teas equally, or is there to be a preferential duty against China and Java teas?

This is a question to which there is no answer. When the idea of an Imperial Zollverein was first mooted, it was, I think, generally understood that British-grown teas were to have an advantage over foreign-grown. But the scheme now before the country is not for an Imperial Zollverein (which involved free-trade within the Empire) and is in some respects inconsistent with it. If tea was grown in Canada and New Zealand, self-governing colonies, no doubt a preference on the British article would be one of the planks of the platform, but, unfortunately for tea-growers, their lot is placed in the dependency of India and the Crown Colony of Ceylon. That being so it is by no means certain that Mr. Chamberlain, with, I am sure, the best wishes for us in the world, will find it feasible to propose a measure which would accentuate the already existing tendency for tea to rise in price. At any rate so far he has said nothing about it.

Besides the fact that, generally speaking, tea-producers have no votes, it must be remembered that they have no representation in the House of Commons, and this, as I have often pointed out, is likely to tell against our interests when delicate matters affecting them come to be discussed. There is, of course, Sir Henry Seymour King, who has done yeoman service in the past and is ready to do it again, but what is he among so many? On the other hand the tea-buyers

ARE STRONGLY REPRESENTED IN THE HOUSE

and, as far as my knowledge of their politics goes, are generally Radicals. It would not be difficult for Mr. Thomas Lough, for instance, if the question of a preference on Indian and Ceylon teas came up, to draw a moving picture of the hardships which would be entailed on the working man by shutting out the healthful teas of China, recommended by the medical faculty, etc., etc. And the tale would lose nothing in the telling by the fact that the admission of these teas on equal terms might suit the honourable member's pocket, while also providing him with a good stick to beat the Government with. I am inclined therefore to think, with the knowledge at present at our disposal, that

IT WOULD BE RASH TO LOOK FOR A PREFERENCE

on British-grown teas. But apart from that there seems to be growing up a general consensus of impartial opinion that the reduction or abolition of the duty would undoubtedly tend to put up the price of tea in bond. Mr. Rutherford, in a letter in the *Standard* which I am sending you, goes so far as to that perhaps the working man would not, after all, get his tea any cheaper than he did before. Here it may be remarked that there is a good deal of confusion as to whether Mr. Chamberlain, if he carries the day, will reduce by three-quarters or totally abolish the duty. In Mr. Vince's book, and I think in the *Daily Telegraph* articles, total abolition seems to have been anticipated, but the only time Mr. Chamberlain went into details he spoke of a reduction of three-quarters, though he followed it up a few days after by implying that tea would drop to half its present price, which it could not possibly do if a tax of 1½d. was retained. Again, it is far from unlikely that by the time Mr. Chamberlain

is in a position to carry his theories into practice, the duty will stand at four-pence only. In that case it is probable that in order to balance the working man's weekly budget he will have to remit the duty *in toto*, if not on all teas at any rate on British teas.

#### THERE IS AN INTERESTING COMMUNICATION

on the whole subject in this week's *Times*, evidently written by some one who has practical knowledge of Ceylon. When the writer goes into figures, however, and attempts to show that the public will get their tea for a shilling, he is not so conclusive as in the other portions of his letter. When Mr. Chamberlain comes into power the price of tea will be, we may hope, a good deal higher than the figure he takes, 7½d.; while he allows nothing for the impetus to consumption which would be given by the reduction of the duty. Besides, it is incorrect to suppose that the tea goes straight from the auction-room to the retailer. The bulk of it goes first to the blender, whose charges amount to about three half-pence a lb.

Perhaps, a better calculation would be as follows:—Auction price of tea 8½d.; duty 1½d.; middleman's charges 1½d.; retailer's profit, 2½d.; cost to working man 1s. 2d.; as against 1s. 4d. at present.

#### SOME OTHER VIEWS.

I promised last week to give your readers the views of some leading people connected with tea, and have spoken to several on the subject.

The first I saw was a Ceylon man who has consistently held the view for many years that a duty operates as a protection to good teas. That being so, he looked forward with considerable apprehension to the duty being largely reduced or wholly abolished, unless a preference was given to our teas. He did not believe that consumption could be sensibly increased, while he feared that any tampering with the duty would let in a flood of cheap China. The next man I saw was a buyer, and it may be mentioned in passing that all the buyers I have come across are opposed to the duty being reduced below 4d. This shows pretty clearly to my mind that the reduction would be a good thing for sellers. We indulge in fine talk from time to time about the community of interest between buyer and seller. But, seeing that the one wants to buy cheap and the other wants to sell dear, it is a little difficult to see where the community comes in. As a general rule in the tea trade, what is good for the one is bad for the other. Well, this gentleman, who is a foreigner with strong views about the late war, wanted to discuss Mr. Chamberlain's treatment of Mr. Kruger. I firmly declined to be drawn off into this side-issue, and pressed him for his views about the tea-duty and nothing else. He held that consumption could not be increased, as it already amounted to over 6 lbs. per head, but he did not believe that any alteration of the duty would much affect the China trade one way or the other. He thought that, if Mr. Chamberlain had his way, it would greatly increase the demand for common tea, both Indian and Ceylon, and this in turn would lead to coarse plucking, so that, after a time, it would be difficult to get a decent cup of British tea. Like the first authority mentioned, he held that a high duty protected good tea, and instanced Russia, where, he said, you got the best tea in the world. I asked how that was, and said I should have thought if the purchaser had to pay a high duty, he would not have so much left to pay for the tea. He assured me the exact opposite was the case, and that the purchaser argued that, having in any case to pay a high duty, he might as well pay a few pence more for the tea and get a good article.

It may be doubted if the British housewife would argue in this way, but as I have said, my friend looked at things as a buyer, and hates Mr. Chamberlain to boot. The next I saw

#### WAS BOTH BUYER AND SELLER,

but I think his buying interests predominate, so I was not surprised to find he was against Mr. Chamberlain's proposals. He said duty had nothing to do with the consumption of tea, and you couldn't increase the consumption any more whatever you did. I said if that was so it followed that if you raised the duty to a shilling it would not check the consumption, and he replied that he didn't see why it should. The last man I saw was a broker with

#### LONG EXPERIENCE OF THE TEA TRADE

in all its branches, but whose sympathies are entirely with the producer. He began by saying that Chamberlain would never

carry the country with him in his scheme. I asked him to pass that by and to assume, for the sake of argument, that the proposal was carried. "Well," he said, "in that case you'll see a boom that will astonish you. The working man won't get his tea any cheaper than before, and the value of tea property will double." I asked him what about China tea coming in? "No fear of that," he replied. "The people don't want China tea. There is a difference now of 2½d. between common China and common Indian and Ceylon, and in another year there will probably be a difference of 3½d. You might as well"—he said, warming to the subject—"you might as well go into a pub. and start serving the customers with milk and water. People in this country don't want China tea, and they won't have it so long as they have money to buy the other."

\* \* \*

**Tea Production in India.**—A correspondent writes to the *Pioneer*:—That the production of tea in India should have increased by 163 per cent. since the year 1885, that the cultivation—the area of land under plant—should have nearly doubled in the same period, as official statistics show, are really wonderful pieces of information: really amazing facts to one who has been quietly working on through the general poorness of tea all the time,—all these eight years. At that time, 1885, or about it, Indian tea was not in a bright, nor in a flourishing way. Prices were low and poor, and different to what they had been, very different for the worse to what they had been: some ten years further back. In 1885 tea had fallen in price some 50 per cent. since the year 1875. In that year the average value of Pekoe Souchong was from twelve to fourteen annas a pound in Calcutta, equal to 1s. 10d. to 2s. in London; while in 1885, the average value of the same class of tea was about 7½ annas a pound in Calcutta, or 11d. in London.

And one might have heard depressing remarks about the future from those concerned: "Salaries will have to come down, that is certain": "We shall all be breaking stones on the road yet," and such like. And then, too, there was Ceylon, the young giant competitor, rushing in like the sea. And yet since that very time, with prices almost always on the decline and with Ceylon always and ever coming on; with the drawbacks of more and more laws and regulations as to land and as to labour, the then vast fabric of the Indian tea industry—the slow growth of some fifty years—has nearly doubled as to area; has far more than doubled as to outturn. How has it all been done? One would have thought that Indian tea was a thing that capital would have fought quite shy of after the misadventures of former years, or even if that retrospect could have been reasonably reconsidered, still with prices ever poor and falling, and with the unknown factor of Ceylon ever looming dark and ominous. And yet it has been done, the result in effect being as if every tea estate throughout Assam, Cachar and every part of the Continent where tea is grown, had just added as much to its area as ever it had before, as much all over again. This is a result that might have been deemed beyond the power and beyond the wish of many a struggling and dividendless concern or company; and as to new blood and new money, it might have been thought that it, even if it had the wish, would never have had the power—would never have been able to get a proper or a satisfactory footing, with all the desirable or suitable positions secured by settlers or by speculators years and ages before. Yet facts are facts, and here is a mighty one, that tea, the poor, uncertain and struggling thing—the thing pretty well to keep clear of—has after all its disasters, through all its clouds and its difficulties, ever surrounding and clinging to it, emerged on measurement twice as large as ever it was; twice as big in every way, and that increase within latter years, not so many too. Well done, faith, capital and enterprise! And there must have been good fruit on many of the trees of the vast orchard all the time, or the vast orchard with all its differences of quality and all its disadvantages, would never have been so greatly extended. And it may continue greatly to extend with the increase of the love of the cup that cheers. But wisely, gently, henceforth, let it be.

Prices are ever small. To-day Pekoe Souchong is worth but 5 annas a pound in Calcutta; or 7d. in London. Amid all this vast extension and doubting there has been overdoing and overflowing, oh! how much! *Ne quid nimis*: beware of too much. Let the circle of demand grow larger and wider, and we swell up to it; yet ever within it: just that.

## NOTES.

Amsterdam Bark  
Market.

1½d. per lb., the same as at the previous sales.

## Cacao in the Phillippines.

Mr. W. S. Lyon has prepared popular directions for the culture of cacao in the Phillippines, including notes on climate, location, soil, planting, cultivation, pruning, harvesting, enemies and diseases, manuring, varieties, and the estimated cost and revenue derived from a cacao plantation.

Rubber in the Federated  
Malay States.

In a despatch addressed to Mr. Chamberlain by the High Commissioner it is stated that the prospects of rubber are so good that, unless some unforeseen disaster happens, the future is full of promise for those who have taken up this cultivation. The area at present under rubber (principally the Pará variety) is given apporximately at 16,000 acres.

## LETTERS TO THE EDITOR.

## THE "LEEMING SYSTEM."

THE EDITOR,

*Planting Opinion.*

SIR,—The letter from a "Planting Correspondent" and its criticism by "Planter" which appeared with reference to the Leeming System, are of such interest to the coffee-planting community that I think any further remarks on the subject should appear in your columns. I consider it a pity that matters of interest to planters *only*, should not always be discussed in them in preference to the *Mail*, however grateful we may be to the latter for so readily accepting our letters and for the attitude it has always assumed towards planting interests. But what we require in the present instance is instruction, and, as many now have adopted the Leeming System, your paper is especially adapted for receiving progressive notes upon it and for an exchange of opinion, as it gradually matures in different districts and with differing experience. You would then after a time be able to collect and condense these opinions and thus provide guidance of some value.

In the hope that I may start "the tambourine a-rolling" and that you will keep it so, let me begin by saying that I am anxious for any and every information on the subject, provided that it is not merely critical from an old position, but the result of actual experience on the new lines. That, I consider, is the new position and the only one of any value to us. "Planter" has evidently not attained to it, and his criticism, though full of interest, and possibly correct, is therefore not to the point. He has, in consequence, fallen into several errors as to the general bearing of the system and the way in which it is carried out. In the first place, he is wrong as to Adam:—When that gentleman grew his coffee he had not, before leaving it to Nature, topped it first for a considerable time. He left it to run up straight away as do the natives still, and the result is perfectly different and, unless very carefully moderated by gradual extension of elbow-room and increase of manure, disastrous. Secondly, "Planter" seems to share the opinion of many coffee-planters that they are fruit-growers. That is not the case, they are seed

growers. A fruit-grower tries to reduce, if possible eliminate, the seed from his fruit and increase his pulp. Our object is to grow as big (and blue) a seed as possible and—to "Hades" with the pulp! In coffee the most pulpy fruit may occasionally give the best seed,—I am firmly convinced that it does not necessarily, or usually—but this may be a matter of experience differing in different localities; in any case it does not effect the point aimed at. Of this the very vine at Hampton Court referred to by "Planter" is as good an example as any. The man who grows coffee weeps to see half his crop gradually disappearing, the grape-grower sets to work and cuts out some of the berries in each bunch. The former knows that, however close together, there will be room for his seeds and doesn't mind whether the fruit round them is hampered for space; the latter creates room for his fruit to grow as large, and for the seed to form as small a proportion, as may be possible.

Of course we have all heard of stripping part of your crop, when the tree doesn't seem likely to bear it without prejudicial results, but the process is different and the purpose to relieve the tree and with no possible idea of increasing the size of the bean. But the chief point in the Leeming System which "Planter" has failed to grasp is that it is based on self-preservation. To the proprietor, whether he manages his estate or has it managed for him, the question how to make both ends meet (not to mention a return on his money) and yet not let the estate degenerate, has for some years been a very difficult one. He knows that if he stops the supply of manure the latter must be the result; he also knows, unless he is a specially favoured individual as regards prices, that, as these run at present and are likely to run for some time, he cannot make the estate pay while sticking to the old system, *i.e.*, pruning, handling, trenching and manuring. Seeing then that pruning and handling run away with a great deal of money, he would naturally welcome a system which would save this and enable him to keep up his manuring. He would further be able to save in superintendence. I reiterate this, though I have once already been hauled over the coals for the statement. Supposing there are only 300 trees to the acre, supposing that no handling or pruning are to be stood over, is it not self-evident that a superintendent can look after a larger acreage? It may seem hard from the superintendent's point of view, and I would be the last to wish any harm to a body of men who have proved themselves as specially brave, cheery, and hard-working under very difficult circumstances. But though a selection of the fittest might be the result of the general application of the Leeming System and some would have to go to the wall, is that not better than that all should do so in a general collapse of the industry? Besides, if it be a success, if, by adopting it, Indian coffee is able to compete with any in the world, would that not lead to its extension and thus provide pleasanter, if more extensive billets for all. I say this as a superintendent; as a proprietor I trust "Planter" (whichever he may be) will not take it amiss if I say I certainly hope advocates of the Leeming System will not be condemned to silence during the "few more years' trial" which he postulates.

There is one more point in "Planter's" letter which I should like to refer to before further airing my views on this new system. He says: "Experienced planters do not ruthlessly cut off bearing wood." That is true, and formerly they probably were also to some extent able to prevent their

coolies from doing so. But labour has changed a good deal in the last twenty years. It has become less permanent, and less able or willing to do intelligent work. Even at its best, and when coffee was able to stand far harsher treatment than it can at present, it was a hazardous business turning fifty or sixty coolies into a field of coffee with pruning knives in their hands (which probably a large number had never seen before), and under the guidance and supervision of perhaps one European and one or two native experts. Here, again, it will be seen how easily the parallel between the fruit-grower in his orchard or conservatory and the coffee-planter on his hundreds of acres comes to grief.

Turning now to the reasons from a field-working point of view which induced me to take up the Leeming System as soon as I had grasped it, I would begin by saying that I started by looking at it as a fad. It required some time to get over the prejudice engendered by working many years in the established groove. Yet all through there was a half-dormant memory which probably accelerated my conversion. Years ago in a village on the Pulneys I and a friend stood under a coffee tree, which by some accident I suppose had been broken off and had formed a double-stem and, perhaps in consequence, had been allowed to grow as it would; for all the coffee round it had been topped and pruned. Each of these double-stems measured over 31 inches in circumference at 18 inches from the ground, the primaries hung down to the ground all round us and there were bushels of fruit on the tree, which was, as far as I remember, about 12 feet high. In the near neighbourhood there were lots of other trees which had been allowed to grow up in the "Adamite" way, but they were straggly lanky things with but little strength in them and little fruit. I believe that No. I owed his magnificence chiefly to his accident in youth and to a good deal of manure of the village kind.

Then came the memory of photographs of Guatemala coffee, each tree forming a shrubbery to itself, and the knowledge that Guatemala kinds fetched as good prices as Indian. Nor, as far as I could recollect, had No. I or the shrubberies in the photographs any sign of leaf-disease, black-rot or branches dying back, but seemed to bear their huge crop easily. The next memory that struck me was that I had pulled up a coffee-feeder-root ten feet long in coffee planted six by six. I examined a considerable number of roots and found them all intermingled and, as it were, fighting with each other. Now if you are fighting for life with four other Johnnies all round you the probability is that you won't be very fit to fight another chap who comes down from heaven or up from hell, such as leaf-disease and bug, or damp-rot and grub.

Then came the recollection of a week in Ceylon, where amid miles upon miles of tea, which had once all been coffee, treated on the approved system, there were still here and there a few coffee trees which had been allowed to run up into suckers after the primaries had been knocked off with pitting bars. In spite of their ill-treatment they had under their newer and freer condition put on an excellent blossom. In one case no tea had happened to be planted near one of those coffee stumps, and this had probably found a *cache* of rich mould; its suckers had bent over unproved and formed a splendid bush out of its former wreck, so that the superintendent and I agreed that perhaps coffee had been cut out too ruthlessly and indiscriminately in the isle of which it once was king.

Then a friend came round my estate with me and he having begun the Leeming System in his places told me I should do the same, which I indignantly pooh-poohed. He then pointed out a bush to me, which being amongst some rocks by itself had escaped pruners and handlers for apparently a couple of seasons and even the weederers had neglected to sucker it for some months. Of course I snorted and vowed disciplinary measures against all and sundry of the criminals. But that bush had a good deal of magnetic power over me afterwards, and somehow it was neither handled, pruned, or suckered any more than it had been, and became more and more a lesson in its splendid isolation.

Of course I had long noticed gradual increase of disease and gradual deterioration of blossom. The former was related to the latter and might be due to pruning off the lungs of the tree, or handling and suckering off its *renewed* lungs and generally in treating it in the same way as a fruit-tree in northern climes, which is in the habit of doing without any lungs when it goes to sleep, during months of wintering. It might also be due to sourness in the soil accentuated in places by a pernicious system known in planting circles as renovation pits or, far more aptly, water-holes. It is to deal with this latter possibility that drains are cut in the Leeming System which aerate the soil without allowing water to stand in them and are besides of value as localizing disease. In addition to this deterioration, I now noticed that after handling a large proportion of the berry suddenly exposed to the light and sun turned brown and baked on one side, and on examination I found that most of the berries thus affected only contained one bean and that no larger than an ordinary bean and not a peaberry. This result I can only put down to handling. I have in the foregoing tried to sketch my gradual evolution as a disciple of Mr. Leeming for the information of those who have not yet come under his banner. He himself and those who have followed him have probably gone through a similar if not identical experience. As to the actual results I can say no more than has been said by various correspondents who have seen Mr. Leeming's estate, or tried his system on their own. I have my moments of fear and trembling, but even in these I cannot help believing that we are right and that it will prove a success.

In any case I feel certain that unless it is universally adopted, probably with modifications and improvements, Indian coffee will not be able to hold its own against that of other countries. Now supposing others who have gone in for the Leeming System give us the result of their experience through your columns. The more the better, as we should then give the experience of districts differing as regards elevation, climate and rainfall. I shall myself gladly add any information I can give, as my experiment progresses.

At present I can only say that here, on about 120 acres treated to their first cutting out and with one lb. of manure per tree, the suckers look magnificent. If any large proportion of these bend over a second thinning out will certainly have to be done 18 months after the first (April of this year, suckers having been allowed to run up 6 months previously). My elevation is 4,700 to 5,500. Rainfall about 100 inches.

"HERMIT."

[We shall be glad to publish correspondence on this subject, but as a weekly paper *Planting Opinion* is obviously at a disadvantage when discussion is required. A daily paper can give immediate publicity to letters, and this facilitates *speedy* discussion, whereas in the case of a weekly delay is unavoidable.—ED., P. O.]

## GENERAL ARTICLES.

## PRODUCE AND PLANTING.

## Indian Wheat and Tea.

Sir Michael Hicks-Beach and Lord Goschen, in speaking last week on the fiscal question, referred to India. The former in the course of his speech touched upon wheat and tea as follows: "India is in prosperous years not very far short in her exports of wheat to this country of the exports of Canada. Well, are you going to protect Canadian wheat against Indian wheat? Because I may remind you that the Canadian tariff is protective, and is intended to remain protective, against your manufactures as compared with their own, but the Indian tariff is on the basis of a much lower duty. Well, I think it is clear that if you give a preference to wheat to Canada, you must also give a preference in wheat to India. But further, in considering the preference of corn, of wheat, of dairy produce, no doubt Mr. Chamberlain considered properly what were the principal exports of the self-governing colonies of this country. You must do the same with India. India can fairly ask for a preference on rice and on tea. So can Ceylon. Give them that, and there is an end of the proceeds of your tea duty." It may be taken for granted that in Mr. Chamberlain's plans there is no intention to differentiate against Indian wheat. All the needs of Canada will be satisfied if her products are substituted for those of the United States, and the Indian supply will help to keep prices down to a reasonable level. As for tea, about which Sir Michael Hicks-Beach seems more concerned now than he did when he was Chancellor of the Exchequer, and found it so useful as a ready means of helping to fill the national coffers, it may be quite practicable to give a preference in favour of India and Ceylon, and yet maintain sufficient duty to provide a reasonable amount for the Exchequer. But tea-growers may reasonably desire to know what will happen under the present Ministry. Will Mr. Balfour and Mr. Austen Chamberlain leave the tea duty unremitted? It is in part a war tax, and the country was given to understand that when the emergency was gone the emergency tax would also disappear. The present Government might possibly withhold relief upon the plea that the Premier's opinions are still seriously distinguishable from Mr. Chamberlain's, but this is scarcely probable. Although the partial remission of the duty, as part of Mr. Chamberlain's proposals, is the only definite political pronouncement on the subject yet made, tea-growers are justified in assuming that the question of remission cannot in justice be shelved for long, either by the present ministry or any other which may succeed it, while should Mr. Chamberlain's proposal ultimately find favour with the majority, British-grown tea may reap advantage from the preferential plan his policy foreshadows.

## Mr. Chamberlain's Proposals and Tea.

The following letter appeared in the *Times* of Tuesday last signed E. Lyulph Stanley:—"Mr. Chamberlain, in his letter to Sir M. Bohnaggee, says that in his scheme of tariff reform 'India would be greatly the gainer, as she could have preferential arrangements with regard to tea.' I assume from this that in his scheme lowering the tea duty from 6d. to 1½d. a lb. would apply to India and Ceylon, but that foreign tea would still pay the higher duty. If that were so, no doubt the Indian and Ceylon tea-planters would get a large bounty at the cost of the British consumer. The tea imported from India and Ceylon in 1902 was worth about £7,935,000, out of a total imported value of £8,787,000, or about nine-tenths of the whole. The weight was about 263,000,000 lbs. out of about 293,000,000 lbs., or about nine-tenths of the whole. But so long as we import one-tenth of our tea from abroad at a higher duty, so long the price in the market will be determined by that higher duty. The price of tea delivered here is by the above figures about 7½d. a lb.; thus a bounty of 4d. a lb. would undoubtedly so stimulate the growth of Indian tea that the extinction of the importations from China and Java would soon follow, and then probably the British consumers would get tea at the cost of production in India and Ceylon, plus 1½d. a lb. duty. For two or three years, however, at least, our market would need more tea than India and Ceylon could produce, and during that time the price would be regulated by the higher duty of 6d. on foreign tea, and we should be paying a bounty of more than 60 per cent. to the Indian and Ceylon tea-planters. Thus for a time the consumer would not be recouped by his saving in tea for

the extra cost of his bread and meat. It seems probable from the growth of the Indian and Ceylon tea industries that, if left to itself, that trade would in a few years drive out the Chinese trade. As a consequence of natural causes, superior local conditions of climate and soil, superior industry and intelligence in the cultivators, this result would be satisfactory. But it would not materially add to the profit of British industry as determined by International trade. If we buy about one million sterling more tea from India and one million sterling less from China, some millions of our exports will be insensibly transferred from China to India, the Chinese coolie will buy less of our calicoes, the Indian coolie will buy more. Shipping, mainly British, will carry about a million worth of produce backwards and forwards between Britain and India, instead of between Britain and China. If the duty on tea be reduced all round from 6d. to 1½d. a lb., the British consumer will at once reap the full benefit, and the same conditions which have rapidly built up our Indian and Ceylon tea industry will continue. No doubt when the cost of tea is reduced by something between 25 and 30 per cent. a stimulus will be given to its consumption, and the increased demand will lead to a wider tea cultivation and a greater international trade connected with its purchase. Such a reduction of cost and increased demand would be a great gain to tea-planters, and would, no doubt, increase their profits and stimulate their activity, apart from any bounties resulting from differential duties. But the tea industry of India, though important commercially as being mainly a crop handled by merchants and exported, is a very trifling part of the total industrial activity of the hundreds of millions of the Indian population, and any favour shown to that industry, mainly employing British and Indian capital, would be no appreciable advantage to the populations of India as a whole. A bounty of about £3,000,000 for a few years would be far better expended for the benefit of India in such works as would diminish the risk of recurring famines than in swelling the dividends of Assam tea-planters. But, if we want to help India to that extent, we might reduce our home charges on India for our Army and Reserves charged on India, which would enable the Indian Government to take off such taxes as press specially on the peasant and hamper the growth of Indian industry."

## Advance in Indian and Ceylon Tea Share Values.

From the following figures, compiled, as usual, by Mr. George Seton, of the Indian Tea Share Exchange, of 120, Bishopsgate Street, London, E.C., it will be seen that, notwithstanding the deduction of dividends, aggregating about £50,000, the market value of the forty-five representative companies, selected by him for particular observation, has again made a substantial advance during the past month. The advance extends pretty well all along the line:—

Face value of 45 companies' shares	...	£9,500,000
Market value	...	July 1, 1897 (highest) £12,000,000
"	...	Sept. 1, 1902 (lowest) 6,050,000
"	...	Jan. 1, 1903 6,600,000
"	...	Aug. 1, 1903 7,500,000
"	...	Sept. 1, 1903 7,400,000
"	...	Oct. 1, 1903 7,800,000

As the grand total of the share and debenture capital of the 170 tea companies (registered in England and Scotland with sterling capital) altogether amounts to about £19,000,000, the fluctuation of the entire volume, based on these figures, may thus be estimated:—

Face value of (about) 170 companies	...	£19,000,000
Highest value, July 1, 1897	...	£24,000,000
Lowest value, September 1, 1902	...	12,100,000
Market value, September 1, 1903	...	14,800,000
Market value, October 1, 1903	...	14,900,000
Market value, November 1, 1903	...	15,600,000

Taking 100 as top value, the lowest level works out at just over 50, and the present value at 65. In view of the present sound position of the trade, Mr. Seton anticipates a further improvement in the immediate future.

## The Regulations for the Imports of Tea into Russia.

With reference to the recent increase of duty on Indian and Ceylon teas, and the certificate of origin required, the following unofficial translation of the new Russian Law of August 15 is given in the *Chamber of Commerce Journal*. Art 1. As proof of the origin of tea passing by Article 20, s. 1, letter a, and subject to the lower duty of the General Customs Tariff will be accepted:—

(a) Invoices and letters (in original) of exporters, whose signatures have been duly testified and sealed with the official seal by the local Russian Missions, Consul, or Consul's Agents; (b) Certificates of Origin issued by Russian Missions, Consul, or Consul's Agents with official seal. Art. 2. The documents mentioned in Art. 1 must contain particulars as to the number of packages, their marks and numbers, and also their gross and net weight. Art. 3. The presentation of documents mentioned in Art. 1 is considered to be sufficient if the goods come into Russia directly from the country of origin. Art. 4. When goods enter into Russia indirectly from the country of origin it is necessary to present:—(a) Invoices and letters mentioned in Art. 1, s. a, in original, or testified copies of same belonging to exporters in which the marks, numbers, gross and net weight, are indicated; (b) for tea coming from Customs Storage Houses a certificate must be obtained with the official seal of the export customs stating that the said parcel landed from the country of origin was all the time in the hands of the Customs up till the time of its export. Art. 5. The above-mentioned documents (in Art. 1—4) of origin or place of export may be presented to the Russian Customs either when the goods are imported with the shipping documents, or when the exporter presents a declaration in which must be indicated the country of origin in the space for quality of goods if he wishes to benefit by the lower tariff. Art. 6. In order to benefit by the lower duty of the Customs Tariff, the tea must be declared in accordance with the accompanying or presented invoices, or letter, or certificate at the declaration, or in the declaration (written one) under a certain article it must be explained which document of origin or place of export corresponds to the tea declared in that article; should this not be complied with, the written declaration is returned to the bearer for him to fill up, and only when these particulars mentioned in this article are indicated in the written declaration can tea be subject to the lower duty of the Customs Tariff. Art. 7. The Customs-houses have orders to make themselves sure during their inspections that the invoices and certificates of origin correspond to the imported tea, and in any case they have the right when they have reasonable doubts to examine the presented proofs without limiting themselves to the above documents. Art. 8. The documents of origin (Art. 1—4), as well as all other documents respecting payment of duties on goods, are forwarded to the local control offices as soon as the Customs formalities are finished.

#### The American Tea Market.

Discussing the American tea market, the *Tea and Coffee Trade Journal*, of New York, says:—"The manner in which our tea market is being influenced by conditions present and to come in London is noteworthy and even significant. Our dealings have heretofore been so dominated by China or Japan that what London thought or did concerned us little. But times have changed. In the first place we are larger, much larger buyers of British-grown tea, and, therefore, brought in closer touch with English tea men, who, naturally, are more concerned with India and Ceylon tea than the Chinese and Japanese variety. But there is even another phase; the Englishmen are to-day buyers here, and there is every reason to believe that they will be such for not a little while, and in a manner that will help much to improve our market. For several years we have been weighted down with low-grade teas that had been acquired by us in China in large quantity, because they looked cheap, only to ascertain by hard experience that they were practically unsaleable here, because we had overstocked ourselves. Not even the later rise in prices here served to budge the Congous a quarter of a cent until on a sudden the British-grown teas experienced an advance, and London in despair, lest the United Kingdom would thirst in vain for low tea, finding there were plenty here that Americans would not have bid for them, and in the first half of the year diminished our stock by some 4,000,000 lbs. Even this diminution did not serve to alter the situation; the tea remained a drag on the market, but now comes the Chamberlain scheme and other tariff changes, with the prospects that an advance in teas in England must occur, and that we shall be depleted of all our teas unsaleable here. The orders are coming from abroad thick enough, and there has been an advance in this tea, here now more than two years, of more than one cent—nine cents a pound and more being demanded. We have, too, a good lot of Foochows of low grade, but costing a little more, and they may be attacked when all the Congous will have been disposed of. We are quite sure that we feel much indebted to the London market, which is relieving us of a situation which was becoming embarrassing.

In other respects, the American market is meeting with attention on the part of London and other English tea marts. The agitation for a pure tea law, an idea derived from the United States, is growing there, and there is study of our Tea Standard Act, which is being printed for general edification. The agitation was started by the importation into England of the Foochow teas rejected at New York. The prices obtained were so low that they nettled not a little the general market, which had, of course, viewed with approval the recovery from the low prices at which Ceylons and Indians had been selling. It might be here observed that this same tea was brought to New York by an English firm, and so we are in no way concerned as a nation with the manipulation that this depreciated tea has met. Let it be stated also that the leaders here or those opposed to the Tea Standard Act were not born in the United States. They hail from England. It is well that the probity and the honesty of the American tea man should be generally understood."

#### Formosa Tea.

Messrs. Smith, Baker & Co., writing from Taipeh, Formosa, September 25, say that the market there is well cleaned up of desirable teas, and that the green leaf to arrive, estimated at 50,000 half-chests, is inferior. They report that the exports of Formosas will amount to 20,000,000 lbs. this season, 2,000,000 lbs. in excess of that exported last season. Total receipts to September 25 are 451,000 half-chests, against 411,116 last season; of these 40,000 are fair, 160,000 good, 190,000 superior, 40,000 fine, 15,000 finest, 5,000 choice, and 1,000 choicest. The settlements were 438,658 half-chests, against 402,599 last year; total exports to the U. S. 12,500,462 lbs., against 10,144,757 lbs. last year corresponding time.

#### Cocoa in America.

The consumption of cocoa in the United States has developed more rapidly than that of coffee and much more rapidly than that of tea. In fact, the use of both cocoa and coffee has increased in the United States in recent years faster than that of tea.

#### MR. R. V. WEBSTER AT TORONTO.

After an absence of some two years, Mr. R. Valentine Webster, of the Ceylon Co-Operative Tea Garden Co., was a visitor at the Toronto office of the *Canadian Grocer* last week. Mr. Webster, who is on his 15th tour of the globe, is en route to Ceylon via San Francisco and Australia, and expects to get back to London some time in February.

Mr. Webster, besides his interest in tea, is an enthusiastic military man. He served in the Cape D. M. T. during the South African War and later acted as financial adviser to Lord Milner in the matter of land settlement and repatriation of the distressed districts.

#### EUROPE TAKING TO TEA.

In reply to questions bearing on the progress of Ceylon tea, Mr. Webster said that of late he had been attending more particularly to France and Switzerland. Up to 1899, the year of the Paris Exposition, very little tea was used in Europe. Now, following the English fashion, the five o'clock tea had become quite the thing, and was offered in the best houses where wine had formerly been used exclusively. All this had come about through the influence of the Paris Exposition. In the United States the afternoon tea idea had not become popular.

#### ST. LOUIS EXHIBITION OUTLOOK.

Mr. Webster had recently been at St. Louis and had gone over the exhibition grounds. They were magnificent, but he anticipated that St. Louis would have the distinction of having the most colossal failure financially in the history of exhibitions; this on account of the great heat during the Summer months and the distance of St. Louis from the more prosperous centres of population.

Ceylon was sending over a Commissioner and an Assistant. They would have a special court for their exhibition of tea, and the beverage would be served by 25 Sinhalese.

India would have a Court of her own. There had been a talk of a combined exhibition of Ceylon and India teas, but an agreement could not be reached. Mr. Blechynden, who had been commissioner for Ceylon at the Chicago Exposition, would have charge of the India tea exhibit at St. Louis.

#### DEMAND FOR CEYLON GREENS.

At large, Ceylon teas were making satisfactory progress. Ceylon greens were making their way very well in this country. Black

teas were a penny a pound more than last year, and in consequence times were very prosperous for the growers. The outlook was certainly firm for blacks. As for greens, they depended altogether on the output. He favoured the securing of experts from Japan and China, so that Ceylon might turn out teas exactly similar to these countries. He was also in accord with what Mr. Larkin had said as to the desirability of imitating Formosa Oolongs. There were demands in certain parts of the world for teas of particular style and character and why should not the Ceylon people undertake to meet these demands? They would thus absorb a certain proportion of the tea crops and secure themselves against the possibility of producing more blacks than the requirements demanded.

An improvement which the Ceylon tea people should make was in the package they put on the market. The matted packages of China and Japan were away ahead of the packages put on the market by Ceylon and India.

In his travels he found the demand for Ceylons increasing from day to day, and if the people were in a position to supply the particular styles demanded, he believed there would be much more exported to foreign countries.

Mr. Webster was the guest of Sir Thomas Lipton during the yacht races, and was with his party until the Baronet sailed for Home on the *Cedric* on October 9th—*Canadian Grocer*, October 30th.

### COFFEE IN DISTANT LANDS.

**Cuba.**—A large portion of the August summary of the Bureau of Statistics of the Department of Commerce and Labour is devoted to "Commercial Cuba." In presenting a brief account of the coffee industry it expresses the opinion that "the rehabilitation of the Cuban coffee industry would appear certain, and already it may be said to have begun. In June, 1903, 14,207 pounds of Cuban coffee were imported at New York."

The report says:—

"The soil and climate of Cuba are admirably suitable for the production of large crops of the best coffee. This fact is proved by historical records. While for many years recently the Cubans have not raised coffee enough for their home consumption, for about thirty years in the first part of the nineteenth century it was one of their leading industries, and the amount annually exported on an average was 15,000,000 pounds. What has been done before can be done again. The soil and climate are the same now as a hundred years ago. The coffee now produced in the island has the same fine flavour that it had then. The industry will doubtless be among the first to be revived in the near future.

"Its decline was owing to several causes, among which were the competition of the East Indies and South America, a succession of 'bad years' for the crop and the increasing attractiveness of sugar-cane culture, in view of the great demand for Cuban sugar fifty and seventy-five years ago. At that period Cuba had almost a monopoly of the sugar market, and a great many planters transformed their plantations from coffee to sugar producers, in order to make more money. If the present sugar conditions should persist indefinitely, there may be a return to the old order of things on the part of many sugar planters of to-day.

"There were 1,600 coffee plantations in Cuba in 1846, whereas now there are less than 200. It is a tempting industry for the Cuban farmer. Though the coffee tree requires almost as much solicitous care as the tobacco plant, it is a pleasant crop to raise, and, if successful, is very remunerative, as the trees yield two crops a year, and thrive best in the shade, so that coffee-planters can plant their little coffee trees in among the larger trees of a fruit orchard, and thus get a crop of coffee and a crop of fruit simultaneously from one and the same field.

"The following table shows the extent of the coffee exports of Cuba during the most remunerative period of that industry:—

Year.	Arrobas.*	Year.	Arrobas.*
1809 ...	320,000	1819 ...	642,716
1815 ...	918,263	1820 ...	686,046
1816 ...	370,229	1822 ...	501,429
1817 ...	709,351	1823 ...	895,924
1818 ...	779,618	1824 ...	661,674

"The decline of the industry is strikingly apparent from the appended table, containing a record of the exports of coffee in the

\* An arroba is about 25 pounds avoirdupois.

years 1867—1886, inclusive, from the ports of Santiago de Cuba and Guantanamo. As most of the Cuban coffee has always been raised in the province of Santiago, the bulk of the exports has always been shipped from those two ports:—

Year.	Pounds.	Year.	Pounds.
1867 ...	3,855,220	1877 ...	37,660
1868 ...	2,671,460	1878 ...	33,200
1869 ...	4,009,320	1879 ...	37,114
1870 ...	2,153,820	1880 ...	23,700
1871 ...	571,600	1881 ...	9,000

1873 ...	56,100	1883 ...	22,500
1874 ...	37,600	1884 ...	...
1875 ...	198,100	1885 ...	6,295
1876 ...	91,000	1886 ...	7,967

### RUBBISH SHOT HERE.

Under the heading "Food at the Ports," the *Grocer* refers to the dumping of cheap tea—that is, too cheap in the British Isles, to which the Chairman of the Central Tea Company of Ceylon called attention last week. It says:—"The tea he had in view he described as 'rubbish discarded by the American Customs as below standard, and of too low a grade for consumption, or the sweepings and refuse of China, for which no other market could be found.' There is a certain amount of danger of this particular kind of dumping, for owing partly to our system of free importing and partly to our position as carriers for the world at large, with the use of our ports for entrepôt or dépôt as happens to be required, we practically keep a dustbin for the world, for which receptacle 'Rubbish shot here' is as appropriate a signboard as would be 'Best goods taken in free.' The effect is that we are asked to take—or made to take without any asking—whatever other people see fit to reject. Now, it happens that in July last trade at the United States ports became subject to a new Law of Congress to exclude all food products and beverages (a) adulterated so as to be injurious to health, or (b) the sale of which is restricted or prohibited in the country of their origin, or (c) which have been falsely branded or labelled. The United States Agricultural Department watches the imports, and when adulteration or misrepresentation is suspected, requests the Treasury Department (as controlling the Customs) for samples of goods arriving. These samples are promptly obtained and furnished to the Agricultural Department for examination by the Bureau of Chemistry, the consignments from which they are taken being meanwhile detained at the port of entry. If delivery is urgently requested the telegraph is used, for instructions, and all the officials using the utmost despatch, there is, notwithstanding the large number of samples drawn, but little delay in the transit of goods, the average detention of consignments at New York being not more than three days, while in many cases a day suffices. So far the effect of this law has been good, foreign exporters to the States being either more scrupulous than they were or more careful to avoid a chance of rejection. In most cases the consular invoices received at the Department of Agriculture are sufficient in themselves to show that the goods to which they refer are not liable to exclusion. As time goes on and the data obtained by examinations are increased, the Department hopes to be able to admit a still larger proportion of food importations on the consular invoices or on purely superficial examinations, so that little or no inconvenience will be caused to the importers or others concerned, whilst the public are protected against the importation of such rubbish as the China tea which was rejected wholesale a year or two ago. But while this may be excellent for the United States, and may save the public there from the wiles of the too-ingenious foreign chemist in many an article besides tea, the attendant results," the *Grocer* thinks, "may not be of unmixed benefit to us in Great Britain. We can find a market for so many things that even adulterated food and rejected 'sweepings' not good enough for the States may be disposed of here in one way or another. But, obviously, the activity of examiners and rejectors elsewhere must throw additional labour and responsibility upon examiners here, either at the ports of entry or at some subsequent stage in the course of the goods through the different hands dealing with them before they are actually consumed. If we are to have unrestricted importation we might avoid much subsequent trouble by a thorough system of inspection at the ports, but even then free dumping has grave dangers." To which we can only add, very grave dangers indeed.

## CARDAMOMS AND NORTHERN EUROPE.

The *Times of Ceylon* publishes the following copy of letter from Mr. Renton to Mr. W. Sinclair:—

MY DEAR SINCLAIR,—I wrote you last from Hamburg, and have now returned from Scandinavia.

There is a good consumption of cardamoms in Sweden and Norway, as the article is largely used in the bread. You taste it in all the white bread. The imports for consumption were last year:—

Sweden	... 52,526 kilos.	= 1,156,672 lbs.*
Norway	... 11,257 „	= 247,654 „ *
Denmark	... 39,336 lbs. Danish	= 432,696 „ English.*

The total population of the three countries is only some 7¼ million inhabitants, so they do well, and would do more if the duty was not so high. In Sweden and Norway it is 1s. 1½d. per lb. a ½ kilo. Importers do not think the consumption will increase. Within the last 10 years it has grown about 10 per cent., more particularly in Sweden. The importers and retailers made a big profit on the article. It is sold somewhere about 3s. to 4s. per lb. In Norway I see the customs valuation of the article is just over 6s. per kilo., this includes duty.

All supplies are drawn from London and Hamburg, and dealers there make their profit on the article. The biggest dealers in Sweden are now buying freely, as they do not think they will go lower, and are stocking the article, as it is cheap.

I don't think there is much chance of increasing the consumption in these countries; but, if the public could obtain the article cheaper, they would probably waste more of it, if direct exports were made.

The London and Hamburg dealers give the Swedish importers three months' credit.

The Scandinavian importers are of the opinion that the only way to raise prices is to limit the output; naturally they are pretty happy, as the public so far has not shared much of the benefit of the drop in prices. The Hamburg importers, whom I also inter-

viewed, are strongly of opinion that there can be no marked increase in consumption: advertising or a propaganda would, in their opinion, be of no use. The only way to increase the price is, they say, to restrict output.

The German custom figures puzzle me a little. Duty paid to end August on

	In 1903 Kilos.	In 1902 Kilos.	In 1901 Kilos.
	46,200	45,100	28,200
	of which from		
British India	15,100	19,000	13,500
Ceylon	21,200	18,000	9,000
	36,300	37,000	22,500
where the balance of	9,900	8,100	& 5,700

kilos., respectively, came from is not explained.

Can you not do anything in England itself to increase the consumption of the article by the public in, say, cakes and pastry?—Yours sincerely,

(Signed) J. H. RENTON.

## THE WEAVING OF RAMIE FIBRE.

Mr. Raja Varma has written as follows to a number of Indian journals:—

Anything that tends to increase the agricultural resources of India should be cordially supported by every patriotic Indian. Agriculture is the great industry of the vast continent of India; famine is its bane.

Now the great weaving industries of India are cotton-weaving and silk-weaving. Of the raw materials used both are to a great measure Home-grown. Between these two, however, there is another substance, a raw material, lustrous as silk, stronger than linen, washable as cotton, and that is Ramie. For a long time Ramie fibre was considered to be incapable of manipulation. When at last the difficulties of decorticating and degumming had been overcome, the technical difficulties of weaving the fibre were found to be so great that ten years ago the Mills which had started Ramie weaving in England gave it up in despair and many hundreds of thousands of pounds (sterling are said to have been irretrievably lost. During my travels in the United Kingdom with the specific object of widening my knowledge of "Men and matters." I made inquiries for Ramie manufactures, and elicited the fact that only one English manufacturer persisted steadily in spite of difficulties and discouragements in weaving Ramie fibre, and has been engaged continuously in doing so for the last fifteen years. Making at first simple hard-wear materials which were exported to India and the tropics and gained the reputation of being proof against even the tender (?) care of the Oriental "dhobie," experiments were subsequently instituted by this manufacturer with the object of weaving bright dress materials, damasks, tapestries, etc. All difficulties, I am reliably informed, were finally vanquished, and to the Bunbeg Mills, 17, Southampton Row, London, belongs the credit of being the first to overcome the difficulties of Ramie weaving, and to produce materials manufactured of pure Ramie which are as brilliant as silk and of a far greater durability.

As I write there are lying beside me a great variety of the Bunbeg Mills fabrics. Here are silky, gauzy materials of delicate tender hues from which the graceful saree can be made; there damasks for sherwanees as splendid in iridescent colours as a peacock's breast, as tender in tints as an opal; hear again are heavy tapestry, curtains and rugs, and there white materials for the riding breaches of the polo-player, of everlasting wear. It is impossible to exhaust the endless variety of the Ramie-woven materials of the Bunbeg Mills, and all are, in comparison to other textiles, moderate in price. They are washable, and having tested them, I must state they are of amazing durability.

At present the supply of fibre falls far below demand in Europe, for thread-makers have discovered that a far more durable yarn can be made of Ramie than of flax, but several of these thread spinning mills, from enquiries made, have had to give up spinning Ramie owing to the impossibility of getting a sufficiency of raw material: the sail cloth weavers have had the same experience.

I make bold to assert without the shadow of a doubt that Ramie can be grown with the greatest ease in India, the conditions of soil, climate and labour are all favourable, and in view of the fact that table linen, damasks, boot and saddle thread, underwear, cords,

\* These English totals should, apparently, be divided by ten.—Ed.

belting can be better made of Ramie than of flax; and now that the Bunbeg Mills have demonstrated that the most exquisite dress and decorative fabrics can be woven of the fibre, it seems to me that India has in the cultivation of Ramie, an agricultural industry of great potential possibilities, if only capitalists and agriculturists would make an earnest and sustained effort to inaugurate an undertaking so pregnant with benefits to India. Co-operation, cohesion and combination are essential to achieve this end, not forgetting the centralization of the fact that Indian-grown Ramie should oust rivals from the European market, and that Indian-grown Ramie by commercial perseverance, push, go, should be brought to the fore in the textile world.

In my next letter I will, Sir, if you will allow me, give information gathered from experts as to the cultivation of the fibre, and in the meantime let all those who are or may be interested in this new industry communicate with the Bunbeg Mills which have achieved so signal a success in weaving this once-thought impracticable fibre into such exquisite fabrics.

### THE COFFEE GROWERS' COMPANY.

The Annual General Meeting of "The United Coffee Growers' Co.," Coimbatore, was held in Coonoor on Friday, the 27th ultimo, with Sir Frederick Price, K.C.S.I., the Managing Director, in the chair. The Directors' report and the accounts were circulated to the shareholders some time before the Meeting, and were unanimously accepted and passed. The Company was formed a few years ago for the purpose of roasting, grinding, and tinning coffee for sale in India, and the Factory was placed at Coimbatore where some of the best hill-grown coffees are cured, and supplies of high-grade coffees are readily obtained. The business already built up, and which this year's report shows is steadily increasing, is evidence that there is room for such an undertaking. The trading account, which, of course, is not published, was laid before the shareholders, and was regarded by them as satisfactory, showing, as it did, that in the past year the Company's business has made considerable progress, with the encouraging feature that the area of its operations is rapidly extending throughout India and to a smaller degree outside the country. Under European management and with the services of an expert, trained in Europe, as coffee roaster, the Company has already established several brands of coffee, which are kept up to a regular standard, and for which there is a steady and growing demand in the trade, and is now engaged in introducing a brand, which by its cheapness and quality will, it is expected, meet the wants of a large section of the public to whom price is a consideration.

The Company's works are the largest and most complete in the country. They include roasting, grinding, and tin-making machinery, and are quite worth a visit by any one passing through Coimbatore. To coffee-planters in particular the aim and objects of the Company should be of special interest. The consumption of coffee in India is estimated at some 2,000 tons per annum, and recent statistics go to show that a very large proportion of this consumption is met by the importation of tinned coffees from abroad, prepared in various ways. In these days of competition, and search for near markets, the first step should be to secure the market at your door. This is being done by tea-planters, but by coffee-planters has been neglected, and they should watch with interest and approval any movement trusting to displace foreign-grown coffee by the introduction of their own product.

### TEA-PLANTING IN JAVA.

#### HOW IT COMPARES WITH CEYLON.

There are at present, says the *Englishman*, two interesting visitors to Ceylon, Mr. J. G. de Dieu Stierling, Chairman of the Preanger (West Java) Planters' Association, and Mr. E. H. Evans, also of Preanger. The latter arrived from Home by the *Prinz Heinrich*, and the former from Java by the *Coromandel*. They have come to Ceylon to learn how things are done here or, to use their own words, "to see if there is anything worth picking up here"—just as Ceylon planters occasionally visit Java and other parts with the object of learning new wrinkles. Both gentlemen are joint Managers of a Tea Company called the Barom Baud, owning six estates. The Company puts 3,300,000 lbs. of tea on the market annually, besides 450,000 piculs of sugar.

Tea is grown principally in Preanger. Unlike Ceylon, Java is not dependent solely on tea. In fact cinchona is the best paying industry at present, and naturally it is grown very largely. Consequently the Preanger P. A. of which Mr. Stierling is Chairman, does not confine itself to tea alone, but is equally concerned in looking after the interests of coffee, cinchona, and cocoa. The Association, which is numerically strong, meets once every two months at the two principal towns in West Java. The tea industry in Preanger was established more than 60 years ago, so that it is much older than it is in Ceylon. Moreover, during that period, it has not passed through any serious crisis or depression. The total annual export, which does not vary to any extent from year to year, is 35 millions. One would have thought that, like Ceylon, Java would have endeavoured to increase its output as years went on, but it has not been considered of much importance, because, as has been said before, tea is by no means the sole industry of the country. Amsterdam is the great market for Java tea, though Mr. Stierling says about as much as goes to Holland goes to London. On the old estates the old Chinese tea-plant was grown, but, as Mr. Evans told our representative, for the last 10 years nothing but the real indigenous Assam plant has been used. Java tea sells for nearly the same price as does Ceylon tea; and costs about as much to produce. Java seems to be a paradise for labour, and none of the difficulties which occur here are experienced. The population numbers 27 millions, and the home labour supply is consequently plentiful and cheap. There seems to be little interference from Government although Mr. Evans said the authorities proposed to do what they have done in Sumatra, that is, insist on contracts by which Government officials should look after the welfare of the coolies; but both the planters and the general population were opposed to this innovation. The supply of labour is fully equal to the demand.

Next as to pests, which is so important a question in Ceylon. Here again Java has the advantage over us. The only blight to speak of is the "*Helopeltis Antonii*," which the planters call the "tea-bug." It does not affect the higher estates; though some of the lower estates are affected rather seriously during a very dry season. And here it may be added that, like Ceylon, Java has its high country and its low country, with small crops and good prices in one, and poor prices but large crops in the other. To get rid of the aforesaid pest, burning and burying of the prunings is sometimes resorted to. The method employed to get rid of the insects is for the coolies to catch them one by one.

Green tea is not produced in Preanger. There is no call for it, Mr. Evans explained. It might also be added that the exploitation of foreign markets for Java tea is left principally to private enterprise; the Planters' Association does not take the lead as it does here. However, they are to be well represented at the St. Louis Exposition. There is one difference between Ceylon and Java which is worth mentioning. There is only one English Tea Company in the latter place, Messrs. John Pett & Co., of London.—*Times of Ceylon*.

### PORTO RICAN COFFEE.

Recently about two hundred of the representative coffee-growers of Porto Rico held a Meeting in San Juan to provide for a permanent organization and establish in the United States a market for Porto Rican coffee.

Mr. Frederick C. Timpson, resident Manager and President of the Porto Rico Export Company, of New York and San Juan, among other things, said:—

"Many people wonder why Porto Rican coffee is not more sought after in the States. My conclusion, after a four years' study of the question, is that it is merely necessary to satisfy the American taste and the victory will be won. Porto Rican coffee is exceptionally rich in tannin, probably more so than any other, and the flavour of this tannin, to which Americans can never become accustomed, must be removed by proper roasting. The so-called 'light' roasting now done in the States does not remove this tannin, while our native 'dark' or 'French' roast does. Coffee so roasted, without burning, will please American palates.

"Nearly all the coffee sold at retail in the United States is done up in packages at the time of purchase, and the customers judge it by its colour, as well as by its flavour after roasting. Porto Rico coffee, put up in convenient, neat, original packages, kept to grade, put out in some ingenious way and properly advertised, will be

given a fair trial and will win on its merits. The United States can consume in two months all the coffee Porto Rico can produce. The coffee of this island should be put up in sealed packages, thus preventing the substitution of cheaper grades of foreign coffee, and should be branded by legislative or other official authority, insuring it as genuine.

"Headquarters should be established in some prominent city of Porto Rico, and the Association should control its own roasting plant. The introduction and advertising should be done by a high-salaried man, a professional in his line. From the beginning the Association should be prepared to sell exclusively to consumers and through agents and sub-agents. A fair price, with reasonable margin of profit, should be exacted on each brand. No coffee should be sold green in the bean, at prices in competition with cheap foreign grades, as is now the custom.

"The St. Louis World's Fair Commission of Porto Rico has decided to send to the Exposition 200,000 or more quarter-pound packages of coffee for free distribution. These packages will be tastily prepared and will be imprinted with the arms of Porto Rico and with a copy of a letter from President Roosevelt to Governor Hunt, in which the President warmly praises some coffee sent to him by the Governor."

## THE CEYLON GREEN TEA BONUS.

### WHAT MERCHANTS SAY.

Two of our leading planters have expressed their views as to the advisability of removing the bonus from our green tea industry, says the *Times of Ceylon*. Mr. William Forsythe suggests—Socratically, it is true—that to remove the bonus will be synonymous with ringing the death-knell of that frail and immature enterprise; while, on the other hand, the Planting Member in Council—the Hon'ble Mr. E. Rosling,—contends that our green-tea market is firmly established, and bonus or no bonus, will continue.

To make the position more general, some of the leading Fort merchants who have an intimate knowledge of the green-tea market have been consulted.

Mr. Lampard, of Messrs. Crosfield, Lampard & Co., courteously gave our representative his views on the situation this morning. "It is a question of competition with Japan," he said. "It is a fallacy to say our market in Canada or America is established. It is a Japanese market. Our price is a shade lower than the commonest Japan, because labour in that country has gone up. Prices, of course, fluctuate. The lowest price Japans have been down to was the year before last, when they were something between 13½ and 14 cents for common Japans, and Ceylon is somewhere about the same price. Common Ceylons have been selling in America at about 6¾d. for Hyson No. 2; 7d. for Hyson No. 1; and about 7½d. for Young Hyson."

"And do you think, if the bonus was removed, that green-tea producers would revert to black?"—"I don't think so. They might revert to black tea for some time, and the result would be that black tea, now fetching 6½d., would fall to 4½d. instead. Then they would make green tea again."

"Is the Ceylon green-tea market fixed, do you think?"—"How can it be fixed? We have made green tea for 18 months or two years. Japan has dealt in greens for 20 or 30 years."

"But it is contended that a market has been made for Ceylon green tea, and that that market must, under any circumstances, be supplied."—"Fallacy, pure fallacy. Americans all prefer Japan tea, and it is only our low prices which have enabled us to gain the small hold on the market that we possess. If we continue this for a year or two longer, then, of course, the same sort of thing might happen with regard to Ceylon green tea as occurred with our black tea. People might get accustomed to a little stronger tea, and then you might say you have a sort of hold on the American market. But a year or two is nothing."

"And your opinion as regards the advisability of discontinuing the bonus entirely?"—"I contend that the bonus should have been gradually reduced. Instead of giving three cents of 5 million lbs. of green tea and then stopping altogether, I think it would have been wiser to have paid 2 cents on 10 million lbs., to provide for the continuity of this business for a sufficient time to enable us to get a real hold on the market, which we certainly have not at present."

### WILL DISORGANISE THE MARKET.

Another member of a Fort firm largely interested in green tea—who did not want his name disclosed—threw some interesting light on the situation. "My opinion always has been," he said, "that, if the bonus is taken away entirely at the end of, say, June, a great many of the estates will go back to black tea, and we shall find that our green tea market—such as it is—is completely disorganised. You must remember that we have to deal with people—especially in Canada—who have an established business in Ceylon green tea now, and they want certain supplies. We shall find people go back to blacks—especially the low-country estates—and then there will be a dearth of green tea. Prices for green tea will go up. Prices for black will go down, and immediately upon this they will be eager to return to green tea. All this will mean complete disorganisation.

"Those black tea growers who are averse to the continuance of the bonus seem to forget this, that the good prices they obtain for their tea is undoubtedly due to the amount of green tea which has been made. Had it not been for green tea I am certain they would never have seen the recent prices for black tea. Again, the main reason for our small hold on the American and Canadian markets is the extremely high prices which are asked for Japan and China greens compared with the lower price for Ceylon greens. My opinion is that we have not sufficiently nursed Ceylon green tea in America. We have still to support it. It has not, in short, the ability to stand on its own legs; and a further bonus is required to save it."

### A BROKER'S OPINION.

Mr. W. E. Drury, of Messrs. Forbes & Walker, was asked by our representative for his views on the question of the green-tea bonus. He remarked "We are great believers," "in the green-tea bonus, and we think it must be very carefully dealt with. If it is taken off suddenly before the required time, very much of the good already done will be lost."

As to what was the required time Mr. Drury said: "It is quite impossible to tell. Only time will show. But I have no doubt if the bonus is taken off, a lot of green tea will be converted into black, to the detriment of black. Ceylon has to compete with Japan, and that is why there is always a danger. We contend that the bonus should be gradually reduced, and withdrawn with the very greatest care."

As to the statement that green tea would find a ready sale with the bonus removed. Mr. Drury said: "If, with the bonus on, our firm find the greatest difficulty just now in making green-tea contracts for next year, with the bonus off I don't know where we should be."

He further stated that we had cut Japan out by our lower prices. If the bonus were taken off he did not consider green tea would rise to the full extent of three cents, which would be necessary to place Ceylon green tea growers on the same footing as they were with the bonus. That would absolutely depend upon how trade developed.

### A LETTER FROM MR. WALTHER.

(To the Editor, *Times of Ceylon*.)

DEAR SIR,—There is little doubt that Mr. Forsythe's questions are all answerable in the affirmative, and that he has asked them so clearly, and made them so definite and lucid, that conviction goes with the answers. There are, however, other questions connected with the bonus on green teas.

Is 3 cents bonus enough to induce the manufacture of 10,000,000 lbs. of green teas, while the average of black tea is at, say, 37-8 cents?

With a prospect of 10,000,000 lbs. of green tea in 1904, will consuming markets pay 34 cents for low-country green tea as at present manufactured?

With the black tea average at 38 cents, do the gardens which Mr. Forsythe quotes, viz.

Ellakande	at 34 cents
Farnham	at 32 "
Vincit	at 33 "

secure, including the bonus, within 2 cents of what they would realise as black teas?

The agent for one of the best low-country greens that comes into this market told me to-day that it costs him 5 cents per lb. more money to manufacture green teas than it did blacks; that, inclusive of bonus, he realises 38 cents, while his black tea is worth over 40 cents to-day. The inducement, notwithstanding the bonus, to revert to blacks, is over 7 cents per lb. in his case. This is no doubt an extreme case, but it exposes the crux of the position, viz., will any reasonable bonus induce the manufacture of green tea while

Black, Ganapalla, sells at 38; and green, Farnham, at 32 cents.

Black, Glendon, sells at 39; and green, Ellakande, at 34 cents.

Black, Kelani, sells at 38; and green, Vincit, at 33 cents.

If the demand for green teas is sound, are they likely to go up in value if only Rs.150,000 are spent as a bonus. Are they likely to fall still further if twice or thrice that sum is promised?

When the bonus was 6 cents do we remember Ceylon green teas unsaleable at 25 cents?

How far was the encouragement of green tea irrespective of the appearance of the leaf responsible for that quotation?

Will an excess of bounty at 3 cents per lb. destroy its object, and by encouraging quantity, and not quality, of leaf send the price of green teas so low, that, notwithstanding bounty, the manufacture will partially go out?

These are questions, Sir, more theoretical than Mr. Forsythe's (his are absolutely hard-pan solid facts); but I think even these are worthy of consideration, and I hope they may elicit a few positive answers and advice worth following.—I am, etc.,

COLOMBO, November 26th.

H. WALTHER.

## DISTRICT ASSOCIATIONS

### INDIAN TEA ASSOCIATION.

#### GENERAL COMMITTEE MEETING.

The following is from an abstract of the proceedings of a Meeting of the General Committee, held on the 24th November:—

**Correspondence with the Indian Tea Association, London.**—Letters dated 30th October and 6th November, from the Secretary, Indian Tea Association, London, having been previously circulated, were brought up for final consideration and disposal. The principal subjects dealt with in the letters were:—

(1) *Advertising in America.*—In his letter dated 18th September, Mr. Tye had made certain remarks with regard to the necessity for extensive advertising in America. In a subsequent letter dated 16th October he had again referred to the question, and had forwarded copies of communications from two members of the London Committee respecting it. These papers had been submitted to the Indian Tea Cess Committee for consideration. In his letter dated 6th November, Mr. Tye remarked further on the question; and he suggested that, in order to facilitate business, the Cess Committee should communicate direct with the London Association instead of, as at present, through the Calcutta Association.

The General Committee had no objection to this proposed arrangement so far as they were concerned. But they thought that copies of all correspondence might be sent to them for information. They agreed to pass on the suggestion to the Cess Executive Committee for consideration.

(2) *Proposed Manufacture of Oolong Teas.*—In his letter dated 6th November, Mr. Tye mentioned that he had requested a firm of brokers to send to Calcutta a package (10 lbs.) of a good type of Formosa Oolong tea. This was in response to a request which had been made by the General Committee.

It appeared to the Committee, on further consideration, that a larger quantity than ten pounds would be necessary. They accordingly decided to ask Mr. Tye to forward a half-chest weighing about 40 lbs.

**The Sale of Tea Waste.**—The Committee had before them a file of correspondence with regard to this matter, which had been under consideration for some time. Judging by certain of the letters on the file there appeared to be a belief among Garden Managers in Cachar and Sylhet that the waste sold locally at the factories is really bought for consumption, and not—as the buyers profess—for chemical purposes. The principal reason for this assumption was that the prices obtainable locally are higher, to the extent of about Re.1 or Rs.2 per maund, than those given by European firms in Calcutta who export the waste to caffeine manufacturers.

The Committee had formerly issued a circular to Garden Agents recommending them to instruct their Managers to send all the waste to Calcutta for sale. This recommendation did not appear to be generally acted upon; and the question of again putting it forward was now considered. But it was agreed after discussion not to approach members on the subject at present. But the Garden Managers who had brought the matter to notice were to be asked if they could procure any specific evidence showing that the waste was sold for human consumption.

**Scientific Department.**—The Committee considered a letter of 23rd November from Mr. H. H. Mann, with reference to a suggestion, which had been made to him by the Kanan Devan Hills Produce Co., Ltd., that, on his return journey to Calcutta, he should visit the Kanan Devan Hills. The object of the visit would be presumably to make investigations in connection with the cultivation and manufacture of tea, particularly it was understood with regard to soils. Mr. Mann asked for the instructions of the Committee upon the point.

It was decided to inform Mr. Mann, in reply, that the Committee were not disposed to regard the proposal favourably; as they were of opinion that Mr. Mann's work in Northern India was sufficiently heavy to occupy his undivided attention.

**Average Prices of Indian Tea.**—In reply to a request made by the Director of Land Records and Agriculture, Assam, in a letter dated 10th November, the following average prices were to be submitted, viz.:—

Tea sold in Calcutta from 22nd May to 24th September, 1903.—Assam Valley Tea, 53,618 packages at 6s. 9p. per lb.; Surma Valley Tea, 123,118 packages at 5s. 2p. per lb.

Tea sold in London from 1st June to 25th September, 1903.—Assam Valley Tea, 99,344 packages at 9'33d. per lb.; Surma Valley Tea, 62,389 packages at 6'38d.

## MARKET REPORT.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 13th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ...	688,600	512,853	46,755
1902-1903 ...	703,461	578,710	37,948
42,890 pkgs. INDIAN 18,706 „ CEYLON ... „ JAVA	Total 61,596 packages were offered in public auction this week.		

Of the various Foreign and Colonial markets taking their tea direct from India, Russia appears to be making the chief progress; Australia, after a heavy set back last year, is again taking a little more, although not so much as two years ago, the total for all outside markets showing a fair increase from the 1st January, but less satisfactory if taken from the 1st April, especially when the increased output of Green Tea is considered.

*Direct Exports of Indian Tea (in lbs.) from Calcutta and Chittagong to places outside U. K. from 1st January to 30th September.*

	1903.	1902.	1901.	1900.

**Note.**—The tea shipped to Hong Kong is probably for North America, that to China for Russia, and that to Bombay for Persia.

The Bombay figures include teas sent from Calcutta by rail this year, and an estimate of lbs. 750,000 for last year.

## When you feel Limp and Languid,

When your head is dull and heavy, your tongue furred, your bowels costive, and you awake in the morning fagged and worn out, with no relish for breakfast and dreading your work, be sure your stomach and liver need help. Indigestion is poisoning your blood and sapping your strength. Mother Seigel's Syrup will cure you. It will purify your blood and restore vigour and tone to your system. Take it daily after meals.

# SEIGEL'S SYRUP

"I suffered for years from chronic indigestion and wind spasms," says Mrs. M. Moss, of 127, Quay Street, Ultimo, N.S.W. "After eating, I was tortured with terrible pains in the chest and beneath the shoulders. I lacked energy and was languid and weak, especially during the Summer. Four months ago I was induced to try Seigel's Syrup and when I had emptied only two bottles, all traces of indigestion had vanished."

**Will re-invigorate you.**

INDIAN.—This week's Indian sales were compressed into two days, and it may be partially on this account that there was hardly as much life in the market as a week ago, resulting in some slight irregularity in prices.

Quality from Assam, Darjeeling and Dooars is hardly up to what it was some few weeks since, while that from Cachar and Sylhet is perhaps a trifle better. Averages:—"Okayti T Co., 1/2½; "Brit. Darj. Co. Turbo," 1/2¼; "Tara T Co." 1/0¾; and "Gopaldhara," 1/0½.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 39,016 pkgs., av. 7·87d. 1902, 27,203 pkgs., av. 7·20d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 510,726 pkgs., av. 7·89d. 1902, 500,981 pkgs., av. 7·14d.

CEYLON.—The auction, although larger than last week, was again comparatively moderate, teas up to about 7d. sold well, bidding for the lowest grades being strong, but medium and better classes over 8d were not so well competed for, and occasionally made slightly easier prices. Averages:—"Carolina T Co. Goatfell," 1/4¼; "Balmoral Est. Clydesdale," 11d.; "Nuwara Eliya T Co. Concordia," 10¾d.; "St. Andrews," "S. T. & L. Brookside" and "Talawakelle Co. T.," 10½d.

Average for week 8·21d., against 7·68d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 879,536 pkgs., av. 7·51d. 1902, 1,000,137 pkgs., av. 6·74d.

JAVA.—No tea of this growth was brought to auction. 2,840 packages are catalogued for next week.

Bank Rate 4 per cent. Exchange on London three months' sight:—Calcutta 1/4½. Colombo 1/4½.

### COFFEE.

Increased firmness has been observable in this market, and the limited public sales have passed off with a livelier competition at

very full prices to an advance of 1s. per cwt., viz., 2,800 bags Columbian (partly of the new crop), low and ordinary at 26s. to 34s., good ordinary at 36s. to 40s. 6d., low middlings to good middlings, greenish, at 43s. to 59s. 6d., good and fine bright coloury at 68s. to 78s. 6d., and peaberry from 45s. to 56s. 6d.; also 1,100 bags new Granada on corresponding terms; 790 bags Guatemala, low at 28s. 6d., small to fine ordinary at 31s. to 42s. 6d., low middlings and middlings at 45s. to 50s., peaberry at 40s. to 52s. 6d.; 560 bags Mexican, ordinary and middling from 40s. to 57s., bold and peaberry at 71s. 6d. to 74s.; odd lots Ceylon Plantation at 100s. 6d. to 111s. for fair to good; 670 bags other East India at current rates; 2,290 bags Unwashed Dumont Santos, small and medium at 29s. to 35s., bold and peaberry at 36s. 6d. to 41s.; 1,230 bags Washed ditto, small at 30s. 6d. to 33s., medium at 34s. 6d. to 40s. 6d., bold at 41s. to 48s. 6d., and peaberry from 37s. 6d. to 52s. 6d., with a few medium Maragogipe at 63s. and superior bold at 101s. 6d. to 104s. per cwt. The market for Futures has not been without some speculative excitement this week, and quotations have been raised 6d. to 9d. per cwt., good Santos deliverable between now and September next having been taken at 30s. to 33s., though the extreme prices have not been maintained to the close. The deliveries of the Dutch Company's Java Coffee in Holland during October were of good extent, comprising 11,300 bags, against 7,510 bags in 1902 and 11,480 bags in 1901, thus giving a total for the past ten months of 133,600 bags, as contrasted with 98,100 bags, and 109,300 bags in the two previous years.

### TEA.

Messrs. Wm. Jas. & Hy. Thompson, in their report, November 12, say: That in order to continue the low-priced canister the distributing trade have for some time past been obliged to a certain extent to alter their methods is apparent from the figures published by the Board of Trade, which show that owing to the higher rates

ruling for common Indians and Ceylons, China Tea has been substituted for Ceylon to the extent of 3,000,000 lbs. during the ten months of this year and an excess of 5,000,000 over the amount used in 1901—the Indian figures being almost stationary. Both supply and demand for these are limited, and business is difficult to transact, while the Calcutta and Colombo markets are reported lower in rates with a less active inquiry—but with the probability of smaller supplies in the future, some recovery in values may be anticipated. The sales have comprised 42,900 packages, against 34,600 packages last year, the total auctions of this season's tea to date thus amounting to 559,000 packages, against 594,600 packages a year ago. Owing to the Lord Mayor's Show passing down Mincing Lane on Monday, the auctions were confined to two days only—Wednesday and Thursday. The sales opened briskly yesterday, common tea particularly being in demand at fully late rates, whilst good Broken Pekoes from 1s. upwards, helped by a fair number of country orders, realised satisfactory prices and were rather dearer than last sales. The only weakness noticeable was in ordinary medium leaf grades from 7d. to 9d. per lb., which occasionally showed some irregularity. Any teas of a stand-out character were well appreciated, an average of 1s. 6½d. for an invoice of British Darjeeling Company's Turbo Estate being worthy of mention. Prices at to-day's sale have hardly been maintained, the knowledge that the increase in the Indian crop will be a substantial one necessarily inducing buyers to act with caution, and the market closes a little easier in tone. For next week the offerings are comparatively small, only about 38,000 packages so far being printed. The auctions in Calcutta last Friday totalled 20,000 packages, which sold at an average of 5a. 11p. per lb. The market ruled firm, with an upward tendency for medium and better kinds, due perhaps to some slight improvement in quality. Cables have been received placing the probable export from Calcutta and Chittagong for the season at about 163,000,000 lbs.

Messrs. Lloyd, Matheson, and Carritt, in their report, November 12, say: In consequence of the Lord Mayor's Show passing through Mincing Lane the usual Monday's auctions were postponed till Wednesday. Business commenced with a stronger demand for the

commoner descriptions up to about 6½d.; fine tippy Broken Pekoes were also in request and sold at full rates. Medium Assam Pekoes occasionally marked irregularities, and when the liquors were without much point prices sometimes favoured buyers to the extent of ½d. to ¾d. per lb. The second day's auctions met with rather less inquiry, and a slightly easier tone prevailed, especially for the commoner kinds. Quality generally showed no change. The Board of Trade write us under date of 7th instant, stating, as a result of further inquiries, that the duties now being levied on tea entering Persia are 1 toman per batman on "White" Tea, and 6 krans per batman on all teas; these figures are equivalent to about 7d. per lb. and 4½d. per lb. respectively. There is evidently some confusion in reference to the tariff, as we are informed by friends largely interested in trade to the Persian Gulf that they are actually paying duty on the scale embodied in the new Treaty as issued by the Foreign Office (this is nearly double the amount), and as a result the tea trade to Persian ports has, they affirm, declined to a mere fraction of what it was last year, although, in our opinion, the high price ruling at present for common teas would be likely to also have some effect in restricting exports to those quarters. The explanation of the apparent discrepancy between the Foreign Office figures and the Board of Trade figures is that the Foreign Office give the maximum amount Persia is allowed to levy under the Treaty, while the Board of Trade give the duties which the Persian Customs say they are levying under the Persian Customs Tariff; the difference is so important and the possible effect on shipments to Persia so deterrent that we are making further inquiries in order, if possible, to elucidate the matter, and we also commend it to the attention of the Indian tea-planting industry.

#### CINCHONA.

At the auctions of cinchona held at Amsterdam on November 12 8,206 packages were offered, weighing 702,329 kilos. and containing 31,879 kilos. quinine sulphate. Of the above quantity 7,802 packages were sold at an average unit of 7'45c. per half-kilo., as against 7'45c. paid at the auction on October 8. The approximate

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

#### CURES

**RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,**

And all Aches and Pains usually treated by outward application.

**IT HAS NO EQUAL ON EARTH AS A PAIN  
RELIEVER.**

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being prescribed by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

quantities of quinine purchased by the principal buyers were as follows:—The English and American factories, 10,203 kilos.; the Brunswick factory, 6,031 kilos.; the Mannheim and Amsterdam factories, 5,588 kilos.; the Frankfort-on-Main and Stuttgart factories, 3,734 kilos.; and various buyers, 5,303 kilos. The prices paid for the manufacturing bark ranged from 4 $\frac{3}{4}$ c. to 77 $\frac{3}{4}$ c. per half-kilo., and for druggists' bark from 6 $\frac{1}{2}$ c. to 59 $\frac{1}{4}$ c. per half-kilo.

### QUININE.

The second-hand market for German sulphate has been steady, with a small business, chiefly in December delivery, at 1s. 0 $\frac{1}{2}$ d. to 1s. 0 $\frac{3}{4}$ d., and March at 1s. 0 $\frac{3}{4}$ d. per oz. To-day's market is quiet, buyers waiting result of the Amsterdam auctions. Latest: 20,000 oz. sold at 1s. 0 $\frac{1}{2}$ d. for December.

### CARDAMOMS.

The tone was flat and prices, although irregular, showed a still easier tendency, although it must be said the quality was mostly common. Ceylon-Mysore, medium and bold dullish, sold at 1s. 8d.; bold medium pale, 1s. 3d. to 1s. 4d.; small and medium dullish, 10d.; small palish, 9d. to 9 $\frac{1}{2}$ d.; peas, 8d.; small lean brown, 8d.; brown and split, 7d.; bold yellowish pale, 1s. 10d.; good medium yellowish pale, 1s. 4d.; medium ditto, 1s. to 1s. 1d. Good bold round pale fruit, slightly open, was limited at 2s. 4d., and a bid of 2s. 1d. was refused. *Splits*: Good medium pale, 10d. to 11 $\frac{1}{2}$ d.; medium pale, 9 $\frac{1}{2}$ d.; small pale, 8 $\frac{1}{2}$ d. to 9d.; native wild Ceylon lean pickings, 3d. Ceylon-Malabar dull lean brown, 8 $\frac{1}{2}$ d.; and small unclipped ditto, 8 $\frac{1}{2}$ d. *Seed* was steady at 1s. to 1s. 1d. per lb.

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 18th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*December 9th.—Weather—*The weather has cleared at last just in time, or there would have been no crop again next year. *Crop* commencing will be a low average one. *Crop prospects* for next year very doubtful if there will be much. *Health—Good. Labour—Short. Interesting item—*A good paddy crop.

### COFFEE IN COLOMBIA.

MANY of our readers will study with interest the instructive consular report which we reprint to-day. It is a report on the present state of the Coffee Trade in Colombia, and has been compiled by Mr. Vice-Consul SPENCER S. DICKSON. Colombian Coffee may be regarded by some as a not very formidable rival to East Indian. Others, who watch London market reports closely, and all who wish to see Indian Coffee recognised and sold generally in the great markets of the United States, will probably realise that the report under notice is one that demands attention. There are in it very interesting points. For instance, the temperature regarded in Colombia as suitable for coffee cultivation ranges from 59° to 77° Fahr. The quality of the crop, it is remarked, does not necessarily depend on the temperature of the district. It depends also on the land and the method of cultivation. Truisms these. But it is remarked further that in the hotter districts the bean is larger. A nice question is suggested, whether this is the result of climatic influences alone? For in these hotter districts shade is employed, and the coffee is pruned carefully; whereas in the colder climate it is said to require less care. At any rate, it receives it, "planters are not generally careful about pruning,

and the quality is, as a rule, sacrificed to the quantity." The very next sentence appears to contradict one inference that might appear to be suggested by the above words, as it is stated that in small and well cultivated plantations the yield per tree is about 1 lb. annually, while in large and less cared for plantations the yield is about half that quantity! This does not suggest that in the latter case quality is sacrificed to quantity; but it would be instructive to have a precise definition of the term "well cultivated." Does it apply to the use of fertilizers, or to pruning, or to both? Whatever the reply to this, one point deserves special notice: there is no standard distance between tree and tree, when planting operations are conducted; the distance depends upon the land, and a careful study of the place chosen is made before a decision is arrived at as to how close together the trees should be planted. In this respect many planters in India might take a lesson from Colombia.

It must be stated, however, that the report before us should not be too readily accepted as literally correct at all points. For example, it is remarked that Colombia Coffee will lose favour with London buyers because some of that which is being exported now is three years old. This reflects the opinion that new coffee is superior to old; but perhaps the words are intended to be read in immediate connection with the reference, that follows, to the mere scientific cultivation that is obtaining in Brazil every year. Besides this, some explanation is offered towards the close of the report. It is interesting to note further that coffee that is sun-dried in the cherry and afterwards cleaned is the lowest class. Better is the coffee that has been pulped and then cleaned by machinery. Best of all is the "parchment" coffee (*café en pergamino*). Some useful particulars of cleaning processes are given; but very little light is thrown on the important question of the cost of labour and the average wages paid. The king of shade trees in Colombia is our old friend, the "Jak." And as regards cost of production this centre would appear to be well placed for rivalry with Brazil. It fails, however, in the matter of cost of transport. To produce coffee at 14s. per cwt. and only to be able to place it in the New York market at 28s. is hard luck indeed; but possibly when the Panama Canal is completed, and when communications in Colombia between "up-country" and the coast have been improved, a great

change will be made in the latter of these figures. At any rate, the cost of production on the estate is low.

Now in former days, some six years ago, Colombia Coffee was carefully sun-dried, yet to-day the sun-dried description occupies the lowest class. Further information on this point would be very welcome. Before the revolution over-production had wrought havoc, and the want of adequate labour was felt. The war gave the final blow to the enthusiasm for coffee-planting, and intensified the acuteness of the labour problem. The remarks bearing upon the Exchange question through the medium of depreciated paper currency are not without significance; but the troubles of the coffee-planter in Colombia appear to have arisen mainly from an excess of zeal in the matter of opening up new land and an increasing deficiency of labour. It is not quite clear whether coffee can be produced on the estate at a cost of 2d. per lb. under present conditions. From want of labour, it is said, the plantations are losing half their coffee. If, after this has been allowed for, the cost can be reduced to anything like 14s. per cwt. the potentialities of Coffee in Colombia have yet to be gauged. We have referred specially to only a few points in the report, not with the object of criticising it, but in the hope of drawing attention to the report itself. There is much in it that should appeal to planters in this country, even though there is also a good deal that may be said not to go beyond giving a zest to further inquiry as to the details of coffee cultivation, curing, etc., in Colombia, and the actual position of the labour, transport and exchange problems, whose influence upon cost of production and the price at which coffee can be exported at a profit must not be underrated.

### THE BOARD OF TRADE RETURNS.

OCTOBER 1903.

**Cocoa (raw).**—Only light importations took place into the United Kingdom during October, and with fair deliveries the stock in bond sank below that in 1902.

In the first ten months.		1903.	1902.	1901.
Imports ...	lbs.	43,132,849	48,627,840	46,356,870
Home consumption ..	"	33,969,924	38,779,895	36,038,992
Exports ...	"	10,031,960	11,666,562	9,774,242
Stocks in bond ...	"	9,602,000	10,382,000	16,811,000
Value of imports ...	...	£1,211,167	£1,412,890	£1,388,666
Do. exports ...	...	293,977	326,586	301,347

**Cocoa (prepared).**—The expanded totals, previously noticed, are well maintained, and the bonded stock is rather small.

In the first ten months.		1903.	1902.	1901.
Imports ...	lbs.	8,616,796	7,129,388	6,980,324
Home consumption...	"	8,154,966	6,624,353	6,414,276
Exports ...	"	388,292	590,973	699,516
Stocks in bond ...	"	122,000	143,000	199,000
Value of imports ...	...	£854,316	£734,287	£719,955
Do. exports ...	...	45,341	63,669	75,998

**Coffee.**—Although the quantity exported in October was nearly double the amount landed, the stock of coffee on the 31st ultimo remained very excessive.

In the first ten months.		1903	1902.	1901.
Imports ...	cwts.	1,041,729	838,811	868,164
Home consumption.	"	229,421	252,782	279,669
Exports ...	"	598,201	306,378	605,832
Stocks in bond ...	"	738,000	512,000	271,000
Value of imports ...	...	£2,908,978	£2,431,376	£2,783,411
Do. exports ...	...	1,493,231	893,725	1,754,489

**Chicory.**—The movements here have been much contracted, and the stock is only half an average one.

In the first ten months.		1903.	1902.	1901.
Imports ...	cwts.	69,970	84,275	85,442
Home consumption.	"	62,311	70,941	68,613

### U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

### COFFEE TRADE OF COLOMBIA.

Mr. Vice-Consul Spencer S. Dickson, reporting on the present state of the Coffee Trade in Colombia, says:—

Coffee can be grown in almost all parts of the country where the climate is suitable, *i.e.*, where the temperature varies from about 59 to 77 Fahr. The principal districts

where the cultivation of coffee is carried on are the departments of Cundinamarca generally, which produces the famous Bogotá coffee; in the department of Santander, the district around Ocaña, Cúcuta and Bucaramanga; and in the Tolima. The lowlands of the Tolima, on either side of the River Magdalena, form the grazing lands. East and west of these, at considerably varying distances, rise the Cordilleras, and it is in the small valleys of the Cordilleras where the coffee is grown. There are three different classes of coffee, *e.g.* :—

1. Dried in the sun while in the cherry and afterwards cleaned. This is called “café trillado,” and is the class of lowest price.
2. The cherry or pulp is washed off the bean, which is afterwards dried and cleaned by machinery. This is called “café lavado,” and obtains a good price.
3. The pulp is washed off and the bean is dried and exported without cleaning the husk off. This is called “café en pergamino,” and is the class which fetches the highest price.

As stated above, the temperature may vary between 59 and 77 Fahr. ; but the quality of the coffee does not necessarily depend on the temperature of the district. It depends also on the land and the method of cultivation. In the hotter climate, of course I speak of first-class land, the bean is larger, but with shade trees properly planted, the coffee pruned satisfactorily and the land appropriate, any quality of coffee can be produced. In the colder climate coffee requires less care and it produces a smaller bean; planters are not generally careful about pruning, and the quality is, as a rule, sacrificed for the quantity.

A tree from four to eight years old will yield, in small and well cultivated plantations, about 1 lb. annually; in large and less cared for plantations the yield is about half that amount. I am told that in the department of Santander the yearly production is as follows :—

District.			Quantity.
			Bags.
Cúcuta	...	...	100,000
Bucaramanga	...	...	120,000
Ocaña	...	...	50,000*

Of all the coffee produced annually, it is said that only about 25,000 bags remain in the country. The best coffee is almost always exported and the damaged beans, in coffee plantations, are set apart and sold locally. By damaged beans are meant the perfectly good beans, which have been torn by the machinery and otherwise damaged in handling. The bad coffee floats to the top during the process of washing. It is skimmed off and thrown on the plantations as a fertilizer.

The following are the average Colombian prices :—

		Average Price.	
		Currency.	Sterling.
		Cents.	d.
Ocaña coffee	...	7	3½
Cúcuta do.	...	8	4
Bucaramanga coffee	...	9	4½
Fusagasuga do.	...	10 +	5
La Palma do.	...	11 +	5½
Tolima do.	...	10	5

This is, however, a point better known by buyers in London. Owing to the revolution, exportation has, till lately, been impossible. Colombian coffee will, therefore, lose favour as some of that which is being exported now is three years old.

On the other hand, I am told that Brazilian coffee is gaining ground and the Brazilians are cultivating more scientifically every year.

CULTIVATION OF COFFEE.

1. **Planting.**—After cleaning the ground, the planting is done with a line, the distances agreed on and marked off with pieces of tape, or the planter takes a rod as a measure and plants every rod length along the line. The trees for planting are pulled by hand from the nurseries and sown at the beginning of the rainy season. The distance depends on the land, and a careful study of the place chosen is made before deciding how close together the coffee trees should be planted.

2. **Manuring.**—The cherry or outer skin of the coffee, with its saccharine matter, is a first-class manure and is generally used for that purpose.

3. **Shade trees.**—With regard to the question as to the best shade trees for coffee plantations, the one most used in Colombia is the Guamo of the Inga genera. There are, however, many different variations of this species, and the only one approved by coffee-planters is the one known as Guamo, “rabo de mico,” so called from the resemblance of the pulp, which contains the seed, to a monkey’s tail. This tree owes its widespread popularity to its adaptability as regards both elevation and climate.

The king of shade tree is, however, the *Artocarpus integrifolia*, native of Ceylon, and commonly known as the “Jack tree.” The reason why it is not used in the interior of Colombia is that this plant is too delicate to stand the long journey.

4. **Picking.**—Picking is done by women and children and is paid by weight. The rate of wages before the war was from 20 to 50c. paper (1½d. to 4d.) per arroba (25 lbs.). This has now risen to 1dol. 60c. Generally the pickers are given their food free. 5 to 6 lbs. of coffee weighed and received from the pickers only give 1 lb. after having been prepared and dried.

MACHINERY.

The motor with Pelton wheel has been very successful and popular for the working of coffee plantations, owing to the many falls of water existing in the mountainous regions of the country. Turbines exist in many establishments, but there is small demand for them. Plantations without water power near the site occupied by the houses or buildings need a steam motor. I have heard of no case of Pelton motors or turbines being placed at the waterfalls for the purpose of giving electrical power to the plantations.

Machinery for coffee must be easily portable on mule back. This is one of the reasons for the success of the Pelton motor. Machinery should make a mule cargo not exceeding 70 kilos. (154 lbs.) in weight.

Before the war, at Titirití, in the department of Antioquia, there was a factory of pulpers of two jets of water, which have given good results for small plantations. These machines are made of wood with some iron pieces. The copper plate which covers the sieve is imported, as they cannot be made in the country.

The usual process gone through in Colombia is as follows :—The pulper receives the fresh coffee, removes the cherry with its sugary matter, and throws the outer skin below into a small ditch of water, whence it is drained off. The berry then falls into a trough, which has three divisions. There

\* About.

† Cundinamarca.

2

it remains until it has fermented a little. The bad coffee is skimmed off by filling the trough with water, on which it floats. This process is gone through in the second division of the trough, the first division being used to receive the coffee direct from the pulper. The third division is immediately over the washer and has a mouth emptying into it. The next day the coffee is washed by a few turns of the washing machine, and is then put on shallow trays in the sun for the water to run off; it is next either dried in the sun or goes up into the stove by elevator or by hand. The husking, peeling and sorting is carried out very cheaply in London by machinery, but in some plantations sorting is done by hand. One plantation I know of had a water wheel, pulper, washer, elevator, fan, and the necessary shafting and belting. The fan sucked the damp air out of the stove and the elevator was used for the purpose of hoisting the coffee to the top of the stove.

#### THE ECONOMIC QUESTION.

With the exception of the few coffee estates near the Magdalena River, the general opinion which I have been able to elicit is that it is not a paying business to grow coffee in Colombia with the price below 8c. (4d.) per lb. in New York. The cost of production on the estates cannot be reduced to less than 4c. (2d.) and, owing to the poor means of transport to the coast, it costs about 4c. per lb. to put it in New York, including seller's commission, etc.

**Credits.**—Before the war large credits were given to coffee-growers to enable them to harvest the crop. Most estate holders, through the fall in the price of coffee and carelessness in superintending the working of their plantations, fell very much behindhand in payments. At present I believe foreign houses are wisely limiting themselves to giving facilities for transporting the coffee which is already prepared for export.

#### CONCLUSION.

A review of the coffee trade shows that, about six years ago, Colombian coffee was produced in big plantations, with good machinery and was stove-dried. The coffee which was carefully sun-dried was also much sort after, for Colombian coffee had a good reputation and, the supply being limited, the price went up. This resulted in an over-planting of coffee all over the country. It was thought that this would replace the quina industry. Money was advanced and credits were given to many who were desirous of enlarging their plantations, and the coffee was very often sold before it was produced. The limited amount of labour available was not sufficiently taken into account. It is true that coffee is easy to plant and hardy, but it requires three years of care and expense before any result is obtained. Labourers were eagerly sought after, and with competing prices they rushed from one plantation to another. About the second year coffee began to be a source of anxiety to the intelligent classes. They saw that it was easy enough to plant, but quite another thing to keep up the numerous new plantations which were brought into existence until they were in a condition to yield some return. The result has been that a large number of coffee plantations have been abandoned, in whole or in part, because the available capital estimated for three years' expenses was all spent in the first year, owing to the unforeseen rise in wages caused by the rush. This was the condition of the coffee industry when the revolution broke out in October, 1899.

The war gave the final blow to the enthusiasm for coffee-planting, for it ruined even those comparatively few plantations which had survived the critical stages just referred to. During the first months of the war work continued in an intermittent way, but, as the disorder spread, the employment of male labour became impossible. I am told, and the statement whether true or not is given a wide credence, that even the employment of female labour was rendered difficult. The condition of affairs, bad as it was before the trouble began, is considerably worse now. Labour was then scarce, but from that limited amount must now be deducted the considerable number of labourers who perished through fighting and disease.

In connection with this industry, one important factor must not be forgotten, *viz.*, the unlimited issue of paper money. At first the depreciation worked favourably for coffee exporters, because prices went gradually up, their expenses were in depreciated paper and their gain in gold. But this financial chaos has ultimately resulted to everyone's disadvantage. The price of transport has, like everything else, become exorbitant and, at the same time, the price of coffee in the markets of the United States and Europe is steadily going down.

To-day the coffee plantations are, from the want of labour, losing half their coffee. Only those who have the best machinery can pretend to do a profitable business. The greater part of the produce of the last three years is still stored in the riverports, as there are no adequate means of despatching it. The coffee which has been kept on the estates themselves, in rooms which were never intended to hold three years' produce, has greatly deteriorated and may tend to lower the market price of Colombian coffee. Formerly, the cost of export was one-third of the net value in London. This has, to a large extent increased, owing to excessive charges, both of transport and of storage. There is a large amount at present waiting its turn on the river, and some considerable time will still elapse before this can be moved and the traffic once more become normal.

Statistical Tables showing the Total Export of Coffee from the different Custom-Houses of Colombia during the years 1894—98:—

#### (1) ACCORDING TO CUSTOM-HOUSES.

Custom-House.	Quantity. Kilos.	Value. Dollars.
Barranquilla ...	72,704,023	24,909,722
Cartagena ...	14,378,824	6,875,350
Buenaventura ...	5,165,896	2,187,473
Tumaco ...	570,712	230,554
Ipiates ...	2,575	443
Riohacha ...	1,000,249	326,534
Cúcuta ...	72,032,915	20,675,553
Meta ...	273,878	16,165
Total ...	166,129,072	55,221,794

#### (2) ACCORDING TO YEARS.

Year.	Quantity. Kilos.	Value. Dollars.
1894 ...	27,981,449	9,979,527
1895 ...	28,850,652	10,972,239
1896 ...	37,630,408	13,222,634
1897 ...	34,001,341	11,030,439
1898 ...	37,665,222	10,016,955
Total ...	166,129,072	55,221,794

*Note.*—For Buenaventura, eight months of 1894 are missing; and, for 1895 the value of 302,351 kilos. are missing. With regard to the Meta, in 1897 there are only data from January, February and September to December; in 1898 from April to July.

Values are in United States gold: 5 dol. = 1£.

## COFFEE NOTES.

**August Flowering of Brazil Coffee.**—"O Café," of Santos, says the following of the August flowering in the Santos district :—

"The August flowering was retarded in many localities by the drouth. Toward the end of that month slight rain fell in several districts, and the flowering was poor and unequal in consequence. In the first week of September rain was general all over the State, and came just in time to prevent serious damage to the coming crop. In many districts the flowering is very backward, in others, Cravinhos, for example, the trees are only just blossoming, and even if conditions continue favourable in September and October, there is every likelihood of the coming 1904-5 crop being a late one."

A letter in the *Brazilian Review* (September 15) dated from Santos, September 12, says :—

"The flowering, which really should have come out in August, but was retarded by the drouth, is a very good one in some districts, but from some parts the reports are less favourable. It is, of course, too early yet to say anything about the future crop."

What is regarded as a matter of considerable importance in Brazil is the emigration of Italians from that country, showing that the coffee crop of 1902-3 is more or less finished. Five steamships are said to have taken away 3,000 Italians in September.

The Legislature of Minas has authorized the Governor to raise the export duty 20 per cent. on coffees of lower grade than No. 8, New York type, and to create a new tax of 100\$000 per hectare on all new plantations. Differential duties are also to be charged on coffee shipped in jute as compared with that in home-grown cotton bags.

"O Café," of September 20, says :—"Harvesting is almost over, even in more tardy districts. The trees are now all in flower, but for three months it will be impossible to tell how it will turn out. From S. José do Rio Pardo the current crop is reported as all harvested and very disappointing."

Talleyrand's receipt for coffee : Pure as an angel, sweet as love, black as the devil, and hot as hell.

Talk about "dry roasted coffee," "plantation to cup" arguments, etc. ! says the *Spice Mill*. Here comes Thomas Barrow, coffee roaster and spice grinder at Shrewsbury, Quebec, with a brand new catch phrase. Mr. Barrow advertises : "Our coffee is absolutely free from sulphur, as it is roasted with pure maple charcoal made on our own estate." This ought to suggest a new line of thought to the average food commissioner. Has it ever occurred to any of these gentry before that the coffee as it is roasted ordinarily with anthracite coal is likely to absorb injurious, sulphurous ingredients from the coal ? This is a serious matter, and one which should be looked into with much prayerful consideration. If the only safeguard is the roasting of coffee with "pure maple charcoal," why not require that every coffee roaster should desist from longer using the poisonous anthracite or the sulphurous gas as the case may be ?

**An American Report.**—There is nothing meek or lowly or merciful or even what is least kindly in the Brazilian

coffee-growers, who lately have been protesting and supplicating the sympathy of the world in their coffee "crisis," which they brought down upon their heads by producing too much. Besides their own, they have made other coffee fields practically unprofitable, among these being those of the Indian growers, who have sought to save themselves, if possible, by sending a delegate to Brazil to spy out how the Brazilians manage to grow so much coffee, and if it is worth while at all to continue coffee-growing. Voicing, we presume, the sentiments of the Brazil growers, the *Brazilian Review* greets the delegate in these words : "The report on the proceedings of the Southern India Association of planters is interesting and significant. If our planters are in a bad way, others are still worse, and we have only to persist in order to drive them and every competitor from the field and have it all to ourselves. It is evident that matters must be very serious when British planters in India, who come of a stock not easy to beat, are inclined to give up the struggle and send out agents to determine whether it is any good to continue to struggle against the inevitable." This is cruel and significant, to use the term employed by the *Review*. He or the nation that would be saved needs no other warning. Brazil can, with ease, drive all competitors from the field ; she says she will, and we are inclined to the belief that it will happen.

Messrs. Salles, Toledo & Co., Queiros, Barros & Co., and Telles, Quirino and Nogueira by cable from Brazil estimate the next Santos crop from 4,000,000 to 5,000,000.

Messrs. John Moore & Co., Rio, cable : "Drouth has done damage to growing coffee crop, but cannot say extent."

Messrs. Padro, Chaves & Co., Santos, cable : "Prospects of next crop becoming less favourable ; drouth has done considerable damage."

Cable advices from Rio say that the *Brazilian Review* of October 27 reports that Mr. Duuring returned from the interior and says that there is very little coffee remaining in the interior.

Three prominent commissarios in Brazil have cabled Europe estimating the yield of the next Santos crop at 4,000,000 to 5,000,000 bags.

**Coffee in London.**—A dull and heavy atmosphere has been hanging around Mincing Lane markets generally this week, says the *London Commercial Record* of 20th ultimo, marking an unpleasant change from the recent and almost universal activity. Even a market like Coffee, surrounded as it is by a favourable bull position, has become quiet in all its branches. Evidently the advices from Havre have not been very encouraging lately, and the tone ruling in that Coffee centre has affected us. Statistically, as far as can be ascertained, there is no change which could bring about a reaction, we may therefore look for a renewal of the recent good markets, and it is to be hoped that such an improvement will extend in a marked degree to actual Coffee. Although much better, yet the demand for spot Coffee has not been as keen and thorough as holders would like to see ; there has been a half-hearted desire to acquire some spot lots and higher prices have been granted, but the buying has not been general. Strange to say, no interest is evinced so far in the new crops of fine East Indian Plantation sorts. Is it that we are still holding too much of them, or is it that we cannot get to reasonable terms with the Indian planters ? What-

ever the reason may be, the fact remains that with a few exceptional cases not a bag of East Indian has been sold on c.i.f. terms in our market. It seems impossible to bridge over the difference in the idea of values—about 5 per cent.—entertained by producers and consumers. With everything in their favour as far as statistical position of Coffee goes, the planters in the South of India are hardly likely to reduce their prices to an appreciable extent, they will rather, we feel sure, run the risk of the market and consign to London later. By that time probably the affairs in Brazil will have made itself felt in European markets and prices will be conceded which our consumers now scoff at. Every year there has been a struggle between planters and European dealers about the range of prices at which the new season had to be opened, and in many instances the former have had to give way to the strength of buyers, backed up by heavy stocks and enormous Brazilian crops, but it is different this year, for not only are stocks and Brazilian crops small, but the East Indian yield also promises a falling off. It is estimated that Nilgiris will produce about 60% and Coorg about 70% of last year's total, and what is also of great importance, the quality will be considerably improved. Last year, as we all know, the crop was seriously spoilt by rain—not so this season. An opportunity has evidently come to the hard-pressed planter at last, and he will not be slow in availing himself of it. Our consumers and planters, who make a speciality of these fine coffees, ought not to lose sight of this, but buy as long as they can do so at a comparatively low figure. 52s. c.i.f. was asked for a good Salem and 53s. c.i.f. for a good Nilgiri crop, which met with no response worthy of the name. When Continental exchanges are tightening again, no doubt our dealers will gather more courage, and we may hope for the opening of the season.

\* \* \*

**New Orleans Coffee Trading.**—Trading in coffee futures on the New Orleans Board of Trade commenced November 2 and the opening was as successful as could be anticipated, considering the fact that the venture was entirely new. One thousand bags of coffee were sold at the first call, and quotations were had on almost all the months. At the second call 750 bags were sold, making altogether 1,750 bags. More than 200 men interested in the coffee trade were present, and great interest was shown by all. The bidding was lively and the local market showed a healthy tone from the start. Seven sales were made at calls and several bids were made thereafter.

\* \* \*

**Nicaragua Coffee Damaged.**—The volcano of Santiago, in Nicaragua has been in eruption, and the consequent fall of ashes has damaged a considerable number of coffee plantations in the neighbourhood of Masaya and Masatope. It is said the coffee crops will be very small in other departments.

\* \* \*

**A Bear Note Which Pipes Weakly.**—Following is a market statement inspired by a prominent coffee house in the United States, leader as a bear for some years, and now thought to have become a bull. The tone indicates the shift:

"The increased activity in the coffee markets, both for futures and actual merchandise, indicates a more general belief in information now so freely circulated about a smaller outturn of the present Brazil crop than was thought possible some months ago. Receipts have not yet fallen off perpendicularly as predicted to coincide with the reduced estimates, but while the movement

should soon be smaller in a natural way, receipts must fall off sharply in the near future, if the total is to be 11,000,000 instead of previous figures of 13,000,000 bags. Explanations are being sought that will account for the change in figures. While it is quite likely that the crisis of over-production and low prices wrought some influence, and farmers have been turning attention to raising other products for their own uses, climatic conditions have played some part, the full effect of this not being known, or probably will not be revealed until the prospects of the now growing crop can be definitely determined."

\* \* \*

**Santos Coffee Market.**—The market letter in the *Brazilian Review*, from Santos, October 2, contains the following:—

"For the past fortnight our market has gone up steadily and exporters were able to do a profitable business. Commissarios were ready sellers at higher rates. The prospects for the new crop have taken a less favourable turn. The second large flowering has come out, but the continued heavy drouth here caused serious damage. The flowers were burned by the sun, and have, to a large extent, turned brown.

"As regards the present crop, it is remarkable that receipts have not fallen off as yet to a larger extent, but the next fortnight should be decisive. It is generally expected that the drop in receipts will be surprisingly sudden. The principal movement is still in primes and superiors. Good average has been dealt in this year to only a small extent. Regulars and lower grades are slack; peaberries are in strong demand and fetch fancy prices; lower grades of peaberry scarce but in good demand; Old Yellows and Washed slow.

"The S. Paulo Railway will, from October 1, reduce tariff for coffee between Santos and Jundiacy 10 per cent.

"The Journal says that we may shortly expect the visit of a certain viscomte, who claims to have formed a syndicate in Paris to buy coffee, but is classed by the police of Paris with Adolpho Coelho and similar knights of industry!

"A Evolucao, of Casa Branca (S. Paulo), says that 'there was a beautiful flowering after the rain, but that the dry weather that succeeded is seriously injuring the tender coffee beans'."

\* \* \*

**The U. S. Coffee Market.**—The coffee market is unsettled with prices in options subject to fluctuation, but steady and advanced a fraction in actual. It is eminently a speculators' market. These naturally like an unsettled state of affairs as permitting profitable and active trading, and they are bringing it about. It is a safe prediction that they will hold sway for some time to come unless there should be a sudden change in other financial activities, making trading other than in coffee more attractive. This seems scarcely probable in the immediate future. The orders have been to sell and buy, and they have been heavy. No inconsiderable profits have been realized by those who undertook transactions when coffee looked and was cheap.

A bull point was the world's visible supply on November 1, which unexpectedly fell short of 14,000,000 pounds. The deliveries in Europe in the month of October proved unusually heavy, and this saved the extra high record. The receipts have been smaller in Brazil, according with the predictions freely sent in. Brazil is not inclined to press its coffee for sale, and consequently its market as a rule has been above parity here. At the close firm offers received included Rio No. 7 at 6c. c. and f., and Rio No. 5, same terms, at 6½c. Owing to the weaker optional markets, the spot invoice market closed a trifle easier, quotations being 5½c. for Rio No. 8, 6½c. for Rio No. 7, 7½c. for Rio No. 4, and 7½ to 7¾c. for Santos No. 4. The consuming trade feels deterred from buying on the advancing prices and so jobbing is limited.

Mild coffee is firm with more movement. The stocks of buyers having run somewhat low, owing to buyers' abstention from entering the market in recent weeks, because of the lack of attractive prices, they have been compelled to come in and have made considerable purchases at the prices asked. Good Cucuta closed 8¾. to 8½c. East India coffees are steady.

Sales during the last week were 183,000 bags.

Stocks in Havre 3,449,000 bags, of which 2,803,000 bags are Brazilian.

Total stock in United States November 1, 2,491,208 bags against 2,594,941 bags November 1, 1902. Brazil stock in the United States November 7, in store and afloat, 2,639,389 bags against

2,728,411 bags at the same time last year. Other than Brazilian, 354,093 bags, against 232,308 bags last year.  
Brazil coffee in New York November 7, 2,014,566 bags. Stock in other coffees, November 1, 314,420; in San Francisco, 34,722 bags and in New Orleans, 4,951 bags. Visible supply in the world of all coffees, November 1, 13,918,131 bags.

**U. S. Coffee Market Review.**—Messrs. Henry Nordlinger & Co. review the coffee market as follows: Our last report was dated October 7. The receipts at Rio and Santos during last month exceeded earlier expectations by about 200,000 bags. This increased movement to ports did not deter speculators from continuing their purchases on a big scale. They argued: "The more comes into sight now, the less will come forward later on." They claim that the present crop will not be more than 11,000,000 bags; some talk even of 10,000,000 to 10,500,000 bags, but we cannot see any reason for reducing our own estimate of 11,500,000 bags, which is the result obtained by a pure and simple mathematical calculation based on the July-September receipts, and if we include the October receipts, we would have to raise our estimate somewhat. The quantity to reach shipping ports out of this crop is however subject to the influences which the prospects for the following, or 1904-5 crop, may exercise. Should these prospects point to a much smaller crop than the one we are in, then it would have to be expected that planters will retain inland a part of what they have left from their present crop. This might have the tendency to reduce the receipts at Rio and Santos for the crop year to the extent of half a million, or even a million, bags, but the coffee would exist just the same, and would be likely to come forward in the following crop year if a high enough price can be obtained.

The prospects reported so far for the growing crop are not at all flattering. To start with, a large percentage of trees were ruined by the frost of August last year, and another very large number has been damaged to such an extent that the planters found it necessary to cut them down so as to give the roots a chance to sprout again. We do not think we err if we say that 20 to 25 per cent. of all the trees in the State of São Paulo have thus been put out of bearing for at least four or five years; therefore record crops, such as we have had of recent years, may be considered a matter of the past.

There have been some very low estimates received here with regard to the 1904-5 crop; but we consider it ridiculous to pay any attention to them, because no one can estimate a crop before the blossoming season has even been passed. We still have the November-December flowering before us, then it remains to be seen how the fruit sets and how it develops, whether sufficient rain falls, or too much rain, etc., and for this reason the next crop cannot be estimated within millions of bags until some time next April or May, when harvesting takes place, and it is found what the cherries contain.

The enormous existing stocks should be a warning post against a too rapid advance in price at the present time. This is no small barrier to be removed by a wave of the hand, like some of our speculative friends would have it, by simply arguing that these big stocks are taken care of, and we must look ahead and see what the future has in store. With regard to the immediate future, we can figure approximately on a consumption of Brazils during the next eight months of about 7,750,000 bags against which we have to expect receipts at Rio and Santos during the same period of about 5,250,000 bags.

Bogotas and Maracaibos are now proportionately the cheapest coffees in the market. They are bound to benefit by the rise in price of Brazils, and we do not hesitate to recommend purchases of them.

TEA NOTES.

**Tea Exports.**—The following figures of tea exports taken from the Calcutta Customs Daily Entries and received periodically from Chittagong are issued by the Indian Tea Association:—Quantity of tea entered for export to United Kingdom for the second half of November, 1903, Calcutta: 10,138,370 lbs.; Chittagong 2,918,346 lbs.; Quantity entered during the corresponding period last year: Calcutta,

7,269,273 lbs.; Chittagong 1,403,300 lbs.; Total from 1st April, 1903, to 30th November, 1903: Calcutta, 107,309,932 lbs.; Chittagong 21,587,551 lbs.; Total 128,897,483 lbs.; Total from 1st April, 1902, to 30th November, 1902, 117,086,836 lbs.

From the 1st to the 30th November the bonus, at the rate of half-an-anna per pound, has been paid on 455,495 lbs. of Indian green tea. The quantity on which bonus has been paid from the beginning of the season to 30th November is 1,703,732½ lbs.

The following telegram with reference to the tea crop in the various districts has been despatched by the General Committee of the Indian Tea Association here to the Committee of the Association in London:—Assam—Outturn last month good; season likely to close shortly. Cachar—Outturn last month good; weather favourable. [Sylhet—Outturn last month good; weather favourable.] Dooars—Outturn last month about normal; season is practically closed. Darjeeling—Season is practically closed.

**Colombo Tea Sale.**—There was, says the *Times of Ceylon* of 2nd instant, a good demand for all kinds, and prices were firm but irregular. All broken with any appearance sold at advanced rates, while common to medium were about steady. Green teas were slightly dearer.

**Tea Stocks in London.**—On the first instant the Ceylon stock stood at 18,900,000 lbs., down 300,000 lbs. since the 1st November; and the Indian stock 56,200,000 lbs., up 6,100,000 lbs. in the month. The totals on the corresponding date in the past two years were as follow:—

		Ceylon. lbs.	India. lbs.
1st December, 1901	...	20,400,000	60,900,000
" " 1902	...	21,000,000	58,600,000

**American Tea Consumption.**—Americans are apparently becoming greater tea-drinkers, says the *Spice Mill*, for in 1903 the net imports of that article were 104,632,260 pounds, against 73,374,041 in 1902. Compared with the preceding years the imports from Japan increased more than 7,000,000 pounds, and there was an increase from China of more than 19,000,000 pounds. The gross imports of coffee in the fiscal year 1902 were 1,091,004,380 pounds, while in 1903 only 915,066,380 pounds came in. Despite the falling off in imports, which was probably due to the market having a large supply on hand, the amount transhipped and exported was 47,701,306 pounds, against 34,462,615 pounds in the previous year. It is interesting to note that the *per capita* consumption of coffee is about thirteen pounds, while that of tea is one and one-half pounds. The price of tea, however, is more than double that of coffee.—Government Official Report.

**British-grown Tea in the U. S.**—The expansion of the drinking of Indian and Ceylon teas in America has been on so large a scale, chiefly as the result of the extensive advertising done at the expense of the cess funds, and presumably satisfactory to the growers of the tea, that it is surprising, says the *Tea and Coffee Trade Journal*, to learn that the British tea men are becoming weary of submitting to the tax, saying that it is about time they were absolved

from further expense on that account, and that now and hereafter it should be provided by the distributors and store-keepers here. Probably the growers and manufacturers are not aware that this is already being done in a large way, but they should not expect that on that account they need to stop. Those who are so enterprising are encouraged to take hold and to continue by noting the strong first steps, the courage and the sympathy of the primal sources, and so the movement grows by accretion. Others want to follow where they see a path so well blazed. The Indian tea men tired of advertising, and they lost proportionately as the Ceylon men continued and spent more money, so that they are glad to resubmit to a tax that they may recover what they have lost. This is eminently an age of publicity. The advertiser gets the business, mostly at the expense of the one that does not. China teas are not advertised, and in effect Japanese is not worth the mention, and the end is as inevitable as it can be unless there is a change whereby the Japanese and the Chinese alter their policies and the British men throw away a pound to save a penny. We imagine, however, that the objections have been much overstated, and that the Britishers do not contemplate seriously giving up so effective an agency for the enlargement of the use of their tea as publicity.

Anyway, the Indian and Ceylon men are going to spend much money at St. Louis exhibiting their teas and also their coffees. A sum upwards of £10,000 will be spent on the former and a considerable amount, although less, on the latter. There is to be a fine bungalow for the exhibition of the tea, which is to be so attractively done that there is sure to be a call for the tea outside of the exhibition grounds, and arrangements are going to be made to establish agencies for the sale of it. This is certainly wise. What is the use of exciting a demand for anything and then not providing a supply? The Indian coffee men are going to be as enterprising as their tea brothers. There is going to be no lack of Indian coffee to drink, or for sale, and if it is as good as the songs sing of it, there is a great treat ahead for the great central part of these United States, which will provide the main share of the visitors, and therefore chiefly benefit in those good things that the exhibition provides. We are great lovers of coffee, and ever disposed to welcome any new comer that has merit. We do not see why there should not be a market here for the celebrated kinds, but as in all things, they must be properly introduced, and what is very important, be afterwards properly managed. Exotics require very careful nursing. Probably \$75,000 will be spent in displaying the set two Indian and Ceylon products, and there will be a great amount of coming together and ideas which cannot be measured in dollars. The Porto Rico growers also plan a large campaign, which includes the giving away of 200,000 packages of their coffee. Presumably nothing but what is near to the best will be presented, and so all in all visitors may expect good treatment in the line of beverages, and, of course, they will reciprocate by taking home with them a consuming taste for the things freely offered them.

British tea is being bought up from the London market for Germany. It is sold afterward in the fatherland as Russian tea.

It is now figured that only 7,000,000 pounds of Congous teas will be imported into the United States this season.

About 12,000,000 pounds were passed through New York alone last season, and that on top of the great accumulation of the year before. About 4,000,000 pounds have been exported to England since January 1.

**Colombo Tea Shipments to the U. K.**—The following is the latest Chamber of Commerce official tea telegram:—

November shipments	...	...	6½ millions
December estimate	...	...	9½ to 10 "

The November estimate was 7 millions. The shipments for November and December last year were 6,434,305 lbs. and 9,112,975 lbs., respectively.

**London Tea Market.**—Cabling to Colombo on the 3rd instant Messrs. Gow, Wilson & Stanton report:—Heavy supplies of Indian are depressing the market. The market for Medium-Liquoring Pekoes and Broken Pekoes is weak. The market for Common Pekoes and Broken Pekoes is weak. The price of Fair-Liquoring Ceylon Pekoe Souchong is 6¼d. The average price of Ceylon Tea sold on Garden Account this week was—7½d. (down ½d.).

North America continues to take increasing quantities of British-grown tea, as shown by the result of the first six months' working of the year 1903, viz.: 1903, 12,029,417 pounds; 1902, 8,624,299 pounds; 1901, 8,336,017 pounds; 1900, 6,820,884 pounds.

**Calcutta Tea Sales.**—Some 20,000 packages were before the trade at the auctions on the 4th instant. Quality generally speaking was poor for the time of year especially from Dooars and Darjeeling whence there is a marked paucity of good Autumn teas. The market was again strong and active and prices all round were fully firm; the best liquoring sorts being in many cases dearer. Bombay buyers were scarcely so busy as of late and an easier tone was noticeable in some teas suitable for these demands. Green teas, with pale bright liquors, were steady, brownish liquoring sorts, however, were easier.

Another report says:—In spite of the poor quality of offerings brought forward at yesterday's auctions, the market, taken as a whole, showed no weakening. Demand for common leaf grades was rather better than last week and those descriptions may be quoted fully firm to occasionally dearer. Medium kinds showed a somewhat quieter tone and were irregular but marked no further decline. The better classes when possessing any approach to quality continued in request and sold at fair prices. It was noticeable that native buyers for the Bombay and Gulf demand did not display that keenness to secure every available parcel that has characterised their operations during the past few weeks, but although the neat leaf Pekoe kinds were not so strongly supported for those outlets as the room has become accustomed to look for, yet they sold freely throughout, only conceding 1—2 points, Green teas again met with a good reception, the few invoices of choice quality seem realising very satisfactory rates. Reuter's London market wire came through as follows:—"Market generally firm at previous rates. Mediums rather easier."

**An American Report.**—The stringency in green tea is the remarkable feature of the present season. Earlier reports were that there would be at least sufficient to go around,

and even a substantial surplus seemed in prospect. Now all on a sudden the market finds itself short, and there is the old hunt for the elusive green. It may prove that dealers with an eye on speculation have brought about what might be called a corner, but that remains to be seen, and in due time we shall know. On top of this realization comes, too, the well founded report that the Ceylon green tea makers will not next year enjoy their bonus, amounting in American money, to one and one-third cents a pound, and this circumstance it is thought will materially incline the tea makers to turn their attention to the exclusive making of black tea, in which there is much larger profit. We presume that the India green tea makers will think and act the same. It remains to be said that the British green tea has made many friends in the market here, and, altogether, has created for itself a very substantial foundation, so much so that it would seem that all lower grade China and Japan teas of the green kind must give way to it. Good quality, low price and push is now all that is necessary. In quality some improvement has been noted all along, especially in the Ceylons, which have been found superior to the Indian green tea in strength and general flavour. A restriction in the manufacture of these teas will all the more complicate the market for the future. Canada seems to have had the news before the local tea men and bought largely in anticipation.

\* \* \*

Messrs. Smith, Baker & Co. report the following table of tea exports from Japan this season to October 5, with comparisons:—

	Total. 1903-04.	Total. 1902-03.	Total. 1901-02.
N. Y., Str. or Sail & R.R. ...	7,109,438	4,058,930	6,495,473
New York <i>via</i> Suez Canal ...	4,515,460	7,523,142	4,607,013
San Francisco ...	5,055,942	2,675,903	3,068,373
Chicago and West ...	15,523,570	12,448,959	11,519,734
Canada ...	3,340,079	2,480,532	4,995,816
Europe, etc. ...	180,243	130,789	179,911
Totals ...	35,724,732	29,318,255	30,866,320

#### Comparative Arrivals and Settlements.

Total arrivals—At both ports, 313,384 pcls., against 289,304 pcls. same time last year, and 282,397 pcls. in 1901.

Total settlements—At both ports, 309,186 pcls., against 282,736 pcls. same time last year, and 275,312 pcls. in 1901. Exclusive of export transactions at Shidzuoka and other interior points.

\* \* \*

**The U. S. Tea Market.**—The tea market is firm in all teas, and a business fairly large in volume is reported. The greens are especially firm. Although produced this season in excess over that of last year, the demand for them has increased, and then the country has been completely denuded of all stocks because of the shortages in the supplies in the last few years. The market has been further tightened by the reported shortening in the production of British green teas. The great supply that was threatened early in the year is now scarcely probable, owing to the greater profit that is being found in the manufacture of British black teas, which have advanced considerably in price. However, the facts are that up to the present time bonuses have been paid in Ceylon on 9,000,000 pounds, and two months more of the bonus remain; India will produce 4,000,000 pounds, and all in all about 15,000,000 pounds may be looked for at the end of this calendar year. Canada will take two-thirds of this quantity.

Japans are included in firm teas. Opinion to this effect is not unanimous however. Consumption of the tea has shrunk, it is held, owing to the deteriorating quality of the tea and its greatly enhanced price, so that people here are taking more and more to the China green teas, Formosa and the British green teas. Besides, in Canada, the tea has met with a decidedly diminished demand; Ceylon and India greens have been found too strong as competitors.

Formosas are firm in all grades, and are improving in price. This has disappointed some houses, especially large retail houses, so that these are turning their attention to Foochows, in which in the past week they have made heavy purchases, some 7,500 packages. There is still much of this tea unsold in this market, but it is from one to two years old, and prices being equal the attraction naturally lies with the new tea. Congous hold firm with upward tendency. The tea is practically on a 9c. basis and better. The expectation is that it will shortly sell for 10c. and at 12c. in the course of two months. London is from time to time advancing its bids. The price for the British-grown teas is constantly advancing there and makes such China growths as we have here in abundance look cheap and they buy. The advancing market in Ceylon and India blacks is felt here. They are very firm and hardening constantly.

Advices from Canada report the condition of the tea market as most satisfactory, a general activity in all grades being observable, Ceylon greens apparently being the principal grades, some very large orders having been taken. China blacks are receiving a little more attention. Japans, low and medium grades are in good demand, with stocks light and prices hard.

London advices in China tea say there has been a fairly active market in low price teas, and some quantity of Foochow kinds have been sold to arrive for direct shipment to the Continent at 4½d. to 5½d., thus showing that they were very hard up for low price tea. There is now little to be bought under 5d. per pound, and, with a rising market in Indian and Ceylon growths, the trade may soon get a quotation of 5½d. for common Chinas. Fresh arrivals of China teas continue to dribble in, but they are quickly absorbed, and tea men cannot now look to America to send us any more at a cost of 5d. per pound. In Indian tea a buoyant feeling has characterized the market at the advance lately exhibited. High-grade tea is becoming increasingly scarce. Latest arrivals of fine Assams showing a marked falling off in quality to the extent of pence per pound. Assam Pekoe Souchongs have been in active request from 7d. to 8d., notably those with point in cup, but Assam Pekoes at similar prices have a comparatively disappointing sale, although they offer very fair value. In Ceylon tea there is an active demand for most grades at firmer prices. The smallness of the weekly offerings are barely sufficient to meet the requirements of the trade, and as no immediate increase is possible there is every reason to expect a continuance of present values. Many of the invoices now arriving are of excellent quality, though there is a paucity of stand-out character. One or two choice lots, however, have realized higher prices than for a considerable time past.

Rejections—	Packages.	Pounds.
Foochow ...	605	26,100
Country Green ...	15	800
Canton ...	12	400

\* \* \*

**Indian Tea.**—Indian tea occupies a stronger position now than it has for several years past, notwithstanding the efforts that have been made to get prices down to a lower level. For a time, says the *Grocer*, some of the larger operators were keeping out of the market for this very purpose, but without avail, as not many of the trade carried an excess of stock to last awhile, and they were soon compelled to come in again as free buyers. In September importers were inclined to overweight the market with supplies by auction. In one week about 50,000 packages of Indian tea were catalogued, but found the dealers less prepared to operate, it having become their policy in recent years to buy only sufficient for their immediate wants, and not to hold heavy surplus stocks as formerly. Under this pressure to realise prices dropped about ½d. per pound for the common qualities down to 5½d., upon which adverse turn holders at once restricted their offerings to about 40,000 packages per week, and came to an understanding among themselves not to place more tea on show than sufficed for the moment to meet the necessary requirements of the trade. It is nevertheless difficult to reconcile all interests in this respect, but the principle not to anticipate matters is often a sound one, especially as later reports concerning the crop are apt to modify the earliest impressions, and instead of an increased yield there may be a shorter one, or *vice versa*.

With regard to this season's crop of Indian tea, expectations are in favour of its turning out to be heavier than in 1902-03, notably so in the Assam, Sylhet, Oachar, Dooars, and Darjeeling districts,

though the increased production for the United Kingdom (from 12,000,000 lbs. to 16,000,000 lbs. more than last year) has been retarded by the shortage of labour and other difficulties in the way of an extended cultivation. Competent authorities are of opinion that the bushes will not maintain their average flushing power throughout the season, and should this prove to be the case in a material sense importers will have a strong hand, for the reason that old season's stocks of tea that put in an appearance last year will not be available this time. There is also another fact to be taken into account, viz., that the shipments of tea from Ceylon to London this year have run decidedly short, being already about 6,000,000 lbs. less than those in 1902—a deficiency which will help to counterbalance the big surplus in the Indian description. Many invoices of the latter have by now passed the hammer in public sale, and the fine and finest parcels have gone off with a lively competition at long and satisfactory prices, the more so where there was anything "tippy," with choice ripe flavour "in the cup." A healthy demand always exists for stand-out and choicest teas, and the brisk competition for these clearly proves that the consumer is not entirely carried away with a desire for common tea, in spite of the public craze for cheapness. Only a little more push on the part of retailers is needed to place desirable teas before their customers, so as sensibly to increase their sale and consumption. Growers also have their part to perform, and would do well to pay special attention to the manufacture of fine teas.

During the past weeks, however, arrivals have exhibited a falling off in quality, partly attributable to coarse plucking, and also in a measure due to the climatic conditions peculiar to the present season. The deterioration has, as usual, chiefly affected the value of the medium grades, causing them visibly to depreciate, and thus widening the gap between ordinary and the finer sorts. A good proportion of the new crop has likewise consisted of common tea of an inferior grade, and the larger quantities offered explain the decline in price above mentioned. To contribute support importers have resorted to numerous withdrawals at auction, but have afterwards frequently placed their teas privately on terms more favourable to themselves than were possible to obtain in the confusion that at times prevails in the public sale room. The scarcity of common leaf has been much felt, sweet, clean tea having lately been difficult to get under 6½d. per pound, and it is said that money has been systematically lost in order to maintain the cheap canister.

\* \* \*

**September Tea Importations in the U. S.**—According to statistics published by the Department of Commerce, tea importations into the United States during September last were 13,914,207 pounds compared with 9,608,568 pounds in September one year ago. The Chinese Empire furnished 6,315,290 pounds, and the Japan ports 6,047,615 pounds.

The imports during the first nine months of the calendar year were 64,270,228 pounds against 56,731,442 pounds in the same time in 1902, and 44,769,854 pounds in 1901.

The tea imported this year averages a cost of 17¼c. a pound; the cost of that imported in 1902, duty of 10c. off, was 13½c., and that imported in 1901 13c., duty subtracted.

\* \* \*

The *Sydney Daily Telegraph* has the following in its commercial column:—"The recent drop in tea freights from Colombo to Australia is not likely to have any beneficial result so far as local importers are concerned. The Colombo market has advanced exactly in proportion to the decline in freight. This is, of course, highly advantageous to Ceylon tea-planters, as well as to the Colombo tea trade. The development mentioned in our last issue is largely the outcome of the charter of the "Hobart" for the Australian markets. Those who undertook the venture really did the Australian tea trade a valuable service, although the pioneers of cheap freight are at the present time being boycotted by shipping companies, who are demanding a 75- (sic) rupee freight, as against 15 rupees, which is the open rate for two months (sic). It is generally believed that freights will at the end of that time return to a common 35-rupee basis. The recent ruling rate of 50 rupees means about 52s. per ton to Australian importers, as against 25s. to London. It is little wonder, therefore, that the spirit of dissatisfaction and unrest has been so largely abroad among Australian tea-men for a long time past. Whether the

Colombo market will come back to meet a 35-rupee freight later on remains to be seen. Local importers, however, are of the opinion that the present shifty condition of the Colombo freight market will not materially alter laid-down cost for Ceylon tea in buyers' favour, but rather the reverse."

\* \* \*

**Consumption of Tea in Canada.**—The excess of imports over exports of tea for the fiscal year ending June 30, 1903, as 16,760,287 pounds, has drawn attention to a remarkable fact in the tea situation in Canada, says the *Canadian Grocer*. While the consumption of tea has by no means decreased in Canada, the importations last year were abnormally low and the exports unusually large.

For the preceding five years our importation of tea was as follows:—

For the fiscal years ending:—

				Pounds.
June 30, 1898	...	...	...	19,954,562
" 1899	...	...	...	25,055,607
" 1900	...	...	...	25,069,002
" 1901	...	...	...	23,044,314
" 1902	...	...	...	19,530,655

The fact is that for the last year the trade has been drawing on the stocks usually held. The uncertainty prevailing has led to hand-to-mouth dealing and stocks are now in most lines very light.

\* \* \*

**The Persian Tea Duty.**—The remarkable muddling which can be allowed to prevail in a Government Department has just been again demonstrated in a most striking way.

Quite recently, Mr. H. H. Lynch asserted that "Indian tea, which has almost a monopoly in Persia, pays an increased duty of 95 per cent."

The publication of this news, coming from such an authority as Mr. Lynch, at once stirred the big tea firms to action. In reply to their inquiries, Mr. H. S. Foster, the Consul-General for Persia, 122, Victoria Street, wrote stating, that prior to February 14th of this year, all teas paid an import duty of 5 per cent. *ad valorem*. On that date the new Customs tariff came into force, and by it the duties were fixed as follows: White tea, per 6·54 lbs. 3s. 9d.; and all other teas per 6·54 lbs., 2s. 3d. On February 9th, however, a special commercial Convention was concluded between the United Kingdom and Persia, and this was ratified on May 27th. Under this Convention tea appeared in the schedule as follows: yellow or pale tea: per 6·54 lbs., 6s. 9d.; and other sorts, 4s. 6d.

"This you will perceive," added Mr. Foster, is an increase of 80 per cent. on the green teas, so-called, and of 100 per cent. upon all other classes. I have been unable, up to the present, to get any explanation of this strange alteration. The English Foreign Office say that the Convention tariff was a mistake, whatever that may mean, and that the commercial tariff of February 14th is correct. The Board of Trade here say that the Convention tariff is right, but that they are acting on the Commercial tariff."

Special investigations in London confirm Mr. Foster's view of the extraordinary confusion which exists. The Board of Trade is still inquiring.

At the Foreign Office it is claimed that the confusion is due to the carelessness of a clerk who copied *en bloc* the Russian tariff. This, it is true, formed the basis, and was originally the exact shape of our own treaty. But one change was made; tea was reduced by British representation from the higher (or second) figure to the lower (or earlier).

The great point, however, is, can Persia charge the higher duties? There is possibly something of a political nature behind all this mystery.

\* \* \*

**Green and Black Teas.**—At the Annual Meeting of Lanka Plantations Company the Chairman, Mr. George Allen, said that he noticed that some 800,000 lbs. green tea had come to the United Kingdom, and he wanted to know what had become of it. He was informed that lately there had been practically no common black tea in London, and when common tea rose in value, fine teas like theirs suffered proportionately. He hoped that producers of black tea would combine and resist the prolongation of this cess or any other. Green tea could very well afford to stand by itself without help from black-tea producers. Mr. Henry Bois, in seconding the adoption of the report, said that, though he had not seen his way to support the proposed increase of the cess, he

thought the making of green tea had done much to relieve the black-tea market. As regards the green tea which had come here, much of it was in transshipment to Canada and elsewhere. Mr. Forbes Laurie said he did not share the Chairman's views about green tea. He thought the present sound position of black-tea was in a great measure due to the amount which had been taken off the market in the form of green tea. He gave figures to show that half the dividend declared was probably due to the action of Ceylon planters in making greens, for, if it had not been for this, the price of the Company's teas would have been a half-penny lower. Speaking as a former cocoa planter, he thought the Company would do well to get rid of Yattewatte at any reasonable price and devote their entire attention to tea. Pará rubber did well in Ceylon about sea level, but he doubted its being a success at Yattewatte.

NOTES.

**Java Cinchona.** The half-monthly shipments from Java in November amounted to 225,000 Amst. lbs., against 758,000 Amst. lbs. last year.

**Fertilizers.** It is considered that crude calcium cyanide (containing 15 to 22 per cent. N.) and possibly cyanide itself (containing 65 per cent. N.) may become valuable commercial fertilizers.

**New Use for Tea Lead.** Demand for discarded tea led is now coming from a new source. Manufacturers of fine glassware are inquiring for it, seemingly using it in the making of cut-glassware. Heretofore makers of bullets have bought the lead. From 3 to 4 cents a pound is paid for it in the United States.

**The Ceylon Cacao Commission.** The final Meeting of the Cacao Commission was held in the Council Chamber at noon on the 2nd instant. The Hon'ble Mr. A. G. Lascelles, Attorney-General, presided, and the others present were:—Messrs. A. C. Kingsford, T. C. Huxley, Peter de Saram, and Eric Watson (*Secretary*).

**Bourbon Vanilla.** A Continental report states that Bourbon vanilla is in a very depressed condition. It is probable, however, that the approaching increased consumption will bring prices somewhat higher, especially as vanillin has now advanced. Tahiti vanilla is also very low in price.

**London and Amsterdam Cinchona-auctions.** The following are the dates on which the monthly cinchona-auctions will be held in London next year, and for reference we also give in brackets the dates fixed for the ten Amsterdam auctions, as per our issue of October 24 :

January	19	[28]	July	12	[28]
February	16	...	August	9	...
March	15	[ 3]	September	13	[ 1]
April	19	[ 7]	October	18	[ 6]
May	10	[19]	November	15	[10]
June	14	[23]	December	6	[15]

**Cacao in the U. S.** Advices dated Washington, October 18, say:—Figures just compiled by the Department of Commerce and Labour, through its Bureau of Statistics, show that the importation of cacao has grown from 9,000,000 pounds in 1883 to 24,000,000 pounds in 1893 and 63,000,000 pounds in 1903. The

value of importations of cacao in crude form has grown from \$1,000,000 in 1883 to \$4,000,000 in 1893 and nearly \$8,000,000 in 1903. Meantime, the importation of manufactured cacao and chocolate has fallen from 1,467,977 pounds in 1897, valued at \$239,819, to 690,824 pounds in 1903, valued at \$144,823. Both cacao and coffee have grown rapidly in favour in the United States in recent years as against tea, which showed no material increase. The coffee importations grew from 515,000,000 pounds in 1883 to 1,091,000,000 pounds in 1902 and 915,066,380 pounds in 1903; those of tea amounted to 73,000,000 pounds in 1883 and only 75,000,000 in 1902, but in 1903 were 108,000,000. Thus, the growth in the importation of cacao has been more rapid proportionately than that of coffee, and much more rapid than that of tea. Other evidence of the growth and popularity of cacao and its product, chocolate, in the United States is in the fact that the number of cacao and chocolate manufacturing establishments reported in the census of 1880 was 7; in 1890, 11, and in 1900, 24, while the capital employed increased from \$530,500 in 1880 to \$6,890,732 in 1900. The value of materials used in manufacturing grew from \$812,403 in 1880 to \$6,876,682 in 1900, and the value of the product from \$1,302,153 in 1880 to \$9,666,192 in 1900.

GENERAL ARTICLES.

PRODUCE AND PLANTING.

New Zealand and British-grown Tea.

According to a cable message from New Zealand, the tariff proposals which the Government have brought before Parliament this week provides for additional duties on foreign goods, amounting to 100 per cent. on cement and from 50 to 20 per cent. on thirty-eight other articles. It also includes a proposal to abolish the duty—2d. a lb.—on tea grown in British dominions, and to impose one of 20 per cent. on foreign teas.

The Labour Troubles of Colombian Coffee-planters.

The coffee industry in Colombia is in a bad way, and scarcity of labour is largely the cause of the trouble. Six years ago, when the price of the berry went up, over-planting resulted. The labourers demanded increased pay when they found there was competition for their services, and finally the revolution of 1899 killed off large numbers by the rifle and disease. The state of the planter is so bad that many large areas have been abandoned. Want of capital is a contributory cause. Mr. S. S. Dickson, British Vice-Consul, in a report just issued by the Foreign Office, adds: "To-day the coffee plantations are, from want of labour, losing half their coffee. Only those who have the best machinery can pretend to do a profitable business. The greater part of the produce of the last three years is still stored in the river ports, as there are no adequate means of despatching it. Formerly the cost of export was one-third of the net value in London. This has, to a large extent, increased, owing to excessive charges, both of transport and of storage."

Planting in the Federated Malay States.

Sir F. A. Swettenham, in his report on the Federated Malay States for 1902, says:—"Planting enterprise in the Federated Malay States has not hitherto proved very successful, but that has not been due to any lack of enterprise or hard work on the part of the planters, who, when one product failed, have tried another, endeavouring with dogged determination to compel a success which they thoroughly deserve and, I trust, will now obtain. The prospects of rubber are so good that, unless some unforeseen disaster happens, the future is full of promise for those who have taken up this cultivation. The area at present under rubber (principally the Pará variety) is given approximately at 16,000 acres."—*H. & O. Mail.*

## GROWTH OF COCOA DRINKING IN THE UNITED STATES.

United States consumption of cocoa has grown more rapidly than that of coffee, and much more rapidly than that of tea. In fact, the use of both cocoa and coffee has increased in the United States in recent years faster than that of tea, which shows no material increase. Following are figures of our import of each of these three articles:—

				Pounds.
Coffee imported:—				
1888	...	...	...	515,000,000
1902	...	...	...	1,091,000,000
1903	...	...	...	915,000,000
Tea imported:—				
1888	...	...	...	75,000,000
1902	...	...	...	75,000,000
1903	...	...	...	108,000,000
Cocoa imported:—				
1880	...	...	...	7,403,643
1885	...	...	...	10,300,120
1890	...	...	...	18,266,177
1895	...	...	...	29,307,048
1900	...	...	...	41,746,872
1901	...	...	...	45,924,353
1902	...	...	...	51,379,396
1903	...	...	...	63,357,294

While our import of crude cacao has increased so largely that of manufactured cocoa and chocolate has fallen from 1,467,977 pounds, valued at \$239,819, in 1897, the year in which the Dingley protective tariff began, to 690,824 pounds in 1903, valued at \$144,823. The benefit to our manufacturing and wage-earning interests is shown in the growth of our cocoa and chocolate factories, quoting Census Bureau figures, the number of factories being seven in 1880, eleven in 1890, and twenty-four in 1900:—

	1880.	1900.
Capital employed	\$530,500	\$6,890,732
Materials used	812,403	6,876,682
Value of product	1,302,153	9,666,192

Experts say that cacao planting in Nicaragua yields \$400 yearly per acre, of which \$350 is profit.

## COFFEE IN LONDON.

The terminal market has remained quiet, says the *Produce Markets' Review* of November 14, although the daily receipts have been on the light side rather than the heavy. Still, after the sharp advance of the last few weeks, it is only natural that a quiet tone should follow, especially as there is even now much uncertainty as to the prospects of the next crop. Those most nearly in touch with the planting interests are confident that climatic variations have considerably affected the trees, and that only a small crop can be looked for, but even this can be minimised by the present crop proving larger than was previously expected, and so neutralising any shortage in the following one. At the auctions the demand has been good, considering the time of year and that the offerings have not been of an attractive nature. Prices have been well maintained; bold Colombian is rather dearer, while very full rates continue to be paid for Nicaragua. It is now reported that last Tuesday's sale contained the last of the Washed Dumont for this season, and, as a result, prices having advanced and profits have been paid on several parcels out of previous auctions.

## TEA IN LONDON.

The *Produce Markets' Review* of November 14, 1903, says:—

INDIAN TEA.—At the public auctions, which comprised 42,890 packages, there was some irregularity in values for teas over 7d., which was due to the falling-off in the quality of some of the growths. Former prices, however, were supported for the lower grades, and practically the lowest quotation for clean sweet tea was 6½d., the market closing steady at this. For the finer qualities, which have been somewhat liberally offered, the most desirable lots have met with a good enquiry, and a large business has been transacted at previous rates. It appears evident, from the increasing demand for this class of tea, that the retailers find it to their advantage to bring the better teas prominently under the notice of the consumers who are prepared to pay a reasonable price, and it

is quite probable that should there be a reduction in the duty in April, the consumption of these kinds will make considerable strides. The medium grades have also been liberally offered and freely taken at about last week's rates. Where weakness in values was observable, it was mainly attributable to poorer quality. The latest advices from Calcutta report that the probable available supply for this market will be from 160,000,000 lbs. to 163,000,000 lbs., a good increase over last year, which would indicate an easier market, but it must not be overlooked that there is a shrinkage in the imports of Ceylon of about 7,000,000 lbs.

CEYLON TEAS.—This market has been rather better supplied, the quantity brought forward on Tuesday having been on a larger scale, although still moderate. There was a good demand, and Whole Leaf kinds up to about 7d. per lb. were well taken at last week's rates, but signs of weakness were apparent in the medium sorts. This was also noticeable in Broken Pekoes, from 7½d. to 9½d., which were occasionally ½d. per lb. easier, but could not be quoted generally lower. Dust continue to be very sparingly offered, and in most cases were dearer, while only a few lots of very ordinary quality sold as low as 6d. At the public sales 18,700 packages were brought forward, of which about 2,500 were withdrawn.

CONGOU TEA.—There has been a good enquiry for all the lower kinds, and prices remain firm. Business in the finer descriptions has been quiet, no transactions of any importance having been reported.

OTHER CHINA TEAS.—There was a strong demand for Moyune Gunpowders at the public sale held on Thursday, and good prices were realised. Medium teas showed a further advance, but there is little alteration to quote in the finer grades. Young Hysons and Sow Mees were of inferior character, and failed to attract much attention. The market for Fancy teas remains quiet, with only a limited demand for Capers. Formosa Oolongs below 1s. are wanted, but the finer sorts are somewhat neglected, and there is no noticeable alteration to quote.

## TEA IN JAPAN.

Mr. Ferguson, of the *Ceylon Observer* staff, has lately visited what he calls "the finest tea district of Japan," viz., the Uji plantations of Nara. Of this he writes: "Tea is supposed to have been introduced into Japan 1,200 years ago by a Buddhist Abbot, and the Uji plantations, which are said to be 800 years old—but, of course, this does not mean that there has not been replanting—have always been considered the chief and best in the country. We had seen a good many patches of tea in different directions before this, chiefly in the form of garden cultivation on the flat; but in one instance, the tea ran up a hillside for some distance. But at Uji, we had continuous fields, though none of any great extent. The bushes were of the small-leaved China variety—some looked as if recently plucked; but much had been allowed to "run" since last plucking (probably in May), so that pruning would be required, according to a planter's idea, before proper flush could be expected. However, the Japanese go about their tea gathering and preparation in their own way. From May onwards is their busy time, and there being no factories, in every peasant's house preparation is going on and the product is collected and sent to Kobe where it is refired, sorted and generally prepared for the American market. The very finest kinds of Uji tea—called in Japanese 'Jewelled Dew,'—are sold at fancy prices at 10s. to 15s. a lb., in small quantities, and, I fancy, for use by the wealthier Japanese themselves.

"The tea fields continued at intervals with us during most of this day's travelling to and beyond Nara, towards Kameyama; but very often the little holding had its patch of tea, alongside of the plot of vegetables,—turnips, tomatoes, beans, potatoes and a variety of kitchen garden products well-known to us—some covered with flowers—one a continuous show of a minute white flowers, the plant yielding a small grain-like sago,—or every now and then we come on a patch of mulberry shrubs grown on one stem with abundance of leafage to feed the silkworms so carefully attended to by the thrifty Japanese. Yet again, we find the line of tea-bushes alternating with a row of mulberry shrubs, or even vegetables. As we got into the upland districts—a few hundred feet higher—we ran up the glens in terraces, Kandyan fashion, with the tea alongside or above, and sometimes we came on patches of tea cultivated 'patana' land; but evidently manured. The primitive 'cottage' preparation of Japanese tea is said to be against the product's appearance and uniformity as presented in

America even with all the care taken at the shipping ports before packing; and a proposal is now being discussed in the Kobe press, for the establishment of exporters' factories in the tea districts, for the prompt 'firing' and preparation of tea as likely to result in a product better able to compete with that of Ceylon and India."

"There are difficulties in the way of the change, not the least being the existing factories in Kobe—although land being so dear there, the buildings and sites could be profitably realised—and the trained labour supply, the change involving a serious loss of employment to thousands of women of the 'coolie' class in Kobe. Of course, labour, after the necessary training, should be equally good and even cheaper in the interior in this country of abundant population; and sites for factories could also be readily and economically obtained. One change is fast coming even in Kobe itself, and that is the introduction of labour-saving machinery, such as we know in Ceylon; but on the Yokohama side, the merchants seem quite resolved to set up factories well-equipped with machinery in the Shidsuoka tea districts—which come second only to Uji—so as to endeavour to turn out a superior tea by preserving the natural aroma through speedy firing and refiring after the plucking and rolling. We must be prepared for changes therefore; but how far they may enable Japan tea to recover lost ground in America remains to be seen. One thing seems evident to me, and that is the great scope there should be for increased consumption of tea in Japan itself, in its populous and prosperous cities, especially as the people find what is now a luxury becoming more and more a necessity to them."

"One little incident at the Uji station we must record: arrived there, our carriage is entered by a boy-official in uniform with dainty tea-pot and cups on lacquered stand, and he pours out at once for the travellers in the first-class compartment, what was certainly the most deliciously-flavoured cup of tea we have tasted since leaving Ceylon—and seldom equalled even there. Vastly superior it was to what we have had at hotels or tea-houses, or afterwards, as a matter of course, in trains on side lines in this region where tea is made and presented to special travellers by a young official travelling with the corridor carriages. But at Uji, the young man in uniform did not leave the station,—we stayed long enough for him to give this attention and withdraw,—and it looked as if the arrangement was one based on the desire of enterprising Japanese interested in the tea industry (a 'Thirty Committee') to give the many visitors to and from Nara, and generally along the route through the tea districts, an idea of what the very best of their tea was like. If so, and if we may judge by the delicious cup tendered us at Uji—in the forenoon, be it remembered, and not when we stood specially in need of refreshment,—all we can say, the plan is a good one, for we are not likely in a hurry to forget the aroma of that tiny cup of Uji tea."

## A SOLUBLE COFFEE.

[From the *New York Herald*.]

### A REAL BOON TO SUFFERING HUMANITY.

No more poor coffee! No more grounds!! Throw away your coffee pots!!! A New York coffee merchant, by name of Cauchois, has perfected a process that reduces pure coffee to an impalpable powder, eliminates the bitterness and makes it more soluble than cocoa, develops the entire strength, necessitates less care in preparation, keeps indefinitely, can be made instantaneously in an ordinary cup or pitcher, and sells as low in price as any pure coffee. We understand this to be the acme of research in the coffee business.

It is in cases just like this that everybody interested in the business will say, "Well! why didn't I or somebody else think of so simple a thing years ago." Only the other day a man got a patent for reflecting the eye sight along a gun barrel so that a soldier could stand or lie in a trench with the top of his head six inches below his gun barrel and sight it perfectly, instead of exposing the top of his head to the enemy as heretofore; a simple thing, of course, but why didn't you or a lot of people think of it? You have often looked into a telescope downward and seen the constellation above; it is simply reflection. In this case the inventor, finding that it was possible to reduce coffee to an impalpable powder without heating or gumming it up, first reduces the coffee to a granulated form in a mill that separates the coffee from the chaff. This chaff is the part of coffee which contains most of the tannin, and when steeped alone makes a splendid gargle for a sore throat (it being so great an astringent) and when left in the

coffee makes it bitter in the drinking, so when the coffee is made in a tin pot the least bit rusted, it forms tannate of iron (which is writing ink) so to speak. Then with the addition of a little pure sugar he runs it through his patent mill, with a blast that prevents it from becoming heated, for without this cooling, the coffee, being ground so fine, would become deprived of its flavour, and without the aid of sugar the machine would gum up, instead of which the sugar aids in the grinding, and readily absorbs the oil as the coffee is crushed. Under a microscope this fact reveals itself—the sugar is saturated with it. Sugar, as we all know, is a preservative, and it is found that the sugar keeps the ground product more perfectly and for a very much longer period than coffee keeps in the roasted bean state. Fruits are preserved with sugar, and still they are pure fruits, hence the reasonableness of calling this product "pure coffee."

The product is like velvet to the touch and dark chestnut in color. Take a pinch of it, it is like a confection; you take another, and it is palatable; take a given weight of it with a similar weight of Baker's Cocoa, place them in a cup, put the same amount of boiling, bubbling water on each, give them a stir, let stand for a few minutes, draw them off, and you'll find less than half the sediment in the cup that the coffee was steeped in than that of the cocoa—more than half of it apparently soluble in an exceedingly short time. The sugar acts as a clarifier also, yet does not sweeten it to the extent of not needing sugar as usual when drinking. And even if some of the sediment should by chance get on the tongue, one would not realize it—it is so smooth, not gritty like coffee grounds.

The patent is concise, clear, and most broad, exceptionally broad, and is registered in all the principal foreign countries.

Professor Wiley at Washington, who has distinguished himself in carrying on the recent food tests on human beings, after thoroughly testing this product at his laboratory, wrote a nine-page report upon it to the Commissioner of Patents, lauding the process and recommending its being granted as applied for. He speaks of it as a product "in which the liquid and oily particles of the coffee berry are uniformly distributed throughout the absorbent mass in a way which cannot be secured by any other known process, thus allowing these particles to be rapidly set free when brought in contact with hot water and to give up almost instantly their active principles to the decoction." "This," adds the professor, "is a desideratum which has long been wished for in coffee, and which has now been attained."

The new soluble coffee is being put up for the market by "The Private Estate Man," in one-pound paste board cartons, non-sifting, and lithographed in red and blue, back and front, with this legend: "One pound, absolutely pure, Coffey's Soluble Coffee, 'Premium Brand,' F. A. Cauchois & Co., the Fulton Mills, Established 1851, New York, U. S. A., Sole Licensees to Manufacture." On the top and bottom is a spread eagle, and the words "Protected by United States Patents," and on one side the following: "This coffee is roasted by a process which preserves the flavour, and ground so all the bitter chaff is removed. With pure sugar it is then reduced to an impalpable powder; keeps perfectly in any climate until used, then permitting all the strength to be extracted easily and quickly, unlike ordinary ground coffee." The package also contains the following by way of directions: "In preparing for the table, the usual way of boiling or leeching may be employed, but, being almost soluble, this is the only coffee known that can be prepared in the following economical and simple manner: Use a heaping teaspoonful for each cup. Put in an ordinary pitcher. Pour on fresh boiling (bubbling) water. Stir it for a second. Let stand for a few minutes, and it's ready to serve." On reverse side the same is printed in German.

Enclosed in each package is a premium list and coupon for "real gold filled jewelry," the articles being guaranteed by the jewelry makers for two years, and really they appear to be of such style that you or I would not be afraid to wear them—on occasions.

One hundred cartons are packed in a case with one handsome show card lithographed in black and gold, the wooden case being lettered on its sides in bright red and blue, while on the ends copies of the premium sheet are pasted. The price at all times will be governed by the ruling market for Ariosa and Lion Coffee.

Mr. Cauchois modestly stated: "I don't want to go on record as expecting to be a competitor of the Arbuckles; they are great people and stand alone, and have my profound respect for the success they have attained, and are entitled to it, but this process

permits me to use not so large or uniform a coffee as theirs, thereby creating a saving in first cost, and, as it is not sold on bean appearance, and there are so many people that buy ground coffee, I may perhaps get some of the crumbs from their table."

I ran a spoon handle through the slot at top to open the carton as directed, took out a teaspoonful, put it in an ordinary pitcher, poured on a large cup of boiling (bubbling) water, stirred it, and then let it stand for a few minutes as directed, and poured off a perfectly clear fluid coffee, which excelled in flavour the similar priced coffees. And this coffee although just packed was made on March 5, 1903. Mr. Cauchois himself said so.

At present Mr. Cauchois is only making a "Premium Brand" grade; later on he will place three higher grades on the market. Just now he is taking no orders for less than thirty days' delivery. He is having new machines built which will be ready to run in about six weeks, and in the meantime miniature samples of the one-pound cartons, holding a fair-sized sample and with premium list enclosed, will be sent to the discerning ones on receipt of six cents in stamps.

When F. A. Cauchois, with his thirty years or more experience in the coffee business, gets so enthusiastic over a product as to back it after this fashion, there must be merit in it.

I have spoken.

SIR ORACLE, in the *Spice Mill*.

### MR. CHAMBERLAIN'S PROPOSALS AND TEA.

We printed in our last issue, says, the *H. & C. Mail*, a letter which Mr. E. Lyulph Stanley addressed to the *Times* upon the subject of Mr. Chamberlain's proposals and tea. The correspondence called forth by this letter shows not only that there is no lack of champions ready to defend the interests of tea-growers, but that the weight of argument is on their side. Mr. Stanley did his best to show that a reduction by three-quarters of the duty on our imports of Indian and Ceylon teas, which make nine-tenths of our whole import, would have no effect on the price of tea, if the duty were not also taken off the remaining tenth which comes from China and Java. All that would happen, in his view, is that the Indian planters would pocket the whole of the difference. A correspondent, who signs himself "Indian Born," points out that for a real, rigid, simple arithmetic view of political economy Mr. Stanley would be hard to beat. "Indian Born" says:—"Will he go one better and say that, if a prohibitive duty were laid on China tea, the price of Indian tea would rise to any figure the Indian planter cared to ask? But let us look into his assumptions a little more closely. He assumes firstly that all tea is the same. But, as a matter of fact, tea is a substance whose price varies from 1s. to 4s. or more a pound, according to its peculiar quality. China tea in itself has a very distinct quality from Indian tea. There is no more economic necessity for the 263,000,000 lbs. of Indian tea to be sold at the same price as the China tea than there is for our New Zealand mutton to be sold at the same price as Southdown. Again, he assumes that our imports from India could not be increased by one-tenth for several years. Let him produce a single tea-planter who would not offer to send 15 or 20 per cent. more at the next harvest if he were guaranteed a sale for it at a price a very little, if at all, above the present price (not counting the duty, of course). The fact is, Sir, that none of these good gentlemen who work out these questions by simple arithmetic have any idea of the conditions that really rule production and prices in the industrial world."

Mr. Stanley endeavours in a second letter to go one better, but it is a lame attempt. He replies, "I assumed in my letter to you, criticised by 'Indian Born,' that it would take two or three years before India and Ceylon could fill up the void now supplied by Chinese teas. 'Indian Born' implies that this extra production would be forthcoming by next harvest. He further asks me if I maintain that the exclusion of foreign tea would send up the price of Indian tea to any figure the planter chooses to ask. In my letter to you I stated that when Indian production equalled our demand, the cost to us would probably be the cost of production *plus* 1½d. duty. One object of my letter was to show that, having regard to the growth of our tea production in India and Ceylon, any preferential treatment would operate for a very short time, and that natural causes under free trade were rapidly giving India and Ceylon the command of our market. A year or two more or less

in the growth of an industry is not very important. I did not state that Indian tea fetches the same price as Chinese tea. I only pointed out that in a commodity the average price of which is about 7½d. per pound a preference of 4½d. is enormous. I find that the price of Bengal tea in 1902 is returned in the 'Annual Statement' at about 7½d. per pound, and China tea was worth about 6½d. per pound. My point is that a preference to Indian tea would only operate for a very short time, and that, while it operates, it must, by keeping up the price of tea to the consumer, deprive him of the countervailing advantage offered by Mr. Chamberlain as a compensation for his taxes on corn, meat, and dairy produce. 'Indian Born' seems to think that barely for one year would the Indian tea-planter reap any benefit. If so, where is the boon offered to India? We cannot of any tax say in the same breath that it will help our colonies and dependencies by increasing the price they will get, and yet assure our consumers that the tax will not keep up or raise the price of the commodity so taxed preferentially."

Indian Born says, in answer to this:—"Mr. Lyulph Stanley makes no attempt to maintain his original assertion that a reduction in the duty on Indian tea would make no difference to the price as long as that reduction was not extended to the one-tenth of our tea imports which we still receive from China. On the contrary, he now veers round and says that the Indian tea-planter will not derive any benefit at all from the preference, because there will be no permanent rise in price, and he concludes by saying that 'we cannot say in the same breath that a tax will help our colonies by increasing the price they will get, and yet assure our consumers that the tax will not raise the price of the commodity.' Nobody has ever dreamt of saying that the preference given to the colonies is to consist of an increase in price; the preference surely lies in an extended and more certain market. Let me suppose that Mr. Lyulph Stanley is at present in the habit of going to two tailors, A and B, and that he suddenly decides to give the furnishing of the whole of his wardrobe to A at the same price as he has hitherto paid. Will A complain that he gets no advantage out of this preference?"

#### BRITISH-GROWN v. CHINA TEA.

The correspondence about tea which the *Times* has published during the last few days, although incidental to the fiscal question, takes a wider range. "Tea-Planter" calls attention to the superiority in the manufacture and cleanliness of treatment of the article in Ceylon and India, as opposed to the manipulation of the same article in China. He expressed the view that if the duty on all teas were reduced or abolished a serious and irreparable injury will be done to British-grown teas, to the advantage of China and other inferior growths. He argued that cheapness, not quality, is what many of the blenders affect, and to put a low-priced article before the British public has more attraction to them than cultivating the taste for a pure and unadulterated article.

He goes on to say:—"There being in London no Custom inspection as in America, any rubbish under the name of tea may be imported, and not only diminish the consumption of the genuine article, but also strengthen the medical campaign which is even now going on against tea-drinking generally, and thus the position of the tea-planter with the duty removed will be worse than if the present exorbitant and unjust tax were retained. I am, however, a strong believer in Mr. Chamberlain's honesty of purpose, and in view of the position he has taken up cannot bring myself to suppose that he would favour a line of action so diametrically opposed to all his public utterances as to reduce the duty all round on tea, without giving any preference to the British-grown article, in the same way as he suggests favouring Australian wines as opposed to those produced by foreign countries. Unless this is done and a higher duty retained upon foreign-grown teas, the British planter will have strong ground for complaint that his interests have not been considered, and every reason to fear that the lowering of the duty may prove an injury rather than a blessing, both to him and to the British public, upon whom a cheap and hygienically unsound article will in all probability be forced by the blender. It is undoubtedly the duty of public bodies interested in the welfare of the tea-industry to bear this point in mind, and to direct their efforts to preventing any reduction in the present duty which shall give a loophole to the dishonest blender to foist an inferior and deleterious article upon the public. This can only be brought about by retaining a

higher tariff upon all teas imported from foreign countries, and by giving a substantial preference to the teas produced by British capital and in British colonies. This, surely, is not asking too much, in view of what British energy and capital has already done for the countries where tea is now produced, and I am quite convinced that if only the Ceylon and Indian Tea Associations will take this question up and press the point, their claims, in view of preferential tariffs being generally adopted, cannot be ignored by the Government, and it will be a lasting disgrace to these public bodies and a betrayal of the trust reposed in them by those they represent if no action in this direction is taken."

Another correspondent, "Warehouse Keeper," writes:—"Conclusive as 'Tea Planter's' letter is as to the injury that would befall the British tea-grower in the event of a total abolition of the tea duty, by not referring to the serious monetary drawback to which the Indian or Ceylon planter is subjected, as compared with his Chinese or Japanese competitor, he has refrained from using a most powerful argument in his favour. His statement that tea imported into London undergoes no Customs inspection is, however, quite erroneous, and, to reassure the consumer, should not pass without challenge. No duty can be paid on any importations of tea into London until samples of every grade forming it have been submitted to a specially trained Customs officer, who can approve or not of their fitness for consumption in this country. Should any doubt exist, he can place the tea under a temporary stop until a sample has been sent to the office of the Customs analyst, whose decision is final. Hundreds of chests are condemned annually by this authority, with the alternatives to the importer of de-naturing the tea before sale to caffeine makers, or of exporting it for consumption abroad. That the inspection it undergoes at a United States port of entry is more rigorous may well be—much of the unwholesome China tea which gains entry here would certainly never be admitted to that country; but the fears of the all too sensitive British tea-drinker that any rubbish can obtain entry here should be at once allayed."

## RUBBER.

### IN MALAYA.

Mr. W. W. Bailey writes from Klang, Selangor, to the *Times of Ceylon*:—

I write with reference to a letter headed "Great Future of Rubber in Malaya" which the *Straits Echo* states appeared in the *Ceylon Standard* of 29th ultimo re an interview with Mr. M. S. Parry, of the F. M. S. United Planters' Association, and Mr. Tunnicliffe.

I do not wish to question the great future of rubber in the Malay Peninsula or to enter into a discussion as to whether the alluvial flats of the Klang, Perak, and other rivers are better for rubber cultivation than the hill lands; for planters cannot have had their eyes shut as to how such well drained flats have proved their capabilities in coffee, tea, and cocoa; (I do not allude to some undrainable swamps or to such so close to the sea, and so low that they are affected by high tides; but I agree with the old saying about comparisons, and I cannot understand how the *Ceylon Standard's* informants had the courage to dictate the following paragraph:—

#### "KLANG AND UP-COUNTRY LAND.

"The varieties cultivated are Pará and Rambong. This latter kind, the *Ficus Elastica*, does well at the Negri Sembilan, and in the Klang land is far preferable to Pará. The Klang is the heavy, undrained deep soil by the coast, and is excellent for coffee, but not as suitable for rubber as the up-country districts, as the roots cannot get sufficient grip in the soft soil, and the sea winds frequently blow down the trees; also white ants are very troublesome there. In connection with this Mr. Parry thinks the Ceylon planters and others who invested in Mr. Wickwar's up-country estates are to be congratulated, this land being preferable to the Klang. Certain up-country planters, Mr. Tunnicliffe informed us, having been asked to float their estates as companies gave the rejoinder that when they get a good thing, why should they give it away by floating. The planters there evidently have faith in the future of the Malay States rubber industry."

If they wished to do Mr. Wickwar's Company a good turn they have had their wish gratified, for I know of no better up-country

estate than the (new) Seramban Company's, and I have not got a word to say against it: and it may prove itself to be even as what is considered by many men to be the best rubber estate in the Peninsula, namely, the Sungei Rengam estate (the Salangor Rubber Company, with 1,150 acres opened in rubber, and 3,600 acres of reserve jungle lying between river and railway for over 5 miles, and with 3 railway stations on it), which is in the Klang district, and of which Professor Troub (of the Botanic Gardens, Buitenzorg, Java) said last month: "It was a magnificent sight, and I did not expect to see such a grand sheet of rubber in the Malay Peninsula." All the Klang district is not good; but there are plenty of splendid estates in Klang, which I do not intend to mention, for I feel sure that other planters will feel hurt at your (*sic*) informants' remarks, whether they happen to have good or bad estates.

I shall say nothing about my own estate in the Klang district more than that I have heard the opinions of such men as Mr. E. S. Grigson, Mr. Thos. North Christie and Mr. Norman Grieve on it, and I am prepared to take their opinions as against your informants'; though none of these men ever ran down the up-country estates: for like me very likely they are interested in both, and consider comparisons as I do. I would not answer this letter had it only appeared in a local paper: for the opinions expressed in it would do no harm here; but, as I represent owners of estates in both Klang and Kwala Lumpur, I feel it my duty to take some notice of it, and if possible to prevent such wrong expression of opinions; and I hope that both up-country and low-country rubber will continue to look as promising as it does at present.

Other men here are not likely to let such a letter as this pass, and it may possibly raise such a nest of hornets about the ears of your informants as will sting them in places that are unprotected, and do them more harm than it can possibly do to the owners of good low-country land.

Take for instance one part of the statement as follows:—

"Klang is a heavy undrained deep soil by the coast, and is excellent for coffee: but is not so suitable for rubber as the up-country districts and," etc.

All land is undrained until it has been drained; and land undrained and undrainable is neither suitable for coffee or rubber, and men who have tried to grow either on it deserve the consequences: yet one estate in the Klang district with a main drain 26 feet wide and 10 feet deep at its mouth and 45 miles of all sorts of smaller drains, gave a large profit last year and supported 600 acres of rubber, 400 acres of which is over 5 years old, besides opening a hundred acre clearing in coffee 7 x 7 and rubber 14 x 14: can this land be bad or unsuitable for Pará rubber?

Again, "deep soil by the coast": men who took up land sufficiently near the coast as to be affected by high tides and salt water should have planted cocoanuts in it: but many of the Klang estates are miles away from the coast, some 15 miles.

I now quote some paragraphs from Brazil diplomatic and consular reports:—

"Trade of Pará and the district for the year 1887" (page 26):—

"*Habit of Pará.*—The localities where rubber trees thrive best are on islands, and low ground near rivers, where the banks are periodically inundated. Ground that has no drainage is not suitable to the tree."

"*Richest zones.*—The richest zones as at present known are along the banks of all the southern tributaries of the river Amazon, and on the islands in the main stream and near Pará."

"The most prolific part is on the river Aquiry or Acrê, one of the tributaries of the river Purús."

"The northern tributaries of the Amazons do not produce much rubber. Of these the river Negro produces the most, and etc."

"The river Branco yields very little rubber, and the upper part runs through pasture lands and high ground (no doubt of a considerable elevation) which is not suitable for good rubber."

"*Rainfall.*—The rainfall during 1897 amounted to 115 inches. Rain fell during 291 days, and the maximum during one day amounted to 3 inches."

"*Height.*—It grows to a height of 60 feet."

"*Leaves.*—The leaves are trifoliate."

"*Flowers, fruits, and seeds.*—The seeds should be planted as soon as possible as they soon lose their vitality."

No doubt the high ground that the Consul writes of in the upper reaches of an enormous river like the Amazon is land of a considerable elevation, and I think Mr. Parry has mis-named the higher

land here planted with Pará as hill land. They should be called low-country hills which have an elevation of, in most cases, not more than 100 feet from sea-level, like the Seramban Company's land, and this land has proved itself to yield well, trees 12 years old having averaged 81 lbs. each.

It is no pleasure to me to have to write this letter, and I am sorry that my friend Mr. Parry should have been tempted to lend his name in the way he did to such a production as the paragraph headed "The Klang and up-country land."

Klang, Selangor, November 24th, 1903.

#### IN SOUTH AMERICA AND MEXICO.

The following are extracts from a letter received from an old Ceylon planter:—

I have just come from a long visit to the rubber forests of Bolivia and Peru on the upper tributaries of the Amazon. The rubber from these forests is exported from Mokeado on the Pacific Coast, and is called "Mokeado Rubber," just as that from the lower parts of the Amazon Valley is mis-called "Pará rubber" from the final port of shipment, Pará.

I am not yet quite clear whether the tree called *Hevea Brasilsensis* in the lower district of the Amazon is identical with the *Hevea Lutea* which I saw near the foot of the Andes.

It grows there in wonderful profusion to a great size and is very rich in milk. I measured trees over 9 ft. in circumference, and the rule is never to tap one less than 3 ft. round. There are tens of thousands of square miles of untouched forests there in which *Hevea Lutea* is one of the most prevalent trees. Hitherto roads have not been attempted to be constructed, and the imbeciles who figure as Governments have pronounced it impossible to make them. However, now English and Americans are developing the country, and find it is just as possible to make roads there as we did in Ceylon.

Unfortunately I was detained over two months in Peru after my business was done, by quarantine, so had to give up a visit to the Mexican rubber cultivation districts, were I had been commissioned to visit and report upon a property which in the prospectus was "guaranteed to give a profit of \$550 per acre per annum for 40 years!"

However, on my return to New York I got the report issued by the Agricultural Department of Washington, drawn up by a Commission specially sent to examine the whole rubber cultivation of Mexico and Central America. It is almost entirely *Castilloa* they cultivate there. The result of the report is that the investor is advised to exercise extreme caution in putting his money in rubber Companies. While here and there small ventures have proved a success, and rubber cultivation has been proved an agricultural possibility, it will be a long time before it is out of the experimental stage. It has proved very capricious as to where it will, and where it will not, grow. No large acreage has proved a success: and, worse than all, often the best-grown and most-promising trees when tapped proved deficient in milk.

I do not write to discourage rubber-growing in Ceylon, but know you are glad of any facts connected with planting enterprises.

#### MARKET REPORT.

[Per Mail advices of November 20th, 1903.]

#### COFFEE.

There have been no offers of Plantation Ceylon at auction during the past week, and the business in East India has been insignificant. There has been a fair demand for Nyassaland, which sold at firm prices. No change has occurred in the value of Central American descriptions, and Colombian is also without change, but the demand was not active. Santos brought valuations. There has not been much variation in the market for Brazil "futures," but the tone was somewhat dull at the close, although prices show some advance for the week; yesterday Santos for December delivery sold at 29s. 7½d. to 29s. 9d., March at 30s. 9d. to 31s., May at 31s. 6d. to 31s. 7½d., and July at 32s. 1½d. per cwt. We quote:—

London ...	Santos ...	March delivery	...	31s. Od.
New York ...	No. 7 Rio ..	"	"	5'85 cents.
Hamburg ...	Santos ...	"	"	31½ pf.
Havre ...	Santos ...	"	"	38½ francs.

Auctions this week have gone off as under:—

EAST INDIA—Of 6 casks 3 barrels 484 bags offered only 26 bags *Neilgherry* sold—small 47s., peaberry 62s.

MOCHA—40 half-frazils retired unsold.

NYASSALAND—Of 293 bags catalogued 180 bags sold—small 35s. to 39s. 6d., low middling to middling 43s. 6d. to 46s. 6d., fair bold 50s. to 51s., peaberry 43s. to 52s.

COSTA RICA—89 bags half sold—small 38s., low middling greenish colory 48s., middling 57s., fair bold 64s. 6d., good bold 83s., peaberry 54s. to 70s.

LIBERIAN—111 bags bold brownish of old import sold at 31s. 6d.

ECUADOR—80 bags partly sold at 32s. for sea-damaged bulked.

GUATEMALA—Of 432 bags offered 150 bags sold—middling 50s., good bold 60s., peaberry 65s.

COBAN—61 bags sold—small 30s., low middling dull grayish 50s.

SALVADOR—Of 211 bags brought forward only 30 bags sold—fine ordinary bold foxy palish 39s. 6d.

NICARAGUA—190 bags sold, good ordinary foxy palish 37s. to 38s., common bold 48s. to 48s. 6d.

COLOMBIAN—1,624 bags practically all sold, small 26s. to 33s. 6d., fine ordinary greenish and brownish 38s. 6d. to 40s. 6d., low middling to middling 45s. 6d. to 49s. 6d., common bold 38s. 6d. to 42s., fair bold 44s. 6d. to 47s., good bold 60s., peaberry 41s. to 50s.

MEXICAN—39 bags bought in.

BRAZIL—54 bags washed Dumont Santos sold, pickings 23s. 6d. to 33s. 6d.; of 1,500 bags unwashed, on quay terms, 930 bags sold, medium greenish foxy 34s. to 34s. 6d., bold 37s. 6d. to 39s. 6d., peaberry 43s. to 43s. 6d. 500 bags Santos were bought in.

#### Receipts in Rio and Santos.

	1903-04.	1902-03.	1901-02.	1900-01.
Since July 1—	Bags.	Bags.	Bags.	Bags.
Rio ...	2,425,000	2,146,000	3,059,000	1,417,000
Santos ...	4,571,000	4,767,000	5,972,000	4,614,000
Total ...	6,996,000	6,913,000	9,031,000	6,031,000
Crop ...	...	12,324,000	15,496,000	10,900,000

Rio Exchange 12½d., previous day 12d.

HAVRE, November 19.—Good average Santos November opened quiet at 37½f. and closed steady at 37½f., December opened at 37½f. and closed at 37½f., March opened at 38½f. and closed at 38½f., May opened at 38½f. and closed at 38½f., July opened at 39½f. and closed at 39½f., September opened at 39½f. and closed at 39½f.

HAMBURG, November, 19.—Good average Santos November opened quiet at 30½pf. and closed steady at 30½pf., December opened at 30½pf. and closed at 30½pf., March opened at 31½pf. and closed at 31½pf., May opened at 31½pf. and closed at 31½pf., July opened at 32½pf. and closed at 32½pf., September opened at 32½pf. and closed at 32½pf.

NEW YORK, November 19.—Closing prices of No. 7 Rio were as follow:—

	Nov.	Dec.	Jan.	Feb.	Mar.
November 19 ...	5'50	5'50	5'65	5'75	5'85
November 18 ...	5'50	5'55	5'65	5'80	5'90

Auctions to-day embraced—336 bags Nyassaland, 21 bags Jamaica, 23 half-bales Mocha, 128 bags Ecuador, 71 bags Mexican, 702 bags Columbian, 84 bags Costa Rica, 172 bags Nicaragua, 82 bags Guatemala, 14 bags Salvador, and 1,010 bags New Grenada. The sales went off with fair demand without alteration in values.

A decidedly steady tone has prevailed throughout the day for Brazil "futures," although little business has been passing the pointers for to-morrow. Santos receipts were very small, 13,000, but we want to see a decided falling-off in receipts to put new life into the market.

Closing quotations—	Sellers.	Buyers.
December ...	...	30/ 29/9
March, 1904 ...	...	31/1½ 31/
May ...	...	31/9 31/7½
July ...	...	32/4½ 32/1½
September ...	...	32/10½ 32/7½

Brazil receipts 54,000 bags, against 43,000 and 57,000 the two previous years, and exchange unchanged at 12½d. Hamburg and Havre unchanged. New York opens unchanged. Transactions include—near 29s. 10d., March 31s., May 31s. 7½d., July 32s. 3d., September 32s. 9d.

Messrs. C. J. Leech & Co. write:—"Receipts in Rio this week were again somewhat smaller, and the decrease has now been a steady one for five weeks in succession, so that 4,000,000 bags for the season appears a fair estimate. Santos receipts show a distinct decrease, and shape favourable for a verification of our estimate of 7,000,000 bags for that port, or say, 11,000,000 bags for Rio and Santos together, against 2,324,000 bags last season; but although this week's crop movement was in every way encouraging, markets have failed to respond mainly because the trade demand has continued slow. In the meantime holders at the primary ports maintain a firm attitude and obtain relatively high prices owing to extensive purchases in both Rio and Santos for United States account. Crop news has been meagre, and practically the only contribution was Mr. Karl Krische's cable on Tuesday, Santos interior stocks small, estimate current Santos crop at 7,000,000 to 7,250,000 bags. Prospects for a moderate crop (1904-1905); drought done considerable damage. Mail advices from New York continue stimulating, and strongly emphasise the opinion that the prospects of the growing crop are decidedly adverse, and that, if only partially confirmed, must result in materially higher prices hereafter. One circular to hand, discussing the damage done by the frost in August last year, expresses somewhat positively that '20 to 25 per cent. of all the trees in the State of São Paulo have been put out of bearing for at least four or five years; therefore record crops such as we have had of recent years may be considered a matter of the past.' Rio receipts this week, 90,000 bags, against 104,000 bags last year and 114,000 bags for six days only in 1901. Santos receipts 167,000 bags, against 233,000 bags last year and 236,000 bags for six days only in 1901. The market in Santos is rather easier, and we quote to-day good average 31s. 3d. c. & ft. A year ago the price was 23s. c. & ft. Fluctuations in the speculative markets have again been moderate, and London futures, after a set-back of 7½d., have recovered on the smaller receipts. Compared with last week, we note London 'futures' partially 1½d. dearer, Havre generally ¼f., and Hamburg ¼pf.

dearer. New York has declined 15 points for most positions, with November only 5 points and December 20 points lower."

LONDON.—Spot market steady, but quiet; at auction Columbian sold at irregular rates, and Guatemala sold well. Futures opened dull and 3d. lower, but recovered later, and closed at about previous prices. Sales, 20,750 bags. London Clearing-house quotations: November, 29s. 6d.; December, 29s. 9d.; March, 31s.; May, 31s. 7½d.; July, 32s. 1½d.; September, 32s. 7½d.

NEW YORK (Reuter's telegram).—Coffee opened quiet and unchanged, became bearish, under easier European cables, longer liquidating, and selling by importers as a hedge against purchases in Brazil. The market closed steady, unchanged, to 5 points down, but mainly unchanged. Spot, quiet, unchanged. Rio, 6½c. Sales, 64,000 bales.

To-day—November, 5.50; December, 5.50; January, 5.65; February, 5.70; March, 5.85; April, 5.95; May, 6.05; June, 6.10; July, 6.20; August, 6.25; September, 6.30; October, 6.35.

Previous day—November, 5.50; December, 5.55; January, 5.65; February, 5.80; March, 5.90; April, 5.95; May, 6.05; June, 6.10; July, 6.20; August, 6.25; September, 6.30; October, 6.35.

#### TEA.

INDIAN.—Public sales included 41,400 packages, against 42,800 at the date of our last circular, and 38,000 at this time in 1902.

South India was represented in the catalogues by about 3,900 packages.

A quieter tone has been apparent and prices have eased nearly ¼d. under 6½d.; above this rate the demand was more irregular, especially for leaf descriptions, but, as a rule, any appreciable decline in quotations was to a great extent due to a falling-off in quality, more particularly noticeable in Assams. Really good tea continued to sell freely, but the proportion of such was limited. The feature of the present market is the wonderful value obtainable between 6½d. and 7½d. in comparison with the grade below.

USE

# ST. JACOBS OIL

**F**OR RHEUMATISM, Gout, Sciatica, Neuralgia, Cramp, Pleurisy, Lumbago, Sore Throat, Bronchitis, Soreness, Stiffness, Bruises, Toothache, Headache, Backache, Feetache, Pains in the Back, Pains in the Shoulders, Pains in the Limbs, and all bodily aches and pains,

**IT ACTS LIKE MAGIC.**

SAFE, SURE, and NEVER FAILING. Price 1/1½ & 2/6.

# CONQUERS PAIN

Fluctuations in a trade of large dimensions are of course, bound to occur, and, in fact, are necessary to its vitality, and confined within reasonable compass, generally prove beneficial. The possibilities of the further future is being reflected in an inquiry for tea shares to an extent which has not been experienced for a very long period.

The exports from Calcutta and Chittagong for the first fortnight of the current month mark, as compared with last year, a falling-off of nearly a million lbs., and the excess shown for the season is now only some  $6\frac{1}{2}$  millions; in view of the crop estimates recently published, it would appear that the bulk of the increase is being realised in the gatherings from October 1st onwards, but it must be remembered in comparing outturn for this period with last year, that the shortage then was altogether phenomenal.

For 38,600 packages on Estate account  $7\frac{3}{4}$ d. per lb. was obtained, contrasted with  $7\frac{1}{2}$ d. for 32,300, and 7d. for 31,800 in the two preceding seasons.

CEYLON.—Auctions comprised 15,600 packages. On the Tuesday before the quantity was rather larger, viz., 1,250 and 15,900 twelve months since.

Business in the country is reported to be quiet, so that buyers were less eager, and the sale passed with some irregularity, former rates not being always forthcoming. Common to fair grades did not, on the whole, show much change, but here and there a slightly lower quotation was made. Good medium kinds received fair attention, although values were not so generally firm as last week. Fine and finest lines which about maintained their position were less plentiful, and quality all round was not so attractive.

The average is 8d. per lb. opposed to  $8\frac{1}{4}$ d. per lb. on the 12th instant, and a little over  $7\frac{3}{4}$ d. per lb. a year ago.

JAVA.—Rather over 2,800 packages were submitted. In sympathy with other growths, these sorts tended against sellers, prices in some cases indicating a decline of  $\frac{1}{4}$ d. per lb. since the last sale a fortnight since. An invoice from Goalpara was however well competed for, and brought 10d. per lb.

Deliveries.—Clearances of all tea (on which duty has been paid) from the London warehouses, as per official returns are, viz.:—  
From 1st to 17th November, 1903 ... 11,666,157 lbs.

" " " 1902 ... 11,160,681 "

#### CEYLON TEA IN AUSTRALIA.

SYDNEY, November 13th.—The bulk of yesterday's tea-buying was done under the hammer. Competition, however, was the reverse of active, as buyers seemed to consider the recent decline in freight rather than the rapid advances in cost, which have immediately followed in the Colombo market. Sales were mentioned privately of 100 packages of Ceylons, at prices ranging from 10d. to 11d., also 80 packages at 8d. to  $10\frac{1}{2}$ d. Other business was pending in Ceylons at about the same limits.

Messrs. H. W. Carey & Co. report having offered 670 packages Ceylon Tea at their sale room yesterday, on account of Messrs. Gibbs, Bright & Co., and Gollin & Co. Proprietary, Limited. Rather more disposition was evinced for business than at the morning sales, but still biddings generally were too much below vendors' costs to be accepted, and in the aggregate they cleared about one half only of the catalogue. Pekoes realised  $7\frac{1}{4}$ d., Broken Pekoes and Broken Orange Pekoes  $7\frac{1}{4}$ d. to  $11\frac{1}{2}$ d.

Messrs. F. H. Dyer & Co. offered a catalogue of tea yesterday at the Royal Exchange, on account of Dalgety & Co., Limited, comprising 424 packages of Indians and 194 packages of Ceylons. They cleared 300 packages of Indians at  $6\frac{1}{4}$ d. to  $7\frac{1}{4}$ d. for Pekoe Souchongs,  $7\frac{1}{4}$ d. to  $8\frac{1}{4}$ d. for Pekoes, and  $9\frac{1}{2}$ d. for Broken Orange Pekoes. One hundred and ten packages of Ceylons sold up to 8d. for Pekoes,  $7\frac{1}{2}$ d. for Broken Pekoes, to  $9\frac{1}{2}$ d. up to 1s.  $2\frac{1}{2}$ d. for fine Broken Orange Pekoes.

Messrs. Fraser Uther & Co. offered 428 packages of Ceylon teas at the City Mart, under instructions from Mr. R. T. Remington. Moderate clearances were effected at 7d. to  $8\frac{1}{2}$ d. for medium Broken Pekoe.  $9\frac{1}{2}$ d. to  $10\frac{3}{4}$ d. for fine, to  $13\frac{1}{2}$ d. for finest. Fine Pekoes sold from  $8\frac{1}{2}$ d. to  $9\frac{1}{4}$ d. They also offered 598 packages of Ceylons on account of Messrs. Fraser, Ramsay & Co., of which a portion found buyers at current rates.

MELBOURNE, November 18th.—Business in tea covers 250 chests of Ceylon up to  $11\frac{1}{2}$ d.; 150 chests of Indian up to 7d., and 75 half-chests of Panyong up to 7d.

ADELAIDE, November 18th.—Teas are moving slowly, and individual sales do not call for special mention.—*Sydney Daily Telegraph*, November 14.

#### Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 20th, 1903, says:—

##### QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1903-1904 ...	703,203	528,661	49,595
1902-1903 ...	742,123	594,776	38,602
41,603 pkgs. INDIAN 15,808 " CEYLON 2,840 " JAVA	Total 60,251 packages were offered in public auction this week.		

The active demand which was so pronounced a few weeks ago has been gradually slackening, and it seems evident that if prices are to be maintained, the quantities brought to auction must be on a considerably smaller scale, and remain so until the demand improves again. The possibility, if not the probability, of a reduction in the duty next Spring affords an additional reason for firmness in dealing with an article which may shortly be under a lesser burden of taxation.

The first nine months of this year show an increase in the use of Indian and Ceylon Tea in Foreign and Colonial markets.

	1903.	1902.	1901.	1900.
Indian ...	28,665,337	28,533,005	24,329,302	18,914,844
Ceylon ...	51,582,247	48,678,769	43,694,968	36,268,160
Total lbs...	80,247,584	77,211,774	68,024,270	55,183,004
	1899.	1898.	1897.	
Indian ...	17,806,844	15,994,547	14,058,281	
Ceylon ...	28,221,746	26,914,107	20,800,934	
Total lbs...	46,028,590	42,908,654	34,859,215	

The advance is not much, but in face of a dearer market it is something to have not only maintained the great increase which took place in 1902, but also to have improved upon it.

##### Export of Indian and Ceylon tea (in lbs.) to places outside U. K. from 1st January to 30th September.

	INDIAN TEA.

Total lbs...	51,582,247	48,678,769	43,694,968	36,268,160

INDIAN.—Although sales were rather less than a week ago bidding lacked animation, and it was evident that supplies were beyond the immediate requirements of the trade; consequently with a weaker market a considerable quantity was withdrawn. Exports to U. K. first half November 12,080,000 lbs., against 12,960,000 lbs. same period 1902; 1st April to 15th instant 115,792,000 lbs., against 109,370,000 lbs. Averages:—"Darj. Con. T. Co. Murmah,"  $1/8\frac{1}{4}$ ; "Amal T. E. Co. Phuguri,"  $1/7\frac{1}{2}$ ; "Tara T. Co.,"  $1/1$ .

##### Revised Customs Imports of Tea from 1st June to end of August:—

	INDIA			
	(including Calcutta and Chittagong)	1903.	1902.	1901.
Madras Presidency (including Travancore)	24,783,906	25,028,861	26,633,744	
Bombay Presidency..	1,678,069	26,897,204	1,179,935	
	435,229	424,948		
CEYLON ...		29,362,554	32,091,652	
CHINA ...		9,075,455	8,294,148	
OTHER COUNTRIES ...		4,340,780	2,841,657	

Week's av. of New Season's Tea sold on Garden Acct. 1903, 38,630 pkgs., av.  $7/59d$ . 1902, 32,606 pkgs., av.  $7/57d$ .

New Season's Tea sold on Garden Acct. 1st June to date 1903, 549,356 pkgs., av. 7.89d. 1902, 533,587 pkgs., av. 7.19d.

CEYLON.—There was less competition among buyers, and last week's prices were in consequence hardly maintained, medium teas especially showing rather easier rates. Exports to U. K. for first half of November 3,300,000 lbs., against 2,600,000 lbs. last year.

Average for week 7.96d., against 7.80d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 894,667 pkgs., av. 7.51d. 1902, 1,015,117 pkgs., av. 6.75d.

JAVA.—All the teas were of direct import and comprised invoices from seventeen estates, they were nearly all disposed of in the room with fair competition and without material change in rates. A few Green Teas were included in the catalogues.

### COCOA.

Public auctions on Tuesday offered 3,094 bags, which experienced but a poor inquiry, hardly 900 bags selling in the room. Of 335 bags Trinidad only 30 bags sold, at 73s. for fine red, and 67s. for middling. Grenada was the exception to the prevailing dullness, a good demand being experienced for this growth at full prices to, in the case of fine qualities, 1s. per cwt. advance; the 283 bags catalogued all sold at 60s. 6d. to 64s. 6d. for good to fine, 55s. to 57s. for fair, and 51s. to 54s. for common to fair common. Of 369 bags Jamaica about 270 bags were disposed of at 1s. to 2s. per cwt. decline, fair bringing 53s., and common 48s. 6d. to 49s. 18 bags fine Demerara realised 64s., and 95 bags ordinary to good Dominica 53s. to 57s. Of 463 bags Guayaquil 100 bags sold—Caraquez at 68s., Esmeralda at 62s. 6d. 5 bags Costa Rica brought 60s. 42 bags fair to good dark Honduras sold at 56s. 6d. to 60s. Of 633 bags African, only 19 bags of fine found buyers at 59s. Ceylon steady in value, but slow of sale; 505 bags offered, and 95 bags sold—fair bold and medium at 62s. 6d., fair to good small at 55s. to 60s. 6d., and collected at 49s. per cwt. Bought-in growths comprised 2 bags St. Vincent, 72 bags St. Lucia, 41 bags Venezuelan, 221 bags Puerto Cabello, and 10 bags Pará. Privately sales include good Trinidad at 70s., very fine fermented Jamaica 63s., Hatti at 42s., Guayaquil Caraquez at 63s. to 72s., and early Arriba at 74s. 6d. to 75s. per cwt.

### PEPPER.

Black.—The market has been very quiet this week. Of Singapore sales on the spot have been made at 6 $\frac{1}{16}$ d. for fair, at 6 $\frac{3}{8}$ d. for January-March shipment, and at same price for February-April; about 100 tons sold.

Auctions on Wednesday offered 148 bags fair Singapore, which were bought in at 6 $\frac{1}{2}$ d. per lb.

The shipments of Black Pepper for the first half of November compare as follows:—

	1903.	1902.
U. K.—Singapore ...	10 }	nil }
„ Penang ...	nil } 10	20 }
Continent ...	210	70
U. S. ...	170	390
Total tons ...	390	480

White is easier and nothing reported done for arrival. On the spot the sales include fair Singapore at 10 $\frac{1}{2}$ d., and fair Penang at 9 $\frac{3}{4}$ d. per lb.

At public sale on the 18th instant, of 365 bags Singapore brought forward 266 bags sold, partly “without reserve”—good bold 10 $\frac{3}{4}$ d. to 10 $\frac{7}{8}$ d., good washed 10 $\frac{1}{2}$ d., and fully fair 10 $\frac{1}{4}$ d., one cutting-in lot 10 $\frac{3}{4}$ d. per lb. 25 bags Penang were bought in at 9 $\frac{3}{4}$ d. per lb.

The shipments of White Pepper for the first half of November compare as follows:—

	1903.	1902.
U. K.—Singapore ...	220 }	70 }
„ Penang ...	20 } 240	20 } 90
Continent ...	10	50
U. S. ...	20	50
Total tons ...	270	190

### GINGER.

COCHIN.—Cut sorts were forced off at a heavy depreciation on the previous somewhat nominal value, especially as regards the bolder lots; washed rough, too, was offered a shade below last week's rates without finding buyers. Catalogues embraced 85 cases 141

bags, of which 25 cases sold, partly “without reserve,” as follows—medium with some bold cut and scraped, lightly limed, 60s., small with some medium ditto 42s. 6d., good plump small cut, limed, 41s. 6d., duller and leaner ditto 40s.; washed rough medium and small was bought in at 31s. to 32s., with small ditto at 29s. per cwt.

BENGAL.—40 bags rather lean and wormy half sold at 27s. per cwt.

JAPAN.—On the spot business has been done privately at 25s. 6d. per cwt.

JAMAICA.—Of 100 barrels catalogued 41 barrels sold—common lean and dark at 38s. to 39s., but chiefly mouldy at 37s. to 38s. For 21 cases of good washed the best bid was 45s., resulting in them being bought in at 60s. per cwt.

### CINCHONA.

At auction on Tuesday 1,407 packages were brought to the hammer, the bulk of which was Calisaya and African; the quantity offered contrasted with 1,780 packages at the previous sale and 1,341 packages in November last year. A strong demand was experienced, more especially for Bark with a good percentage of Chinchonidine contents, and prices were higher, the value of the unit being 1 $\frac{1}{2}$ d. compared with 1 $\frac{7}{16}$ d. at the November auctions, 1 $\frac{1}{4}$ d. this time last year, and 1 $\frac{1}{8}$ d. per lb. in 1901.

Of 422 bales *South American* offered 300 bales sold—Bolivian cultivated yellow Calisaya quill 5 $\frac{3}{4}$ d. to 6 $\frac{7}{8}$ d. per lb.

23 bales *Ceylon Chinchona* sold—Succirubra chips 3 $\frac{1}{2}$ d. per lb.

Of 330 bales *East India Chinchona* catalogued about 200 bales sold as follows:—Officinalis, chips and shavings 2 $\frac{1}{2}$ d. to 6 $\frac{3}{8}$ d., ditto renewed 4d. to 7 $\frac{1}{8}$ d., branch 3 $\frac{3}{4}$ d., root 7 $\frac{1}{8}$ d. to 8 $\frac{1}{2}$ d.; Ledgeriana, chips 6 $\frac{1}{8}$ d., branch 2 $\frac{1}{4}$ d. per lb.

Of 190 bales *Java Chinchona* 50 bales sold—Ledgeriana, branch 8 $\frac{3}{4}$ d.; Hybrid, branch 5d. to 5 $\frac{7}{8}$ d., root 6 $\frac{3}{4}$ d. per lb.

442 bales *West Coast African* sold—Succirubra quill 4 $\frac{1}{2}$ d. to 5 $\frac{1}{2}$ d., broken quill and chips 4d. to 4 $\frac{3}{4}$ d. per lb.

The dates of the Sales for 1904 in London have been fixed for: January 19th, February 16th, March 15th, April 19th, May 10th, June 14th, July 12th, August 9th, September 13th, October 18th, November 15th, and December 6th.

The shipments of Bark from Java compare as follows:—

	1903.	1902.	1901.	1900.
January ...	593,000	975,000	1,000,000	603,000
February ...	655,000	520,000	748,000	641,000
March ...	1,040,000	680,000	864,000	650,000
April ...	1,065,000	1,000,000	791,000	524,000
May ...	1,155,000	1,040,000	745,000	816,000
June ...	1,200,000	1,170,000	1,036,000	666,000

## QUININE.

Sulphate of Quinine has been very quiet owing to the approach of December, when many speculative contracts matured. A small business was transacted in March at 1s. 1d. but the closing value is 1s. 0½d., with sellers of December delivery at 1s. 0¾d. 30,000 ozs. have privately changed hands. The manufacturers' quotation remains at 1s. 1d. per oz.

Quiet. There was a firmer feeling on the receipt of the news of the small bark-shipment for the half month, with December buyers at 1s. 0½d., and small sales of March at 1s. 1d. Subsequently, however, the second-hand market declined, small sales of December delivery being made on Wednesday at 1s. 0¼d. for good brands of German sulphate. At the Java tenders quinine held at Batavia on November 18th 7,656 kilos. of Ed. II. was offered, of which 117 kilos. was sold at an average of f. 19 per kilo. (about equal 7¼c. Amsterdam unit) against f. 19½ per kilo. at the previous tender. The next tender to be held at Batavia will take place on December 23.

## VANILLA.

At the auctions held on Friday, November 14, a considerable quantity, amounting to 1,410 tins of Seychelles, was offered, and, with a brisk demand, practically the whole was disposed of at

steady to higher prices. Fine long beans were in very small supply, and sold at a considerable advance. Short and medium realised full prices, and red and split were in good demand at full to rather higher rates. The following prices were paid: Fine Seychelles, 8 to 8½ inches, 17s. to 19s. 6d. per lb.; good to fine, 7½ to 8 inches, 11s. to 17s.; browner, 7½ inches, 9s. 3d.; fair to good, 7 to 7½ inches, 8s. 6d. to 11s.; ditto, 6½ to 7 inches, 5s. to 8s. 9d.; 6 to 6½ inches, 5s. 3d. to 8s.; 5 to 6 inches, 5s. to 6s. 9d.; 4 to 5 inches, 4s. 6d. to 6s.; 3 to 4 inches, 4s. to 5s. 3d.; ordinary weak, 6 to 7 inches, 4s. to 5s. 6d.; various, red and split, ordinary to fine, 3s. to 7s. 6d. per lb. The next sale will take place in January, 1904, but the date is not yet fixed.

## INDIA-RUBBER.

The market has fluctuated, and prices fell to 3s. 9¾d. for hard fine forward and 3s. 9d. for soft, but close firmer with sales of hard fine Pará forward up to 3s. 10¾d., ditto spot 3s. 11d., soft cure fine forward at 3s. 9½d.; negroheads, scrappy sales down to 3s. 3d.; Cametas, spot at 2s. 3d. Peruvian, sales of ball down to 3s. 2d., forward delivery and scrappy same price; prices for medium kinds are also rather cheaper. 500 tons Congo rubber offered in Antwerp this week sold at 10 to 12 per cent. decline on the valuations of last sales. There were no auctions here to-day.

(AVERAGE FOR ALL INDIA 7.59d., NOVEMBER 20TH.)

## A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VIII.]

MADRAS, SATURDAY, DECEMBER 19, 1903.

[No. 50.]

### SEASON REPORTS.

#### TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Wednesday, the 30th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

#### Munzerabad.

*December 15th.—Weather—*Wind from the East. Nights very cold down to  $48^{\circ}$  in the early mornings. Rain gone. *Works—*Gathering started, but only a little coming in,  $\frac{1}{2}$  bushel to  $\frac{3}{4}$  bushel. *Coffee—*A fine bold sample. *Crop prospects—*very moderate; for next year the prospect is also moderate, the wood was good, but the late rains have done much damage, causing a false bud to sprout; it is yet to be seen how great the damage was. *Health—*Good. *Labour—*Short. *Interesting item—*The Deputy Commissioner lies at Sukrawar-sante, after a bad illness at the Bisle Ghaut. A moderate paddy crop, rain interfering with the harvest also.

### NOTICE.

In consequence of the Christmas Holidays there will be no issue of this paper next week.

The Editor avails himself of the present opportunity to wish all Readers

A Happy Christmas

AND

A Prosperous New Year.

### COFFEE IN COORG.

FROM the report on the Administration of Coorg in 1902-03 it appears that the acreage held under the coffee tenure in that Province was 101,160, as against 101,711 in 1901-02. The smallness of the decrease is surprising, considering the adverse conditions that the Indian Coffee industry has had to face; but there are other statements in the report that tend to show that the effect of these conditions has been very serious. It is remarked, for instance, that the extent recorded as actually cultivated with coffee fell from 65,732 acres to 59,417 acres, the decrease being due to the abandonment of cultivation in gardens held by natives chiefly in Ammatinad and the Mercara taluk. The figure for the total area held under the coffee tenure, *viz.*, 101,160 acres, includes (a) 10,887 acres of "coffee-assessed cardamom malés," (b) 1,443 acres of orange gardens, (c) 29,413 acres of abandoned coffee, and (d) 6,270 acres of immature coffee. There was thus a nett area of 53,147 acres of coffee under bearing, of which 38,143 acres are reported to be cultivated in the European method, and 15,003 acres in the native style. It is added that the native coffee is disappearing so fast that in a few years' time but little of it is likely to remain. This is not an entirely unsatisfactory feature. Writing without racial prejudice, we may assert that what is known as "native cultivation" has, for some years past, done much to lower the general reputation of Indian Coffees. There has been a tendency to let the coffee grow as it will; to harvest the crops in bad years, to leave them almost untouched in bad years. The quality of coffee thus produced has been unsatisfactory, and though there may be no reliable evidence on the point we cannot but think that abandoned estates (European and Indian) and neglected estates (mainly Indian) have favoured the spread of disease, and have thus militated against the prosperity of the coffee industry as a whole.

In Coorg the assessment leviable under the coffee tenure is ordinarily Rs.2 an acre, but since the summary settlement a higher rate (Rs.2 $\frac{1}{4}$  per acre) has been charged on excellent coffee grown on bane land, while *per contra* large areas are held free of assessment or at favourable rates in consideration of a variety of circumstances, among which the following have been enumerated as the most important:—(a) the free allowance of 10 acres granted in respect of the authorized cultivation of bane land with coffee; (b) the favourable rates

allowed during the opening up of new estates; (c) reductions on account of the deterioration of the coffee growth or its eradication for purposes of pasturage, and (d) the concessions allowed in the case of coffee-assessed cardamom malés. The extents held in 1902-03 under the various rates are shown below:—

*Rate of Assessment per Acre.*

	Free.	As.4.	As.8.	Re.1.	Rs.1½	Rs.2.	Rs.2½	Total Area.
Acreage held by Natives ...	20,513	2,022	9,373	12,908	155	19,572	4,691	69,234
Acreage held by Europeans ...	1,562	398	2,346	2,075	188	22,145	3,212	31,926
Total ...	22,075	2,420	11,179	14,983	343	41,717	7,903	101,160

As an indication of the extent to which coffee has deteriorated it may be observed that during the year under report reductions of assessment aggregating Rs.6,958 were sanctioned in respect of 6,652 acres, while the orders of the Chief Commissioner were awaited in respect to similar proposals relating to an aggregate sum of Rs.6,243 distributed over an area of 5,499 acres. The unfavourable conditions affecting the industry formed the subject of special representations by a deputation from the Coorg Planters' Association on the occasion of Sir DONALD ROBERTSON'S visit to Mercara in February 1903, the outcome of which was the decision to consider the expedience of (a) modifying the assessment rules by permitting the imposition of a grazing rate on land which, though naturally fit for coffee-growing, cannot be profitably cultivated while prices continue at the present low rate, (b) permitting the complete exemption from tax of wet lands, the entire bane attached to which is cultivated with coffee paying full assessment, and (c) refusing applications for reduction of assessment from planters whose negligent cultivation has made their estates a material factor in the spread of infection from the borer insect.

Coorg coffee enjoys such a high reputation that remarks such as the above cannot be read without anxiety. They do not encourage the hope that Indian Coffee can be made profitable in the face of the increasing rivalry of Brazil; and, though here again no reliable statistics are to be had, there is little room for doubt that the Brazilian product is ousting the low-class Indian product in some of the chief markets of this country. If estates in India had the whole of the Indian market under their control, it would be something. There is, however, reason to fear that it is losing its hold in this country, and if that be the case we can scarcely look forward very hopefully as to the progress of the superior sorts in other markets. It is particularly saddening to reflect that the great American market, the finest in the world, has hitherto been virtually closed to Indian Coffees. The exhibits at St. Louis next year, and the pushful measures that are to be undertaken in connection with these, may bring about a change for the better. It almost seems, however, as if the fate of the Indian Coffee industry might be said to depend upon this cast of the dice. Failure at St. Louis will at least show that the American market is to continue to exclude Indian supplies, whereas success should mean the opening up of a demand that may greatly enhance the value of the really fine sorts that are still produced in this coffee. That the cultivation of

these sorts depends largely upon the giving of a little encouragement to planters, or the withholding of it from them, appears to us to call for no argument. And by "encouragement" we allude to steady demand, not to remissions of assessment or other concessions made by Governments in India, for the results of the latter cannot be far-reaching enough to bring about the salvation of an industry that is hard-pressed by the competition that results from Brazilian over-supply. Pessimistic as these remarks are, we cannot but think they are justified by the present position of affairs and we would again urge all coffee-planters in India to realise that they must either open out new markets for their staple product or—go to the wall.

#### U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

#### COFFEE-GROWING IN COLOMBIA.

Last week we gave a report by the British Consul; we now give one by United States Consul-General Snyder, Quito:

The principal districts for the cultivation of coffee are the Department of Cundinamarca as a whole (which produces the famous Bogotá coffee), the Department of Santander, the districts around Ocaña, Cúcuta, Bucaramanga, and the Tolima. The lowlands of the Tolima, on either side of the Magdalena River, form the grazing lands, while east and west of these, at varying distances, rise the cordilleras of the Andes, in the small valleys of which the coffee is grown.

There are three classes of coffee produced in the Republic. First, that which is dried in the sun in the cherry and afterward cleaned; this is known as *café trillado* and is the lowest priced coffee. Second, that which is prepared by washing the cherry or pulp from the bean, which is then dried and cleaned by machinery. This grade is called *café lavado* and brings a good price. Third, that from which the pulp is washed and the bean exported, after being dried in the husk. This grade is known as *café en pergamino* and is the highest priced coffee.

The temperature may vary between 59 and 77 degrees F., but the quality of the coffee does not depend so much upon the temperature of the district as upon the soil and cultivation. The bean is larger in the hotter climates, but with properly planted shade trees and satisfactory pruning and suitable land any quality of coffee can be produced. In the colder climates the bean is smaller, but the plant requires less care; planters are not as careful in pruning, and quality is generally sacrificed for quantity.

A tree from 4 to 8 years old will yield, on small and well-kept plantations, about 1 pound annually, but on the large plantations the yield is usually about half that amount.

It is stated that of the annual crop but about 25,000 bags are retained for home consumption. The best grades are always exported, and the damaged beans are reserved by the planters for sale locally. By damaged beans is meant those that have been torn by the machinery in cleaning or otherwise damaged in the handling. The unmarketable beans float to the top during the process of washing and are skimmed off and used as fertilizer on the plantations.

With Brazilian coffee at 6 cents a pound, as a standard, the average prices of Colombian coffee run from 7 cents for Ocaña to 11 cents for Tolima. For some time, owing to the revolution, the exportation of coffee has been almost at a

standstill, and on this account Colombian coffee will undoubtedly lose favour, as some of the coffee now being exported is three years old.

It costs about 4 cents per pound to put the coffee in New York, including commissions, etc., and as the cost of production on the estates cannot be reduced to less than 4 cents, the general opinion here is that, with the exception of a few estates on the Magdalena River, coffee-growing in Colombia is not a paying business with the rate below 8 cents per pound in New York. The high cost of putting the coffee in New York is chiefly owing to the poor means of transport to the coast.

Coffee-growers, before the war, in order to enable them to harvest their crop, were given large credits, but most of them, through the fall in the price of coffee and carelessness in the working of their plantations, fell far behind in payments. The result is that foreign houses are limiting credits to the amount necessary to secure facilities for transporting the coffee which is prepared for export.

With a view of ascertaining the system of recruitment and management of labour in the tea gardens of the Doors, Madras and Ceylon, the Chief Commissioner of Assam, with the approval of the Government of India, proposes to depute Mr. J. C. Arbuthnot, C.I.E., to visit these places and institute local inquiries. Mr. Arbuthnot will visit the tea districts of Madras at the end of December.

#### COFFEE NOTES.

**The U. S. Coffee Market.**—The week in coffee has been somewhat unsettled, says the *Tea and Coffee Trade Journal* of 17th ultimo, but closed better in tone, and on Monday of this week showed advances in the speculative market. This was due to bullish reports of conditions in Brazil, where the receipts are showing a decided falling off, and if continuing, a market surely of only 11,000,000 bags as the crop of 1903-04 should follow. Further, the weather conditions for the growing crop are not reported of the best. Buying in options for investment account by financial interests has had a revival, and is a factor that has to be taken into consideration by the trade. Apparently the financial world finds coffee the only good thing for its idle funds, and is prepared to lavish its capital and manipulative power on the exchanges, American and European. France, too, is beginning to show interest; reports from there being to the effect that large concerns are preparing to give the coffee market their attention. Up to the present time Hamburg and Havre have been loth to follow New York, regarding the activity and advances in the option market as unwarranted by the statistical position of coffee. In view of the augmenting interest in the market by men of wealth, still further advances in coffee may be expected despite the present inclination to halt and even re-act. A good deal of manipulation may naturally be expected. Reactions, too, are only healthy, and even needful signs.

So far as actual coffee is concerned, in Brazil coffee a dragging market is reported. Orders are slow and small, the trade expecting a retrogression in prices or is very well supplied, and thus may be pardoned if inclined to wait in placing orders.

The Brazil markets are unchanged and firm; offers including Santos No. 3 at 7½c., c. & f., at which sales were made. Spot invoice is steady, but demand slow. Quotations

closed at 5½c. for Rio No. 8, 6½c. for Rio No. 7, 7½c. for Rio No. 4, and 7½ and 7¾c. for Santos No. 4.

Mild coffees are firm, especially for Colombian kinds, the troubles in Colombia leading to fears that movements of the coffee from that country may be arrested. Some traders have even advanced prices. For good Cucuta 7½ to 8c. is demanded. East Indian coffee steady.

Receipts at Santos last week were 162,000 bags, against 208,000; at Rio, 88,000 bags, against 98,000 bags one year ago. Total 250,000 bags.

Total stock in United States November 1, 2,491,208 bags against 2,594,941 bags November 1, 1902. Brazil stock in the United States November 14, in store and afloat, 2,668,624 bags against 2,720,752 bags at the same time last year. Other than Brazilian, 358,463 bags against 231,135 bags last year.

Brazil coffee in New York November 14, 1,920,584 bags. Stock in other coffees, November 9, 320,851; in San Francisco, 32,580 bags; and in New Orleans, 5,032 bags. Visible supply in the world of all coffees, November 1, 13,918,131 bags.

\* \* \*

Mr. C. E. Bickford's (San Francisco) coffee circular of November 6th, says:—"The demand since last issue has been very active and a large business has been done both locally and for overland shipment at somewhat higher figures, in sympathy with the advance in the New York and European markets. Spot quotations in New York have advanced ½c. on No. 7 Rio and ¾c. on No. 4 Santos during the past month and futures from 60 to 80 points and remain steady under unusually heavy buying—sales on the exchange averaging more than 100,000 bags per day for the past ten days. While the advance is attributed to the heavy buying of speculative interests, the prevailing opinion is that prices will tend higher. "The local position is good, there remaining 33,172 bags in first hands, not an over-abundant supply in second hands, and a continued active demand for overland shipment. A shortage of the more desirable shipping grades exists, and business with overland markets is naturally curtailed by the remaining holdings. The market is bare of prime to fancy washed coffees and these grades will command attention immediately following their receipt.

"To-day's first hand stock consists of 4,240 bags Costa Rica, 1,472 Nicaragua, 3,530 Salvador, 17,400 Guatemala, 670 Mexican, and 5,860 various; in all, 33,172 bags.

\* \* \*

A Santos cable to new York says:—"Flowering a failure in western part of São Paulo."

\* \* \*

Messrs. Holworthy, Ellis & Co., Santos, cabled of the growing Santos coffee crop:—"Too early to give estimate, but prospects good; damage is overestimated. The weather is favourable for growing Santos crop."

\* \* \*

The shipments of Hawaiian coffee show an increase of 720,456 pounds over the shipments of the previous period, and a falling-off of 689,615 pounds from the shipments of the year ended June 30, 1901. The shipments of coffee for the past year were worth \$110,216 more than the shipments of the year before, and \$75,037.27 less than the shipments of the year ended June 30, 1901, all of which indicates a partial recovery in this product from the depression of the year to June 30, 1902.

\* \* \*

Messrs. Karl Krische & Co. cable on Brazil coffee:—"Stocks in interior small. Estimate this season's crop at 7,000,000 to

7,250,000 bags. Prospects of a moderate crop. Drouth has done damage."

The virus of coffee speculation seems to be growing, and efforts are now being made to introduce retail coffee dealers to the fascinating art of bucking the coffee tiger, says a Philadelphia contemporary. It was ascertained during the week that certain large stock brokers are sending out literature to small retail coffee dealers in various parts of the country, soliciting speculative business in coffee options.

**Coffee in London.**—The principal item of interest this week, says the *Produce Markets' Review* of 21st ultimo, is a statement that the growing Java crop has suffered so severely during the period of flowering that it is likely to yield only about one-third of the one now current, or, stated in figures, 210,000 bags against 600,000 bags. It seems as though we were entering upon a period of very small production, for the estimates of practically all the various growing countries are on a reduced scale, with the single exception of Mexico. Should this be the case, we must look for a higher range of prices for all mild Coffees, whatever sized crop Brazil should actually turn out. At the auctions rates have in many cases been dearer, though supplies have been limited almost entirely to Colombian, some parcels of which have shown a very marked improvement in quality. In the terminal market the fluctuations have been on a small scale; after advancing 6d. the quotations have gone back, and the close is about 3d. above last week. The receipts continue rather heavier than last year, notably from Rio, and until this position is altered there is hardly likely to be any great rise.

The purity of the coffee sold in Philadelphia has been so successfully attacked by Philadelphia trade journalists that New York brands are in better request there. For about thirty cents a pound any New Yorker can obtain magnificent coffee—a drink literally fit for the gods.

News reaches us, says the *Tea and Coffee Trade Journal*, that the Porto Rican coffee-growers are extending their associations for common benefit and are feeling encouraged that the United States Government will be able to effect a treaty with Spain admitting the island's coffee into that country on reciprocal arrangement, by which Spanish wines are admitted into Porto Rico free. Thus coffee exchanges with wine. The islanders hope for a return of good times by this measure. Meantime, they seem to be suffering for lack of money, and at the present moment many planters are in peril of losing their coffee plantations on account of their inability to pay their taxes, a harsh law exacting a foreclosure by the Government if taxes due are not paid within six months. Governor Hunt has promised to be lenient, and it is just possible that the planters will be able to tide over their immediate difficulties in the rise of coffee to \$10 and \$12 a bag from \$6 to \$8 last year. While it is well and natural to look to the old fatherland for assistance in a market way for their coffee, the Porto Ricans should feel that the great market is the new fatherland—us, the United States of America. So far, in the matter of demand here for Porto Rico coffee, the islanders have only wept some, and agitated a little for the impossible, such as protection for their coffee, and have done very little to put on sale their coffee, so that a world beyond question ready to give the article a trial at least, might buy it. Who has seen an advertisement telling where the coffee was to be bought? The President has said, "I only use your coffee," and the newspapers have reported the testimonial from Maine to Oregon. The Boston "Transcript" says:—"President Roosevelt has written a letter saying that he uses no other coffee on his own table. This will be used probably as an advertisement next year." Next year! Will the Spanish mind ever learn that procrastination is the thief of time? The Pittsburg "Gazette" says:—"As the President endorses it so highly, we all want a sample of it, and if it

is to be found as good as he says it is, we will want a lot more of the same." The Newport "R. I. News" remarks:—"It does not seem as if Porto Rico coffee for a moment ought to go begging for a market. It is a superior coffee, and gives universal satisfaction when tried." From the Malden, Mass., "Mail":—"A great many people would like to try it and see how good the President's judgment is as to coffee. He says he thinks it the best in the world. Perhaps he don't know; but if he does, our people should all have a chance to sample it. Malden has a number of up-to-date grocers, and here is a chance for them. It isn't every brand of coffee or anything else that can get a puff from the President of the United States." Following is from the New Castle, Ind., "Courier":—"There is no better coffee in the world outside of Arabia than that grown in our island." The Philadelphia "Record" says:—"It is very good of the President to use Porto Rican coffee—which is very good coffee by the way—and we hope the islanders will get all the markets in this country and Europe that they need." These are only a few of the expressed sentiments. They indicate a widespread desire to give Porto Rican coffee a trial. We wonder the coffee trade has not, of its own accord, tried the sincerity of the public. It seems as if there were money in it, and the temptation should prove superior to the prejudice that the coffee is hard to sell because of the dark roast it exacts. Some grocers not troubled much by a severe conscience, are selling, we are told, Brazil coffees as Porto Rican. Perhaps they wouldn't, if they could meet with the genuine article. Whatever be the plight of the Porto Ricans, they cannot, with justice, complain that at least we have not been willing to meet them half way in the purchase of their coffee, buying all we can get hold of.

Imports of mild coffee at New York during November to the 12th instant are 40,028 bags, of which 13,000 bags are Savanilla and 9,000 bags Maracaibo. Exports to that date were 6,749 bags.

The Annual Meeting of the Members of the Baltimore Coffee Exchange was held on November 10, and the Executive Committee for the next year was elected. Owing to the enlarged business of the Exchange, the Executive Committee was instructed to formulate plans to get quicker quotations from other coffee exchanges.

The Revision Committee of the New York Coffee Exchange has voted to make no changes in the grading of coffee sold on the Exchange. In response to a petition signed by Exchange members, the Board of Managers has amended the by-laws, abolishing the Revision Committee and fixing permanently the difference between grades at 50 points. The changes will be voted on by the members November 23.

Circles on the New York Coffee Exchange have it that Adolph Lewishon, J. A. Stillman, and H. H. Rogers, the so-called "metal interests," are the leaders in the bull clique, Lehman Bros. operating for them. Another report has it that the Lewishons have sold several hundred thousand bags of coffee to leading bulls. But the Lewishons deny all reports that their interests in coffee are not intact.

One of the objects of the use of glaze on roasted coffee is that the substance helps to settle the beverage when it is drawn.

Genuine Mocha coffee has a small, round symmetrical bean of a rich olive-green tint, and almost translucent if new crop but a bright yellowish hue if old.

According to Rio estimates, some 30,000 bags of 132 pounds each are wasted every year in Rio, in simply giving samples of coffee. New York importers generally allow 1 pound per bag for sampling.

Messrs. F. Metz & Co., Havre, October 29, say:—

"The advance starting in New York, is very unpleasant for the great majority of the European arbitrage people; with the heavy premiums existing in New York it has been for years a well paying business to sell in New York against Coffee in store, against importations from Brazil or purely as arbitrage. In declining or unchanged markets such trades brought good profits to the seller in New York, but this has ceased to be the case since New York has become leader of the advance; we estimate the amount sold in New York for Havre account alone at nearly 400,000 bags, and in

a further advance the margin question may become a very awkward factor."

Messrs. J. S. Bache & Co., New York, say:—

"Coffee is being bulled energetically on the proposition that the low prices have discouraged production; that the trees have been hurt by last Autumn's frost in some instances; that in other instances they have been injured by the drouth this Summer, and that the planter has been neglectful of his crop because it did not pay him to raise coffee. Consequently it is claimed production will show a falling-off from recent averages, beginning with the crop growing, and that the Brazilian will make no effort to increase his outturn while prices remain so low."

Messrs. Willett & Gray, of New York, say:—

"The coffee trade in this country, as well as in Europe, is looking with mistrust upon the advance in coffee, and the experiences of the past six or seven years fully justify the apprehension that the present crop is really larger than a number of firms in Brazil represent it to be. On the basis of the receipts for the past three years, the current crop in Rio and Santos promises to be 12 million bags. Whatever the final outcome proves to be, it is well enough for the trade to take the benefit of the doubt, and should it be that the current crop is marketed as rapidly as that of 1899-1900, as is generally considered as probable, then five-eighths will have been received in the first four months, leaving the other three-eighths to be received during the remaining eight months of the crop year, and which would be more than likely to create a favourable impression upon values."

Messrs. Lehman Bros., of New York, say:—

"A halting disposition on the part of buyers has from time to time forced sellers to accept slight recessions, and thus, at times, values have made a moderate loss. There is still apparent a marked degree of confidence by holders on this side. Europe, however, ostensibly will not follow and does not share in the optimistic view of either the trade or speculation of this country, so that in this case we also find somewhat of a clog in prices and which, as it seems to us now, while still at a relatively low level, must in a large measure, be governed by what may transpire hereafter, particularly in regard to the coming crop, which, though some time ago was generally accepted as somewhat more favoured by the elements, has in the last few days been referred to in another cable as once more suffering by the continued drouth. At best it does not seem to us that the outlook favours large expectations concerning the coming yield."

## TEA NOTES.

**The U. S. Tea Market.**—Business in tea is normal at firm rates, says the *Tea and Coffee Trade Journal* of 17th ultimo. The market continues in a healthy condition, and is showing an inclination to increase in the volume of trading. No large orders are reported, but there have been not a few of fair-sized proportions, this applying to both line and invoice business. Congous are especially favoured by a good outlook. The market in London is continually improving for the tea, becoming more and more barren for this grade of goods at the price and must shortly enter the market here with renewed interest. By the Spring our own market must become quite barren of Congous, for the imports have been very light on this side. The situation of the tea may thus be grasped at a glance. The tea is now at 9½c. and should rise to 11c. for such as is not very poor quality. In the East more active conditions are reported for Foochows with larger trading. All greens are firm held and also Formosa. Japans are likewise firm but quiet so far as the New York market is concerned. It is beginning to be thought here that many of the customers of the local market have been captured by Western and Northern firms, and thus it happens that such Japan tea as is here is little movable. To all accounts the rest of the country has taken the tea in large quantities. Canada reports firm prices for it. India and Ceylons

are firm in response to the improved conditions ruling in England and the demand here continues good. The same applies to the British green teas.

Mr. A. R. Robertson writes:—Since advising last month on the tea situation, a very decided improvement has taken place in demand; buyers are examining everything offered very carefully, and buying much more freely.

Formosa teas have received a very fair share of attention, and prices are firmer; some buying of large blocks have been reported, so that it is more than likely that line prices will advance all round, and more especially on finer grades. Foochows are quiet on spot market, but advices from East intimate some activity at fair prices. Congous are selling well and fetching higher prices. There is nothing to be had under nine cents for Government standard lines. Ping-sueys show considerably more activity, and slightly better prices are being paid. Moyunes are quiet.

In Japans the market is unusually dull, and the only inquiry is "tea for price"; holders are firm, the season being practically over, and such leaf as is left out there is not good enough to pass inspection. Indias and Ceylons are offering freely, but at prices much higher than this market will pay. Foreign markets are asking figures equivalent to London valuations, which it is impossible to obtain at the moment. It may be that buyers here will have to raise their ideas or go without the tea; but most of them are pretty sanguine here that if they hold out, just a little longer, they will stock up for less money. Conditions abroad do not now warrant such a decision, but sometimes the unexpected happens.

India and Ceylon greens are slightly easier in price, with no great activity showing itself. It will be unfortunate if so many of these teas are made, that the United States has to be used as a "dumping ground." It will later be a serious proposition for the "growers" and yet, a healthy quiet, steady demand could have been fostered and a regular market made, had they not driven too hastily.

\* \* \*

**London Tea Market.**—Messrs. Gow, Wilson & Stanton's report, dated the 11th instant, says that buyers are operating very cautiously and the market for Medium-Liquoring and for Common and Broken Pekoes is weak. The average price of Assam and Indian tea sold on garden account this week is 8½d. and 7¾d., respectively.

\* \* \*

**American Imports of Tea.**—The imports of tea for the first nine months of 1903 show, says the *American Grocer*, a good increase over the same period in 1902 and a heavy gain over 1901. The following table shows the net imports for the nine months ending September 30:—

	Pounds.
Total imports ...	64,270,228
Total exports ...	4,299,508
Net imports, 1903 ...	59,970,720
Net imports, 1902 ...	56,012,171
Increase ..	3,958,549

Of the imports this year 29,607,439 pounds, or 46.1 per cent., came from Japan; 23,714,344 pounds, or 37.5 per cent., from China; the United Kingdom, British North America, and the East Indies supplied 10,549,106 pounds, or 16.4 per cent.

\* \* \*

American advices state:—There is a quiet market for British-grown teas. India and Ceylon greens favour the

buyers. Messrs. A. R. Robertson & Co. say: "It will be unfortunate if so many of those teas are manufactured that the United States have to be used as a 'dumping ground'; otherwise a healthy trade might be established."

At the recent Annual Meeting of the American Asiatic Association, Secretary Foord said: "The National Tea Association, which was formally organized last March, must be welcomed as a valuable aid to the promotion of commerce with Asia, and as an exponent of principles and purposes with which this association has declared itself to be in complete accord. The co-operation of the National Tea Association may be counted on in giving such assistance as the members of this Association can extend toward promoting the success of the exhibits of China and Japan at the Louisiana Purchase Exposition." Mr. Foord is also Secretary of the Tea Association, and we presume his remarks may be regarded as semi-official expression of the intentions of that body. It is a wise plan to arouse the interest of the Chinese and Japanese tea-growers in the exposition. Up to the present time we have not heard of any enterprise on their own account in this direction. The Ceylon and India growers will spend thousands of dollars at St. Louis, and they will be rewarded proportionately, we are sure, and it looks at the expense of the inert and indifferent Asiatics. These have made large profits in recent years, for the merchants have been in their favour. It may be that they regard the past years as permanent, but there can be no question as to the ultimate disposition of a sleepy competitor fought by a live one. A competition equal in real strenuousness need not be feared, we think, in its effects. It would tend to that larger consumption of tea in the United States, which is the just mead of the commodity, and in such healthy conditions everybody should flourish. Otherwise the American market will become the exclusive prize of the Indian and Ceylon men, the China and Japan teas finding favour only as something more or less rare, consumption falling to some such similar neglect as now prevails in the United Kingdom. By rousing the Asiatics to pay some attention to the portents of troublesome weather ahead, the National Tea Association will be doing them at least a charity, at the same time saving the possibility of variety for our own market.

Tea importations at Chicago during October last, reported by the Custom House, amounted to 3,275,809 pounds, valued at \$564,885.

TEAS EXAMINED AT CHICAGO FOR CHICAGO.				
Kind.		Pkgs.	Wt., lbs.

Cup Yields of Teas.—It is well known, remarks the *Merchants' Review*, that India and Ceylon teas are superior to China and Japan leaf as regards their comparative liquor-

yielding qualities, but it is not so well known that many of the higher grade China and Japan teas are so much superior in the same respect to the lower and cheaper grades that they are actually cheaper to use. Some extravagant claims are made for some of the high-grade teas, as, for instance, that certain 60-cent tea will furnish twice as much liquor as ordinary 35-cent tea. The best way to test this assertion is to give the good and cheap teas in stock the liquor test. Teas are bound to vary, according to kind, style of curing and age, and the grocer can only determine the relative cup-yielding qualities of his teas by committing samples to the watery depths of the testing cups.

Total settlements of Formosa tea at Tamsui to October 13 were 465,000 half-chests. Advices are that "low" grade is in full supply but of undesirable character; "good" is scarce and a few "good to superior" and "superior" were left, but of mixed yellow leaf and so not very attractive. It was at that time thought that the crop cannot be kept inside 500,000 half chests and will exceed that quantity. Tait & Co., Amoy, say, if all low rubbish offered is taken by buyers.

The *Kokumin* has published in a series of editorials a succinct account of Japan's economic progress during the last decade. Notwithstanding the fact that our trade was subjected to various adverse influences on the Foreign markets, its progress has been on the whole not so bad as might have been expected, the increase in fact amounting to 15.1 per cent. as follows:—

		Yield.	Comparative.
		Kwan.	Rate.
1891	...	7,054,493	1,000
1901	...	8,120,390	1,151
— <i>Japan Times</i> .			

The Brick Tea Trade of Siberia.—Mr. Inamasu, the representative at Vladivostock of the Japanese tea guilds, reports on the brick tea market in Eastern Siberia. He says that, of all the districts in that part of the Russian dominion, Stretensk, situated as it is at a point of vantage on the Shilka, is the foremost place where brick tea finds its way, Chita, Vladivostock, Khabarovsk, and Blagovestchensk coming next, though at considerable distance. The condition of the brick tea market at Stretensk is simply amazing. Heaps upon heaps of the commodity may be seen piled up on the pier, and the town is crowded with godowns built solely for its storage. This prosperous business is due, according to our informant, to the fact that the Russian authorities have exerted themselves for generations to develop Stretensk as a centre of the Siberian colonies—with the result that hundreds of villages have sprung up around it. The annual amount of brick tea, both green and black, dealt with in the locality, is stated to be something like 500,000 boxes, each containing 572 pieces. The wholesale price ranges between 25 and 29 roubles per box. Transactions in Japanese products have been opened there comparatively recently, so that they have not yet gained much ground. There is, however, concludes Mr. Inamasu, ample room for our goods to make headway in Stretensk and elsewhere.—*Japan Times*, November 19th.

The Royal Statistical Society and Tea.—The Royal Statistical Society held their first ordinary Meeting of the session last week, under the presidency of Major Patrick George Craigie, of the Board of Agriculture and Fisheries. In his address the President said that he had already shown that since 1830 the British Empire had grown from 4 per cent. to 24 per cent. of the surface of the earth. In the "thirties" the population outside the British Isles was 100,000,000; the figure for 1900 was three and a-half times that number. No less striking was the increase in the supply of food, the consumption of meat being thirteen times as great now as it was about seventy years ago. The increased supply came largely from abroad. Major Craigie pointed out that tea had also become more and more popular. The quantity sold per head in the year 1852 was 2 lbs., by 1859 it had increased to 2.67 lbs., in 1885 to 5 lbs., and now the country took 6 lbs. per head. As much as 98 per cent. came from China fifty years ago, but now practically all came from India and Ceylon. More food and better food was obtainable in the

United Kingdom to-day than at any earlier date. *Apropos* Major Craigie's lecture, which referred to food generally, the *Daily Telegraph* has discussed the question whether we overeat and drink too much. In connection with this subject our contemporary consulted an eminent London physician, and incidentally referred to tea. As medical men are not, as a rule, enthusiastic in their praise of tea-drinking, we may take it that this physician's remarks are not wholly unfavourable, and we must be thankful accordingly. Questioned as to the enormous increase in tea-drinking, which the figures produced by Major Craigie disclosed, he said, "Over-tea-drinking is undoubtedly the cause of numerous evils. Many forms of indigestion, as well as certain nerve derangements, are directly attributable to the abuse of tea. Not only is tea injurious on account of the tannin and theine it contains, but the practice of partaking of a heavy meal and drinking with it several cups of tea is very pernicious, because bulk of fluid taken seriously interferes with the process of digestion. To drink two or three cups of tea with one's lunch is a fruitful source of dyspepsia. Another way in which tea does harm is that on account of its stimulating action it stops the craving for food, and prevents more suitable nourishment being taken. Many women engaged in teaching live largely on tea and bread and butter, to the exclusion of meat, and consequently become nervous and anæmic and suffer from general breakdown. Stop their tea-drinking, put them on an ordinary diet, and they speedily get better. Still, I do not look upon the fact that we consume more tea than formerly as wholly bad. I believe that in many cases tea has replaced alcohol as a beverage. The number of men who now take cold tea to their work instead of beer is very large, and in so far as tea-drinking has replaced the excessive consumption of beer I must say I think it has been beneficial."—*H. & C. Mail.*

In China tea is generally prepared in the cup and drunk without milk or sugar.

Tea-blending is useful in order to give to a sample a number of desirable qualities, as for example, flavour, strength, body, colour, richness. If at the same time the cost of the sample is not much increased, the profit to the dealer will be immediately apparent. In making a successful blend of tea the most powerful ingredient should also be the highest grade in the blend, as the other teas will thus be elevated to the level of the highest grade leaf. When the most costly tea in the blend is a delicate one and the lower grades are coarse or powerful, the high-grade leaf will be brought down to their level.

### NOTES.

#### German Quinine.

During the eight months ending August the exports of quinine preparations, etc., from Germany were as follows:—

	1901.	1902.	1903.
Kilos ... ..	136,900	134,400	110,600

#### Italian Emigration to Brazil.

Italian statistics state emigration to Brazil in 1902 to have been 23,951 persons. During the first quarter of 1903 the number was 2,816 as compared with 13,952 in 1902, a very serious falling off. This decrease has an important bearing on the cost of coffee-growing in Brazil, tending to show that labouring on the plantations is not profitable. It tends further to enhance the cost of such labour.

#### Journal d'Agriculture Tropicale.

*Aperçu du contenu du n° 29 (mis en vente à Paris le 30 novembre 1903):*  
71 contributions inédites de MM. Neuville, Couturier, P. des Grottes, Hamel Smith, Berthelot du Chesnay, Guérin, Low, Main, d'Hérelle, Rivière, Hecht frères & Cie. #### Cardamoms at St. Louis.

The Honorary Secretary of the Travancore Cardamom Hills Planters' Association writes to the *Times of Ceylon*:—Mr. Sinclair, in writing on 1st November that South Indian planters had refused to combine with the Ceylon Cardamom Committee, was not quite accurate as regards this the principal cardamom district of South India. Under certain conditions we are willing to combine with Ceylon, and any proposals made to us will be carefully considered. I may mention that, apart from the money voted by the United Planters' Association of South India, a fund is being raised for the purpose of pushing the sale of our cardamoms at the St. Louis Exhibition; the cardamom planters of Travancore and the Annamalais are giving four annas per acre, the Travancore Government have been asked for Rs.1,000, and an effort is being made to induce native ryots to subscribe a small amount.

#### World's Production of Rubber.

The figures in the following table were published in *Industrie et Commerce de Caoutchouc* of November 6, 1903, and relate to the world's production of rubber:—

	Quantity Produced.	
	1900.	1902.
	Tons.	Tons.
Brazil, Peru, and Bolivia ... ..	25,000	30,000
Other States of South America ... ..	3,500	1,000
Central America and Mexico ... ..	2,500	2,000
Straits Settlements and dependencies ... ..	...	1,000
East and West Africa and the Congo country ... ..	24,000	20,000
Java, Borneo, etc. ... ..	1,000	...
Madagascar and Mauritius ... ..	1,000	...
India, Burma, and Ceylon ... ..	500	...
Total ... ..	57,500	54,000

#### Peruvian Products.

According to a British Consular report on the trade of Peru during 1902, there are now twenty-one small factories for the production of crude cocaine in that country. During 1900 164,864 oz. was produced, and in 1901 the output increased to 376,320 oz. The figures for 1902 do not appear to be available. Of coca-leaves 754 tons was exported from Peru last year, against 601 tons in 1901 and 557 tons in 1900. From Salaverry 30,856 oz. of crude cocaine was exported, valued at £5,002, of which 8,812 oz. was shipped to the United Kingdom last year, and the remainder to Germany and France. Coca-leaves representing 61,096 lbs. (£1,371) were shipped from Salaverry during 1902, of which 7,840 lbs. went to Germany, and the remainder to the United States. Among the exports of Bolivian produce from Mollendo were 5,540 cwt. of cinchona (£14,540), 25 cwt. of coca-leaves (£51), and 25 cwt. of rhatany (£127). Included among the

Peruvian produce exported from Mollendo were 96,560 cwt. (£34,300), borate of lime, 170 cwt. cinchona (£453, 13,940 cwt. coca-leaves (£28,300), 320 cwt. rhatany, and 1,232 lbs. (£14,330) crude cocaine. The bulk of the exports of coca-leaves from Mollendo is now sent to New York, whereas in former years Hamburg was the chief market.

## GENERAL ARTICLES.

### PRODUCE AND PLANTING.

#### The Russian Boycott of Indian Tea.

A letter appeared in Wednesday's *Times* from Sir Roper Lethbridge, who is very indignant with the wicked free-fooders and their suggestion that the recent increase of the Russian duties on Indian tea is the result of the Indian Government's action in imposing countervailing duties on bounty-fed Russian beet sugar. Sir Roper states that the reason for the Russian tea duties is well known in Calcutta, and the tea plantations of the Caucasus, which are now being developed, have a striking similarity to Ceylon and Indian teas in flavour, and it is with the object of fostering the new industry that a heavy duty has been imposed on the imported article. Sir Roper says:—"Why should the Czar admit Indian and Ceylon teas of precisely the same quality and flavour at a duty that would enable them to crush this most lucrative industry? The free importers would freely do it, in the sacred name of Free Trade; but the Czar is neither a fool nor a fanatic." It is common knowledge to all interested in tea-growing that the Russian authorities wish to protect their much-talked-of tea industry in the Caucasus, and that this was a reason for imposing heavier duties on British-grown tea imported into Russia. But it is quite likely that a double shot was intended, and that in addition to wishing to foster the infant tea industry of the Caucasus the Russian authorities may have also intended to show their resentment at the Indian countervailing duties on Russian bounty-fed sugar.

#### The Supplies of Tea at Auction.

The quantities of tea offered at public auction continue on such a large scale that it is not surprising to find the demand slackening. In their last circular Messrs. Gow, Wilson & Stanton sounded a note of warning on this subject. They stated "that if prices are to be maintained the quantities brought to auction must be on a considerably smaller scale. The possibility, if not the probability, of a reduction in the duty next Spring, it is further remarked, affords an additional reason for firmness in dealing with an article which may shortly be less burdened by taxation than at present." Few will be found to dispute this statement, but in practice each grower and importer seems to rely on his neighbour to act upon it instead of following the advice himself. It is a difficult problem. Tea-growers, many of whom have to consider shareholders clamouring for dividends, are beset with anxieties as to the best course to adopt, and as the plan for regulating supplies seem ineffective, the old policy of everyone for himself is naturally resorted to, with the result that supplies come merrily to market and prices are not maintained.

#### Mr. Seddon's Preferential Scheme.

A telegram from Wellington gives some particulars of the new tariff arrangements provided for by Mr. Seddon's preferential trade bill, which passed through the New Zealand House of Representatives last week. The duty on tea grown in the British dominion is removed. The Bill passed the Upper House and comes into force at once. In addition to increasing the duties on foreign goods the Bill provides for reciprocity with foreign countries making concessions in favour of New Zealand products. Slight modifications in the Bill will have to be made to meet existing contracts. It is understood that the increased duties will amount to between £70,000 and £80,000, against which the remission of the tea duty will, it is estimated, involve a loss to the revenue of £40,000. The only opposition offered to the measure in Parliament was on the ground that the Government was rushing through important proposals in the dying hours of the session.

#### The Board of Customs Report and Tea.

The annual return for year ending December 31, 1902, of samples of tea analysed in the Custom Department under Section 30 of the

Sale of Food and Drugs Act, 1875, shows that the total number of samples analysed during the year was 1,399, as follows:—760 samples black tea, congous, etc.; 311 black tea, dust; 23 black tea, siftings; 27 green tea, faced; 93 green tea, unfaced; 185 green tea, capers; total 1,399. Of this total, 1,252 samples were considered satisfactory, and the importations represented by them were accordingly delivered on the certificate of the analyst. The remaining 147 samples, representing 1,522 packages, were of doubtful character, and they were reported to the Board for their decision. The Board decided that the whole of these 1,522 packages should not be admitted for home consumption or for use as ship's stores, but should be restricted to exportation, or for the manufacture of caffeine.

#### A Tea Missionary.

Mr. A. Suter, of the Montreal branch of Crossfield, Lampard, Clark & Co., the London, England, and Colombo tea house, has returned from his two weeks' tour through New York State, Ohio, Michigan and Pennsylvania. "Mr. Suter's trip was made," says the *Canadian Grocer*, "with a view of opening branches and agencies for his house in the special interest of Ceylon and Indian teas, and though the popular taste has not taken hold of our southern and western cousins as in Canada, he was pleased to learn that owing to the stimulating advertising that had been done during the past number of years the trade was beginning to look with distinct favour upon these teas, and it was only a question of a few years when the excellent merits of British-grown teas would meet with favour. Many of the leading jobbers in Bay City, Detroit, Cleveland, Columbus, Buffalo, and Pittsburg were considering the advisability of taking hold of Ceylon and Indian teas, and there is little doubt but that the St. Louis Purchase Exhibition next year, where large bungalows are being erected by the Ceylon Government and Tea Association for the purpose of introducing these teas to the American public, will have a marked effect. The introduction of Ceylon green teas since the Chicago Fair will make the work of diverting the taste of tea-drinkers easier, as Americans are, if drinkers of tea at all, more friendly to China and Japan greens than to blacks. Mr. Suter reports his reception as very favourable and most encouraging."

#### A Lament about Coffee.

The *Boston Herald* is almost sad as it thinks of the good old days of coffee-drinking in Great Britain. It says: "Would you think it, coffee is not popular, as a beverage, in Great Britain. Fancy that the coffee merchants complain of a steady decrease in its import, and then pity the poor benighted little Englishers who neglect the invigorating cup! It is difficult to say why the steady decrease in the importation of the berry has come to pass. What does England drink, tea? Probably Sir Tommy can account for the falling off to his own satisfaction. But when it is recalled the coffee tavern was one of old London's favourite resorts, and the 'coffee palace' became an institution about 1876, it must astonish the merchants to find public taste is changing. It does not seem as though tea or gin could be such rivals of that stimulating drink, but some counter influence is at work, if the imports during the last thirty years are evidence. Most likely somebody is scared about his liver."—*H. & C. Mail*.

### PEPPER AND NUTMEG CULTIVATION.

In the market for spices at the present time, interest largely centers in pepper and nutmegs. In this connection it may be noticed that there is a large increase in the consumption of both these spices in America, and that the tendency is toward higher prices and a scarcity of supply to meet the demand.

Through the courtesy of A. Adelsdorfer, of M. J. Brandenstein & Co., this city, we are enabled to present the accompanying views from photographs of pepper and nutmeg plantations secured by Mr. Adelsdorfer on the occasion of his last trip to the East Indies. They are interesting at this time, when so much attention is being directed toward markets for pepper and nutmegs.

One picture shows a pepper plantation near Singapore. Singapore is perhaps the greatest emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. Pepper is obtained from the dry unripe fruit of the *piper nigrum*, a climbing plant of the simplest culture, being multiplied with facility by cuttings or suckers. The ripe fruit, when deprived of its outer fleshy covering by washing, forms the white pepper of commerce.

The pepper vine rises about two feet in the first year of its growth, and attains to nearly six feet in the second, at which time, if vigorous and healthy, the petals begin to form into a corolla or blossom. All suckers and side shoots are carefully removed, and the vines are thinned and pruned if they become bushy at the top. The vine will climb, if permitted, to the elevation of twenty feet, but bears best when kept down to the height of ten or twelve feet. It produces two crops in a year. The fruit grows abundantly from all the branches, and in small clusters of from twenty to fifty grains; when ripe it is of a bright red colour. After being gathered it is spread on mats in the sun and dried, when it becomes black and shriveled. The grains are separated from the stalks by hand-rubbing.

A pepper plantation never survives its thirtieth year unless in extremely rich soil, and then it is unproductive; nor will the young vine thrive on an old, worn out pepper land, a peculiarity which is noticeable in the coffee tree. The chief crop lasts from August to February. Four pounds of dry produce for ten of green is considered a fair estimate, and great care is required in the management of the vine, and especially in training and tying it on the props. The pepper plant is subject to injury by the attacks of a small insect. Green pepper dries in two or three days, and if it is intended that it shall be black it is pulled before it is quite ripe. Pepper, unlike many articles of far eastern produce, is an article that will keep for a very long time without discoverable deterioration if not handled much. The United States *pro rata* of population as compared with other countries in Europe consumes more spices of pepper, nutmegs, and mace especially, than any of them, and as to pepper large quantities of it are used in curing meats on an extensive scale in meat-packing establishments, and on the farms in our Western States in addition to household consumption.

The photograph, from which was made the picture of the nutmeg plantation, was taken on the Banda Islands. The nutmeg, as most people in the trade are well aware, is the kernel of the seed of *myristica fragrans*, a dioecious evergreen tree found wild in the Banda Islands and a few of the neighbouring islands extending as far as New Guinea. Nutmegs and mace are almost exclusively obtained from the Banda Islands, although the cultivation has been attempted with varying success in Singapore, Penang, Bengal, Reunion, Brazil, French Guiana, and the West Indies. The trees yield fruit in eight years after sowing the seed, and reach their prime in twenty-five years, and bear for sixty years longer. Almost the whole surface of the Banda Islands is planted with nutmeg trees. The light volcanic soil, shade, and excessive moisture of these islands, where it rains more or less during the whole year, seem exactly to suit the requirements of the nutmeg tree. In Bencoolen the tree bears all the year round, but the chief harvest takes place in the later months of the year, and the smaller one in April, May, and June. In the Banda Islands, the fruits are gathered in small, neatly-made oval baskets at the end of a bamboo, which prevents bruising, the baskets being opened for half their length on one side, and furnished with two small prongs projecting from the top, by which the fruit stalk is broken, the fruit falling into the basket. The ripe fruit is about two inches in diameter, of a rounded pear-shape, and when mature splits into halves, exposing a crimson arillus surrounding a single seed. When the fruit is collected, the pericarp is first removed, then the arillus is carefully stripped off and dried, in which state it forms the mace of commerce. The seed consists of a thin, hard testa or shell enclosing a kernel, which, when dried, is the nutmeg. To prepare the nutmeg for use, the seed enclosing the kernel is dried at a gentle heat in a drying house over a small fire for about two months, the seeds being turned every second or third day. When thoroughly dry, the shells are broken with a wooden mallet or flat board and the nutmegs picked out and sorted, the small, inferior ones being reserved for the expression of the fixed oil which they contain, and which forms the so-called oil of mace. The dried nutmegs are then rubbed over with dry sifted lime. The process of liming, which originated at the time when the Dutch held a monopoly of the trade, was commenced with a view of preventing the germination of the seeds, which were formerly immersed for three months in milk of lime for this purpose, and a preference is still manifested in some countries for nutmegs so prepared.

There is a remarkable difference between the Banda trees and those of the Straits. This has to do with their respective heights. The tree of the Straits is a mere shrub compared with that of the Banda Islands, where fifty to sixty feet is no uncommon size. The

male tree is much shorter lived than the fruit-bearing one. The Banda fruit hangs upon longer and more slender stalks than the Straits, the skin is more free from all blemish, more thin relatively to the fruit and of more uniform proportion. The Banda manner of breaking the fruit when dried is also superior to that followed in the Straits. This is done by spreading them on a sort of drum-head and striking them with flat pieces of board. Several are cracked at each stroke, and re-supplied as fast by a man standing alongside. One man in this way will break more nuts without injury than half-a-dozen men after the Straits' fashion. It is computed that each female tree when at full maturity, under careful culture, will yield ten pounds of nutmegs and about one pound of mace annually. Nutmegs are divided into two varieties, royal and the green. The former is of a larger size and has its mace longer than the nut, which, in the latter, is not entirely enveloped by the leafy net-work. Good nutmegs are distinguished by being large, round and heavy, finely marbled, and of a light, gray colour.

## RHEA IN NORTH BORNEO.

(THE SUAN LAMBA ESTATE.)

F. M. J. S. writes to the *British North Borneo Herald*:—In an interesting article on abacá, the Philippine Staple Industry, specially written for the *Hongkong Telegraph* the following extracts which are devoted to an account of the cultivation of Rhea as experimented in B. N. Borneo show that this country has not yet been given a fair trial in the development of an industry which, in view of the deterioration in the quality of Manila Hemp that has been characteristic of the market during the last few years, gives rise to the suggestion that Borneo could be brought to the front with a little capital investment as a successful rival of the Philippines.

It is evident that decorticating by machinery, with its enormous saving of hands, must be of the greatest advantage in a sparsely populated country, like Borneo, where the labour has to be imported at considerable expense. One of the greatest obstacles to the prosperity of the tobacco estates has always been the high death rate among the coolies, of whom a large tobacco estate employs many hundreds; some having more than a thousand men in pay. A hemp plantation will by no means run into such figures, and besides the coolies would be spread over a great surface, making the sanitation much easier.

If, therefore, a part of the crop would pass through the machinery, the number of coolies could be greatly reduced, even if the contention of the manufacturers, that a 14-H.P. plant (costing about £900 f.o.b. Liverpool) requiring 25 coolies, would produce about 3,000 lbs. of cleaned fibre, *baled for export* had to be considerably discounted. The quantity named after our previous estimate, would represent a single man's work for sixteen months.

That machinery, effective in any way, will be constructed in the near future, does not admit of any doubt. Too great interests are at stake and the antediluvian way of decorticating may be soon enough a thing of the past. Many years will elapse before over-production sets in reducing the high prices now paid and the product of the hemp industry, for a considerable time, will be unusually high. A stuff, which requires at least two to three years for growing cannot be produced in any quantity at once and the first in the market will benefit most.

Unfortunately the proprietor of Suanlamba, Mr. P. D., of Glasgow, did not engage the services of a practical man in due time. After procuring, at great cost, several thousand young plants from the Philippines, the estate was opened out with a success which would have startled the experts from this country.

In two years, *i.e.*, in a year less time than the Filipinos require for that work, perfectly developed clusters of stems more than four yards long had been obtained and this result was greatly to the credit of the Superintendent, a well known scientific man of high standing. The botanist's part of the business being finished, a practical Estate Manager ought to have been procured at any cost, to work out a good system of roads and the necessary drains, and to build permanent houses and sheds. The man of science perhaps knew too little of these requirements. Besides, being overstrained—at least entirely absorbed by his official work—he had no time to occupy himself especially with the superintendence of the estate.

The latter was worked by Managers recruited from the casual unemployed, who, as a rule, had as little practical knowledge of

estate work as the doctor and far less idea of managing working men. They seem never to have come to an appreciation of the requirements of the case, nor of the number of coolies necessary for the pulling of the fibre. Special funds for the latter were never demanded from the proprietor; invalids dismissed from the hospital, or jail-birds had a few weeks of leisure on the estate, enjoying a regular daily pay for their esteemed presence, and a happy *modus vivendi* without care or trouble set in, which brought the estate no further progress, but most effectually dealt with the funds sent from Europe. The original wooden buildings in the course of a few years decayed through neglect and the Managers shifted their residence to Sandakan, 26 miles by water from the estate. This happy Arcadian life came to a sudden close. The proprietor, who had long expected a good return from the laid out capital and rather unwillingly allowed the continuous drain on his purse, sent out a real planter to report about his property and, if possible, to put it on a reasonable footing. The report was not very encouraging, but the man immediately saw the extraordinary possibilities of the case and demanded £2,500 for coolies, roads and drains, new houses, extension work and the upkeep of all this for about 1½ years, after which time he pretended to be able to make the concern pay a very handsome return. The irate proprietor read the report of this new man and soon saw him—elsewhere. The estate was closed and ever since the waving leaves of a solitary banana bush in the rear of Sandakan bay are reflected by the dark, over-shadowed waters of a deserted river. Years of work and many thousands of capital have been spent up to the present without result, and one of the most justified expectations of B. N. Borneo as a colony has been frustrated or, at least, delayed for many years.

And yet the capital employed in this plantation is not completely lost. A thorough clearing, removing of the over-ripe stems as well as the too exuberant growth of young shoots, rebuilding of houses and roads, and a staff of coolies alone is required to put the estate at once again in working order. And this will scarcely, if at all, cost more than it would have cost at the closing of the estate. This is one feature of abacá planting, which raises its chances high above that of the tobacco; the latter plant dies out in the year it is planted, while tea and coffee degenerate and are choked by herbs and wild growth of all kinds in a short time, causing an almost entire loss of the capital invested, after operations have been stopped.

The man whose report was so fateful for Suanlamba estate, a Sumatra tobacco planter, who had privately studied the development of ramie for some time, put all consideration of this certainly valuable plant off and started, in his land of adoption, a propaganda for his new ideal, abacá. Like many another prophet his word counted for little in his own country. He studied carefully everything contained about abacá in a dozen books relating to travels in the Philippines and wrote a pamphlet on the subject of his hobby in three languages—Dutch, German and English (only the latter is as yet not printed), and at last obtained from the proprietor of Sthe uanlamba plantation the lease of this concern.

#### DUTCH GOVERNMENT PLANTATION OF GUTTA-PERCHA AT TJEPETIR.

Mr. R. N. Bland writes in the *Agricultural Bulletin of the Straits and Federated Malay States*, October 1:—In the *Bulletin* for July the Government Gutta plantations at Tjepetir are referred to (page 227).

By the courtesy of Herr Spakler, the Consul-General for the Netherlands in Singapore and Dr. Tromp de Haas of Buitenzorg, I have recently been afforded an opportunity of visiting this plantation. I am also indebted to Herr A. F. de Neve who was good enough to go round with me.

The area reserved for this plantation is about 6,000 acres situated in the hill country near the Salak and Gede volcanoes. The elevation is over 2,000 feet above the sea. It is about an hour's drive from Tjepadak, a station on the main line some two hours from Batavia.

The soil is excellent—a rich volcanic loam in which anything would grow. The surface is undulating—in some places the slopes are steep.

Roughly about 1,000 acres have so far been planted. The oldest trees are some 17 years old, and these appear to be over 30 feet in height. The planted area is now being increased at the rate of

some 500 or 600 acres a year. Seed is obtained, I understand, from the Government plantations at Poer Wokarta and grown in nurseries. There were 90,000 plants in the nurseries at the time of my visit. These young plants are handed over to natives when 8 or 9 months old, and planted by them in fields of hill padi or Indian corn, 20 feet apart.

These people contract with Government to clear the land and to plant and maintain the *Dichopsis oblongifolium* plants for 3 years at 8 guilders a bauw (2 acres). They get what they can off the land by their padi crops as well.

After 3 years the plantations pass into the charge of Government.

About 1 cooly, I think, is employed for every 8 acres.

The trees in all stages look extremely healthy. They are not grown under shade at all,—some were pointed out to me as having suffered from the effects of shade, which has now all been removed.

The chief enemy of the young trees is a moth, *Rhodeneura mytaca*, the caterpillars of which destroy the young shoots at the extremities of branches.

Great care is taken to prevent the planting out of hybrid plants. Seed is brought from known and isolated trees, and any plant showing signs of hybridization is removed from the nurseries before it is 2 months old. One cooly was in charge of the nurseries of 90,000 plants.

Some of the older trees have been experimentally tapped, but I am told that the results of tapping are not satisfactory, and the wounds heal very slowly.

More is hoped for from the process of extracting gutta from the leaves.

Only *Dichopsis oblongifolium* is planted.

#### PARÁ RUBBER IN SELANGOR.

Mr. S. Arden writes in the *Agricultural Bulletin of the Straits and Federated Malay States* for October, 1903:—

In a report on *Hevea brasiliensis* published some months ago, the question of extracting the latex, and the effect of wounding on the flow of latex was gone into, and I now intend to give the results of some further experiments made with the object of verifying the results which appeared in that report.

The aim of the planter is to produce the maximum of latex with as little injury to the tree as possible and at least possible expense. It has previously been pointed out that this tree is fortunately, very hardy and appears to be little effected by the wounding necessary to obtain the latex, so that if ordinary care is exercised little or no injury results; but a point which I think has not yet received the attention it calls for when deciding what style of incision should be practised, is that of the necessity of economising the available tapping surface. Previous experiments have shown conclusively that the first 3 feet of the trunk from the base, contains the largest amount of latex, while if the tapping be extended beyond 6 feet from the base, the quality of the latex decreases as well as the quantity, being much poorer in the percentage of caoutchouc and containing a larger proportion of resin, and the rubber is therefore not so elastic. It will be seen, then, how very essential it is to economise this somewhat limited tapping area, for no matter how skilfully the wounding is accomplished the result will be a rough and broken surface which will be found difficult to work, while the disconnected tissue will undoubtedly interrupt the flow of latex if tapping operations are repeated before cicatrization is complete.

The necessity of taking advantage of what is termed "wound effect" was shown in the report previously referred to, and I recommend that the wounds should be re-opened by taking off a thin slice from the cut surface for a number of occasions say 8—12 times although it has not been possible to lay down any definite number owing to the different behaviour of trees in responding to this wound effect. I notice however, that in some experiments conducted by Mr. Ridley at the Singapore Botanical Gardens that better results were obtained by making a new incision a few inches away from the old one, than by renewing the old incision as described above; and these results are opposed to those hitherto obtained by me I have been induced to repeat my experiments in this direction.

In the following experiment 10 trees were tapped with V-shaped incisions. On one side of the tree a V-incision was made at 6 feet

from the base, another at 3 feet from the base and another close to the base of the trunk. The two lines forming the V were 6 feet long in each case and the incisions were renewed on four alternate days. On the opposite side of the same tree a similar incision was made at 6 feet from the ground, another at 5 feet 6 inches and so on every 6 inches until the base of the tree was reached, there being 12 incisions in all. Three of these incisions were made each day, the base being reached on the fourth day. The results are given in Table 21 and show very clearly the advantage of renewing the old incision although the difference would probably not have been so great had only one incision been made on each side of the tree, as no doubt the flow from one wound interfered to some extent with the flow from the others close by. The reason for opening three incisions each day was so that the exposed surface would equal that of the incisions on the opposite side of the tree at the same time and therefore avoid any chance of the results being influenced by climatical conditions.

### A CASTILLOA BORER.

Mr. H. N. Ridley writes in the *Agricultural Bulletin of the Straits and Federated Malay States*:—Among some young trees of *Castilloa elastica*, about 15 feet tall, in the Botanic Gardens, Singapore, was one in which the top died and dried completely up. On breaking this dead portion up it was found to contain grubs and an adult beetle, belonging to the family of Longicornia which includes some of the most destructive borers in timber. The beetle, appears to be *Epepseotes luscus*, of wide distribution in the Eastern Archipelago. The grubs are, when full grown about an inch and a-half long, legless, white, and with a hard dorny brown head, quite similar to the larvae of other longicorns. It burrows in the wood of the *Castilloa* near the pith cavity, going vertically up or down the stem, but I found traces of its work also in the central pith of the younger part of the tree. The perfect beetle is three quarters of an inch long and about  $\frac{1}{4}$  inch wide across the back. The antennae,  $1\frac{1}{4}$  inch long, and slender. The lowest joint globular, and sunk in a raised socket. The next joint dilated upwards, rather thick. The remaining nine joints are more slender, and all but the terminal one thickened at the tip. They are black with fine greyish fur. The head is broad and short, mottled grey, with patches of yellow fur round the eyes and on the cheeks and neck. The eyes are large semi-circular surrounding the base of the antennae, black, with fiery red glint. The thorax is rounded and margined rather short, grey with a central vertical bar of yellow fur and a row of spots of yellow fur on each side. There is a short blunt process on each side. The elytra are oblong about  $\frac{3}{8}$  inch long, blunt and slightly excavate at the tips, brown mottled with yellow, and punctate all over: on each shoulder is a round black velvety spot. The scutellum is semi-ovate, yellow. The under side of the body is covered with very fine fawn coloured down. The legs are rather long and grey.

The beetle appears to fly by night as many of these longicornia do. I have taken it at rest in the day time on the leaves of the *Castilloa*, and in the morning have found it on the roads and walls. It is evidently a common insect here and does not confine its attacks to *Castilloa* but at present I have not traced it to any other tree.

One tree which had been attacked was saved by passing a wire down the hole made by the beetle grub, and pouring Jeye's fluid down it. This brought all the grubs out, and the tree recovered.

### RUBBER-TREE PLANTING IN THE EAST.

United States Consul-General Hughes, Coburg, Germany, writes:—

The recent report of Mr. Stanley Arden, of Selangor, is of real value on account of the information it contains about rubber cultivation the Far East. It records the assured success of the *Pará* rubber-tree in the Malay Peninsula, thus extending the field available for the production of the world's best grade of rubber.

While the initial planting of *hevea* in India proved a complete failure, better results were obtained from the beginnings made in Ceylon and the Malay States, where the seedlings rapidly developed into vigorous trees. But, as Mr. Arden says, very little interest was taken in rubber by planters, presumably on account of the

high prices then ruling for coffee, which afforded an earlier return than was possible in the case of rubber. With a decline in the price of coffee, planters began to look for other sources of profit. During the season 1896-97 the planting of rubber was taken up seriously. Since then its cultivation has received great attention, and there are at the present time, in the Malay Peninsula alone, at least 12,000 acres planted with *hevea*, representing about 1,500,000 trees, presumably the whole being the progeny of the trees originally introduced by the Government of India (in 1876).

The opinion has prevailed, and quite naturally, that any rubber species would require, for its successful cultivation, the conditions of soil, climate, etc., peculiar to its native habitat. The conditions found on the margins of the Brazilian waterways clearly do not exist in the Malay States, but this fact has not interfered with the satisfactory growth there of *hevea*.

### LARGE AMERICAN CHICORY CROP.

TWO MICHIGAN PLANTS BEGIN TARDY OPERATIONS.

BAY CITY, MICH., *October 19*.—Both plants of the National Chicory Company in this city began operations this week, the west side plant on Monday, and the east side plant Wednesday. The roots are coming in as freely as could be expected in view of the weather, and the quality is extraordinary. Three car loads of the manufactured product have been shipped to the East this week.

The factories started later this season than usual, the delay being caused by the bad weather preventing the farmers from getting the roots out of the ground.

"A good many farmers are now getting the roots out," said C. C. Whitney yesterday: "we have instructed them to do so if possible, as they will not rot as easily as in the ground. Last year, it was so wet that many of the roots did not mature and many which did were frozen in the ground before they could be gotten out. I think that this year all the crop will be harvested."

Eugene Beitter, the New York representative of the National Company, has been in the city a week. He left last night for Chicago. Mr. Beitter is the manager of the Flushing, N. Y., plant of Henri Franck Sons & Co., the biggest concern of the kind in the world and which company holds half the stock in the local company. This concern takes the first thousand tons of the local product this year. The company owns and operates a score of factories in Europe and has a reputation for its goods all over the world. Mr. Beitter was much pleased with local conditions. Chicory is scarce and high this year, the crop in Germany and Belgium being short on account of wet weather, the rains interfering with their growth. The local crop is larger than last year, although the acreage is much less. About 1,180 acres were grown this year, while last year there was over 2,000 acres. The price is the same as last year, farmers being paid \$7 a ton. Many farmers are of the opinion that their chicory crop pays better than sugar beets. While the tonnage is not as large to the acre they get a good price and the roots do not exhaust the soil as do sugar beets.

The cutting and drying season usually lasts about 100 days, but the roasting plant on the west side runs all Winter and well along into the following Summer.

If the season this year is favourable, it is expected that the east side plant will be entirely remodelled and a new kiln built which will be 75 feet high.—*Spice Mill*.

### THE PLANTERS' LABOUR LAW IN TRAVANCORE.

At a Meeting of the Travancore Council on the 5th instant, Mr. Raja Ram Row delivered the following speech on the Planters' Labour Bill:—At one of the former Meetings of this Council, I obtained permission to introduce a Bill for amending the present law relating to criminal breaches of contract, but I did not follow up that permission by the actual introduction of such a Bill, because I thought, as I explained to the Council on the 28th February last, that I could embody in it several provisions of the Planters' Labour Law which was about being passed by the Madras Legislative Council. Since then, that Labour Law has been passed as Act I. of 1903, and I have carefully looked into it. But, for reasons which I shall explain in another connection later on this afternoon, I find the two subjects have to be treated separately.

My present object is, therefore, to ask the Council's permission to introduce a Bill to regulate the relations between the planters and their coolies on the estates. After the varied discussions which have taken place in the Madras Legislative Council discussions which must be fresh in the memories of most people, there is very little that I shall have to say by way of explanation about the necessity for such a law. Whatever necessity there is in the Madras Presidency for such a law, that necessity there is in Travancore also, for we have five large planting districts, namely, Ashambo, Ponnudi, Shencotta, Peermade and Kanan Devan Hills, comprising nearly 120 estates, the area of all of which must be nearly a lac of acres. These estates which are all on the Hills are owned by 54 proprietors, of whom some are single individuals and others corporate bodies and several thousands of labourers from the low country are employed for work there every day. The relations between the employers of labour and the employed have, however, been very indefinite, and there have been complaints from both sides that the existing legal enactments are not sufficiently far-reaching to protect both the large capital employed in the planting enterprise and the interests of labourers who work under the planters. After the passing of Act I. of 1903 in the Madras Presidency, an influential Planters' Association in Travancore has applied to the Government for the enactment of a similar law, and I, therefore, apply to you now for permission to introduce, on a subsequent day, a Bill on the lines of that Act.

Permission was granted accordingly.

In addition to the above Bill, a Breach of Contract Amendment Bill has been introduced. The same gentleman remarked in regard to this:—"I may assure the Council at the outset that I do not mean to ask them to consider the principle of the Bill to-day, but I shall only ask that the Bill which has already been printed and published and copies of which have been furnished to the members may be simply introduced into the Council.

I have already mentioned that I have thought it well to treat this as a separate measure unconnected with the Planters' Labour Law, and shall briefly explain my reasons for thinking so. Whereas the Bill will deal, as the present law itself does, with every class of criminal breach of contract committed in any part of the State by artificers and workmen generally, the Planters' Labour Law will regulate the supply and treatment of labour on plantations, that is, on certain areas only in the country which will be specified and proclaimed by notifications as being brought under its operations. The two enactments will thus be distinct in their main characteristics, and, when passed into law, will have to find separate places in the statute book."

## THE STANMORE ANAMALAY CO., LTD.

### MEETING AT HATTON.

The following are the Minutes of the Meeting of the Shareholders of the Stanmore Anamalay Co., Ltd., held at the Hatton House. There were present Messrs. R. Maclure (*in the Chair*), C. E. Welldon, and F. Liesching.

Mr. Maclure stated that he had visited the Company's property and was pleased with its condition, and that the growth of all the products had been very satisfactory since his previous visit about fourteen months before. The coffee looked well and had a nice crop on it. With the 50 acres planted in 1902 the acreage in tea was now 162 acres. Mr. Bannatine was himself taking charge of the Company's property that month, and it was proposed to begin making the Company's teas in Monica factory, from the 1st February, 1904. With these few remarks he begged to move the adoption of the report and accounts.

Mr. Welldon seconded, and the motion was carried.

### REPORT.

The Directors have to submit their report and accounts for the year ending June 30th, 1903. The Company was incorporated on the 14th day of October, 1902, and the property taken over as from the 1st July, 1902. The following was the acreage of the Company's estate on the 1st July, 1900:—

Tea planted 1900, 112 acres, planted throughout with Java Ledger succirubra cinchona, 20 feet x 17 feet.

Coffee planted 1900: 100 acres with succirubra cinchona 20 feet x 17 feet, and 65 acres of which only about 30 acres are planted with cinchona.

Cinchona, 1901, 50 acres, hybrids and ledgers (Java).

Rubbers, 1901, 4 acres Para rubber

Cardamoms: 1900, 80 acres; about 18 acres Ceylon variety; 1901, 55 acres; 1902, 46 acres.

Total cultivated 512; Reserve Forest 1886 = Total acreage 2,398.

The buildings thereon are: (1) a permanent bungalow partially furnished; (2) three sets of permanent lines; (3) stables and a writer's house, both permanent. An arrangement has been come to whereby the Company's tea is to be made at the Monica factory until the Company's own factory is built. As will be seen from the accounts for the year July 1st, 1902, to June 30th, 1903, annexed, nearly all the expenditure for the year has been incurred on capital account, viz., in the roading, draining, weeding, and upkeep of clearings; in the opening and planting of tea, cardamoms, and coffee, and in addition to the buildings. The original issue of shares amounted to Rs.217,900, and 140 shares of the further issue made during the year have been subscribed for. The scheme of finance to bring 450 acres of tea into bearing and build a suitable factory for the Company will be put before the shareholders at the General Meeting.

In terms of the Articles of Association all the Directors now retire, and are eligible for re-election. It is proposed to change the office of the Company to Hatton as it is more conveniently situated for transaction of the Company's business, and to appoint Mr. F. Liesching, who now resides at Hatton, Secretary of the Company.

Mr. F. M. Simpson has audited the Company's accounts for the year. It will be necessary to appoint an auditor for the season 1903-04.

### NEW ISSUE OF SHARES.

The financial arrangements necessary to bring 850 acres of tea into bearing were then discussed, and Mr. Maclure stated that it was proposed by the Directors to increase the present tea acreage of 162 acres to 850 acres, and, in order to do this, 1,325 new shares (ordinary or preferential of Rs.100 each) would have to be issued, payable in five calls spread over five years. By the carrying out of the arrangement it was calculated that by the 1st January, 1908, the shareholders might expect a return of 12 per cent. on their whole capital from tea alone, the returns from rubber, cinchona, coffee, and cardamoms not being taken into account. Mr. Maclure then proposed that 1,310 further shares of Rs.100 each be issued as from 1st March, 1904, in five calls, payment to be spread over the next four years.

Mr. Welldon seconded.—Carried.

### DIRECTORS RE-ELECTED.

The retiring Directors, with the exception of Mr. Backhouse, who found he was unable to attend the Meetings, were re-elected.

It was resolved:—"That the office of the Company be removed to Hatton, and that Mr. Liesching be appointed Secretary."

Mr. F. M. Simpson was appointed auditor for the year 1903-04.

Messrs. Julius & Creasy and Mr. F. M. Simpson were thanked for their services during the past year, and the Meeting terminated with a vote of thanks to the Chair.

## COFFEE IN DISTANT LANDS.

**Queensland.**—The production of Coffee in Queensland is, says the *Queensland Agricultural Journal* of November 1903, only 45 per cent. of the consumption within the State, but notwithstanding this fact the area planted does not increase at the rate it should do.

From February, 1895, to 1901 the plantations steadily in size, the figures being:—

Acres.			Acres.		
1895	...	60	1899	...	495
1896	...	138	1900	...	537
1897	...	311	1901	...	547
1898	...	432	1902	...	396

The decrease in 1902 may be set down to the extraordinary season all crops have recently had to encounter, and it is hoped that the better conditions now prevailing will result in an area being cultivated considerably in excess

of that of 1901. There was no encouragement in the former year to plant fresh areas.

The divisions of the State contributed to the coffee crop in the following areas :—

	Bearing Acres.	Not Bearing Acres
Southern ...	54	9
Central ...	3	16
North ...	257	57

In 1901 the Herberton district obtained the highest yield—2,200 lbs. of parchment coffee from 1 acre.

The average yield per acre and the total yield from the productive area since 1896 are :—

	Average lbs.	Total lbs.		Average lbs.	Total lbs.
1896 ...	373	9,707	1900 ...	361	102,134
1897 ...	453	81,614	1901 ...	352	130,293
1898 ...	284	56,552	1902 ...	361	113,301
1899 ...	470	104,981			

The records for 1895 are not given as in the table showing the area under coffee-trees, because the returns for that year did not discriminate between bearing and non-bearing trees.

The production for 1901 and for 1902 amounted to 130,293 lbs. and 113,301 lbs., respectively, a decrease for the latter year of 16,992 lbs.

The imports of raw and roasted coffee for the past five years have been :—

	Lbs	Valued at		Lbs.	Valued at
1898 ...	178,681	£7,302	1901 ...	167,908	£6,153
1899 ...	217,602	8,259	1902 ...	164,044	5,884
1900 ...	153,647	6,323			

In his report the Instructor in Coffee Culture says :—

As my position as a responsible officer of the department, entirely resident in the tropical portion of the State, necessitates a somewhat wide range of work covering several branches of agriculture, and does not permit of my confining myself, as was at first anticipated, to work in connection with coffee culture, I am including in this report short references to such other duties as can be grouped under distinct headings. Indeed, during the past year no inconsiderable portion of my time has been occupied with such matters of importance themselves in tropical agriculture, but which cannot be included under the one heading of "coffee culture."

The scope of the Department is steadily increasing in the North, and the necessity for due consideration to agricultural matters is becoming increasingly evident—matters that often require special treatment, owing to the great climatic differences between the Northern and the other districts of the State.

**Coffee Culture.**—The season for coffee this year has been somewhat trying, owing largely to the extreme meteorological variation experienced during the first half of the season, when the conditions of drought, already severely felt during the previous season, continued and increased in severity until the close of the calendar year, and also the latter half of the season, when heavy rains amounted to almost an equal extreme, showing a fall within six months or so almost equal to the average for the past ten years.

The excessively dry time in the earlier part of the season referred to had the effect in several instances of making the coffee droop, and in a few cases of burning off blossom—a thing previously unknown. The effect throughout the country has been to make the crop considerably later than usual. The subsequent heavy wet season has induced a heavy flushing or growth of leaf and wood, but altogether, while somewhat trying, but little harm has been done.

Fair to good crops have been obtained generally, as was anticipated, especially on estates that have received attention in weeding, and prospects are for a really heavy crop in the coming season.

The dry season also had the effect of retarding the growth of trees, which in the case of badly-planted estates has resulted in good rather than harm, the condition of the trees, after the enforced rest, being remarkably fine.

The sample of berry, which last season was small owing to the continued shortage of rainfall, is, this year, very much larger, and will undoubtedly obtain better prices in consequence, especially when better attention is given to curing.

No frosts were experienced this season, and estates that were affected last year have recovered, the trees being almost as large and bearing even more heavily than before they were unfortunately frost-bitten. The continued drought, especially after the damage by frost, has resulted, as anticipated in last year's report, in the dropping out of several small growers and the abandonment of their small areas, in which places the coffee-trees, though by no means killed out, are now almost past recovery from neglect and weeds.

I am pleased to note in many directions adoption of improved methods, and greater attention to culture and field work as well as curing, and in some cases the satisfactory overcoming of little difficulties in the direction of labour for picking and other matters showed resourcefulness and self-reliance on the part of some of the pioneers of the industry.

The matter of reducing the cost of production to the lowest possible point by attention to details both in field and store work is not yet receiving the attention from growers that I should like to see. As growers begin to appreciate the importance of this matter and exercise due economy in time and labour, there is not a doubt they will find, not only that it makes often all the difference in amount of profits, but settles most of the vexed questions assailing the planter.

The greater number of inquiries for advice and information this season, have, however, been in the direction of curing and disposing of crops.

The smaller growers have complained of a difficulty in obtaining a ready market, owing to the reduced demand by the smaller local produce merchants to whom they had hitherto been able to dispose of their small lots, the merchants explaining that the abolition of the duty on tea has so widened the difference of price between the beverages as to show an appreciable reduction in the consumption of coffee. The reimposition of the duty on tea being impracticable, a bonus on the coffee produced in the Commonwealth, as petitioned for by the Coffee Growers' Association, even if considerably less than the amount stated by them, would undoubtedly largely meet the case. Nor need it be feared that such assistance would not benefit the growers—but be taken advantage of by speculators—in other words, the produce merchants—who now buy direct from the producer, if the growers will go to the open markets of the Commonwealth, as in Sydney and Melbourne.

The total amount of such assistance would be but trifling, and, in any case, is not to be compared to the advantage to the Commonwealth of fostering, encouraging, and, in fact, establishing so advantageous an industry.

The obvious remedy for the present low prices offered within the State for the raw product, apart from co-operation and organisation, were it practicable, is in the further treatment of the coffee by hulling and grading as pointed out in last year's report and in my report submitted after visiting the Southern States for this especial purpose. This curing can be done by each individual grower with hand-power machines of cheap cost.

Acting on my advice, several growers have so cured their crops this season, and despatched them to Sydney for sale by auction by brokers; the coffee being dealt with in the same manner as tea, with very gratifying results. The cost of sending the crops to Sydney amounts to no more than in shipping to Brisbane, and the freight and charges amounted to less than  $\frac{1}{4}$ d. per lb. The prices obtained were not the highest possible by any means but were good, and taking into consideration the fact of the small size of the sample, largely due to the drought, and the fact of this being in most cases the first consignment, the prices were gratifying and the sales prompt. According as care is taken in curing, i.e., thorough drying after pulping, hulling, and grading, packing in double bags, not more than 70 lbs. in a bag, branding and marking (for neatness in packing is just as important a point in coffee as in any other line of produce) the quality is recognised as being uniform and reliable, and the brand becomes known, so well the confidence of the buyers be obtained and the prompt and ready sale of each grower's crop, be the quantity large or small, be assured and prompt.

With an industry capable of extension to twenty times its present size before any grave consideration need be given to exportation, no fear need be entertained regarding the advisability of the cultivation of coffee in the Commonwealth on account of the apparent surplus in the world's supply of low-grade coffee as would seem to be entertained in some quarters.

With attention to what may seem small items of field and store work, adoption of practical and approved methods, all of which lead to reduction in cost of production, which cannot be too much emphasised, and due attention to curing, etc., the prospect for coffee-growers in Queensland are very distinctly favourable.

The tour through the coffee-growing centres of the Southern part of the State, usually undertaken during the earlier part of each season, was this year abandoned through the necessity of retrenchment, and therefore the districts of Rockhampton, Yeppoon, Byfield, Tungamul, Percy Island, Marlborough, Pialba, Mount Buderin, and Maroochie River were not visited. It is proposed to visit these places this season, however. The touring for instruction and demonstration has therefore been confined to the North—between Mackay and Cooktown; the only places not being visited this season being the Bloomfield River and Geraldton. In all, seventeen tours were undertaken, aggregating 117 days.

The amount of correspondence, including applications for information, advice, and visits, etc., has been about the same as last season. One article entitled "Staking" has been published in the *Queensland Agricultural Journal* for August, 1902. It is to be regretted that the general work in the North, especially while single-handed in the office, does not admit of more time being devoted to the writing of such articles for the *Journal*.

## TEA IN EUROPE.

### THE BALKAN STATES.

As might be supposed, the tea trade of the principal Balkan countries is not a very important one. The conditions vary somewhat in the several States, but relatively to population, Roumania takes most tea, and Servia least. It is difficult to say whether the trade on the whole is progressive or rather stationary, the figures available showing considerable fluctuations in different years. The quantities of tea imported for home consumption in the three principal Balkan States during the last available five years are as follows:—

		1898.	1899.	1900.	1901.	1902.
Servia,	kilos.	... 2,216	4,092	17,943	22,429	...
Bulgaria	"	... 72,893	37,530	36,048	52,897	...
Roumania	"	... 280,911	198,269	...	166,239	191,878

On the basis of these official figures, the average annual tea consumption of the three States combined would appear to be about 610,000 lbs., which, taking the joint population as nearly 12 millions, would give approximately 0.8 oz. per head. This compares with an average annual consumption of coffee nearly 14 times as great, *viz.*, about 8,300,000 lbs. or over 11 oz. per head.

The principal sources of tea supply are, in the order named, Germany, Great Britain, and Russia. Holland is also a contributor. Taking the largest tea consumer, Roumania, we find that Germany has far outstripped her competitors, whilst imports from Great Britain are at best stationary.

Roumania.		Tea Imports for Home Consumption.				
From		1898.	1899.	1900.	1901.	1902.
Germany,	kilos.	... 178,122	116,968	Not available	82,863	92,862
Great Britain,	"	... 49,414	41,062		53,946	39,572
Russia	"	... 9,413	15,741		9,559	7,344
Holland	"	... 1,662	1,919		7,232	30,526

In Bulgaria, the decline in imports from Great Britain has been still more marked, *viz.*, from 82,356 kilos. in 1898 to 7,270 kilos. in 1901. The corresponding figures for Germany are 37,727 and 36,021 kilos, and those for Russia 8,896 and 4,977 kilos.

None of the statistics available show any direct imports of tea from India or China. From information locally obtained, however, it would seem that there is a tendency to draw more supplies from Constantinople, where Indian tea is the principal stock; and it is believed that an Agent at Stamboul holding a good selection of suitable British-grown teas would be in a good position to compete successfully for a share of the Balkan trade.

At present, business is done principally with Hamburg, London, and Odessa, and the bulk of the wholesale trade is controlled by German or Russian houses. In retail, little or no Indian or Ceylon tea could be discovered on sale—at least under their own names: the demand among consumers runs chiefly upon Russian kinds. The packet trade is thus almost wholly in the hands of Moscow and Odessa firms, retail prices ruling generally high—say from 4s. 6d. to 14s. 6d. a lb.

In Bulgaria, the great similarity of the language to Russian is a point much in favour of the Muscovite packet trade. Thus at Sofia, for instance, no tea was to be seen that did not purport to be of Russian origin, though from figures given above, most of the tea used in Bulgaria must come from Hamburg and London, the labels on packets were usually in the Russian language, and the weights were frequently fractions of the Russian pound (409 grammes) and not the newly-introduced kilogramme.

The Customs duties proper levied on tea are not excessive, but are much increased by various 'Excise' and other local dues. The total burden imposed works out as about 6d. per lb. in Servia, 7d. in Roumania, and nearly 1s. in Bulgaria. The various tariffs may be stated thus:—

### DUTIES ON TEA.

*Servia.*—Frs. 125 per 100 kilos., plus "Obtr" tax and 7½ per cent. *ad valorem*.

*Bulgaria.*—14 per cent. *ad valorem* plus "Excise" 1 franc and "Octroi" or town dues, ranging up to a further 1 franc per kilo.

*Roumania.*—Frs. 50 per 100 kilos., less tare 20 per cent.

"Excise" and "Octroi" Frs. 150 per 100 kilos., less tare 40 per cent.

The duties on coffee are in all cases lighter than those on tea, ranging from about 2d. per lb. in Roumania to over 6d. in Bulgaria.

On the whole, the outlook for the tea-trade in the Balkans would seem to be rather uncertain. There are some signs of progress being made, but only at a slow rate. The prospects for British-grown tea in particular are not very encouraging. There is practically no Indian and Ceylon tea being imported direct over sea, while the imports hitherto drawn from Great Britain appear to be declining rather than otherwise, and the trade tending to pass into German hands. There are many difficulties to contend with in these countries. The absence of large centres of population; the scarcity of capital, involving, as it does, a wide-spread system of credit-trading; the complexity of local trade customs; and lastly the numerous and little-known languages—all these seem likely to remain difficult barriers to the British trader. Under these conditions, any "frontal attack" by British-grown tea would hardly be a hopeful enterprise; but, as already indicated, it is possible that well-directed efforts from Constantinople might do a little to turn the position.

### AUSTRIA-HUNGARY.

Considered as a field for tea, the Austrian Empire is at first sight a somewhat disappointing country. The third State in Europe both as to area and population, its *per capita* tea consumption ranks only with that of Bulgaria, and is less than half that of Germany. The reason for this apparent small per head consumption is probably to be found in the fact that, among the numerous heterogeneous peoples that go to make up the Austrian Empire, there are large sections of population—almost whole provinces—that drink practically no tea. Its use to any serious extent is confined chiefly to the larger towns and to the so-called Cis-Luthan provinces of Austria proper. Even in Hungary, with its wide area and comparatively healthy population of some 19 millions, the quantity of tea consumed, outside of Budapest itself, is relatively very small. In several of the remoter and poorer provinces the conditions are still less favourable—Bosnia and Herzegovina for instance. Thus, almost everywhere, if we except the two great capitals of Vienna and Budapest (and possibly also the province of Galicia which is more Russian in its habits) we find tea-drinking practically confined to the upper and richer classes; and by them tea is taken rather as a fashion, and for the most part only in Winter.

Coming to figures, it is, therefore, not surprising to find that the total imports of tea into Austria during the last 3 years, 1900 to 1902, do not average more than 1,038,000 kilos., or 2,283,000 lbs. annually. Upon a population estimated to number over 47 millions, this gives an annual per head consumption of approximately 22 grammes or 0.78 oz. per annum.

Low as this rate still is, it nevertheless marks an increasing use of tea; for in 1886, for instance, the ratio per head was not much over 11 grammes, which had grown to about 20 grammes by 1898. Taking the total weight of tea imported, this was in 1886 no more than 444,100 kilos., but had risen by 1898 to 922,300 kilos., and by 1902 had further advanced to 1,024,300 kilos. or about 2,253,400 lbs.

The total weight of coffee imported in 1902 was some 44 times greater than that of tea, *viz.*, 45,102,900 kilos., which is not far from 1 kilo., or about 2.11 lbs. per head of population.

The following table shows the progress made in both tea and coffee during the last 5 years:—

		Quantities (in kilos.) of tea and coffee imported into Austria for home consumption.				
		1898.	1899.	1900.	1901.	1902.
Tea.	kilos. ...	922,300	930,900	1,065,200	1,024,800	1,024,300
Coffee	,, ...	43,613,400	40,884,800	42,418,000	44,931,400	45,162,900

From this table it is seen that, while tea and coffee are about maintaining their relative proportions both are increasing a little.

The salient feature of the Tea imports is the complete predominance of China kinds, which constitute over 90 per cent. of the trade. The bulk of this tea comes direct to Austria from Chinese ports; and direct importations from India and Ceylon, still very small, are similarly tending to grow, though at present amounting to barely 5 per cent. of the whole.

Imports *direct* from Ceylon are not specified in the tables prior to 1900, and are still very insignificant in volume, as shown below:—

Tea imports into Austria *direct* from "Countries of Origin."

		China.			India.	Ceylon.
		Kilos.				
1898	...	...	...	...	24,600	...
1899	...	...	...	...	33,500	...
1900	...	...	...	...	40,100	1,200
1901	...	...	...	...	50,500	2,300
1902	...	...	...	...	36,400	3,300

It is at least satisfactory to observe that the rate of increase of British-grown imports is more rapid than that of their overshadowing competitor. And there also remains, of course, a proportion of British-grown tea (not easy to distinguish accurately) included in the supplies drawn from other countries, especially those from Great Britain and Germany; but it may be doubted whether the total import of Indian and Ceylon teas forms 10 per cent. of Austria's tea trade.

Outsid; the direct imports from Eastern countries of origin, Austria buys not inconsiderable quantities of tea from Russia, Great Britain, and Germany. The imports from each of these countries is shown in the subjoined table, which also includes all other tea imported *except* that from the Eastern tea-growing countries already given:—

Annual Tea Imports into Austria from:—

		1898.	1899.	1900.	1901.	1902.
Russia,	kilos. ...	30,700	27,200	47,500	33,900	35,400
Great Britain	,, ...	23,200	21,300	21,200	25,300	28,100
Germany	,, ...	12,200	14,700	19,200	19,000	19,200
Other countries	,, ...	10,400	8,700	11,500	10,000	10,700
(Excl. China, India and Ceylon.)						

The Customs duties levied in Austria are payable in gold, not currency, and discriminate between imports over "Sea" and "Overland," favouring the former, *i.e.*, the direct trade, by 10 or more per cent. The rates are as follows:—

Tea.	By Sea	90 gulden (gold) per 100 kilos.	} Say 10d. to 11d. per lb.
	Land	100 " " "	
Coffee.	By Sea	37 " " "	} Say 4d. to 5d. per lb.
	Land	40 " " "	
	Roasted	50 " " "	
Cocoa.	By Sea	20 " " "	} Say 2d. to 2½d. per lb.
	Land	24 " " "	

It will be seen that both Coffee and Cocoa are much more highly taxed than tea, specially Cocoa, the consumption of which is increasing considerably. The present relative consumption in Austria of these three beverages may be thus shown in English weights:—

Tea,	per head	...	0.78 oz. per annum.
Cocoa	,,	...	1.25 "
Coffee	,,	...	33.45 "

Having thus glanced at the statistical position, there remain some other conditions to be noticed. We have already seen how limited, outside the great cities, is the general use of tea; yet one of the complaints, at least in Vienna, was that the trade is in too many hands. There appear to be no wholesale houses in Austria dealing solely in tea, the retailing of which is usually an adjunct to some other business—such as a China and Japan warehouse or a wine and spirit trade. Almost everywhere one may see "Tea and Rum" advertised together, and merchants aver that it is mainly by help of the latter that they are enabled to carry on their tea business. This is mostly on a small scale. Many trade customs

and conditions prevalent in Austria, especially the pernicious "depôt system" involving long credits and the overkeeping of tea stocks by retailers, constitute factors unfavourable to any rapid expansion. Among the leading firms connected with tea, it was generally spoken of as a "bad article," and little encouragement could be found for the idea of introducing British-grown teas to the Austrian consumer. But the latter's interests are hardly identical with those of the purveyor at the high prices, which still rule the retail trade. The bulk of this is done at from 4/- to 7/- a lb., while 10/- or more is frequently paid by the well-to-do classes. At Budapest, prices range even higher, one sample of a fairly fine China tea being purchased at the principal tea-dealers at a price equivalent to 18/- a lb. Very small quantities, however, can be sold at such fancy prices. As to quality, the tea on sale in Austria is for the most part poor—at least to English nations. A few fine Chinese or Russian varieties are met with at extravagant prices, but, in general, local demand has to be content with China Souchongs and mixings of the ordinary type, blended occasionally with a little Indian leaf. Pure Indian tea was nowhere observed on sale, but in Vienna, Ceylon and even Japanese varieties were sometimes seen.

On the whole it is difficult to feel sanguine as to the outlook for tea in Austria-Hungary. Coffee, cocoa, local beers and light wines are articles of widespread popularity; while for tea there is little demand. Of such small market as does exist, China already holds the monopoly, and this at prices practically prohibitive to rapid expansion.

The introduction of good British-grown teas, at reasonable rates direct to the consumer is doubtless much to be desired, and should prove beneficial both immediately to the consuming public and ultimately to the Indian and Ceylon tea-growers. But it is not easy to suggest a practical method of carrying out this idea, unless at a disproportionate expenditure of time and money. And here naturally arises the question whether there are not in Europe to-day other fields for tea development, more promising of result than any to be found at present within the Austro-Hungarian Empire?—*Capital*.

## DISTRICT ASSOCIATIONS.

### WYNAAD.

Proceedings of a General Meeting held at Meppadi Club on December 2nd, 1903. PRESENT:—Messrs. Abbott, Armstrong, Atzenwiler, Behr, Capt. Carslake, Day, Mackinlay; J. R. Malcolm, Nicolls, S. Powell Jnr., Richelmann, Taylor, Trollope, Waddington; and B. Malcolm, *Honorary Secretary*.

Mr. J. R. Malcolm *in the Chair*.

1. Proceedings of last Meeting—Taken as read.
2. **The late Mr. E. C. Mitchell.**—The Honorary Secretary read the copy of his letter to Mrs. Mitchell which was approved.
3. **Roads.**—Read letter to the Executive Engineer, P. W. D., Calicut, drawing his attention to the distance for which metal was being spread, on the Chundale-Lakadi road, ahead of the rolling. Read reply from Executive Engineer stating orders had been issued to the effect that metal was not to be spread for an unreasonable distance ahead of the rolling.—Recorded with satisfaction.

**Tea Cess.**—Read letters to Indian Tea Association, Collector of Customs, Madras, and several Coast Firms *re* the marking of weights on Tea chests. Read letter from Messrs. Peirce, Leslie & Co. enclosing copy of proceedings Board of Revenue, dated October 21, 1903, stating that "The Assistant Commissioner will now be instructed to accept either the nett weight marked upon the chests, or the invoices received from the Factories, whichever may be most convenient to the individual exporters."—Recorded with satisfaction.

**Government Entomologist.**—Read letter from Mr. Maxwell Lefroy offering to send the Association copies of his pamphlets on insect pests. Read letter thanking Mr. Maxwell Lefroy and accepting his offer.—Recorded.

**Labour Law.**—Read letters to Collector of Malabar and U. P. A. S. I. enclosing copies of the recommendations of the Committee *re* the matter of "Rules and Regulations" under Act I. of 1903. Read letter from Collector of Malabar stating that his final report had not gone in to Government yet.—Recorded.

**Rules.**—*Resolved*, that the matter of "Rules" of the Association be brought up at the next Annual General Meeting.

**Madras Industrial Exhibition.**—The Committee appointed to collect Exhibits reported that they had been unsuccessful in collecting any and tendered their resignation. A vote of thanks was passed to the Committee for the trouble they had taken.

**U. P. A. S. I.**—(a) *Coffee Assessment.*—The Honorary Secretary was instructed to address the U. P. A. S. I. re the proposal to ask Government to remit the assessment on Coffee cultivation, asking what steps had been taken in the matter.

(b) *Pushing of Tea Sales at St. Louis Exposition.*—The Honorary Secretary was instructed to wire to the I. T. A. asking if 1,000 lbs. of tea would be accepted as a contribution from this district for the pushing and backing up of sale of tea in America, if delivered in Calcutta by 15th January next.

(c) Read sundry U. P. A. S. I. circulars.

(Signed) J. R. MALCOLM,  
Chairman.

( „ ) BERNARD MALCOLM,  
Honorary Secretary.

## INDIAN TEA ASSOCIATION.

### COMMITTEE MEETING.

The following is from an abstract of the proceedings of a Meeting of the General Committee held on the 8th December. There were present: Messrs. H. C. Begg (*Chairman*), T. McMorran (*Vice-Chairman*), R. H. A. Gresson, G. Kingsley, G. A. Ormiston, R. R. Toynbee, and T. Traill.

Mr. Lockhart Smith and Mr. W. Warrington wrote regretting their inability to attend.

**Correspondence with the Indian Tea Association, London.**—Letters dated 13th and 20th November, from Mr. Ernest Tye, Secretary, Indian Tea Association, London, were brought up for final consideration after previous circulation. The principal subject dealt with in the letters was—

*The Louisiana Purchase Exhibition.*—With the letter dated 20th November, Mr. Tye forwarded a copy of a preliminary report by Mr. R. Blechynden, the Association's Commissioner at St. Louis. In this report Mr. Blechynden defined the present position, and detailed the steps he was taking to provide an adequate representation. A site for the Indian pavilion had, he said, been secured in a favourable part of the Exhibition grounds; and the work of erection was being proceeded with. He was endeavouring to make satisfactory arrangements for the sale of tea and coffee in the cup, and for the distribution of samples. He was also arranging for the interior of the building to be decorated with Indian art-ware, ..... pictures, photographs, etc. It was his opinion that tea in the cup should be served by Indian servants, but he did not desire to advance definite proposals in that connection at present. He also dealt with several other points of detail.

The Committee noted Mr. Blechynden's report with much interest. In writing to the London Association certain of the points raised in it were to be referred to; and the views previously expressed on this side were to be re-affirmed.

The Committee also had before them a telegram, dated 3rd December, from the Honorary Secretary, Wynaad Planters' Association, asking if 1,000 lbs. of tea from that district would be accepted as a contribution towards pushing the sale of South India teas at the Exhibition. The Committee discussed this offer but they were not prepared to guarantee that the tea would be distributed as Southern India tea; for they did not think that it was desirable, in giving away or selling tea, to differentiate between the produce of the various districts. But samples sent for exhibition purposes only, would of course be labelled with the name of the garden and the district in which it was situated.

A reply in these terms was to be sent to the Wynaad Planters' Association:—

**Persian Import Tariff.**—In the proceedings of the Meeting held on the 10th November, 1903, reference was made to a recent enhancement in the Persian import duties on tea. This enhancement was, it was understood, additional to that provided for in the new Persian Tariff, which came into operation on the 14th

February, 1903, and was mentioned in the Committee's proceedings, dated 20th March, 1903. From a statement made in a London daily newspaper it appeared that on the 9th February a special commercial Convention was concluded between the United Kingdom and Persia. This Convention was ratified on the 27th May. In the schedule attached to it the duties on tea were stated to be: yellow or pale tea 6s. 9d. per 6·54 lbs.; other sorts 4s. 6d. per 6·54 lbs. In the new Tariff the duties were to have been: white tea 3s. 9d. per 6·54 lbs.; all other teas 2s. 3d. per 6·54 lbs. Consequently the Convention entailed an increase of nearly 100 per cent. for black teas and about 80 per cent. for green teas. This great enhancement was, it was alleged, due to a clerical error in the British Foreign Office; and no satisfactory explanation was forthcoming as to what the rates were really to be.

On the 17th November the Committee had drawn the attention of the Government of India to the matter, but had received no reply so far. They now decided to ask the London Association to make enquiries with a view to the elucidation of the difficulty.

**Act XIII. of 1859.**—The Committee considered a letter, dated 6th December, from Mr. Jas. Peter, of Mertinga Tea Estate, Sylhet with reference to certain cases in which labourers had absconded before completing their Act XIII. contracts. The cases had been dismissed by the Sub-Divisional Officer, whose decision had been upheld by the Sessions Judge. Mr. Peter now asked that the Association should bear the cost of an appeal to the High Court.

Before coming to any conclusion on the point the Committee decided to telegraph to Mr. Peter asking him to furnish immediately the full records of the cases. On receiving these the nature of any further action which might be possible would be considered.

**The Calcutta Port Commissioners' Tea Warehouse.**—The Committee considered a letter, dated 26th November, from Messrs. J. Thomas & Co. with reference to the working of the Port Commissioners' Tea Warehouse. The trade in general had been put, Messrs. Thomas & Co. said, to considerable inconvenience, owing to the delay on the part of the Warehouse authorities in preparing teas for sampling. As a result samples were late in reaching buyers, and brokers did not have sufficient time to inspect their teas properly. Moreover, in order to get the samples out in reasonable time, brokers were often compelled to draw them from a small proportion instead of from an entire break. This made it an extremely difficult matter to present a fair sample to the trade at this time of the season, when teas have not a uniform appearance and character. Messrs. Thomas & Co. had endeavoured to facilitate matters by closing their catalogues a day earlier than usual, in order to give the Warehouse authorities more time to get the teas ready. But no improvement had resulted; and, in their opinion, the staff employed was insufficient for the work. They suggested that the Association should press for an increase in the staff, and for the provision of additional hydraulic lifts.

The question was one which had been watched by the Committee for some time past; and they now decided to address the Port Commissioners respecting it. They agreed with Messrs. Thomas & Co. in thinking that the staff was inadequate; and they decided to suggest that it be increased, and that additional hydraulic lifts be provided.

**Scientific Department.**—A letter, dated 27th November, from Messrs. Octavius Steel & Co., concerning the contributions of certain of their gardens to the fund raised in this connection by the Surma Valley Branch, was to be referred to that Branch for consideration.

## PROPHETS OF EVIL.

In every age there has been an abundance of prophets, and the things they have foretold have generally been of a disastrous character. Yet still this old world of ours wags on more or less merrily, and supports a larger number of people in a greater degree of comfort than at any former period.

Now here is a prophet of evil who discourses of that sleeping sickness which first appeared on the west coast of this continent, and is spreading in all directions—a dreadful malady, truly, one which to the present has defeated the world's science—speculating as to the probability of it being the appointed means for the extinction of mankind.

Seeing that this new and mysterious disease has so far attacked only Negroes, and has killed only a few hundreds of that race, whereas smallpox has killed hundreds of thousands of every race, it is difficult to appreciate this gloomy prophet's opinion. Perhaps the prophet suffers from indigestion; in which case he would do better to cure himself, by taking a few doses of Mother Seigel's Syrup, than disseminating his gloomy ideas. Indigestion not only prevents food from nourishing us; it converts it into poison which contaminates the whole system, depressing the mind, constipating the bowels, impoverishing the blood, and punishing the unfortunate patient with severe pain at the chest after eating, headache, drowsiness, and other symptoms which complete his misery.

Among the many people who know these facts from experience is Mr. H. Henegan, of Crawford Street, Port Elizabeth, who, in writing to Messrs A. J. White (Colonial), Ltd., corner of Princes and Diesel Streets, Port Elizabeth, Cape Colony (proprietors in South Africa of Mother Seigel's Curative Syrup), says: "It is now two years since I first used Mother Seigel's Curative Syrup, and I rejoice to tell you (as I have told my friends ever since) of the good it has done for me. I can never forget the pain and distress I suffered, and my wretched condition when a friend persuaded me to try your Syrup. I had consulted several doctors and taken their medicines without obtaining any relief from the pains in my chest and back. Often I was compelled to neglect my work, being weak and quite without energy. To my friend's earnestness in recommending Seigel's Syrup I owe my present good health. I am now a strong, healthy man; but I always keep a supply of the Syrup at hand, and, whenever I need any medicine, never fail to resort to it."

These favourable opinions, based upon actual benefits received, expressed by Mr. Henegan on 8th July, 1903, closely resembles numerous other testimonials which constantly reach Messrs. A. J. White from various parts of the country. Mr. Henegan's complaint was chronic indigestion, a very prevalent malady, in itself sufficient to destroy all joy in life, but which, when neglected, leads to all sorts of dangerous complications. Mother Seigel's Syrup is its only sure cure. It is a perfectly natural remedy, made from fruits, roots, and herbs, containing no noxious drugs whatever. The essential qualities of the plants are extracted by a scientific process known only to the proprietors, and the result is a specific which, for thirty-five years, has been acknowledged as an unrivalled remedy for indigestion and all bilious diseases by the people of the sixteen principal countries of the world.

Mr. W. Sly, of 12, Darlow Buildings, Parliament Street, Port Elizabeth, in a letter dated 8th August, 1903, expresses himself in terms similar to those of Mr. Henegan. "I had a severe attack of indigestion while staying at Port Said, in Egypt," writes Mr. Sly, "and tried numerous so-called remedies without deriving the least benefit from any of them. But when I came to Mother Seigel's Curative Syrup it was different. The very first dose did me good, and shortly after the indigestion left me."

Prophets of evil are never welcome. Prophets of gladness are sometimes mistaken. Proved facts, such as we have been reading of, are independent of all prophecy.

## MARKET REPORT.

[Per Mail advices of November 27th, 1903.]

### COFFEE.

The *London Commercial Record* says:—Auctions were held only on one day this week, Tuesday, when but limited supplies were offered. With a fair demand no alteration in value can be quoted for any description. In the market for Brazil "futures" there have been occasional fluctuations, but the general tendency has been to firmness, owing to smaller receipts, and the latest sales show a little advance upon last prices; yesterday Santos for December delivery sold at 30s. to 30s. 1½d., March at 31s. to 31s. 3d., May at 31s. 9d. to 31s. 10½d., July at 32s. 4½d., and September at 32s. 10½d. to 33s. per cwt. We quote:—

London ...	Santos ...	March delivery	... 31s. 3d.
New York...	No. 7 Rio ..	" "	... 5'95 cents.
Hamburg...	Santos ...	" "	... 31½ pf.
Havre ...	Santos ...	" "	... 38½ francs.

The particulars of the auctions are as under:—

EAST INDIA—203 bags partly sold as follows: *Neilgherry*, good bold hard grayish 65s.

SOUTH SEA ISLAND—72 bags sold, pickings 24s. 6d., middling brownish colory 48s. 6d., good bold 65s., peaberry 56s. 6d.

COSTA RICA—Of 254 bags catalogued 150 bags sold, fair bold 63s. to 66s.

PERUVIAN—91 bags mostly sold, smalls 37s., fine ordinary greenish foxy 40s., middling blue 44s., peaberry 46s.

VENEZUELAN—45 bags sold, smalls 38s., middling 46s. 6d., good bold 70s. 6d., peaberry 63s.

COLOMBIAN—1,394 bags practically all sold, smalls 25s. 6d. to 34s., fine ordinary to low middling 38s. to 43s. 6d., middling bright brownish 46s. to 46s. 6d., common to fair bold 42s. to 47s. 6d., good bold 54s., peaberry 38s. to 49s.

BRAZIL—Of 1,750 bags Unwashed Dumont Santos on quay terms offered 1,125 bags sold, smalls 29s. 6d. to 32s., medium 34s. 6d. to 35s., bold 38s. 6d., peaberry 39s. 6d. to 40s.

Rio Exchange 12½d., previous day 12d.

HAVRE, November 26.—Good average Santos November opened quiet at 38f. and closed steady at 38f., December opened at 38f. and closed at 38f., March opened at 38½f. and closed at 38½f., May opened at 39½f. and closed at 39½f., July opened at 39½f. and closed at 39½f., September opened at 40½f. and closed at 40½f.

HAMBURG, November 26.—Good average Santos November opened steady at 30½pf. and closed steady at 30½pf., December opened at 30½pf. and closed at 30½pf., March opened at 31½pf. and closed at 31½pf., May opened at 32pf. and closed at 32pf., July opened at 32½pf. and closed at 32½pf., September opened at 33pf. and closed at 33pf.

NEW YORK, November 26.—Closing prices of No. 7 Rio were as follow:—

	Nov.	Dec.	Jan.	Feb.	Mar.
November 25 ...	5'55	5'60	5'75	5'85	5'95
November 24 ...	5'55	5'55	5'65	5'85	5'90

Catalogues to-day embraced—161 bags Nyassaland, 146 half-bales Mocha, 141 bags Colombian, 79 bags Nicaragua, 168 bags Mexican, 19 bags Guatemala, 69 bags Costa Rica, and 104 bags New Granada. These small public sales went off quietly with prices much the same as on Tuesday.

Brazil "futures" opened steady, but became very active about mid-day, when it was known that the 51,000 bags tendered had been taken up, and a very large business has been passing. Transactions include: December at 30s. 1½d., March 31s. 3d. to 31s. 6d., May 31s. 10½d. to 32s. 3d., July 32s. 6½d. to 32s. 7½d., September 32s. to 33s. 3d.

### TEA.

INDIAN—A slight diminution was noticeable in the offerings which totalled 38,400 packages, contrasted with 41,400 in the week before, and 45,700 for the corresponding period a year ago.

There has been a moderate demand at easier rates, differences in quality as before being mainly accountable for any marked shrinkage in quotations. Tea "for price" up to 6½d. per lb. has been the firmest market, ordinary to medium continuing to be relatively very cheap. The value obtainable in medium compared with common grades is anomalous, and calls for serious attention. Efforts have already been made by many large distributors to induce the public to drink a better tea than is afforded by the low-priced blends of inferior quality now dispensed, but to attain the desired result, further and more concerted action amongst those responsible for educating the public taste is necessary. Both in India and Ceylon the manufacture of Green Tea, together with other causes, such as the increasing consumption in countries outside Great Britain, etc., will probably tend to decrease the amount of common Black available for this market, so that no relief is discernable for those who continue to supply the very cheap mixtures.

**SOUTH INDIAN**—3,100 packages were included in the catalogues, and meeting with a good general enquiry, sold comparatively freely.

The quantity that has passed through the auction room is now some 2 million lbs. more than last year, and taking into consideration the greater weight dealt with privately, both garden and Calcutta-bought, it may be concluded that a full proportion of the increase in the crop that has arrived has been disposed of.

It is announced that the duty on British-grown tea in New Zealand has been removed.

For 35,200 packages on estate account  $7\frac{3}{4}$ d. per lb. was obtained, opposed to  $7\frac{1}{2}$ d. for 36,400 and  $7\frac{1}{2}$ d. for 38,300 in the two foregoing seasons.

Including what is advertised for Monday next, 30th instant, the following quantity has been catalogued during the month:—

1903.	1902.	1901.
Packages	Packages	Packages
196,900 (5 weeks)	151,900 (4 weeks)	184,100 (4 weeks)

making 686,000 packages of this year's crop passed through the Mincing Lane Sale Rooms against 668,000 and 655,000 in the same time of 1902 and 1901 respectively.

**CEYLON**.—Nearly 18,900 packages were submitted *versus* 15,600 on the 17th instant and 17,000 in 1902.

The easier feeling in the Indian market was reflected, though to a more modified extent. Competition was fairly sustained for the lower grades, with here and there a fractional decline on former prices. Medium to fine sorts ruled irregularly, but finest and choice lines met a strong demand, Caledonia, B.O.P., and Brookside, B.O.P., bringing 1s. 11 $\frac{1}{2}$ d. and 1s. 10d. per lb. respectively, while some good averages were chronicled, notably Brookside 1s. 0 $\frac{1}{4}$ d., Henfold 11 $\frac{1}{2}$ d., Wanarajah 11 $\frac{1}{2}$ d., and Caledonia 11 $\frac{1}{4}$ d.

The average is  $7\frac{3}{4}$ d. per lb. On the 19th instant it was 8d., and  $8\frac{1}{2}$ d. twelve months since.

Printed during the month:—

1903.	1902.	1901.
65,100 packages	63,000 packages	65,900 packages
(Avge. 8d. per lb.)	(Avge. $7\frac{3}{4}$ d. per lb.)	(Avge. $7\frac{1}{4}$ d. per lb.)

Quality has mostly shown a falling-off from the level attained in many of the earlier arrivals of high-grown tea, and quotations have suffered accordingly. It looks as if we had seen the best of the crop for the time being, especially as advices from the Island point to unfavourable weather for growth and manufacture having been recently experienced in most districts. On the whole it may be said that the early Autumn gatherings, although affording a few choice invoices, have speaking generally failed to reach the usual standard of excellence.

We learn that it has been decided that the three cents bonus on green tea shall be continued during 1904 until 5,000,000 lbs have been passed, which quantity, it is calculated, will be made by June 30, after which date it is thought that no bonus will be paid. The supply of common black tea is therefore, unlikely to be augmented for some time to come.

**JAVA**.—Rather over 1,700 packages passed the hammer; fine grade went steadily, but for others some weakness was displayed.

The following are auction totals for November:—

1903.	1902.	1901.
7,200 pkgs.	4,500 pkgs.	4,400 pkgs.
(Avge. 7d. per lb.)	(Avge. 6d. per lb.)	(Avge. 6 $\frac{1}{4}$ d. per lb.)

making since 1st January 92,600 packages, an increase of 12,100 packages on the corresponding period last year.

**Deliveries**.—Clearances of all tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 24th November, 1903	16,263,356 lbs.
Do. do. 1902	16,172,654 "

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	28,968	9,409	38,377
Ceylon	15,937	2,923	18,860
Java	1,611	108	1,719
Totals	46,516	12,440	58,956

Also 35 packages from second hands.

*Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report, dated November 27th, 1903, says:—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1903-1904	768,190	547,571	314
1902-1903	788,321	612,9	

37,987 pkgs. INDIAN } Total 58,616 packages were offered in public auction  
18,910 " CEYLON } this week.  
1,719 " JAVA }

The feature in the week's auction has been the depression in medium teas, which, at the present time, are showing exceptionally good value, and are nearly as cheap as they have ever been. There is a want of life in the market, due to the general depression of demand in the country—probably attributable to the depression of Christmas.

North America is taking an increasing quantity of tea, doubtless owing to the large quantity of Green Tea which has been manufactured.

	1903.	1902.	1901.	1900.
Indian	5,236,640	7,057,253	4,389,878	3,108,973

Ceylon	5,684,276	6,252,801	4,555,501
Total lbs...	9,633,042	9,736,471	8,464,749

**GREEN TEA**.—From the time the bonus was first given for the manufacture of Ceylon Green Tea in October, 1898, to the end of December, 1902, it was paid upon 6,149,862 lbs., while from the 1st January to the 30th September this year, it was paid upon 8,395,814 lbs. The Thirty Committee have voted a sum sufficient to pay a bonus of 3 cents per pound, that is about  $\frac{1}{2}$ d., on 5,000,000 pounds to commence on the first January, 1904.

The bonus on Indian Tea has been paid as follows:—1901, 30,000 lbs.; 1902, 720,000 lbs.; and to the end of September, 1903, 959,606 lbs.; making a total from its commencement to the 30th September this year of 1,709,606 lbs.

*Indian and Ceylon Tea taken in United States and Canada from 1st January to 30th September.*

**INDIAN.**—The sale passed with a generally weaker tendency, teas between 7d. and 9d. shewing a distinct fall in price. averages:—"Okayti T. Co." and "Turzum," 1/5½.

Week's av. of New Season's Tea sold on Garden Acct. 1903, 235 pkgs., av. 7.64d. 1902, 36,998 pkgs., av. 7.49d.

New Season's Tea sold on Garden Acct. 1st June to date 1903, 21,228 pkgs., av. 7.26d. 1902, 570,585 pkgs., av. 7.19d.

Market was irregular, nearly everything shewing slightly easier rates, specially teas over 7d. Quality is not as good as it was a few weeks since.

Average for week 7.75d., against 8.11d. in 1902.

Ceylon Tea sold on Garden Acct. 1st January to date, 912,899 v. 7.52d. 1902, 1,030,330 pkgs., av. 6.77d.

Old with a slightly weaker tone in sympathy with other

### COCOA.

quiet market prevails, and in the absence of public transactions are of limited extent. The few sales reported for last include mixed to good red Trinidad at 64s. to 69s., unclayed Carupano at 64s. 6d., fine Puerto Cabello at 130s., and fair ditto at 79s. per cwt.

### PEPPER.

**BLACK**—The market remains in the same quiet condition as reported in our last. On the spot sales of fair Singapore have been made at 6½d., and January-March shipment at 6¾d. down to 6⅝d., being cheaper; about 100 tons sold.

At public sale on the 25th instant 100 bags fair greyish Aleppy retired at 6¼d., also 140 bags sifted Saigon—weighing 5 lbs. 12 oz. per gallon—at 6½d. (6⅝d. per lb. bid).

**WHITE**—is cheaper. 20 tons Singapore, December-February shipment, have changed hands at 9¾d. On the spot sales of fair Singapore at 10d., fair Penang at 9¾d. per lb.

At auction on Wednesday, of 517 bags Singapore offered 28 bags good sold at 10¼d.; 10½d. refused for good bright ALP, the buying in price of which was 10¾d. per lb.

To-day, Pepper quiet. Singapore January-March shipment 6¾d. sellers.

### CINCHONA.

In auction 12 serons of good Loxa quill sold at 10¼d. per lb.

### QUININE.

A rather firmer feeling has been evident this week with small sales of December at 1s. 0¼d. to 1s. 0¾d., March at 1s. 0½d. per oz., and May at 1s. 0¼d. If the month's shipments of cinchona should prove small, a further improvement may be looked for.

### CARDAMOMS.

There was a very small supply and prices showed a slight improvement. Ceylon Mysore, good bold smooth picked were limited at 2s. 9d., and bold medium pale at 1s. 9d. Good medium pale sold at 1s. 2d. to 1s. 5d.; fair medium pale, 1s. 1d. to 1s. 2d.; small brownish, 10d.; good bold, slightly dullish and open, 2s. 2d. to 2s. 3d.; good medium slightly open, 1s. 6d. to 1s. 7d.; small open, 11½d.; brown and split, 8d. to 9½d.; lean brown Malabar, 8d. to 9d., subject. Seed, 1s. per lb.

### GINGER.

**COCHIN**—was extremely dull at auction, the offerings at which summed to 73 cases 955 bags, the whole of which passed the hammer unsold—medium and small cut and scraped, limed, at 47s., washed rough at 28s. A pile of fair washed rough offered down to 25s. per cwt. evoked no response. Privately 1,000 bags of medium and small washed rough have been forced off at 26s. per cwt., being considerably below the figure at which business had been done lately in this grade; at the reduced price there are further sellers.

### INDIA-RUBBER.

The market continues to fluctuate considerably. Sales have been made of hard fine spot up to 4s. 0½d., forward 4s., but since prices have declined a penny and we close firmer with buyers of hard fine forward 3s. 11d. and spot at 3s. 11½d. Soft cure fine sales up to 3s. 11d., and since offered cheaper. Negroheads—Scrappy sales of spot and near 3s. 4d. to 3s. 4½d.; Cametas at 2s. 4d. to 2s. 3½d. forward delivery. Peruvian sales of ball forward delivery at 3s. 2½d., and near at 3s. 3½d.; slab scarce and enquired for.

# ST JACOBS OIL

Was in the olden times largely used by the monks of St. Germain for the same complaints as it is used to-day. It was found most effectual then for Gout, Rheumatism, Neuralgia, Soreness, and general bodily aches and pains. It was the custom then among these good monks to carry the oil about with them, as here described, for the relief of pain among the poor and needy, and although in those days St. Jacob's Oil was put up in rather a crude state, it was found the most useful of all remedies to conquer pain. To-day, by the aid of pharmacy and science, St. Jacobs Oil is far more efficacious than in the old days. To-day St. Jacobs Oil is a highly condensed, scientific, pharmaceutical preparation. It has the largest sale of any medicine in the world.

### CURES

**RHEUMATISM, NEURALGIA, GOUT,  
SPRAINS, SORENESS, SCIATICA,  
LUMBAGO, HEADACHE, BACKACHE,**

And all Aches and Pains usually treated by outward application.

**IT HAS NO EQUAL ON EARTH AS A PAIN  
RELIEVER.**

*It acts like magic. It is peculiar to itself, different from any other remedy. Price 1/1½ & 2/6.*

Mr. H. F. MARLOW, 82, Coldbath Buildings, London, E.C., writes:—"I unfortunately dislocated my knee joint about three years ago, and after attending St. Bartholomew's Hospital, and being pre-cured by several private doctors, I was still in great pain. One day a friend of mine who had used St. Jacobs Oil advised me to try it, and I am glad to say that after suffering terribly for over eighteen months, on the first application of St. Jacobs Oil the pain disappeared, and I have not had any return of it since."

# CONQUERS PAIN.

At auction to-day small supplies were brought forward, and a fair part sold at firm prices.

Pará and Peruvian—12 packages offered and 2 sold—mixed ball at 3s. 2d.; 1 bag virgin at 3s. 5d.

Mollendo—18 packages sold—fine 3s. 10d., mixed entrefine 3s. 4d. to 3s. 6d.; negrohead 3s. 2d.

Mattogrosso 4 packages, Mangabeira 25 casks, and Columbian 34 packages retired.

Central American, etc.—76 packages offered, and 49 sold—fair to good scrap 3s. 0½d., Carthage slab and sheet, mixed dirty and loaded 3s. 1d.

MADAGASCAR—80 packages offered and 57 sold—fair Majun 2s. 6d., mixed ditto, part very dirty 2s. 1d. to 2s. 4½d., dirty da coated 2s. 3d. to 2s. 4d. West Coast Niggers, part fair, part earl 2s., ditto more earthy 1s. 7d.

MOZAMBIQUE—111 bags offered and 87 sold, fine clean stickl sausage 3s. 6½d., sandy ditto 2s. 1½d., Beira ball, part rather soft 4½d., Lamu ball 3s. 1½d. to 3s. 1¾d., mixed reddish ball 3s. 2½d.

NYASSA—56 bags sold, good clean reddish ball 3s. 6¾d.

ASSAM—14 packages offered and 2 sold, fair red but mixed little heated and soft 3s.
